ABSTRACTS

18th International Pragmatics Conference

Brussels
9-14 July 2023

18th INTERNATIONAL PRAGMATICS CONFERENCE

SPECIAL THEME: The shape of interaction: the pragmatics of (a)typicality

Conference chair: Jürgen Jaspers (ULB)

Local Organizing Committee: Philippe De Brabanter (ULB), Liesbeth Degand (UCLouvain), Philippine Geelhand (ULB), Mikhail Kissine (ULB), Laurence Meurant (U Namur & FNRS)

The **International Conference Committee** includes, in addition to the LOC members: Charles Antaki (Loughborough), Valentina Bambini (Pavia), Diana Boxer (Gainesville, Florida), Winnie Cheng (Hong Kong), Anita Fetzer (Augsburg), Pilar Garces-Conejos Blitvich (Charlotte, North Carolina), Maartje De Meulder (Utrecht), Christiane Hohenstein (Winterthur), Michael Haugh (Brisbane), Sachiko Ide (Tokyo), Cornelia Ilie (Strömstad), Napoleon Katsos (Cambridge), Sophia Marmaridou (Athens), Rosina Marquez Reiter (London), Maj-Britt Mosegaard Hansen (Manchester), Melissa Moyer (Barcelona), Jemina Napier (Edinburgh), Neal Norrick (Saarbrücken), Ira Noveck (Paris), Tsuyoshi Ono (Edmonton), Anna Papafragou (Philadelphia), Nausicaa Pouscoulous (London), Mieke Vandenbroucke (Antwerp), Mieke Van Herreweghe (Ghent), Jef Verschueren (Antwerp), Tuija Virtanen (Turku)

IPrA President: 2018-2023: *Stephen Levinson* (MPI, Nijmegen)

IPrA Secretary General: *Jef Verschueren* (Linguistics, Antwerp)

IPrA Executive Secretary: *Ann Verhaert* (IPrA Secretariat, Antwerp)

Adjunct Secretary General: *Mieke Vandenbroucke* (Linguistics, Antwerp)

Members of the IPrA Consultation Board (2018-2023):

Nana Aba Appiah Amfo (Accra, Ghana), Charles Antaki (Loughborough, UK), Rukmini Bhaya Nair (New Delhi, India), Barbara Bokus (Warsaw, Poland), Diana Boxer (Gainesville, USA), Charles Briggs (Berkeley, USA), Frank Brisard (Antwerp, Belgium), Winnie Cheng (Hong Kong, China), Jenny Cook Gumperz (Santa Barbara, USA), Anita Fetzer (Würzburg, Germany), Pilar Garces-Conejos Blitvich, Helmut Gruber (Vienna, Austria), Yueguo Gu (Beijing, China), Susanne Günthner (Münster, Germany), Hartmut Haberland (Roskilde, Denmark), Michael Haugh (Brisbane, Australia), Janet Holmes (Wellington, New Zealand), Sachiko Ide (Tokyo, Japan), Cornelia Ilie (Strömstad, Sweden), Shoichi Iwasaki (Los Angeles, USA), Helga Kotthoff (Freiburg, Germany), Dennis Kurzon (Haifa, Israel), Stephen Levinson (Nijmegen, The Netherlands), Sophia Marmaridou (Athens, Greece), Rosina Marquez Reiter (Surrey, UK), Yael Maschler (Haifa, Israel), Yoshiko Matsumoto (Stanford, USA), Michael Meeuwis (Ghent, Belgium), Maj-Britt Mosegaard Hansen (Manchester, UK), Melissa Moyer (Barcelona, Spain), Neal Norrick (Saarbrücken, Germany), Tsuyoshi Ono (Edmonton, Canada), Jan-Ola Östman (Helsinki, Finland), Salvador Pons Bordería (Valencia, Spain), Marina Sbisà (Trieste, Italy), Gunter Senft (Nijmegen, The Netherlands), Tuija Virtanen (Abo, Finland)

Editors of *Pragmatics*:

Editor-in-chief: **Helmut Gruber** (University of Vienna)

Associate Editors: **Frank Brisard** (University of Antwerp), **Xinren Chen** (Nanjing University), **Yoko Fujii** (Japan Women's University, Tokyo), **Sophia**

Marmaridou (University of Athens), **Rosina Márquez Reiter** (University of Surrey), **Constantine V. Nakassis** (University of Chicago), **Angeliki Tzanne** (National and Kapodistrian University of Athens), **Ruey-Juan Regina Wu** (San Diego State University), **Elda Weizman** (Bar-Ilan University)

IPrA owes a debt of gratitude to its host and sponsors:

USER NOTES:

1. This abstracts book only exists in electronic format. To go to the appropriate sections, just click the corresponding bookmark on your pdf-screen.
2. All abstracts within the **plenary**, **panel**, **lecture**, and **poster** sections are ordered alphabetically by title.
3. All abstracts in the **panel contributions** section are ordered alphabetically by title within each panel that is itself alphabetically listed by title.
4. At the end of this book, there is a complete author index. To find the right page for the author you're looking for, just click the page number.
5. *The abstracts contained in this book are in the form in which they were submitted. Authors were given the opportunity to edit their abstracts themselves. Yet, the end result may still not be fully satisfactory in all cases.*

All abstracts (and all related materials) are also accessible online through the program at <https://ipra2023.exordo.com> (with your IPrA username and password).

<i>1. University of Leeds</i>	
The Dark Matter of Pragmatics	6
<u>Prof. Stephen Levinson¹</u>	
<i>1. Max Planck Institute</i>	
The Grand Tug-of-War: Clarity, Economy, and Expressivity Across the Ages	7
<u>Prof. Laurence Horn¹</u>	
<i>1. Yale University</i>	
The social shape of language	8
<u>Dr. Mark Dingemanse¹</u>	
<i>1. Centre for Language Studies, Radboud University</i>	

Panels

(A)typical users of technology in social interaction	10
<u>Prof. Florence Oloff¹, Dr. Henrike Helmer¹</u>	
<i>1. Leibniz-Institute for the German Language, Mannheim</i>	
(A)typicality in narrative forms and practices	11
<u>Prof. Neal Norrick¹</u>	
<i>1. saarland university</i>	
(A)typicality of Japanese ‘sentences’ in conversational contexts	12
<u>Dr. Natsuko Nakagawa¹, Prof. Tsuyoshi Ono²</u>	
<i>1. National Institute for Japanese Language and Linguistics, 2. University of Alberta</i>	

(Im)politeness on written discussion websites: Relational work in Reddit-esque communication	13
<u>Prof. Daria Dayter¹, Dr. Thomas Messerli²</u>	
<i>1. Tampere University, 2. University of Basel</i>	
A contrastive analysis of potentially face-threatening acts in different linguacultures	14
<u>Dr. Weihua Zhu¹, Prof. Xinren Chen²</u>	
<i>1. University of Wisconsin-Madison, 2. Nanjing University</i>	
Arts of distancing in talk-in-interaction	15
<u>Dr. Akira Takada¹, Dr. Emi Morita²</u>	
<i>1. Kyoto University, 2. National University of Singapore</i>	
Boko Haram terrorism in Nigeria and atypical discourses	16
<u>Dr. Ruth Karachi Benson Oji¹, Prof. Akin Odeunmi²</u>	
<i>1. Institute of Humanities, Pan-Atlantic University, 2. University of Ibadan</i>	
Children's language creativity, emergent performativity and heteroglossia in multilingual settings	17
<u>Prof. Ann-Carita Evaldsson¹, Prof. Amy Kyratzis²</u>	
<i>1. Department of Education, Uppsala University, 2. Department of Education, University of California</i>	
Clause combining at the discourse-grammar interface: Answers from coordination, subordination and insubordination	18
<u>Prof. Liesbeth Degand¹, Mr. Víctor Royo Viñuales¹, Dr. An Van linden², Dr. Wout Van Praet¹</u>	
<i>1. UCLouvain, 2. Université de Liège</i>	
Cognitive and interactional perspectives on conversational humour	19
<u>Prof. Michael Haugh¹, Dr. Béatrice Priego-Valverde², Mr. Amir Sheikhan¹</u>	
<i>1. The University of Queensland, 2. Aix-Marseille University</i>	
Communicative practices in online dating	20
<u>Ms. Elisabeth Andersen¹, Prof. Will Gibson², Dr. Riki Thompson³</u>	
<i>1. University of Southern Denmark, 2. UCL, Institute of Education, 3. University of Washington</i>	
Complex syntax for interaction	21
<u>Prof. Yael Maschler¹, Prof. Simona Pekarek Doehler², Prof. Jan Lindström³</u>	
<i>1. University of Haifa, 2. University of Neuchâtel, 3. University of Helsinki</i>	
Conflict talk in Spanish digital interactions	22
<u>Dr. Lucía Fernández-Amaya¹, Dr. María de la O Hernández López¹</u>	
<i>1. Pablo de Olavide University</i>	
Convergent and divergent information in multimodal and multisensorial communication	23
<u>Prof. Paul Bouissac¹, Prof. Ellen Fricke²</u>	
<i>1. University of Toronto, 2. Chemnitz University of Technology</i>	
Corpus linguistic approaches to epistemic and evidential marking in talk-in-interaction	24
<u>Prof. Johanna Miecznikowski¹, Dr. Jérôme Jacquin²</u>	
<i>1. Università della Svizzera italiana, 2. Université de Lausanne</i>	
Digital play as socio-pragmatic practice	25
<u>Dr. Hiloko Kato¹</u>	
<i>1. Department of German Studies University of Zurich / Game Design Zurich University of the Arts</i>	

Discourse and disfluencies in cognitive and speech disorders	26
<u>Dr. Ludivine Crible</u> ¹ , <u>Dr. Christelle Dodane</u> ²	
<i>1. Ghent University, 2. Université Paul Valéry, Montpellier 3</i>	
Discourse-pragmatic markers of Chinese origin in East Asian languages	27
<u>Prof. Seongha Rhee</u> ¹ , <u>Prof. Reijirou Shibasaki</u> ² , <u>Prof. Wenjiang Yang</u> ³	
<i>1. Mahidol University & HUFs, 2. Meiji University/University of British Columbia, 3. University of Macau</i>	
Discourses of identity: Placing self in the public sphere	28
<u>Prof. Jenny Cook-Gumperz</u> ¹ , <u>Prof. Elena Raymond</u> ¹	
<i>1. University of California Santa Barbara</i>	
Doctor-child communication: Insights from pragmatics	29
<u>Prof. Ilse Depraetere</u> ¹ , <u>Dr. Vikki Janke</u> ²	
<i>1. University of Lille, 2. University of Kent</i>	
Dude food and chick beer: Linguistic and semiotic perspectives on nutrition as a gendered cultural practice	30
<u>Prof. Theresa Heyd</u> ¹ , <u>Dr. Sofia Rüdiger</u> ² , <u>Prof. Janina Wildfeuer</u> ³	
<i>1. University of Greifswald, 2. University of Bayreuth, 3. University of Groningen</i>	
Emancipatory pragmatics: Interactional modality from the perspective of Ba-theory	31
<u>Dr. Scott Saft</u> ¹ , <u>Dr. Sachiko Ide</u> ² , <u>Prof. Yoko Fujii</u> ²	
<i>1. University of Hawai'i at Hilo, 2. Japan Women's University</i>	
Embodied and linguistic repair practices in atypical child-adult Interaction	32
<u>Prof. Minna Laakso</u> ¹ , <u>Prof. Barbara A. Fox</u> ²	
<i>1. University of Helsinki, 2. University of Colorado, Boulder</i>	
Emerging otherness in social interactions: Multimodal and multicultural approaches	33
<u>Dr. Keiko Tsuchiya</u> ¹ , <u>Dr. Valentina Fantasia</u> ²	
<i>1. Yokohama City University, 2. Lund University</i>	
English address terms in a globalized world: Socio-cultural impact on recent language variation and change	34
<u>Prof. Svenja Kranich</u> ¹ , <u>Dr. Anke Lensch</u> ²	
<i>1. Universität Bonn, 2. Universität Koblenz</i>	
Experimental and corpus perspectives on (socio)pragmatics	35
<u>Prof. Anne Bezuidenhout</u> ¹ , <u>Prof. Andreas Jucker</u> ²	
<i>1. University of South Carolina, 2. Universität Zürich</i>	
Exploring the body as the source of meaning-making in sign language interaction	36
<u>Dr. Emily Shaw</u> ¹ , <u>Dr. Alysson Lepeut</u> ²	
<i>1. Gallaudet University, 2. Université de Namur</i>	
Exploring “image work” in Chinese communication	37
<u>Prof. Xinren Chen</u> ¹	
<i>1. Nanjing University</i>	
First-order pragmatics: How lay people talk about speech (inter)actions	38
<u>Prof. Klaus Schneider</u> ¹	
<i>1. University of Bonn</i>	

Gesture in spoken and signed-to-spoken language interpreting	39
<u>Dr. Sílvia Gabarró-López¹, Prof. Alan Cienki²</u>	
<i>1. Pompeu Fabra University & University of Namur, 2. VU Amsterdam</i>	
Getting close in a ‘formal context’: Ideologies and styling practice in Japanese	40
<u>Dr. Haruko Cook¹, Dr. Momoko Nakamura²</u>	
<i>1. Univerity of Hawaii at Manoa, 2. Kanto Gakuin University</i>	
Going viral, cinematic and media perspectives: New studies on iconic communication and fictional dis-course in a shared world.	41
<u>Dr. Monica Cantero-Exojo¹, Dr. Eduardo Urios-Aparisi²</u>	
<i>1. Drew University, 2. University of Connecticut</i>	
Health and life events. (A)typical modalities and challenges to interaction	43
<u>Prof. Stef Slembrouck¹, Prof. Melissa Moyer²</u>	
<i>1. Linguistics, Ghent University, 2. Universitat Autònoma de Barcelona</i>	
Hierarchies of knowledge in online health communities	44
<u>Prof. Barbara De Cock¹, Dr. Carolina Figueras²</u>	
<i>1. UC Louvain, 2. Universitat de Barcelona</i>	
If you see what I mean: Comparative-contrastive analyses of implied meanings across populations, con-texts and texts	45
<u>Prof. Sara Gesuato¹, Prof. Emanuela Sanfelici¹, Dr. Elena Pagliarini¹, Prof. Francesco Vespignani¹</u>	
<i>1. University of Padua</i>	
Imitation and simulation for instructing and learning Kata: A multimodal analysis of Japan-style trans-mission of practical skills	46
<u>Dr. Seiji Nashio¹, Dr. Ikuyo Morimoto², Dr. Yasuharu Den³</u>	
<i>1. Hiroshima University, 2. Kwansai Gakuin University, 3. Chiba University</i>	
Impoliteness in Chinese social media	47
<u>Prof. Yongping Ran¹</u>	
<i>1. Center for Linguistics & Applied Linguistics, Guangdong University of Foreign Studies</i>	
Institutional incongruity: When the practitioner is doing the right thing at the wrong time	48
<u>Prof. Gonen Dori-hacohen¹, Dr. Bracha Nir²</u>	
<i>1. University of Amherst, 2. University of Haifa</i>	
Integration of conversation analytic and other linguistic methods	49
<u>Mr. Yida Cai¹, Dr. Erika Sandman¹</u>	
<i>1. University of Helsinki</i>	
Interaction in clinical and non-clinical settings with children and adults with communication disorders	50
<u>Mrs. Pamela McMahon Morin¹, Prof. Carole Anglade¹, Prof. Stefano Rezzonico¹, Prof. Claire Croteau¹</u>	
<i>1. Université de Montréal</i>	
Interaction in nursing: Conversation and multimodal analytical studies	51
<u>Prof. Esther González Martínez¹, Dr. Evelyne Berger²</u>	
<i>1. Department of social sciences, University of Fribourg, 2. La Source School of Nursing, HES-SO University of Applied Sciences and Arts Western Switzerland</i>	

Interaction in video-mediated settings in higher education	52
<u>Prof. Sabine Hoffmann</u> ¹ , Dr. Margarethe Olbertz-Siitonen ² , Prof. Götz Schwab ³	
1. <i>University of Palermo</i> , 2. <i>University of Jyväskylä</i> , 3. <i>Ludwigsburg University of Education</i>	
Interactionally troublesome exchanges: Accounts, evaluation, and antagonism	53
<u>Dr. Melisa Stevanovic</u> ¹ , Dr. Mervyn Horgan ²	
1. <i>Tampere University</i> , 2. <i>University of Guelph</i>	
Intergenerational encounters and old age	54
<u>Dr. Kaarina Hippi</u> ¹ , Prof. Camilla Lindholm ²	
1. <i>University of Oulu / University of Helsinki</i> , 2. <i>Tampere University</i>	
Internet memes of everyday life	55
<u>Dr. Loukia Lindholm</u> ¹ , Prof. Tuija Virtanen ¹	
1. <i>Åbo Akademi University</i>	
It's not what you are like, it's what you like: Appraisal, stance and evaluation in online fandom	56
<u>Dr. Thomas Messerli</u> ¹ , <u>Prof. Miriam Locher</u> ¹	
1. <i>University of Basel</i>	
Language aggression and conflict in post-digital societies	57

Plenary Lectures

Autistic Communication and the Neurodiversity Paradigm

Plenary

Prof. Sue Fletcher-Watson¹

1. University of Edinburgh

Neurodiversity is a simple, incontrovertible scientific fact, and yet the implications of this concept are both profound and radical. In this talk I will first examine some flaws in our existing models of understanding neurodevelopment. Research in autism and relating to other neurodevelopmental diagnoses has been driven by “core deficit” paradigms whose assumptions are being undermined by new transdiagnostic data, and participatory research insights.

The neurodiversity paradigm provides us with a new way to think about neurodevelopment. I will define neurodiversity and three core tenets of the neurodiversity paradigm and then directly address some of the myths around neurodiversity, drawing on the work of prominent neurodivergent scholars to provide a solid basis for understanding.

Having established these foundational principles, I will go on to review in detail a series of qualitative and quantitative findings on how autistic people communicate with each other. Deploying creative experimental methods we have demonstrated that defining autism by core “social and communication impairments” neglects to consider the interactional nature of social communication and the role that two (or more) people play in a successful interaction. This phenomenon has been most effectively articulated by Damian Milton’s Double Empathy Problem.

Specific findings that I will share pertain to: lived experience of autistic-autistic interactions; verbal information transfer between autistic people; mechanisms and markers of interactional rapport; creativity and alignment between autistic people; visibility of autism diagnostic status in an interactional context; and application of these findings to social care settings.

Finally, I will show how this research can be thought of as “neurodiversity-affirmative” and what the implications are for diagnosis and practice.

Discourse in and about International Sign Language: A Case of Multilingualism

Plenary

Prof. Christian Rathmann¹

1. Humboldt-Universität zu Berlin

The paper deals with the linguistic properties, use and learning of International Sign Language (IntSL). It proposes that IntSL is a global sign language (in the sense of Bloomaert 2010) shared by (deaf) sign language users worldwide, and that there is such a continuum between cross-signing (see Byun et al. 2018) and International Sign Language (IntSL) as an global language with rich cultural diversity. The presentation will be structured as follows: (i) examination of empirical data in two studies, (ii) emergence and stabilization of IntSL, (iii) contact between IntSL as a global sign language and local sign languages and IntSL as a translanguaging and multimodal experience, and (iv) globalization of sign multilingualism and its implications.

In the first study (Rathmann 2020), dyadic conversations between signers of Polish Sign Language (PJM) and German Sign Language (DGS) and between signers of Brazilian Sign Language (Libras) and German Sign Language (DGS) were collected. PJM signers and Libras signers were divided into two groups (signers with exposure to IntSL and signers without any exposure to IntSL), while a DGS signer is an experienced IntSL user. They were asked to retell stories, talk about their hobbies and construct selected lexical concepts. In the second study (Rathmann & Quadros 2022), interviews were conducted with seventeen signers from different parts of the world who have some experience with IntSL. Selected topics in the interviews include interviewees' experiences as learners of IntSL and personal insights into IntSL.

Four themes emerged from these empirical findings. The first theme deals with the phonological and lexical variation of selected signs in IntSL (Rathmann & Quadros under review) and raises a number of issues related to lexical stabilization and conventionalization. The second issue focuses on language contact between Libras/PJM/DGS and IntSL and suggests that there is such a language continuum between local sign languages and IntSL. Between these poles of the continuum are both cross-signing and multilingual & multimodal translanguaging practices. The fuse of participants' linguistic and semiotic resources (see Kusters 2021 and Moriarty & Kusters 2021) and different kinds of repair strategies (see Byun 2019) play a role for maintaining dyadic conversation. This is often due to different learning experiences as L2 signers. The third theme explores the dynamics of global multilingualism at the global level and its impact on global discourse among Deaf signers.

Pragmatics, learnability and natural concepts

Plenary

Prof. Anna Papafragou¹

1. University of Pennsylvania

Cross-linguistically prevalent semantic distinctions are widely assumed to be easier to learn because they reflect natural concepts. Using the case study of evidentiality, we present an alternative, pragmatic perspective that links both the cross-linguistic prevalence and the learnability of semantic distinctions to communicative pressures. Across languages, grammatical evidential systems are more likely to encode indirect sources (especially, reported information) compared to direct sources (e.g., visual perception). On a conceptual account, this seems puzzling, since humans reason naturally about how seeing connects to knowing. On a pragmatic account, however, the predominant encoding of the speaker's reportative compared to visual information sources can be explained in terms of informativeness (visual access is ubiquitous and potentially more reliable, hence less marked). I present experimental evidence in favor of this pragmatic account: (a) Adult English speakers exposed to novel miniature evidential morphological systems consistently showed higher learning rates for systems with a single indirect (reportative) compared to a single direct (visual) evidential morpheme; (b) This pattern persisted even when participants were given specific cues to the target meanings and partly extended to cases where evidential meanings were conveyed through visual, not linguistic, means. (c) This pattern was robust across multiple learning contexts. As this case demonstrates, the cross-linguistic prevalence of certain semantic distinctions can have pragmatic origins that also shape semantic learnability.

Presumed (in)abilities and the ‘shape of interaction’ in classrooms

Plenary

Prof. Julia Snell¹

1. University of Leeds

The starting point for this talk is the educational disadvantage socioeconomically marginalised students continue to experience at school relative to their more privileged peers (e.g., European Commission 2020; Hutchinson et al. 2020; Simon 2021). Spoken interaction has an important role to play in tackling these inequities, since we know that the kind of talk and interaction children experience at school has implications for their learning and cognitive development (and thus for their educational success and future prospects). There is evidence, internationally, that children who experience academically robust classroom discussion – or what some researchers have termed ‘dialogue’ – make greater progress than their peers who have not had this experience (e.g., Resnick, Asterhan & Clarke 2015). A recent UK-based study found that gains in achievement were greatest for students on free school meals (used as a proxy measure of low socioeconomic status), thus underlining the potential for dialogue to act as a lever for educational equity. However, dialogic interaction is rarely enacted in schools, especially those serving low-income and racially minoritized communities (e.g., Applebee, Langer, Nystrand, & Gamoran 2003; Kelly 2008).

In this talk I investigate the mechanisms through which some groups of children are denied access to dialogic interaction at school, and thus to learning opportunities. I focus in particular on a detailed case study of one school where a ‘hidden curriculum’ (Giroux and Purpel 1983) emphasised strict control of talk, behaviour and bodies for working-class children perceived by their teachers to be immature and unruly. I argue that these perceptions are underpinned by widely shared discourses of language, class, and ability, and thus that the approach to classroom interaction evidenced at this school is representative of a more general pattern. Here, I shift the focus away from individual teachers and their interactions with students to the broader social and political context that ‘shapes the institutional listening subject positions that teachers are able to inhabit’ (Flores, Lewis & Phuong 2018: 23).

The Dark Matter of Pragmatics

Plenary

Prof. Stephen Levinson¹

1. Max Planck Institute

Presidential Address on the occasion of the 18th International Pragmatics Conference.

The Grand Tug-of-War: Clarity, Economy, and Expressivity Across the Ages

Plenary

Prof. Laurence Horn¹

1. Yale University

As far back as the first century, rhetoricians have recognized the trade-off between brevity and obscurity (Horace), between the speaker's goal of "not saying less, but not saying more, than the occasion demands" (Quintilian). Closer to our own era, philologists like Curtius (1870) and Gabelentz (1891) explored the dynamic compromises between *Bequemlichkeit* (economy or least effort) and *Deutlichkeit* (clarity or distinctness), as oriented toward the requirements of the speaker and hearer respectively. Among those undertaking the investigation of the "tug-of-war" (Jespersen 1921) between these pragmatic pressures are Whitney (1875), Paul (1889), Zipf (1935, 1949), and Martinet (1962). Working in a very different tradition, Grice (1967) developed the twin forks of his Maxim of Quantity, a key ingredient in the formulation of scalar implicature: "Make your contribution as informative as is required"; "Do not make your contribution more informative than is required". While Grice's two submaxims and their interaction have been directly linked to Zipf's hearer's and speaker's economy respectively in the "Manichaeic model" of pragmatics (Horn 1984, 2007; cf. also Atlas & Levinson 1981, Levinson 2000), we lack a the broader view encompassing the development this chapter of intellectual history by philosophers, linguists, and psychologists, redefining and refining the interaction of the principles involved and their influence on language change and lexical choice.

On stepping back, it becomes clear that the duality between economy and clarity, however significant for delineating the role of efficiency in "the exchange of information" (Grice 1967; Stalnaker 1998), yields a crucially incomplete account of the overall nature of communication and of linguistic diachrony. Overlaid on the dialectic between the two sides of the tug-of-war is another factor affecting the expression and development of language beyond information exchange, a socially motivated goal repeatedly rediscovered and variously identified with "novelty and fashion" (Darwin 1871), "a playful or artistic sense" (Gabelentz 1891), a "need for expressivity" (Frei 1929), or "extravagance" (Haspelmath 1999, citing Keller 1994). Just as expressive meaning, in the sense of Kaplan's use-conditional analysis of *ouch* and *oops* and subsequent elaboration by Potts, Gutzmann, and others, operates on top of descriptive truth-conditional semantics, so too, as Frei argues, it is the *besoin d'expressivité* that turns a static equilibrium into a dynamic impetus for change. This drive and its effects can be detected in the push and pull of Jespersen's cycle and Meillet's spiral of successive strengthening and weakening, in the treadmill of euphemism, in affectively motivated word order, in the playfulness of expressive morphology, and in the success of constructions, from lexical clones to "pleonastic" double negation, whose existence seems to challenge both clarity and economy.

The social shape of language

Plenary

Dr. Mark Dingemanse¹

1. Centre for Language Studies, Radboud University

Language is both quintessentially social and deeply intertwined with action. In this talk I explore some of the consequences of this, surveying how language is shaped by and for social interaction. The primary empirical focus is a set of interactional tools that hover just below our awareness even as they occupy up to 20% of our turns at talk: humble words like ‘m-hm’, ‘huh?’ and ‘oh’. These items, and a few more, help streamline conversation and embody the fluidity and reflexivity that make human language unmatched among animal communication systems. I share results from an ongoing research programme that looks into these items from a number of methodological perspectives. Qualitative work remains unparalleled in its power to uncover fundamentals of interactional infrastructure, as I show in a discussion of “liminal signs” (Dingemanse 2020). Insights from sequential analysis can supplement collocational approaches to corpus data and give us ways to carry out language-agnostic and even species-agnostic comparison of interactive data. I illustrate this using work on continuers and repair. Finally, I explore some of the implications of the empirical study of language in interaction for computational models of pragmatic reasoning and for the design of diversity-aware language technology.

Panels

(A)typical users of technology in social interaction

Panel

Prof. Florence Oloff¹, Dr. Henrike Helmer¹

1. Leibniz-Institute for the German Language, Mannheim

This panel aims to reflect on the notion of (a)typicality regarding the use of technological devices and appliances used for communicating, assisting, moving, inspecting, learning, etc. More specifically, the panel's objective is to focus on different types of users of technologies and to investigate their routines, skills, and challenges while interacting with technology and their co-participants.

In conversation analysis and applied clinical linguistics, the notion of “atypical interaction” relates to social settings in which some of the participants have been diagnosed with conditions that result in communicative difficulties (e.g., autism or aphasia, Goodwin 1995, Wilkinson 2019). Here, the usual focus is on the specific formatting and management of social actions, and technology has not been centrally considered (but see, e.g., Aaltonen/Arminen/Raudaskoski 2014). While studies on assistive technologies in social interaction have been emphasizing the situated learning processes of participants with “communicative challenges” (Krummheuer/Raudaskoski 2016: 812, see also Due 2021), research more globally interested in technology in social interaction usually considers users who do not have specific communicative difficulties (e.g., Raclaw/Robles/DiDomenico 2016, Porcheron/Fischer/Sharples 2018, Pelikan/Broth/Keevallik 2020). What all types of technology users have in common, however, is that they systematically face pragmatic challenges and disfluencies at some point. Indeed, participants might frequently experience “frustrations in communication” (Antaki/Wilkinson 2012: 533) when introduced to a new technological tool or practice. In this respect, novices could be considered as more “atypical” than more expert users, and “(a)typicality” can also be connected to the idea of acquiring strategies, routines and standard procedures involving a specific technological tool. Digital literacy studies, for instance, looked into (mostly younger) users' situated appropriation of new techno-digital skills (e.g., Wolfe/Flewitt 2010, Melander Bowden 2019). These learning processes do obviously not only concern very young participants (e.g., Flewitt/Messer/Kucirkova 2015, Kucirkova/Zuckermann 2017), but also elderly persons getting in touch with a tactile interface for the first time (e.g., Weilenmann 2010, Oloff 2021). Conversation analytic studies focusing on first-time encounters between participants and, for instance, voice-user-interfaces (Porcheron/Fischer/Sharples 2018, Reeves/Porcheron/Fischer 2018) give a glimpse in how “atypical” users can turn into “typical” users of a given technology. In this respect, a user-centred approach (Amrhein/Cyra/Pitsch 2016) and a longitudinal perspective on empirical data (e.g., Deppermann/Pekarek Doehler 2021, Pekarek Doehler/Balaman 2021) can be deemed particularly relevant.

This panel brings together researchers from Ethnomethodological Conversation Analysis, Interactional Linguistics and Human-Robot-Interaction who are interested in empirically reflecting on different facets of “(a)typicality” with regard to technology use in social encounters. The contributors of this panel touch facets such as: newcomers vs. expert users, “typical” user routines and new challenges, as well as assistive technologies in “atypical” interactions and their potentials and challenges. The range of technological tools under scrutiny will include both mundane (e.g., Smartphones, Smart Speakers) and specialised ones (e.g., the Seeing AI for visually impaired people). Ultimately, we wish to discuss the contribution of human and social sciences to an interactionally founded understanding of “(a)typicality” for studying technology use and skills in social interaction.

(A)typicality in narrative forms and practices

Panel

Prof. Neal Norrick¹

1. saarland university

The announced theme of the conference “The shape of interaction: the pragmatics of (a)typicality” provides the impetus for this panel where contributors develop various perspectives on (a)typicality in narrative forms and practices: Atypicality as tellability in narrative, (re)telling typical stories, (a)typicality in narrative identity construction, formulaic narrative structures, the evolution of typical narrative practices in new interfaces, and diverse approaches to describing typicality such as quantification via corpus linguistic methods. Participants will address storytelling practices and their reception in such diverse contexts as oral history interviews, radio call-in shows, ritualized toasts, internet websites, and cinema.

Certain features are typical of narrative at the macro-level: recurrent story types, stories as anticipated responses and characteristic speech acts such as confessions. On the micro-level, narration typically unfolds sequentially in past tense clauses, while breaks in sequential order, tense shifts, and negation are atypical structures generating inferences. Typical phrases or formulas occur at characteristic junctures such as prefaces and closings; especially in recurrent “typical” stories, one finds formulaic moves like the climax phrase: “and I said ‘this is it’” in near-death stories (Labov), while atypical wordings can achieve novel results.

From an epistemic perspective, the teller typically has knowledge of an event to impart to listeners and bears responsibility for clear, concise telling; shared background knowledge, co-membership in a community of practice with “specialised terminology and linguistic routines” (Holmes & Meyerhoff) in common allow recipients to pose appropriate questions, express doubts and fill in blanks to ensure uptake according to the principle of “epistemic vigilance” (Sperber et al.).

Typically, tellability is determined by newsworthiness or reportability, but there’s a “dark side of tellability” (Norrick), where the determining factors are taste, tact and social distance. In some (atypical?) contexts, like children recounting their daily experiences at the dinner table and the retelling of family stories, newsworthiness typically fades, replaced by interest in a child’s developing narrative competence and the rapport of co-narration respectively.

Typical is a single focalization (Genette), namely internal on the teller-protagonist in personal experience narratives, but a switch to an external (omniscient) perspective can produce comments about unrealized trajectories and future outcomes; in narratives of vicarious experience focalization is typically omniscient, but it can narrow to detail perceptions and feelings of the protagonist and even include play-acting on the part of the teller. The notion of a typical story from the perspective of face-to-face interaction is now evolving along with the dynamic interplay of affordances offered by varying platforms, as genres and practices develop through story sharing, recontextualization and resemiotization on social media (de Fina). Recently the pandemic has further disrupted traditional production formats for narratives, moving them to online interfaces, which has in turn affected typical narrative practices and reactions to stories; finally, narrative formats are being used atypically to envision future developments, as in narratives conceptualizing cell-based and lab-grown foods.

(A)typicality of Japanese ‘sentences’ in conversational contexts

Panel

*Dr. Natsuko Nakagawa*¹, *Prof. Tsuyoshi Ono*²

1. National Institute for Japanese Language and Linguistics, 2. University of Alberta

The sentence in Japanese, especially in the Western context, has traditionally been understood to look like the constructed example in (1), where full NPs (‘Taro’ and ‘five big hamburgers’) are followed by the final verb in the finite form (*tabeta* ‘ate’) (Tsuji-mura 2013:229):

(1) taroo ga kinoo ookii hanbaagaa o itsutsu **tabeta**

Taro NOM yesterday big hamburger ACC five ate

‘Taro ate five big hamburgers yesterday.’

More pragmatic-based studies, however, have highlighted a variety of examples found in different types of data, which look rather different from (1). These include the so-called ‘one-word sentence’ (Watanabe 1953) such as *itai!* ‘Ouch! (lit. ‘painful’), categorized as a sentence perhaps due to its semantic completeness, and clause chaining (Iwasaki 2013), a sequence of loosely connected multiple clauses, strikingly similar to the ‘never-ending sentence’ in German (Auer 1992), shown in (2) where the speaker narrates a situation where he had trouble getting into his room (based on Iwasaki 2013:272):

(2)

1 *soshite hairenakute* ‘...then (I) couldn’t enter (the room) and so’

2 *okoshite* ‘(I) woke (him) up and’

3 *de haittara* ‘and (I) entered then’

4 *yakkosan moo shikatanai tte na kanji de nee okitekite* ‘the guy got up with a disgusted look and’

Most participants in the events described in these utterances are not overtly expressed (called zero anaphora), and thus are shown in parentheses in the translation. Each line ends with the verb in the non-finite form (i.e., *-te* ‘and’ and *-tara* ‘then’) marking that another clause will follow. Clause chaining ends with a finite verb completing the sentence, but line 4 ends with the nonfinite *-te*, indicating that more talk will follow.

Though these past studies give valuable insight into various sentence types, their observations tend to be descriptive and particular to data types (e.g., constructed, written, and narrative), and considerations as to how these disparate types of examples all represent a ‘sentence’ are generally not given.

We systematically examine various sentence types in everyday conversation, the most fundamental form of language (Fillmore 1974, Schegloff 1996). Individual presentations focus on one or more sentence types featured in the literature. We will see if they regularly appear in the data, and if so, how they look structurally and how they are used in context. We are keen to see if these different types can be characterized as (a)typical depending on the uses. We will examine further how different types may function together in the data, which might motivate unifying them as sentences. This prepares us for cross-linguistic studies with languages such as German and English, where close examinations of the sentence in conversation have already begun (Auer 1992, Miller and Weinert 1998, and Lindström, et al. 2019).

Papers in the panel represent a variety of theoretical and methodological perspectives, highlighted especially by important research on this topic being done in Japan, so far published mostly in Japanese. The panel creates a cross-disciplinary and cross-continental forum by going beyond traditional boundaries ensuring high-quality discussion and wider dissemination of research.

(Im)politeness on written discussion websites: Relational work in Reddit-esque communication

Panel

***Prof. Daria Dayter*¹, *Dr. Thomas Messerli*²**

1. Tampere University, 2. University of Basel

The study of the computer-mediated communication (CMC) is commonly conceptualised in terms of three ‘waves’. In the first one, researchers approached CMC as an almost monolithic entity to be distinguished from other modes of language use (‘netspeak’). The second order development has taken us to an understanding of the role of individual genres and communication types in language online. Finally, the third wave has focused on contextually dependent discursively negotiated communicative practices that are negotiated by individuals and communities based, among other things, on the particular affordances they are given (e.g. Androutsopoulos 2006, Herring 2019).

Similarly, politeness theory has undergone a ‘discursive turn’. It took a step from the mitigation-focused theories to the concept of relational work and an understanding of interpersonal pragmatics whose norms determine not only marked, but also unmarked non-polite behaviour against which face-threatening, face-saving and face-enhancing action can be measured (e.g. Locher 2013).

Bringing together both the third wave of CMC and the discursive politeness theory on the particular example of modern online forums, such as Reddit or 4Chan and similarly structured platforms like Quora or Hive, our panel wants to explore what relational work norms are being constructed by online communities in these online spaces. For instance, subreddits, the individual forums that constitute the Reddit platform, combine codified norms of behaviour with discursively negotiated patterns, with moderators as well as normal users serving as gatekeepers of politic (polite and non-polite) behaviour.

We understand each of these sites as a communicative space with its own setting and particular participation structure, in which language use and more generally communication are situated practices that serve transactional as well as interpersonal purposes.

Taking the subreddit r/ChangeMyView as an example, we can see, for instance, that original posters employ particular conversational moves to construct their own identities as approachable and persuasible, whereas commenters include the norms created or reinforced by the posts they respond to in the way they phrase their responses, which are all attempts at persuasion (Dayter & Messerli 2022). Within this context, impolite responses appear less likely to be received as successful attempts at persuasion than non-polite or impolite responses.

We invite to our panel other researchers focusing on Reddit and related communicative settings, including the members of the CopRe research network. Potential contributors include Ylva Biri, Lisa Donlan, Marie Flesch, Robert Lawson, Sven Leuckert, Lisa Sugiura, Elizabeth Marsden and Alessia Tranchese.

A contrastive analysis of potentially face-threatening acts in different linguacultures

Panel

***Dr. Weihua Zhu*¹, *Prof. Xinren Chen*²**

1. University of Wisconsin-Madison, 2. Nanjing University

In this panel, we intend to compare the realization, variation, or perception of relatively less explored, potentially face-threatening acts, such as complaining, criticizing, teasing, and verbal assault, in a diverse group of linguacultures. A lack of knowledge about varying pragmatic norms has the potential to lead to misperceptions and misunderstandings in intercultural communication. It may be one reason for discrimination and stereotyping (e.g., Gumperz, Jupp and Roberts, 1981) which can severely affect people's lives (Erickson and Schultz, 1982). To promote two-way understanding and develop respect and harmony (Boxer, 2002), a plethora of studies have been conducted to reveal pragmatic differences in areas such as (in)directness in requests (e.g., Ren and Fukushima, 2021), (in)formality of address terms (e.g., Bruns and Kranich, 2021), compliment responses (e.g., Chen, He and Hu, 2013), disagreements (e.g., Zhu and Boxer, 2021), thanking and greeting (e.g., House and Kadar, 2021b), among others, in different linguacultures. However, many of these studies focus on well-studied or less potentially face-threatening objects of inquiry. This panel attempts to fill these gaps by including research that examines the pragmatic patterns, variation, or perceptions of under-studied, more potentially face-threatening acts across languages in various social contexts. Data have been derived from a variety of sources, such as spontaneous conversation at service encounters, CMC, social media, TV drama, or standup comedy, in different languages, such as American English, Canadian English, Nigerian English, Japanese, Chinese, Spanish, Greek, and so on. Data triangulation has been employed to accomplish research validity. Data have been analyzed through either qualitative or quantitative methods (House and Kádár, 2021a) and interpreted through both macro and micro contextual lenses (Zhu, 2019). We hope that our panel can offer new perspectives to contrastive pragmatics research in terms of the interplay between linguistic practice and pragmatic perception or contextual effects on face-threats in different linguacultures.

Arts of distancing in talk-in-interaction

Panel

***Dr. Akira Takada*¹, *Dr. Emi Morita*²**

1. Kyoto University, 2. National University of Singapore

As the Covid-19 pandemic has been raging worldwide, ‘social distancing’ has become a popular concern across various media outlets. The concept of *social distance* was initially advocated by anthropologist Edward T. Hall. Hall (1966) proposed four main zones of space between individuals, i.e., (1) *intimate distance* (less than half a meter), (2) *personal distance* (about 1 meter), (3) *social distance* (2 to 3 meters), and (4) *public distance* (more than 5 meters). Socio-pragmatically, however, each of these ‘distances’ is defined by more than just the degree of physical spacing defined above. Since the seminal work of Tuan (1977), the conceptual distinction between *space* and *place* has been accepted in various disciplines. Likewise, studies of pragmatics have taught us how *communicative practices* can construct, define, and negotiate the socio-cultural meaning of space as place. Certain forms of directives are used to indicate vertical distance within institutional settings, for example, while the use of informal register, specialized vocabulary and dialects are used to co-construct the intimacies of “home” and the membership of casual and professional “in-group” relationships.

Thus, to understand how social meaning is constructed in place, it is necessary to clarify how various semi-otic resources are used in talk-in-interaction (e.g. Goodwin & Cekaite 2018). Through the examination of naturally occurring interaction data, this panel aims to investigate how interactionally constructed place (home, workspace, professional settings) and distance categories (friend/stranger, participant/bystander, etc.) are manifested in everyday talk-in-interaction.

Along line with this purpose, Burdelski and Cekaite explore ways in which preschool children in Sweden and Japan engage in practices that seek to put social and spatial distance between themselves and other children. Their analysis suggests that children’s pragmatic acts of social and spatial distancing simultaneously entail social proximity, including displaying resistance and alignment in forming social relationships.

Morita and Takada examine the use of the Japanese verbal suffix *-haru* and indicate that this once honorific verbal suffix for denoting pre-established social distance has now also been pragmaticised as a way to proclaim distance one’s own differential measure of agency, social responsibility, and/or intentionality from that of another in reference to a certain specifically denoted act.

Kawashima et al. attempt to deal with interactional management of “distance” with the fetus during the prenatal genetic counseling. Their analysis shows that by managing the distance with the fetus interactionally, the clinical geneticists and parents process their decision-making not only with the objective/medical reasoning but also personal stance toward the fetus.

Kim explores the interactional meaning of the Korean nominalizing expressions involving the general noun *-ke(s)* (‘thing’) and found that *-ke(s)* plays a key role in rendering these forms interactional resources geared to implementing “distancing” practices.

Thus this panel approaches the notion of distancing by focusing on specific linguistic forms (Kim; Morita and Takada), as well as by examining art of distancing in certain institutional settings (Burdelski and Cekaite; Kawashima) and discuss how people construct and make sense of distancing among participants.

Boko Haram terrorism in Nigeria and atypical discourses

Panel

***Dr. Ruth Karachi Benson Oji*¹, *Prof. Akin Odebunmi*²**

1. Institute of Humanities, Pan-Atlantic University, 2. University of Ibadan

The story of Nigerian terrorism can be traced back to the emergence of Boko Haram (BH) in the country during the rule of President Goodluck Jonathan, and it is still an ongoing phenomenon in the current political dispensation under the presidency of General Muhammadu Buhari. The diachronic history of BH terrorism comes with its own context: its being unprecedented, its mutative nature leading to different manifestations of its nomenclatures and operations, and its conspiratorial dynamics. These are shown not only in Boko Haram's inception battle against Western education but also in its changing nomenclatural forms from "Boko Haram", to "terrorists" and to "bandits"; its open brazen recruitment of fighters and (unofficial) recognition by the Nigerian government and the public; and its continuous integration of "soldiers" and "policemen" into its operations. Recently, operating pugnaciously alongside Islamic State's West African Province, with crime perpetrators beyond its official group coverage embodying other criminal groups in Nigeria, Boko Haram has been connected to banditry, which has been focused mainly on kidnapping, armed robbery, and uncontrollable killings. The operations' demands of unreasonably huge ransoms are currently marked in the Nigerian political history and social experiences. These are atypical events which are blatantly opposed to the principles of good governance and human living in any form but which have become almost a way of life in Nigeria and have birthed new discourse forms. These forms, with different pragmatic functions, are, at one level, manifest demonstrations of the threat to life and collapse of the national security system heralded by the emergence of Boko Haram and its mutations. The high-level conspiratorial nature of the operations and the suspicions of the compromise of the security intelligence system have, at another level, incited caution and discreteness into the discourses of Boko Haram. Consequently, what obtains is a mix of direct and indirect communicative resources to describe and expose the havoc wreaked by BH in the media, on the social media, in public life, and in other avenues of communication, itself a pragmatic phenomenon embodying face management, pragmatic constraints, and common ground.

This panel discusses the atypical discourses resulting from the atypical operations of BH and its allied connivers. In particular, it addresses the diachrony of the nomenclatural and operational mutations of BH, the contexts and constraints of its operations, its media reportage and its everyday engagements, the ideological configurations informing its discourses, and the pragmatic orientations associated with the atypicality of the discourses. or comparative purposes, the panel is also interested in the atypical discourses emerging from the operations of related organisations such as ISIS, ISWAP and several other terrorist groups found in many places of the world

Children's language creativity, emergent performativity and heteroglossia in multilingual settings

Panel

***Prof. Ann-Carita Evaldsson*¹, *Prof. Amy Kyratzis*²**

1. Department of Education, Uppsala University, 2. Department of Education, University of California

The aim of this panel is to gain new insights into children's emergent language creativity and the multilingual peer group as a central socializing agent. Language creativity is a novel gateway into exploring the dynamic and culturally contingent dimensions of language use (Carter 2016). Creative play with language is a pervasive feature of children's everyday language practices linked to children's ability to engage in socially nuanced and novel actions and sensitize them to conventions for language use in various socio-cultural contexts (Duranti & Black 2012). Children's everyday language practices in peer group play also provide a site for them to explore adult roles and registers (Paugh 2018), learn new language structures and take critical stances. For example, through translanguaging, that is, engaging in fluid bilingual or multilingual discourse practices, they can "re-sis[t] the historical and cultural positionings of monolingualism or of additive bilingualism" (García & Leiva 2014: 204). It is in multilingual peer groups that children have opportunities to engage in playful interactional practices and use innovative/transgressive language forms such as language-play, play with word forms, pretend play, language-crossing, verbal improvisations, joking, and teasing (Goodwin & Kyratzis 2011) that are unlikely to occur in more asymmetrical interactions with adults. Notably, there is a wealth of sociolinguistic research on how youth in multilingual interactions orient to, take stances on, and exploit linguistic diversity along with ethnic divisions and race stratifications (Rampton 2017). This panel adds to previous research by exploring children's creative language use and *heteroglossic verbal practices* (Bakhtin 1981), that is, their use of multiple codes and registers, and the larger socio-political meanings and ideologies that are negotiated through those linguistic forms (Kyratzis, Reynolds & Evaldsson 2010). It emphasizes how children in everyday interaction play with and juxtapose linguistic features and their social and cultural meanings (Maybin & Swann 2007), forming their own associations between linguistic codes, social values, persons and places (Bailey 2007). By attending to the plurality of language practices, values, identities and groupings that children are exposed to and exploit in everyday interactions, the panel will contribute knowledge on children's creative language use and spontaneous play *in situ*, as it emerges in multilingual and culturally heterogenous communities.

Clause combining at the discourse-grammar interface: Answers from coordination, subordination and insubordination

Panel

Prof. Liesbeth Degand¹, Mr. Víctor Royo Viñuales¹, Dr. An Van linden², Dr. Wout Van Praet¹

1. UCLouvain, 2. Université de Liège

As previous research has pointed out (Haiman and Thompson 1988, Bybee and Noonan 2002), speakers' strategies of clause combining in contexts of natural language may be more diverse than hitherto accounted for. From assessing different degrees of syntactic integration (Evans 2009) and different levels of dependence (Mithun 2008, Verstraete & D'Hertefelt 2016) to exploring the (non)discreteness of the categories of coordination and subordination (Croft 2001), scholars have developed an interest in new accounts for the diversity of clause combining relations and strategies observed in speakers' discourse.

In the same vein, this panel aims to better understand the nature of the discourse-grammar interface –conceived as the linguistic space where speakers create, share and conventionalize new uses– by bringing together current research exploring how different patterns of clause combining (i.e. coordination, subordination and insubordination) can be found to receive new uses in discourse. More precisely, the contributions to our panel will provide accounts on (i) how new, language-specific uses of different clause combining strategies arise in discourse; on (ii) how such innovative uses are reflected by morpho-syntactic and prosodic marking; on (iii) which semantic-discursive functions such innovative uses fulfil; on (iv) how such types of use can be traced in historical data so as to understand their diachronic development; and finally, from a more theoretical perspective, on (v) how such innovations affect category boundaries between different clause combining patterns.

On the basis of a widely diverse range of languages (Indo-European, Japonic, Semitic, Trans-Himalayan and Uralic), and using a broad variety of methodological approaches, the contributions to this panel include historical (both diachronic and synchronic) accounts of different clause combining strategies, investigations about distinct degrees of (in)dependence and their linguistic correlates, studies about the interaction between clause combining patterns, semantics and discursive features, and various specific accounts of the phenomenon of insubordination from a variety of perspectives (namely studies on nominalization as a case of insubordination, contrastive approaches to insubordination, and language-specific explorations of how insubordination arises in discourse).

Cognitive and interactional perspectives on conversational humour

Panel

***Prof. Michael Haugh*¹, *Dr. Béatrice Priego-Valverde*², *Mr. Amir Sheikhan*¹**

1. The University of Queensland, 2. Aix-Marseille University

Conversational humour, which broadly encompasses (sequences of) utterances that are designed to ‘amuse’ participants or are treated as ‘amusing’ by participants across various different kinds of social interaction, has been the object of study in pragmatics and related fields for a number of decades. Two main schools of research about conversational humour have emerged over that time: cognitive-pragmatic approaches that model how participants understand humour in interactional contexts, including the inferential and conceptual bases for recognizing and resolving incongruities; and discourse-pragmatic approaches that focus on describing the forms and interactional practices by which conversational humour arises and its associated social functions (Haugh and Priego-Valverde, forthcoming). As Attardo (2020) notes, however, apart from a few notable exceptions (Langlotz 2015; Tabacaru 2019; Thielemann 2020), there has been little cross-fertilisation between these two strands of research, a situation which mirrors the divide between theoretical pragmatics and sociopragmatics in the field of pragmatics more broadly.

The aim of this panel is to bring together scholars working from broadly cognitive and interactional perspectives in order to consider how we might develop a more comprehensive, empirically-grounded, and theoretically-sound account of conversational humour across different language and cultures. Papers in this panel focus on key questions that arise in undertaking such an endeavour, such as whether the traditional distinction between humour competence and humour performance can be maintained when theorising conversational humour, what makes conversational humour ‘funny’ and the role of incongruity therein, the role of common ground, shared knowledge and the epistemics of conversational humour, and the extent to which there are universal cognitive or sequential mechanisms underpinning conversational humour across languages and cultures, as well as attributions of humorous intentions and inferences about humour. Using cognitive, corpus-based, interactional, and neurolinguistic approaches to conversational humour, the papers in this panel explore different forms of humour in a range of contexts including in talk shows, digital spaces, classroom settings and naturally occurring interactions.

Communicative practices in online dating

Panel

***Ms. Elisabeth Andersen*¹, *Prof. Will Gibson*², *Dr. Riki Thompson*³**

1. University of Southern Denmark, 2. UCL, Institute of Education, 3. University of Washington

Dating Apps have fundamentally changed the communicative practices of dating with 413 million adult users of dating apps worldwide at the end of 2022. This panel brings together studies of textual interaction among dating app users, analysing in detail the interactional features of these encounters.

Drawing particularly on Conversation Analysis and cognate areas, the panel explores a diverse but interrelated set of issues describing communicative practices in online dating. Such issues may involve but are not limited to the ways that users use location information and orient to place to generate topics and to organize offline meetings, the negotiation of gender norms and practices associated with online dating, and the relationship between education, age, and forms of talk.

The analyses in the panel pay attention to the distinctive textual features of these chats, including the role of profile information in structuring conversations, and/or the use of particular communicative practices such as emoji. Together, these papers provide an important advancement on existing studies of face-to-face dating (Korobov 2011; Stokoe 2010; Turowetz & Hollander 2012), and a critical contribution to the small but growing body of work on online dating and language (Kavroulaki 2021; Licoppe 2020; Mortensen 2017; Thompson 2022), showing how modern technologies are radically altering the ways that people manage dating.

Complex syntax for interaction

Panel

***Prof. Yael Maschler*¹, *Prof. Simona Pekarek Doehler*², *Prof. Jan Lindström*³**

1. University of Haifa, 2. University of Neuchâtel, 3. University of Helsinki

Recent developments in linguistics have seen the emergence of a radically alternative understanding of the grammar of natural languages: Grammar is no longer understood as an autonomous system of abstract rules, but as a locally sensitive, temporally unfolding resource for social interaction (Hopper 1987, 2011, Auer 2009). Accordingly, grammar is studied in its natural ecology, i.e., talk-in-interaction, and in relation to embodied semiotic resources, such as gaze, gesture, and the moving body (see, e.g., Keevallik 2013, Pekarek Doehler et al. 2021). Based on the thriving research in the field of interactional linguistics (Couper-Kuhlen & Selting 2018), we have to date robust evidence of how specific linguistic constructions function as interactional resources for accomplishing precise social actions in a growing number of languages.

In this panel, we seek to deepen our understanding of the socio-interactional workings of grammar as it interfaces with other semiotic resources (gaze, gesture, posture...) by focusing on a domain that has received comparatively little attention in interactional linguistics, namely, complex syntax (i.e., structures beyond a simple clause; see, e.g., Laury & Suzuki 2011, Maschler et al. 2020). We set out to explore how patterns of complex syntax are implicated in the production and coordination of actions within social interaction. Focusing on the temporal and locally emergent nature of grammar, the papers brought together in this panel examine three key-facets of complex-syntax-for-interaction: They investigate (a) how structures that post-hoc appear formally as clause-combining patterns are in fact patched together on the fly, in ways that respond to interactional contingencies; (b) how formally dependent structures, such as ‘if’-clauses or ‘because’-clauses, can be used as so-called in subordinate clauses (Evans 2007, Maschler 2018, Lindström et al. 2019, Günthner 2020) for precise interactional purposes; (c) how what formally might appear as part of canonical clause-combining patterns (e.g., complement-taking predicate structures such as ‘I don’t know’, initial parts of pseudo-clefts) are used as independent marker-like elements fulfilling interactional functions (e.g., Lindström et al. 2016, Pekarek Doehler 2019, Maschler & Pekarek Doehler 2022).

Based on audio- and video-recordings of naturally occurring interactions in a variety of settings, and drawing on conversation analysis and interactional linguistics, the contributions document routinized grammatical formats of social action involving (pieces) of what canonically appear as complex clausal structures. They study these across several languages, including, English, Estonian, German, French, Hebrew, Italian, Mandarin, and Swedish. They share the aspiration to shed further light on the role of grammar within a larger ecology of interactional resources, and how participants deploy these in real time to organize and coordinate their mutual actions. Taken together, the papers deepen our understanding of how grammar contributes to action formation in interaction, how interactional exigencies shape grammatical resources, and how grammar interfaces in complex ways with bodily conduct such as gaze, gesture, or posture.

Conflict talk in Spanish digital interactions

Panel

***Dr. Lucía Fernández-Amaya*¹, *Dr. María de la O Hernández López*¹**

1. Pablo de Olavide University

In recent years, violence and hostility has increased exponentially within the realm of digital discourse (KhosraviNik and Esposito 2018). This fact has made many scholars turn their attention to conflict as a common phenomenon in digital media (Esposito 2021). Some of the digital contexts in which conflict has been examined include discussion fora (Mancera 2009; Garcés-Conejos Blitvich 2018), online email communities (Graham 2003, 2005, 2007), YouTube (Bou-Franch and Garcés-Conejos Blitvich 2014), social media such as Facebook (Bou-Franch and Garcés-Conejos Blitvich 2018, 2019) or Twitter (del Valle 2018; Bou-Franch 2021), and instant messaging tools such as *WhatsApp* (Fernández-Amaya 2019, 2020; García-Gómez 2018, 2020; among others). However, conflict in Spanish digital interactions has received considerably less attention (but see Garcés-Conejos Blitvich 2020 for the most recent critical overview of studies dealing with impoliteness and conflict in Spanish). This panel aims to contribute to filling this gap by presenting a number of papers in which renowned specialists analyze conflict in Spanish digital interactions from a variety of angles. The relevance of this panel lies on the fact that the presenters examine corpora gathered in different digital environments, such as YouTube, Facebook, Twitter, Instagram and consumer sites in which users can post online consumer reviews and interact with sellers or other users. What these global platforms have in common as part of the 2.0 culture is that users can produce content and contribute to each of the websites not only to provide information, but also to complain, denounce, or vent negative feelings that may cause offense, conflict or negative reputation. This panel, therefore, includes different methodological perspectives and theoretical approaches in order to gain deeper insight into the phenomenon of digital conflict in Spanish-speaking contexts.

Convergent and divergent information in multimodal and multisensorial communication

Panel

***Prof. Paul Bouissac*¹, *Prof. Ellen Fricke*²**

1. University of Toronto, 2. Chemnitz University of Technology

Research in multimodality has studied the ways in which congruency is achieved through the functional or “appropriate” combination of various modalities and information channels converging toward intended pragmatic goals. In artifactual multimodal messages such as television advertisements or personal profiles on line, the combination of multimodal information is designed in a way that ensures convergency and congruency as a semiotic and rhetorical strategy (e.g., Hiippala 2016). However, in natural social interactions and in the interpretation of multimodal environmental phenomena convergency and congruency cannot be taken for granted. There are many cases in which different channels convey dissonant, discrepant, or even contradictory information. Research on the social meaning of the smile, for instance, has drawn attention to the differences between genuine and contrived smiles based on the analysis of divergent facial information that can be observed in face to face conversations in combination with verbal utterances. [In scientific inquiry, observed lacks of congruency in multimodal data prompt experiments designed to account for the truth of counter-intuitive knowledge that can be defined as trans-modal]. The theoretical approach proposed in this panel will aim at developing a theory of dysfunctional multimodal communication such as identifying mismatches and discrepancies between functional design and identity design (e.g., van Leeuwen 2022); the forensics of failed marketing strategies, political campaigns, or software projects (e.g., Kaisler, Money, and Cohen 2021); and the potential undermining of multimodal rhetoric by the interfering power of discrepant visual, acoustic, haptic, and olfactory signals. This may apply also to human-machine interaction and the different sensors used in hybrid group settings. To address some aspects of these pragmatic dysfunctions, it is necessary to take into consideration not only cultural constraints and their social semiotics dimensions but also the relative weight in human interactions of signals that have evolved in staggered manner over evolutionary time and variously impact decision making. Sensitivity to contact and to various molecules in the proximal or distal environment, or the processing of acoustic input predate the emergence of vision as a comparatively recent adaptation. Along the same logic, we may ask whether images are bound to override the power of words either spoken or written. Both social semiotics considerations and evolutionary theoretical perspective could help design experiments to investigate how the interplay of multimodality and multi-sensorial information are negotiated in human interactions. This panel will accept both theoretical papers and case studies.

Corpus linguistic approaches to epistemic and evidential marking in talk-in-interaction

Panel

***Prof. Johanna Miecznikowski**¹, **Dr. Jérôme Jacquin**²*

1. Università della Svizzera italiana, 2. Université de Lausanne

This panel brings together corpus linguistic contributions on epistemicity (Boye 2012) in spoken language in an interactional perspective.

The question of how knowledge is negotiated among speakers is crucial for the study of talk-in-interaction. This has been suggested by research about epistemic stance-taking in conversation analysis and in interactional linguistics, which has investigated its role in the formation, ascription and sequential organization of actions and in the construction of identities and social relations. After seminal works such as Heritage's study about 'oh' as a change of state token (1984) or Pomerantz' work about source-giving (1984a,b), that research has been developed significantly in the last two decades (Heritage & Raymond 2005; Stivers & Rossano 2010; Mushin 2012; Stivers, Mondada & Steensig 2011; Heritage 2012; Levinson 2012; Sidnell 2012; Lindström et al. 2016), more recently considering multimodal aspects as well (Mondada 2013; Kendrick 2019; Pekarek Doehler 2022). CA research mainly presents detailed qualitative analyses of single cases or sequence collections. Still other methods have been adopted in typological and functional linguistics, which usually focus on individual grammatical or lexical markers of epistemic modality and of information source or on paradigms of such markers. In these fields, the specific question of epistemicity in spoken language has attracted scholarly attention only recently. The existing studies have mainly adopted a corpus linguistic/pragmatic approach (Aijmer & Rühlemann 2014), i.e. are based on oral corpora, resort to systematic annotation in various stages of analysis and take into account the quantitative distribution of phenomena. Meeting the tradition of linguistic research on discourse markers, they treat epistemic and evidential marking both in a semasiological perspective (Cuenca & Marín 2012; Cornillie & Gras 2015; Jacquin et al. 2022) and in an onomasiological perspective (Pietrandrea 2018; Miecznikowski 2022).

From the viewpoint of interactional linguistics, that body of research raises a series of issues: In which sequential positions do epistemic and evidential markers and constructions tend to occur? How are they combined with, or do alternate with, paraverbal means (gaze, facial expression, gesture, body posture)? How should the classes of actions for which they are relevant be defined? Which role does the situational context play, especially as a source of perceptual evidence? What is the relation of epistemic and evidential marking with practices that organize larger portions of discourse, such as story-telling or argumentation? How does it vary across activity types and discourse genres?

To answer these questions, detailed qualitative analysis can fruitfully be combined with methods that allow to treat larger amounts of oral data. The panel therefore includes contributions on the topic that adopt corpus linguistic/pragmatic and collection-based approaches and will explicitly address the methodological challenges raised by the use of such methods.

Digital play as socio-pragmatic practice

Panel

Dr. Hiloko Kato¹

1. Department of German Studies University of Zurich / Game Design Zurich University of the Arts

Since the advent of *Tennis for Two* in 1958, digital games have evolved into an everyday activity for people of all ages. Especially during the Covid-19 crisis, socially engaging in digital play has been brought to a new level: The gaming industry's campaign “#PlayApartTogether”, for instance, strongly encouraged players to follow the WHO's health guidelines. Furthermore, in 2021, digital games were for the first time promoted to be displayed at the Olympics in Tokyo. In the fields of Esports, games like *Counter Strike: Global Offensive*, *League of Legends* and *Dota 2* amass large fan-based communities that help to raise prize pools at international events up to several million US dollars. Ultimately, digital games have reached the status of a cultural asset, being collected, for example, at the Literaturarchiv Marbach in Germany or at the MoMA.

However, digital games are far more than just an area where digitalization is visibly shaping the every-day lives of new generations. What makes digital games relevant is that they are a highly dynamic field of experimentation where new forms of socio-pragmatic practices are devised and intensively explored. In research, this is mirrored by some very intriguing publications especially in the field of multimodal interaction and ethnomethodological and conversation analytic informed approaches (Reeves/Greifenhagen/Laurier 2016). Additionally, digital games are explored using broader linguistic approaches to digital game discourse (Ensslin 2019) or pragmatic approaches to digital games in general (Bogost 2011). As this field of Game Studies is evolving at a rapid pace, qualitative research on digital play as socio-pragmatic practice has become a subject of increasing interest.

The data discussed in this panel focuses on digital games with this qualitative socio-pragmatic approach for an in-depth exchange on the state-of-the-art research concerning digital play.

Discourse and disfluencies in cognitive and speech disorders

Panel

***Dr. Ludivine Crible*¹, *Dr. Christelle Dodane*²**

1. Ghent University, 2. Université Paul Valéry, Montpellier 3

This panel gathers researchers adopting a discourse-analytic approach to a range of cognitive and speech disorders, including Autism Spectrum Disorder, aphasia, Alzheimer's disease and stuttering. The term « discourse analysis » is here taken in a broad sense and encompasses quantitative and qualitative studies that investigate the pragmatics of (atypical) interaction, in a functional, context-bound approach to empirical data. The focus therefore lies on linguistic phenomena such as disfluencies (pauses, repetitions, truncations, etc.), gestures, coherence markers or any other devices reflecting discourse-structuring or discourse-representational processes. These pragmatic devices are particularly prone to be impacted by various disorders (e.g., Dipper & Pritchard, 2017) because of their high frequency, optionality and relative freedom of movement. They also reflect mechanisms of interaction management and discourse structure, processes which have been described as particularly challenging for atypical speakers (Merrison & Merrison, 2005).

Such a focus on the pragmatics of atypical speech is in line with the current momentum for mixed approaches, after a long prevalence of purely quantitative, formal and relatively decontextualized studies in the field. This panel will thus shed some light on the micro- and macro-level features that characterize the discourse level in cognitive and speech disorders, a step which is in turn crucial to better describe these populations in general and to understand their specificities with respect to (neuro-)typical speakers.

Discourse-pragmatic markers of Chinese origin in East Asian languages

Panel

***Prof. Seongha Rhee*¹, *Prof. Reijirou Shibasaki*², *Prof. Wenjiang Yang*³**

1. Mahidol University & Hufs, 2. Meiji University/University of British Columbia, 3. University of Macau

This panel addresses some sets of compounds of Chinese origin used in Chinese, Japanese and Korean, and investigates the issue whether they have grammaticalized into discourse-pragmatic markers (DMs, hereafter, as an umbrella term) from their earlier lexical expressions either similarly across these languages or distinctively in language-specific ways.

It is well known that some compounds derived from the same Chinese characters are used as DMs in these languages (e.g., Rhee et al. 2021); therefore, one natural question is whether those DMs were borrowed from Chinese to Japanese and Korean as Sino-Japanese and Sino-Korean words, respectively. In fact, the higher borrowability of DMs in contact situations is reported in a wide range of works (e.g., Matras and Sakel 2007). If DMs had not been borrowed from donor to recipient languages, another possibility is ‘replica grammaticalization,’ namely, the process that a grammaticalization process in one language is realized based on a model process in another language (Heine and Kuteva 2005). Furthermore, some particular meanings of a form may have their own potential to operate grammaticalization independently from language contact and regional areas (e.g., ‘fact,’ ‘result,’ ‘issue,’ to name a few; see Heine et al. 2021 and Higashiizumi and Shibasaki in preparation for details).

Typically, DMs are used in spoken discourse. Therefore, if a DM is borrowed from one language to another, it would imply borrowing through spoken contact (e.g., *you know* in Clyne 2003). On the other hand, the heavy lexical borrowing of Chinese words into Japanese, Korean and Vietnamese almost exclusively through written texts is different from those typical cases (Norman 1988; Sohn 1999; Alves 2007; Irwin and Zisk 2019). Further, Fedriani and Sansò (2017: 16) point out that “the pool of sources from which grams originate... [snip] when dealing with a given class of DMs it is more difficult to identify similar restricted pools of sources.” Fortunately, East Asian languages have a massive amount of materials for the central issue of this panel.

Since contact linguistics is a thriving field (e.g., Grant 2020), what is addressed in this research project would thus deserve attention as a point of departure for offering a good opportunity to extend our knowledge on the issues from the perspective of DMs in East Asian languages.

This panel, consisting of three 90-minute sessions, features eight thought-provoking analyses of DMs that developed from the borrowed lexemes from Chinese, by the researchers on Asian languages, e.g., Chinese, Japanese, Korean, Thai, and Vietnamese and a comprehensive discussion.

Discourses of identity: Placing self in the public sphere

Panel

Prof. Jenny Cook-Gumperz¹, Prof. Elena Raymond¹

1. University of California Santa Barbara

Our contemporary life is marked by one of the largest migrations of people due to global economic and political crises. In these circumstances, the need to adjust daily routines to new situations presents many challenges, as not only are people required to communicate for their personal needs in languages and places that differ from their previous life, but there may be changes in the communicative medium through which these critical needs can be met. This can require articulation of identity and new dynamic situational realizations of self (Gumperz & Cook-Gumperz, 2007).

In this panel, we will look at identity as choosing a sense of personal self through speaking activities, conversations and discussions with others, both close and intimate as well as through interactions with strangers. Social identity from this perspective follows Auer (2007) who, in his discussion of linguistic heterogeneity and identity, differentiates the constitutive discourse practices of social identity from the study of collective identities. He argues that the construction and management of social identity in interaction attends to the “categorization of participants in an interactional episode as social personae [...] not to the definition and delimitation of collectivities” (Auer, 2007:3).

Kroskrity (2001), in his discussion of identity, points out that such processes also typically occur in smaller communities or social groups between people who know each other in so many roles that they must interactionally establish which identity is situationally relevant. The panel’s framework rests on the assumption that identity, as a dynamic aspect of social relationships, is forged and reproduced through language and is inscribed within the agency/structure dyad (Giddens, 1984). While broader structures of power, ideologies, and global cultural forces exercise important constraints on identity work, local practices of agency, resistance and style are interwoven in the process of individual and group (re)workings of identity. People may look globally for cultural identifications, but it is in local communities of practice that they audition, embody and adapt these identities in order to make them meaningful. Therefore, despite the widespread conceptions of cultural homogenization and the elimination of geographic boundaries under globalization, locality remains paramount in people’s lives. The meetings between the global/structural and the local/individual can lead to a mutual struggle for coexistence, and at times hybridization.

We tackle this problem through an interdisciplinary approach in this session. There will be five papers covering a range of public discourse domains: police encounters with the public, political interviews, requests for help in specific institutional settings, and adult and teenage discussions of gender and social identity in daily conversations.

Doctor-child communication: Insights from pragmatics

Panel

***Prof. Ilse Depraetere*¹, *Dr. Vikki Janke*²**

1. University of Lille, 2. University of Kent

This panel features pragmatic analyses of interactions between healthcare providers and paediatric patients. The medical literature provides guidelines about appropriate vocabulary to use with children but neglects other aspects of communication that affect how a child participates during the process. Tates & Meeuwesen (2001) report that the contributions of children range from 2 to 12%, a figure that needs to rise if increasing a child's agency is taken seriously. Attention to this aspect of care is important as a calm child co-operates more readily (Toledo del Castillo et al 2019), facilitating a smoother procedure. But the relevance of their emotional state extends further because heightened anxiety increases pain perception (Dionigi & Gremigni 2016), worsens health outcomes, and remains in the child's memory for years (Poot et al 2023). Thus, exposing optimal communication methods is vital. This workshop discusses the multifaceted nature of successful interactions, demonstrating how they increase the child's agency.

The papers analyse clinical encounters and address questions pertaining to some or all of the following: relative participation of participants, management of turn-taking, alignment and facework, anxiety-reducing communicative strategies, directness/indirectness and gesture/gaze. The context for three of the presentations (1/6, 3/6, 5/6) is a single case study: a consultation in which the pediatrician prepares a young child for an invasive procedure. The first serves as a general introduction, setting out the aims of the qualitative case study and showing the video on which it is based. The third and fifth relate the communication within the consultation to participation frameworks and facework strategies. The second presentation (2/6), examines the impact of social distance within a number of clinical pediatric settings, including interactions between doctors, parents and children. The fluid nature of social distance is demonstrated by the range of clinical contexts examined. The fourth presentation (4/6) focuses on communicative interactions between a child with anarthria and his mother. Crucially, dynamic repair-like phenomena occur through gaze, providing an essential conversational structure to dialogue. The final paper (6/6) examines the discourse used with elderly clients in care homes. Concerned with increasing opportunities for creative practices, it identifies how discourse departing from routine sequences constitute creative practice, which help redress the power imbalance in the care relationship. Since presentations 1, 3, 5 focus on one doctor-child-parent consultation, participants interested in this strand should attend the first presentation which shows the relevant video clip.

Dude food and chick beer: Linguistic and semiotic perspectives on nutrition as a gendered cultural practice

Panel

***Prof. Theresa Heyd*¹, *Dr. Sofia Rüdiger*², *Prof. Janina Wildfeuer*³**

1. University of Greifswald, 2. University of Bayreuth, 3. University of Groningen

Food and drink, and consumption more generally, is deeply linked to cultural practice, and to the negotiation of social status and other aspects of social identities. This connection is entrenched in classical sociological theory (Veblen; Bourdieu), and has been increasingly explored in linguistics in recent years. Thus linguistic approaches to food practices (Rüdiger and Mühleisen 2020; Tovaes and Gordon 2020) have highlighted how social status and categories of belonging are talked into being around practices of food and drink consumption (e.g. Silverstein 2003 on wine talk and status anxiety; Cotter and Valentinsson 2018 on bivalent class indexing in specialty coffee discourse; Mapes 2020 on palatable eliteness; Schneider 2020 on third wave coffee and cosmopolitan discourse).

However, the gendered dimension of food and drink talk has so far received less attention. In cultural and social theory, approaches such as Contois' (2018, 2020, 2021) work on food and masculinity have pointed to these connections: ideologies of gender are cast upon practices of eating and drinking, from gendered product ranges and eating places to gendered assumptions and regimes of un/healthy eating, dieting and cooking (see also Bouvier & Chen 2021).

In a similar vein, foodie culture and practices have been shown to perpetuate the performance of stereotypical, classed femininities and masculinities, while also allowing an escape from them, particularly for women (Cairns, Johnston and Baumann 2010). Dichotomous gendered eating practices have also been observed in the context of fitness magazines (Fuller, Briggs and Dillon-Summer 2012). In addition, cookbooks authored by female chefs emphasize aspects of hegemonic femininity such as care for self and others, while concurrently offering competing discourses of self-fulfillment and independence (Matwick 2017).

In this panel, we provide further perspectives on the nexus between gender and food-and-drinks talk, with a particular focus on discursive, multimodal, material and embodied ways of doing gendered food talk: How are products made, packaged, marketed and sold? How are eating and drinking spaces discursively styled towards gender binaries? How are gendered characterological figures inscribed into cooking and eating practices? What linguistic and semiotic repertoires are used to construct male and female bodies in the context of eating and drinking? How are gendered food identities of the self discursively constructed and how do these emerge in interactions? These and related questions are the scope of our panel.

Emancipatory pragmatics: Interactional modality from the perspective of Ba-theory

Panel

***Dr. Scott Saft*¹, *Dr. Sachiko Ide*², *Prof. Yoko Fujii*²**

1. University of Hawai'i at Hilo, 2. Japan Women's University

By placing a focus on non-western languages that include |Gui, Hawaiian, Japanese, Kilivila, Korean, Libyan Arabic, Mandarin, Persian, and Thai, the perspective of Emancipatory Pragmatics (EP) has helped expand our understanding of the diverse ways that language is used in social interaction. Emerging from EP research is an approach to context termed *ba*-theory that underscores the dynamic relationship among language, social interaction, and human beings. Deriving from the Japanese concepts of *ba* and *basho* (both most frequently translated as “place” or “field”), *ba*-theory centers on the ideas of mutual dependency, impermanence, and non-separation, and thus provides an alternative to western approaches that assume a separation between the individual and the surroundings. With all aspects of contexts starting in a state of non-separation, *ba*-theory allows researchers to explicate how taken-for-granted distinctions such as self-other and mind-body emerge from and sometimes dissolve through social interaction.

This panel further explores *ba*-theory as a dynamic approach to language and social interaction by introducing the concept of interactional modality, which builds on the already existing idea of discourse modality. Discourse modality highlights the fact that speakers employ language to express not only propositional content but also their own attitudes toward the content and their addressees, and interactional modality takes this a step further by emphasizing that such attitudes are highly ephemeral and constantly in flux as interaction unfolds. In short, interactional modality intends to describe, as interaction emerges from a state of non-separation, how participants employ various interactional practices, including linguistic forms and also non-linguistic acts such as gestures, head nods, and silence (i.e., refraining from speaking and leaving something unsaid), that contribute to the construction and dissolution of boundaries between people. Indeed, the concept of interactional modality recognizes the possibility that the modality—not the proposition—may be the most important aspect of interaction since it plays such a significant role in creating and negotiating human relationships.

The panel seeks to explore interactional modality through the examination of interactional practices across diverse languages. Presentations may feature the usage of aspects of language that include but are not limited to pronouns, deixis, verb-morphology, sentence final particles, and honorifics, and they may also focus on non-verbal practices. The panel also encourages analyses that compare interactional practices across languages. What, for example, can a comparison of head nodding by speakers of similar languages like Japanese and Korean tell us about how people in Japan and Korea merge their perspectives together in *ba*? Likewise, how may an analysis of pronouns in structurally different languages such as Thai and Hawaiian inform our understanding of the means through which speakers construct a sense of personhood in relation to others? By seeking answers to such questions through analyses adopting a *ba*-theory perspective on context, this panel will move the perspective of EP forward in its goal of heightening our ability to “see” the roles played by language and social interaction in the organization of our social world.

Embodied and linguistic repair practices in atypical child-adult Interaction

Panel

*Prof. Minna Laakso*¹, *Prof. Barbara A. Fox*²

1. University of Helsinki, 2. University of Colorado, Boulder

The panel focuses on repair organization in child-adult interaction involving children with challenges in language development. Regarding language development, children may have challenges in learning their first language (L1), or a second language (L2). Both mono- and multilingual children are included.

Repair organization provides a powerful mechanism for handling problems of mutual understanding, and there is evidence for its universality across languages and cultures. Generally speakers self-repair their own speech, and recipients other-initiate repair on the speech of others, so that there is a preference for self-repair (Schegloff, Jefferson & Sacks, 1977; Schegloff, 2007:100-106). This means that if we notice that our speech is not understandable to others, we clarify it, and if the recipients do not hear or understand what we say, they ask for clarification, and we clarify. Besides linguistic means, multimodal embodied practices can be used for clarifying (e.g., pointing at a referent one cannot label), and for seeking assistance from others (e.g., gazing at a co-participant), during repair sequences. Usually repair is a swift operation in which the problem is quickly solved, and after which the main line of conversation proceeds. In atypical adult interactions, e.g., in connection with aphasia, repair operations have been found to be less swift or efficient. Repair sequences may prolong and the participants use embodied resources extensively. On the other hand, in child-adult interaction the adult contribution in repair operations has been found emphasized. Adults may e.g. directly other-correct or expand children's expressions.

The dyadic child-adult interactions in focus of this panel present asymmetric competencies in language use between child and adult participants. Linguistic asymmetries potentially cause problems in intersubjective understanding between the interlocutors, which makes the study of repair organization central. The panel will explore whether the universal self- and other-initiated repair practices described in previous adult-focused research are preferred and used similarly, or, whether they differ in child-adult interactions. Comparisons can be made e.g. by looking at the distributions of self- and other-initiated repair operations between child and adult participants, as well as comparing interactions involving neurotypically developing children and children with challenges in language development.

Comparative analyses have the potential to reveal how participation in social-interactive repair operations adapts to interactions in which there are asymmetric roles (adult vs. child) or competencies in language use. Furthermore, we find it essential to examine both linguistic and embodied actions in order to understand the full range of participation in child-adult interactions. Comparisons of embodied actions in connection with typical L1/L2 acquisition as well as with connection with developmental language disorders may reveal whether adaptations differ depending on the nature of asymmetry, and whether embodied actions compensate for challenges in language use.

In the panel, comparative analyses of repair will be explored through a brief introduction by the organizers, three empirical papers, and a concluding summary on the combined findings, presenting also a methodology for quantifying the distributions of repair practices in different data sets.

Emerging otherness in social interactions: Multimodal and multicultural approaches

Panel

***Dr. Keiko Tsuchiya*¹, *Dr. Valentina Fantasia*²**

1. Yokohama City University, 2. Lund University

Engaging in social interactions is a fundamental human practice (Enfield, 2017). Social interactions are construed through the coordination of actions and meanings by those participating in them. As argued by EMCA (ethnomethodological conversation analysis) theoreticians (Garfinkel & Sacks 1970), people contribute – and are perceived to do so – to jointly construct meaning and make sense of common knowledge by means of overt, systematic deployment of multimodal resources, such as behaviours and language (Goffman, 1974), by establishing common ground (Clark, 1996). This panel explores closely what happens in those interactional systems when people succeed or do not succeed in trying to make sense of each other, particularly in multicultural settings.

Multiculturality in this panel includes broad contexts, e.g., intercultural communication among individuals with various ethnic and linguacultural backgrounds, and interdisciplinary professional interactions between those who belong to different sub-groups in an institution. Multicultural (or non-monocultural) attitudes are also applied to the interpretation of social interactions. Alterity and intersubjectivity, for example, are two central aspects of social engagements on which Western theories have long drawn attention to, assuming individual interactants as ego-centric agents (Duranti, 2010). In the *ba*-theory in the Eastern cultures (Hanks et al., 2019), on the other hand, everything is submerged in a context in primary *ba*, and the Self and Other distinction emerges in secondary *ba*.

Social interactions involve both intersubjectivity and alterity, which are “opposing forces” in “a single, integrated, dialectal system” and should not be discussed in isolation (Wertsch, 2000, p. 27), and contribute to both social interactional and individual processes (Vygotsky, 1991[1966]). In some cases, alterity could reside within an individual, i.e., the practice of pretence, which could be jointly realised by encouraging other interactants to respond “the pretense” in interactions (Tollefsen, 2005).

This panel explores the dynamism of emergent alterity in social interactions in multicultural settings, describing interactants’ use of multimodal semiotic resources in the process, e.g., gaze behaviours and pointing gestures for joint attention (Carpenter & Tomasello, 1995). Drawing on multimodal and multicultural, or non-monocultural, approaches, this panel addresses three questions: (1) how and by whom alterity is framed and negotiated for grounding in interactions to establish intersubjectivity in a multicultural setting, (2) what multimodal semiotic resources are exploited in the process, and (3) how and with what theoretical framework alterity and intersubjectivity are interpreted and discussed by the analyst/researcher.

The panel includes contributions by researchers investigating interactions among individuals with autism, local communities and the government social welfare policies in England (Kyoko Aizaki); the acoustic characteristics of speakers’ voice and its influence on recipients’ decision-making in social interaction (Jonathan Caballero); anaesthetists’ gaze behaviours in surgical team simulation in Japan (Keiko Tsuchiya); the diversification of interactional resources in L2 Spanish learners of English (Victor Garre Leon); the interconnections of bodies, languages and objects in migrant students’ interactions in Brazil; and pretend play interactions among kindergarten children with different cultural and linguistic background (Valentina Fantasia).

English address terms in a globalized world: Socio-cultural impact on recent language variation and change

Panel

***Prof. Svenja Kranich*¹, *Dr. Anke Lensch*²**

1. Universität Bonn, 2. Universität Koblenz

Present-day English address terms range from more informal variants, such as first names (e.g. *Lilian*), kinship terms (e.g. *Dad*) and endearment terms (e.g. *sweetie*) to more formal variants, such as last names combined with title (e.g. *Ms Miller*), or the use of title only (e.g. *Sir*) (cf. Bruns & Kranich 2022). Generally speaking, diachronic change affecting English address terms has been well investigated (cf. e.g. Brown & Ford 1961; Ervin-Tripp 1978; Jucker 2020; Buyle 2021). Yet, relatively little is known about the effects of more recent developments such as globalization, the advent of the internet and social media, the subsequent increase in global connectivity, democratization and colloquialization on the use of address terms in English-speaking speech communities and communities of practice across the globe.

Previous studies have shown that inter- and intra-variety variation in the use of address terms prevails, despite the increasing degree of interconnectedness through globalization (cf. e.g. Bruns & Kranich 2022). Thus, to this day in South Asian varieties of English, such as Indian English and Sri Lankan English, the address terms *Madam* and *Sir* still appear to be the default, while they are almost considered archaisms in British English and American English, where especially younger generations appear to be prone to choosing informal variants over more formal ones (cf. Bernaisch 2015: 126f.; Bruns and Kranich 2022: 129).

This panel has the aim to provide a better understanding of the determinants of recent change affecting English address terms, with a particular focus on the impact of the relatively recent sociocultural developments connected to globalization listed above. The contributions to this workshop are based on state-of-the-art empirical research that establishes on-going trends affecting the use of address terms, which can transgress national borders and social constraints in the wake of globalization.

Experimental and corpus perspectives on (socio)pragmatics

Panel

***Prof. Anne Bezuidenhout*¹, *Prof. Andreas Jucker*²**

1. University of South Carolina, 2. Universität Zürich

Linguists interested in pragmatic variation use a variety of methods to investigate the social and cultural factors influencing the language choices made by conversationalists in verbal communication, including observational, experimental and corpus-based methods. In this panel we focus in particular on recent developments in the experimental and in the corpus-based methods. On the experimental side, the traditional methods of discourse completion tasks and role plays have seen significant modifications and improvements over recent years. They have been supplemented by a range of methods from experimental psychology, with a focus on comprehension tasks and a broader appreciation of the interaction between conversationalists. Corpus pragmatics has seen an equally significant development of tools and methods driven by the unprecedented growth of the availability of new corpora and their sizes. Corpora that have recently become available include specialized corpora of texts drawn from social media sources, corpora containing several decades of spoken language or corpora that include pragmatically tagged units. These exciting developments offer a broad range of possibilities for innovative research questions and new insights into the use of language across different social contexts, different cultures, and different time periods. In this panel, we showcase the application of such newly developed experimental and corpus-based methods in the study of socio-pragmatic topics, such as im/politeness, social identity-construction, interaction in professional settings, and so on.

Exploring the body as the source of meaning-making in sign language interaction

Panel

*Dr. Emily Shaw*¹, *Dr. Alysson Lepage*²

1. Gallaudet University, 2. Université de Namur

Since Stokoe et. al's (1965) groundbreaking work on American Sign Language, five decades of research on sign language (SL) have remained heavily focused on syntax and the lexicon at the expense of other, less conventionalized practices. Initially limited by technology (i.e., filming equipment and the means of processing and analyzing videos, most SL studies relied on field observations or elicited data “from small numbers of signers, monologic retellings and/or spontaneous narratives” (Hodge et al., 2019).

Today, scholars record and analyze signing via video. However, with a few exceptions (e.g., de Vos et al., 2015; Manrique, 2016; Mesch, 2016; Ferrara, 2020), little work has been conducted on pragmatic and interactional mechanisms of signed discourse, particularly in face-to-face conversations. As raised by Baker and van den Bogaerde (2012), some “aspects [of signed interactions] have not been studied at all [...]. It will be a challenge of the next decade to broaden our knowledge in this area” (p. 490).

This panel responds to the call to broaden our knowledge of SL interactions by shifting focus away from single-signer datasets. It will feature studies that consider the semiotic diversity of language in interaction via diverse methods (from corpus linguistics to ethnomethodological conversation analysis (EMCA)). In addition, contributions will focus on interactional practices that regulate the flow of signed conversations, including (but not limited to) these questions:

- What embodied practices regulate turn-taking in signed discourse (e.g., the active participation of addressees through backchannels or repair sequences)?
- What joint actions do participants engage in when overlapping signing?
- What methodological tools can be drawn from EMCA to further pragmatic analyses of multimodal data? How can we expand transcription methods to include multimodal data?
- How does the study of SL interaction in diverse contexts advance our understanding of language writ large as a pluri-semiotic phenomenon?

Exploring “image work” in Chinese communication

Panel

Prof. Xinren Chen¹

1. Nanjing University

This panel explores how Chinese people perform various types of “image work” by discursive means in a variety of communicative context. By “image work”, it is meant to refer to any discursive effort (Chen, 2022; Chen & Jin, 2022; Jin & Chen, 2022; Locher, 2004), serious or jocular, that communicators make for the purpose of (dis)claiming, constructing, maintaining, or beautifying the image of a person (the speaker, the hearer, or a third party), a social group or an institution, a region or a country; on the negative side, it can also be used to denote any discursive effort, serious or jocular, that is intended to belittle, harm, or uglify the image of any entity mentioned above. The reported studies in the panel on “image work” in Chinese communication are all grounded on both constructionist and pragmatic approaches to the notion of image: 1) image is not a static thing “out there” but a dynamic “thing” (Chen & Jin, 2022) such that it is subject to construction, modification and deconstruction in discourse (cf., Goffman, 1959; Lakoff, 1989; Schlenker & Pontari, 2001; Tracy, 2001); 2) it can be discursively represented and explicated (cf., van Dijk, 2000); 3) it is negotiable and contestable (Chen, 2022); 4) it can be a pragmatic resource deployable for illocutionary and interpersonal purposes (Chen, 2020, 2022). Various types of image work enacted through an array of pragma-linguistic strategies across a wide range of communicative contexts, interpersonal, institutional and public, are presented and discussed in relation to communicative goals and contextual correlates. All the studies in the panel are conducted on the basis of naturally-occurring data in real-world life or on social media, employing qualitative analyses with or without quantitative analyses. It is hoped that the panel can contribute to existing scholarship on image research in general and dynamic discursive approach to image in particular.

First-order pragmatics: How lay people talk about speech (inter)actions

Panel

Prof. Klaus Schneider¹

1. University of Bonn

The distinction between first- and second-order concepts, i.e. between lay interpretations and expert definitions, was first fruitfully introduced to pragmatics in politeness research (e.g. Eelen 2001). It was argued that theories should not be based on scholarly constructs (alone), but (also) take into account how lay persons understand politeness and related phenomena. Such lay concepts can be examined by analyzing the use of relevant metapragmatic expressions, e.g. *polite*, *rude*, *courtesy*. Culpeper's 2011 corpus-based book-length study is a prime example of this approach.

The present panel is aimed at broadening the scope of this field of first-order pragmatics in more than one way. The contributions to this panel, which are all corpus-based, examine not only metapragmatic expressions used for discussing (im)politeness, they also explore the meta-illocutionary lexicon (Schneider 2022) employed to discuss speech acts, e.g. *apology*, and meta-rhetorical labels such as *understatement*. The contributions concentrate on one language (e.g. German) or contrast languages (e.g. English and Japanese). In several studies, comparison is made across varieties of the same language (e.g. German, Austrian, and Swiss German; British, Kenyan, and Hong Kong English). While the focus is predominantly on present-day language, historical language is also considered (e.g. Early Modern English). The presentations in this panel thus contribute to variational metapragmatics (Schneider 2021), and also to contrastive metapragmatics and historical metapragmatics. These fields of inquiry may be considered subfields of first-order pragmatics.

Key questions addressed in this panel include (1) in which contexts, constructions and functions metapragmatic expressions are used by lay people in spoken and written discourse, (2) what such uses reveal about first-order conceptualisations of speech (inter)actions, and (3) how these conceptualisations may differ from technical definitions provided by scholars in language philosophy and linguistics.

Gesture in spoken and signed-to-spoken language interpreting

Panel

***Dr. Sílvia Gabarró-López*¹, *Prof. Alan Cienki*²**

1. Pompeu Fabra University & University of Namur, 2. VU Amsterdam

Gestures have been frequently observed in interpreted discourse, either when spoken language interpreters work in the booth and are not visible, as in (simultaneous) conference interpreting [e.g. 1, 2], or when they are “visible” to the audience, as in community interpreting. Signed language interpreters do not work in a booth, as they need to be visible to the audience when they interpret into the signed language. Depending on the type of service, they are also visible to the audience when interpreting into the spoken language (e.g. in liaison interpreting) or at least to the deaf person who is being interpreted to (e.g. in a conference, the interpreter sits in the first rows of the audience). Regardless of the modality of the source discourse (spoken or signed) and of whether they are seen or not, interpreters do gesture in their spoken target production.

The study of gesture and interpreting can shed light on how interpreters structure their discourse and on how their bodily actions construct meaning. This incipient interdisciplinary approach of researching interpreters’ gestures with their speech may uncover specificities of interpreting that have been overlooked: previous research focused only on sign or speech, but not on the combination of the different semiotic resources available to interpreters. Despite the promising applications that such research may have in the quality of interpreting services and interpreters’ training [2], this topic has largely been overlooked in research. So far, only a few accounts describe gesture in spoken or signed-to-spoken language interpreting [e.g. 1, 2, 3].

This panel aims to contribute to this incipient field of study by gathering scholars who work on gesture in interpreted discourse including different language pairs and modalities. Accepted contributions cover a variety of topics such as gestural alignment, the role of gesture during disfluencies and in the management of cognitive load, the comparison of gesture in interpreted vs. non-interpreted discourse and in simultaneous vs. consecutive interpreting, and the use of gesture in constructed dialogue and reformulation structures. These studies draw on different datasets (elicited and naturalistic interpreted data, non-interpreted data), include one or two modes of interpreting (simultaneous and consecutive) and are recorded in different settings (conference, liaison interpreting, on-site and video remote interpreting). The diversity of the contributions, which is representative of the field of interpreting, will set the scene for the discussion and collaboration between participants of the panel.

Getting close in a ‘formal context’: Ideologies and styling practice in Japanese

Panel

*Dr. Haruko Cook*¹, *Dr. Momoko Nakamura*²

1. University of Hawaii at Manoa, 2. Kanto Gakuin University

This panel is composed of discourse analysis research of the Japanese language exploring how speakers’ styling practice constructs contexts (Duranti & Goodwin 1992). Specifically, the goal of the panel is to analyze how speakers create closeness and solidarity in a formal context, which calls for linguistic politeness according to social norms.

Studies of sociolinguistics and pragmatics have tended to focus on interactions in either a formal or informal context, presupposing that the formality and informality produce distinctive types of interaction. For example, typically, institutional talk is regarded as a formal context, and family conversation, as an informal context. In languages with a rich system of honorifics such as Japanese, typically a formal context is tied to the use of honorifics, and an informal context, to the non-use of honorifics. The research of style shift based on naturally occurring data in Japanese, however, has uncovered that the association of formal context with honorifics and that of informal context with non-honorifics is too simplistic (e.g., Cook 1996, 2008; Geyer 2008; Ikuta 2008; Jones and Ono 2008). In practice, honorifics index multiple social meanings, and the distinction between ‘formal’ and ‘informal’ contexts is not always straightforwardly equated with the use and non-use of honorifics. For example, in a formal setting of a teachers’ meeting in a middle school, the teachers sometimes shift to the plain form (Geyer 2008), while in an informal family conversation, the family members at times shift to the addressee honorifics (Cook 1996). These studies suggest that the simple dichotomy of ‘formal’ and ‘informal’ contexts is a static ideological construct. The research on style shift in Japanese, however, narrowly focuses on the addressee honorific, *desu/masu* form and its non-honorific counter-part, the plain form. There are linguistic and non-linguistic resources other than honorifics and the plain form that can construct so-called ‘formal’ and ‘informal’ contexts. This panel goes beyond the style shift research and explores in detail how speakers go against the norm of ‘formal context’ and interactionally incorporate an ‘informal’ context within a ‘formal context’. Specifically, the panel addresses the following research questions:

- What kinds of linguistic and non-linguistic resource(s) is/are mobilized to construct a close relationship in a ‘formal context’?
- What changes does the construction of a close relationship make in ‘footing’ and ‘participation framework’ (Goffman 1981)?
- What is interactionally accomplished by creating closeness and solidarity in a ‘formal context’?

By problematizing the language ideologies of distinctive formal/informal contexts, the panel intends to introduce a new perspective to the field of discourse analysis that captures the intricate and complex styling practice of speakers and to demonstrate how the situated practice constitutes and shifts the formality and the informality of a situation. The panel analyzes various ‘formal contexts’, including institutional, mediatized, and pedagogical situations.

Going viral, cinematic and media perspectives: New studies on iconic communication and fictional discourse in a shared world.

Panel

***Dr. Monica Cantero-Exojo*¹, *Dr. Eduardo Urios-Aparisi*²**

1. Drew University, 2. University of Connecticut

This panel continues the investigative approach that began in a similar fashion at the 15th IPrA conference (Belfast 2017) and continued at the 17th IPrA (Winterthur 2021). Within the conference (2023) main theme of the pragmatics of (a)typicality, this panel explores how the communication of knowledge during atypical events (health crises, natural disasters, terrorist attacks etc.) is perceived, learned, shared and used by the individual and/or social groups with diverse backgrounds across separated geographies. This panel uses two main frameworks: (1) Iconic communication proposed by Barker and Yazdani (2000) that defines types of communications that occur mainly in social media; and (2) the Pragmatics of Fiction (Miriam A. Locher & Andreas H. Jucker, 2017), that studies pragmatics within fictional context(s).

One of the takeaways from these two approaches is that within these relationships and interactions with the fictional/non-fictional context(s) is that individuals who may or not share the same socio-cultural background or geographical space still find shared experiences embedded in the verbal-visual fictional/non-fictional discourse(s).

The panel welcomes presentations on the study of iconic communication and the pragmatics of fiction from a diversity of theoretical perspectives including, Systemic Functional Perspectives (O'Halloran 2004), Semiotic Approaches (Kress and Van Leeuwen 2001), Conceptual Metaphor theory (Lakoff 1980, 1984; Kövecses, 2010, 2020) and Tele-cinematic and Media discourse(s). In this context, the panel is open to research taking any perspective, but it would like to focus on one of the following points:

- the interaction between images and words or other modes of communication in social media/cinema.
- the present impact of social media and iconic communication in catastrophic events (health crisis, natural disasters, terrorist attacks, mass shootings, etc.)
- the relationship of iconic communication to the increase of online communication through different platforms in the context of the CoVid-19 pandemic and social movements: MeToo, Black Lives Matter, Global Warming and Climate Change.
- How cinema, television and the visual arts reflect on and disseminate discourses of social change/or the opposite, conspiracy theories.
- How cinema and media are used as frameworks of learning to cope.

Health and life events. (A)typical modalities and challenges to interaction

Panel

***Prof. Stef Slembrouck*¹, *Prof. Melissa Moyer*²**

1. Linguistics, Ghent University, 2. Universitat Autònoma de Barcelona

Atypical life events affecting people's health such as those experienced from birth (deafness, blindness, or cerebral palsy), or those acquired during the course of one's life (such as aging processes, the recent covid-19 crisis, or a traumatic brain injury) bring to the forefront various ways in which the interactional dynamics of communication is challenged.

There are several key social, policy, and linguistic issues concerning the analysis of interactions in health-related matters. Social categorizations (Blaxter 2004) and stigmatization (Goffman 1963) are closely connected to the way people who are affected by a health issue talk about it but also it affects the way professionals and policy makers use of language to represent and communicate about atypical life events with relevant stakeholders. Interaction is connected to the way we construct meaning, represent our identity, or exercise agency but in those cases where a person's speech, writing or interactional space is compromised on account of a life altering event, alternative ways of understanding and participating in interaction (Goodwin 2003) and the adoption of alternative modalities and representations for expressing meaning (Kress 2009) become crucial. Earlier research has focused on individual interactants and the dynamic negotiation of meaning in face-to-face encounters (e.g. Gumperz 1992; Erickson 2004), but aspects of physical visibility and embodiment fundamentally shape the way communication can take place. The relative (non)disclosure about health matters becomes a focus point of subjectivities, categorizations, control and regimentation on the part of health authorities and nation-states (cf. Piller et al. 2020 on the recent pandemic).

The panel addresses the interstices of language, interaction and meaning making strategies in a multimodal perspective together with the way communicative practices relate to wider social processes where identity, exclusion, agency, control, risk, and security in relation to health and atypical life events are involved. Contributions to the panel that help to understand what can go on "beyond" the face-to-face interaction in an era of social media and the digital management of personal data and lifeworld will provide valuable insights on some of the ways in which power, control, entitlement and agency currently play out in our contemporary world.

We anticipate inviting Rodney Jones (UReading), Jonathan Crichton (U of South Wales), Irene Walsh (Trinity College), Dana Kovarsky (U of Rhode Island), Lesley Stirling (UMelbourne), Melissa Moyer (UABarcelona), Stef Slembrouck (Ghent U), Gema Rubio (UABarcelona), Ignasi Clemente (CUNY), Candy Goodwin (UCLA), Jeff Bezeemer (UCLondon).

Hierarchies of knowledge in online health communities

Panel

Prof. Barbara De Cock¹, Dr. Carolina Figueras²

1. UC Louvain, 2. Universitat de Barcelona

Social support has been found to be a critical factor in improving patients' well-being and overall quality of life. Feeling understood and supported by others with similar health experiences seems to reduce stress and to increase compliance with treatments and clinical interventions (Shigaki et al., 2008; Wright & Bell, 2003). With the advent of the Internet, there has been a widespread proliferation of web-based platforms that facilitate patients' access to social support, ranging from asynchronous mediums, like online forums or blogs, to more interactive synchronous social networking sites and live chats.

The availability of a variety of online platforms for supportive communication is particularly valuable for individuals who live with long-term conditions or with mental issues that are not widely understood or for which a treatment is difficult or not completely successful (Coulson, Buchanan, & Aubeeluck, 2007; Mo & Coulson, 2008). In these contexts, online social support incentivizes the opportunities for building and sharing knowledge among caregivers and patients.

The focus of this panel is to examine the types of knowledge shared in these online platforms, and to identify the interactional processes invested in knowledge creation and transmission that are characteristic of online supportive communications, through the following questions:

1. How is knowledge created and shared among participants in online health support groups?
2. Are there different types of knowledge that are primarily constructed according to the type of health condition?
3. How do the participants interact to bring about knowledge about the condition and its treatments, and how do they transmit and (re)construct this knowledge over time?
4. How do participants co-construe authoritative knowledge coming from a range of distinct sources (medical literature, health care professionals, lived experiences of patients, alternative health providers)?
5. How are hierarchies of knowledge in online health support communities being built?
6. What territories of knowledge, in terms of Heritage (2012), operate in each site and in each health condition?

If you see what I mean: Comparative-contrastive analyses of implied meanings across populations, contexts and texts

Panel

*Prof. Sara Gesuato*¹, *Prof. Emanuela Sanfelici*¹, *Dr. Elena Pagliarini*¹, *Prof. Francesco Vespignani*¹

1. University of Padua

A central question in linguistics is how textual and contextual information contributes to the meaning of an utterance. This is shaped, among others, by previous discourse, the speaker's beliefs and attitude, and salient situational entities/individuals and events. Therefore, being understood and understanding requires not only packing and unpacking the literal "content" of expressions, but also being aware of their hidden content – the notions presupposed, entailed, implicated; the scenarios activated; the connotations evoked; the interpretive key adopted; the relevant alternatives.

These phenomena span from the syntax-semantics interface, as in scope ambiguities and information structure; through the semantics-pragmatics interface, as in scalar implicatures and presuppositions (Horn 1972; Gazdar 1979); to the discourse-syntax interface, as in discourse particles (Zimmermann 2011) and word order variation (Bianchi, Bocci, Cruschina 2016); to the semantics-prosody interface, as in presupposition (Féry 2013).

Inferential comprehension is not an in-built capacity – it develops over time, as cognitive skills grow, and through practice, through socialization into communicative practices. It therefore builds upon a variety of "props" and strategies such as: familiarity with the topics and goals of given genres; developing adequate working memory (Alptekin, Erçetin 2010); building models of interpretation (Hammadou 1991); making educated guesses based on context and world knowledge (Baldo 2010). In addition, participants' expectations or requirements about what is ideally to be taken for granted because plausibly/easily retrievable – and thus left unexpressed – may vary across texts, contexts, and communities of practice. Consequently, communicative effectiveness and comprehension may achieve different levels of accuracy, depending on the participants' encoding expertise and inferencing skills.

The papers in this panel explore oral and written manifestations of implied meaning-making (e.g. the conversational role of dysfluencies, the expression of suggestions, expressive pragmatic skills) and meaning retrieval (e.g. inferential skills, metaphor comprehension, sentence processing, judgements of informationally-redundant utterances) through a comparative-contrastive approach (e.g. in typical- and atypical-developing children and adults; among native and nonnative speakers; with regard to different types of implied meanings such as implicatures, presuppositions and entailments). These studies contribute to our understanding of the exchange and handling of indirect communication.

Imitation and simulation for instructing and learning *Kata*: A multimodal analysis of Japan-style transmission of practical skills

Panel

*Dr. Seiji Nashio*¹, *Dr. Ikuyo Morimoto*², *Dr. Yasuharu Den*³

1. Hiroshima University, 2. Kwansai Gakuin University, 3. Chiba University

This panel aims to suggest a new approach to studying instructing–learning interaction, which is inspired by methods of transmitting practical skills from instructors to learners in Japanese traditional arts.

The panel’s organizers have analyzed instructing–learning interactions in *Geido*, a form of Japanese martial and musical arts, and have described the multimodal processes where particular practical skills are acquired via *Kata*—stylized sequential patterns of bodily motions that have been developed and refined over time. *Kata* is referred to as a “container” of not only forms of bodily conduct but also as an indescribable inner sense and intelligence necessary to improve and acquire skills. This panel focuses on specific manners of instructing and learning *Kata*—imitation and simulation—widely adopted in *Geido* training, and attempts to elucidate the ways in which language and bodily conduct are intertwined to organize such manners. Given the analyses, we discuss how this method contributes to the Japan-style transmission of practical skills.

The recent rise of multimodal analyses in pragmatics, conversation analysis, gesture studies, etc. (e.g., Streeck, Goodwin, & LeBaron 2011, Haddington, Mondada, & Nevile 2013) has provided us with novel insights into the organization of language and body in daily activities. This line of research has drawn particular attention to the processes of teaching and learning practical skills, such as driving and cooking lessons.

To contribute to the body of multimodal research, organizers have conducted panels focusing on instructing–learning interactions in *Geido*, where *Kata* is considered medium for transmitting intelligence from experts to novices. The question is how *Kata* works as a useful medium for transmitting intelligence in the instruction and learning processes. Thus, this panel specifically focuses on two manners of practicing *Kata*: imitation and simulation. Imitation refers to intercorporeal (Meyer, Streeck, & Jordan 2017) assimilation among participants, especially between instructors and learners. Simulation refers to how practitioners learn practical skills under the type of physical and mental pressure experienced in real situations. While these processes are significantly incorporated into *Geido* training, such Japan-style transmission has also been adopted in other Japanese social activities.

The presenters in this panel have analyzed video-recorded interactions in the Japanese context, including some *Budo* (*Karate*, *Taido* and *Jiu-jitsu*) and other activities (*Sado*/tea ceremony, *Manzai*/comedic performance and pottery making). We hope to deepen the discussion about not only what imitation and simulation have achieved in instructing and learning practical skills but also identify other fields in which those methods can be applied for transmitting skills.

Impoliteness in Chinese social media

Panel

Prof. Yongping Ran¹

1. Center for Linguistics & Applied Linguistics, Guangdong University of Foreign Studies

With the increasing dominance of digitally mediated communication, online discussion boards, WeChat, blogs, Facebook, YouTube, Twitter and other online platforms become inseparable from our daily life and work, even problem solving or trouble management can be done online. And in online settings dissatisfaction, opposition, anger or other negative emotions tend to be expressed directly, and it is easy to find speeches of offence, aggression and abuse with negative interpersonal or social outcomes. This means that online interaction is much more likely to cause impoliteness, offensiveness or unwelcome effects in varying degrees, the management of both interpersonal and social issues is therefore of great importance (Culpeper 2011).

Due to the above background, this proposed panel aims to explore how online impoliteness is different from offline impoliteness with supportive evidence from Chinese social media, and further considers whether and how existing models of (im)politeness fit new modes of interaction from the perspectives of both interpersonal pragmatics and sociopragmatics, since (im)politeness is a multidisciplinary field of study (Culpeper 2011). Although (im)politeness is mainly interpersonal, it can also become a social or public issue in the public sphere of social media, due to the fact that the online participation framework is different from the offline ones in many aspects (Dynel & Chovanec 2015), and online acts or speeches are most likely to arouse relevant responses or comments from side participants, including readers, watchers or overhearers, thus online impoliteness and its evaluation are also sociopragmatic (Haugh et al. 2021).

This panel is planned to invite and accept contributions that address issues of impoliteness in internet-based Chinese social media, especially those culturally informed ones with interactional evidence of conflict, incompatibility, aggressiveness, offensiveness or some forms of derogatory language uses, through which we can see how and why interpersonal and social norms or orders are challenged and maintained in online social practices. Besides, the panel is also interested in studies about online evaluation of impoliteness with evidence from comments and their responses made by online side participants, including readers or watchers, since impolite or inappropriate behaviors can also be dynamic and discursive in social media. The overall aim is to provide insights into what leads to impoliteness in Chinese social media, and how negatively evaluated interpersonal and social behaviors can therefore be managed and restored. This panel hopes to offer insights into (im)politeness norms, maintenance of social orders, social or interpersonal relationship (de)construction in online public spaces, and further helps to understand relevant East-West debates (Spencer-Oatey & Kádár 2016).

Institutional incongruity: When the practitioner is doing the right thing at the wrong time

Panel

***Prof. Gonen Dori-hacohen**¹, **Dr. Bracha Nir**²*

1. University of Amherst, 2. University of Haifa

Rational: Interactions in institutions are constrained by structures at the sequential level (e.g., Drew and Heritage, 1992) as well as at the level of the overall structural organization (Robinson, 2012). Thus, participants in such interactions not only perform their part as interlocutors but also perform their institutional parts. Both structural levels direct the participants to routinely follow particular actions and processes. However, the multi-layered participation in interaction can lead to incongruity in the performance of such routines – the issue at the heart of this panel.

We follow Goffman's (1959) view namely that different orders exist in social life to focus on possible incongruities between them. The panel aims to highlight cases where incongruity emerges between the institutional (or technical in Goffman's terms) order and the interactional one. Specifically, the panel focuses on situations where the practitioner follows the routines of the institutional interaction; however, they do not follow the moments of the exchange itself. Thus, they perform an action that is correct from an institutional perspective but is misplaced or mistimed at the specific interaction.

Scope: The overall aim of the panel is to bring together scholars who investigate the complexity of institutional interactions from various approaches – highlighting aspects of pragmatics and communication alongside linguistically-motivated analyses and conversation analysis to illustrate how the incongruity between institutional and interactional orders may create problems for the other participant(s) in the interaction. Similarly, these incongruities illustrate the functional flexibility of various actions. Thirdly, we aim to discuss the harmful potential these incongruities have on the remainder of the interaction and the participants' relations.

The panel will rely on insights from data that allow the analysis of incongruities from various institutional settings. The panel invites contributions that focus on face-to-face in either mediated or non-mediated settings, including but not limited to Speech-Language-Therapy interactions, doctor-patient interactions, television game shows, and talk shows. Each setting will focus on specific actions, such as questions or evaluations, typically routines to that setting, and will explore the various conditions under which these routines are employed counter to the interactional constraints. The analyses will take into account the interaction of grammatical restrictions and conventions of usage across comparable contexts. For example, welcomed contributions will point to what can be perceived as failures of the specific agents to follow the here-and-now and instead to follow the pre-conceived structure. As such, the panel follows the pioneering work of Zimmerman, Whalen, and Zimmerman (1988) while conceptualizing this path using the concept of incongruity.

Aims: The panel aims to look into several questions that, to date, have not been systematically considered with respect to institutional discourse:

- Which interactional actions are susceptible to the constraints of the institution?
- Which incongruities emerge as a result of the aims of the institution?
- What can violations of the pragmatic constraints on a given action tell us about these actions?

Integration of conversation analytic and other linguistic methods

Panel

***Mr. Yida Cai*¹, *Dr. Erika Sandman*¹**

1. University of Helsinki

The panel focuses on the integration of conversation analysis (CA), a central method used in Interactional Linguistics (IL; Couper-Kuhlen & Selting 2018), and other methods for describing and explaining linguistic phenomena in talk-in-interaction from a wider perspective. In Interactional Linguistics, CA is often used as the sole method with only a secondary use of other methods for analyzing certain linguistic phenomena. However, depending on research questions, CA may not provide enough tools for explaining, for example, the motivation of the interactional functions of a particular linguistic resource or how conversational structures function across languages. On the other hand, making use of CA in different types of linguistic frameworks has started to increase.

Many researchers have started to integrate CA to other linguistic approaches for explaining the use of linguistic resources, including usage-based linguistics (e.g. Zeschel & Proske 2015), construction grammar (e.g. Fischer 2015), linguistic typology (e.g. Dingemanse, Torreira & Enfield 2013) and descriptive field linguistics (e.g. Gipper 2020; Sandman & Grzech 2022). On the other hand, efforts of a closer combining of CA and IL with other methods, such as cognitive grammar, have been made (e.g. Etelämäki & Visapää 2014), and by complementing sequential analysis of CA and IL with tools for semantic analysis (Interactional Semantics; Deppermann 2011). All these studies demonstrate that intergrating CA and other linguistic methods can be of benefit in providing a deeper understanding of using linguistic resources in social interaction, including their frequency and usage in certain sequential contexts in both well-documented and lesser-studied languages, as well as their cross-linguistic patterns of use.

The panel aims at enhancing discussions on methodological integration of CA and other linguistic approaches, including cognitive linguistics, functional linguistics, descriptive field linguistics, corpus linguistics and computational linguistics as well as considering the possibilities, advantages and limitations of integration for solving linguistic research questions.

Interaction in clinical and non-clinical settings with children and adults with communication disorders

Panel

Mrs. Paméla McMahon Morin¹, Prof. Carole Anglade¹, Prof. Stefano Rezzonico¹, Prof. Claire Croteau

1

1. Université de Montréal

Communication disorders, for example, developmental language disorder in children or aphasia in adults, might alter the interactions a person will have with his/her communication partners, may they be family members, teachers, friends, or non-familiar people in the community (clerks, waiters, etc.). The first block of lectures will explore how social interactions in clinical settings can differ from the interactions in non-clinical communication settings (for example, in the classroom, in the community). A second section of the panel will discuss how speech-language pathologists/therapists and other communication specialists can strive to develop interventions that will enhance and facilitate social interactions in daily life settings. Different tools and methods were developed to assess and prompt more natural interaction in clinical settings, for example, communication partner training or interventions that focus on the interaction itself rather than on the communication disorder. In addition, the clinical settings can be redesigned to embrace this need for authenticity in the interaction while being in intervention with a speech-language pathologist/therapist. Although challenging, normalising interventions in natural environments, like in the classroom, in the family, or in the community is a relevant step to support people with communication disorders in achieving pragmatic improvement in their daily interactions. Finally, the panelists and the audience will be invited to discuss the question of the social acceptance of atypical interactions in daily life. This question is calling on a shift in perceptions, from the “atypical” pragmatic behaviors that persons with communication disorders should try to “correct” to reach a certain “normativity”, to an acknowledgement of this “atypical” pragmatic as something that can be valuable in itself.

Interaction in nursing: Conversation and multimodal analytical studies

Panel

***Prof. Esther González Martínez*¹, *Dr. Evelyne Berger*²**

1. Department of social sciences, University of Fribourg, 2. La Source School of Nursing, HES-SO University of Applied Sciences and Arts Western Switzerland

Based on recordings of naturally occurring interaction, conversation and multimodal analysis are well established approaches for the study of healthcare activities such as primary-care doctor-patient consultations, psychotherapy sessions and surgical interventions in operating rooms. However, nursing and nursing practices have been relatively neglected both by these analytical and methodological approaches and also more widely in language and social interaction research. Recent studies are however beginning to redress this imbalance, which goes hand in hand with the expansion of nursing activities to novel areas, the academization and professionalization of nursing, and increased acknowledgment of nurses' importance in healthcare. The panel provides an opportunity for conversation and multimodal analysts of interaction in nursing and healthcare activities to meet, present and discuss research findings, and identify possible areas of collaboration. The papers will focus on the situated organization of speech and body behavior as nursing students, nurses and related healthcare professionals undergo training, provide care, and interact with coworkers, activities that require constant mutual adjustment of communication practices. In contrast to the traditional image of the nurse interacting mainly with patients by their bedside, the panel places special emphasis on communication between professionals in planned work interactions (handovers, discharge meetings and psychoeducation interventions) as well as unscheduled ones (corridor encounters). Relying on conversation and multimodal analytic research, the studies to be presented will provide detailed descriptions of the healthcare professionals' linguistic and embodied conduct when engaged in professional practice and, on this basis, will have the potential for informing training activities and on-the-job interventions. The panel will also aim to foster comparisons across clinicians' interactional practices in different institutional settings, countries and languages.

Interaction in video-mediated settings in higher education

Panel

***Prof. Sabine Hoffmann*¹, *Dr. Margarethe Olbertz-Siitonen*², *Prof. Götz Schwab*³**

1. University of Palermo, 2. University of Jyväskylä, 3. Ludwigsburg University of Education

Professional and/or institutional meetings are increasingly taking place online (cf. among others Due and Licoppe 2020). The Covid pandemic has certainly accelerated this trend to a great extent. Such meetings usually take place using video conferencing tools, e.g. Zoom or WebEx, or on platforms such as Microsoft Teams, Slack, or the like, which provide a wide range of communication channels and thus offer numerous opportunities for collaboration and exchange.

Parallel to the increasing use of videoconferencing, there has also been an increase in research in the field, which is usually interdisciplinary in nature. In addition to quantitatively oriented studies, e.g. in business contexts, there are also conversation analytic works that can be assigned to the research field of workplace studies or deal with corporate communication in the field of applied linguistics (see overview in Asmuß and Svennevig 2009). Methodologically, a fairly general distinction can be made between discourse and conversation analytic procedures, which have been expanded in recent years by multimodal procedures (Asmuß 2015, Schwab and Schramm 2016).

While conversation analytic research in this area is growing rapidly, video-based interaction in the specific context of higher education is still marginalized. That is why our panel “Interaction in Video-Mediated Settings in Higher Education” is focusing specifically on conversation analytically, especially multimodally processed video data from university/tertiary contexts. These can come from the areas of teacher training, university communication or from the teaching/learning context. The focus could be on individual aspects of such meetings, e.g. the formal/informal structures, the different phases and transitions (cf. e.g. Mondada 2010), instructions and assignments (cf. Hoffmann and Kasper 2021) as well as the role of the moderation, the chosen language(s), or the emergence and role of hierarchies and asymmetries.

Interactionally troublesome exchanges: Accounts, evaluation, and antagonism

Panel

***Dr. Melisa Stevanovic*¹, *Dr. Mervyn Horgan*²**

1. Tampere University, 2. University of Guelph

Social interaction may sometimes have unsatisfactory, bothersome, or unsettling outcomes, both in ranking and disturbing a person after the incident, and in disrupting the accomplishment of local social order. Abusive behaviors such as sexual assaults, racial harassment, and bullying at work or school are examples of seriously problematic interactions with long-acknowledged devastating psychological consequences for the target. Sometimes problematic interactions may deal with seemingly trivial matters, but still include violations of the ritual order of interaction. Existing research discusses such situations as interactional vandalism or failed ritual, such as uncivil inattention or uncivil attention. Interactionally problematic situations might involve impositions of engagement and intimacy, insensitivity to hints, or subtle violations of expectations with respect to someone's epistemic and deontic rights and obligations.

People's experiences of *interactionally troublesome exchanges* (ITEs) typically become apparent when people account for these experiences in retrospect. The accounting situations constitute interactions of their own, which are subject to cultural norms and expectations with respect to the content and composition of the accounts. Research on ITE accounts may thus take various directions.

This panel focuses on (1) empirical presentations that draw on conversation analysis or discursive and narrative approaches and use data from audio or video recorded interactions, single-person/focus-group interviews, or written texts, and (2) conceptual papers that seek to bridge approaches broadly connected to pragmatics with other disciplines, including but not limited to psychology, sociology, anthropology, philosophy, etc. with a view to identifying confluences, complementarities and contradictions between various disciplinary approaches. The main goal of the panel is to discover systematic patterns and practices in how accounts of interactional trouble are produced and/or socially dealt with in various contexts, including institutional encounters, workplace meetings, and everyday interactions among family members and friends. While it is both critical and challenging to counter overtly abusive behavior, we maintain that also ITEs with more implicit problematic behaviors may color people's social experiences in significant ways. In both cases, accounts of the problematic experiences are key to all attempts to address them.

Intergenerational encounters and old age

Panel

***Dr. Kaarina Hippi*¹, *Prof. Camilla Lindholm*²**

1. University of Oulu / University of Helsinki, 2. Tampere University

The panel focuses on older adults and their language use in interaction with the younger generation. The panel sheds light on age-specific positions, perceptions on (older) age (that the younger or the older adults themselves possess), and different views on constructing understanding in interaction between older and younger interlocutors.

As earlier studies show, interlocutors can construct meanings and identities of (old) age explicitly (Coupland, Coupland & Grainger 1991; Nikander 2009), and the exploration of everyday encounters can also reveal implicit attitudes on age (Heinrichsmeier 2018). In addition, linguistic biographies can show how multilingual older adults' identification with languages influences their transmission of languages to younger generations (Mononen & Straszer 2017). On this basis, we will further discuss the concept of old age and language use in relation to other age groups.

The panel will approach the theme from different viewpoints, discussing, e.g., perceptions on language use and differences between generations in interaction, ageing talk, multilingual older adults as well as preferences of address forms. The variety of perspectives aims to give a deeper insight into language use in older age, and of particular interest are descriptions of grassroot intergenerational encounters, and here, mainly outside institutional care. The methods used in the papers of the panel are qualitative, such as discourse analysis, and for example re-interviewing is discussed as a method in one presentation.

Internet memes of everyday life

Panel

Dr. Loukia Lindholm¹, Prof. Tuija Virtanen¹

1. Åbo Akademi University

A key element and form of digital participatory culture, internet memes are both products and driving forces of online social practices (Xie, 2020). Memes in various forms, such as image macros, GIFs, phrasal templates, and online videos, are prototypical instances of user-generated multimodal digital humor and creativity (e.g., Piata, 2020; Vásquez & Aslan, 2021). The multimodal features of memes and meme practices among online users have attracted considerable research interest from various theoretical and methodological viewpoints (e.g., Dynel, 2021; Jiang & Vásquez, 2020; Scott, 2021; Yus, 2019). Yet, there is still ample scope to explore the form and function of internet memes in various sociocultural settings and local discourse contexts, especially when it comes to everyday experiences as a source and target of memes.

Focusing on internet memes in context, this panel explores the interactional dynamics of memes and how online users creatively mobilize the mimetic dimensions of form, content, and stance (Shifman, 2013) for ‘cyberselfing’ purposes (Virtanen, 2021) and meaning-making in online exchanges across different social media platforms. Of particular interest to the panel is how users deploy memes to enact personal and collective identities, negotiate shared understandings of everyday experiences, and in doing so, construct relatability in online social spaces. Panel contributions examine the interactional dynamics of memes in online exchanges, their humorous meaning-making potential and semiotic trajectories in local contexts, and their function concerning online identity construction and community building. These studies address memes and memetic practices in a variety of digital affinity spaces and communities of practice and across different languages (English, French, Finnish, Turkish, and Mandarin Chinese). The contributions adopt approaches spanning (semio)pragmatics, multimodal discourse analysis, construction grammar, CA-informed discourse analysis, social semiotics, and digital ethnography.

Camilla Vásquez (University of South Florida) will serve as discussant.

It's not what you are like, it's what you like: Appraisal, stance and evaluation in online fandom

Panel

Dr. Thomas Messerli¹, Prof. Miriam Locher¹

1. University of Basel

Fan-related practices online have amplified fandom from a niche phenomenon into an important aspect of mainstream consumer culture (Bednarek 2017). Social media in general can be understood as embedded in a Like-economy (Gerlitz 2013) or culture of evaluation (Herrmann et al. 2022) – and sharing likes and dislikes is of particular importance to fan communities. It is a constitutive aspect for these communities what they are fans of, i.e. the object of stance they collectively orient to.

Some of the typical objects of fandom are telecinematic artefacts (Androutopoulos & Weidenhöffer 2015; Bednarek 2017, Locher and Messerli, 2020), which are part of public discourses around popular culture. Fans of television series engage in a range of practices that can be described as community-building – from the expansion of fictional diegetic worlds through fan fiction, to the sharing of recommendations and criticisms in reviews, to the expression of emotive stance in pseudo-synchronous text-based practices (Messerli and Locher 2021). Their evaluative practices include motivational evaluation (Heydebrand and Winko 1996) – starting from the choice of the object of fandom that is constitutive for the the fan group, but also including particular aspects of the telecinematic artefact itself and/or surrounding discourses, the in situ construction of values and value systems to which they orient, and specific ratings of aspects along the activated scales.

In short, evaluation has been shown to be an important part of TV reception in particular (e.g. Buschow et al. 2014), and it is also key to online discourses in general (e.g. Zappavigna 2017). Nevertheless, little research has so far specifically approached the pragmatics of fandom practices through an evaluative lens, applying appraisal theory (Martin and White 2005), evaluation (e.g. Hunston et al. 2001) or stance (Du Bois 2007) to online fan interaction.

In our research on fan interaction on *Viki*, we have found fansubtitles to be a vehicle for fans to share expertise and facilitate communal negotiation of meaning. We have also found that viewer comments employ evaluations and opinions to construct communality. In both cases, stance taking is a crucial aspect of individual and collective fan identity construction and community building: Fans laugh and complain together; they develop shared understandings and evaluations of episodes, genres and cultures; they look for others with shared common ground, even across linguistic borders.

Focusing on the broad range of fan practices online, our panel explores the specific role evaluation/stance/appraisal play in online discourse communities (Dayter 2016), digitally based communities of practice (Hössjer 2013) and other communities that can be understood as fan communities. The variation that online communities exhibit in terms of such factors as anonymity, social distance, shared enterprise, common ground, mutual engagement, and other community-relevant aspects, is likely tied to an equal variation in terms of evaluative practices that are part of parcel of the communicative patterns of situated language use each of them exhibit.

Language aggression and conflict in post-digital societies

Panel

***Prof. Pilar Garces-Conejos Blitvich*¹, *Prof. Maria Sifianou*²**

1. University of North Carolina, Charlotte, 2. National and Kapodistrian University of Athens

Conflict and language aggression in post-digital societies

Not long ago, Paglia (2010) lamented that, despite the undeniable centrality of different types of conflict and aggression in human daily life, scholarship in linguistics and related fields (with few exceptions, see Grimshaw (1990), White (1990), Tannen (1998), Lakoff (2000)), had tended to explain those away as peripheral oddities, and not as central (and often essential) to communal life.

Attitudes, in this sense, started to change in the mid-2000s when, amongst others, subfields of pragmatics such as impoliteness research experienced unprecedented growth (Bousfield, 2008; Bousfield and Locher, 2008; Culpeper, 2011). This mirrored a similar, burgeoning interest in the social sciences regarding conflictual phenomena (Hamilton, 2012). Academics' beginning to systematically look beyond cooperation, solidarity, and harmony coincided with the widespread use of digital technologies and, crucially, with the launching of the major social media sites (among others, YouTube in 2005, Twitter in 2006, Facebook in 2009, and Instagram in 2010) which highly contributed to relocating conflict and aggression from back to front stage, no longer to be ignored.

It was also in the mid-2000s that the *Journal of Language Aggression and Conflict (JLAC)* was launched. The journal aimed to provide a dedicated space for the study of conflict and aggression phenomena (from disagreements to hate speech) mostly realized through discourse and to help coalesce an incipient field. In 2023, coinciding with IPrA 18th, *JLAC* will celebrate its tenth anniversary.

By convening this panel, and taking stock of the last ten years, we propose to look forward by bringing together specialists' views on whither conflict and language studies are faring. As a common thread, we suggest a focus on theoretical conceptualizations and empirical approaches that situate conflict and aggression in the off/online nexus of post-digital societies, whereby "both 'zones' – the online and the offline – can no longer be separated and must be seen as fused into a bewildering range of new online-offline practices of social interaction, knowledge exchange, learning, community formation and identity work" (Blommaert, 2019, p. 1). Consequently, on/offline conflict and aggression are inseparable, synergetic, and thus mutually co-constituting.

We will be looking into private – and often polymedia mediated (Androutsopoulos, 2021) realizations of conflict; the potential conflictual role of different types of on/offline surveillance; algorithmic activity and bias and how these can be conducive to harmful content and hate speech; the offline outcomes of online grooming practices; the fueling of offline polarization activism via online conspirational discourses; the key functionality of on/offline conflict in the creation and construction of social identities; the understanding of conflict from a critical and social justice perspective; the role of conflict in on/offline linguistic landscapes; online red flags indicating potential offline criminal behavior; and the conceptualization of online spaces as moralizing and evaluative sites where manifestations of conflict and aggression are subjected to discursive struggle.

Language and geopolitics: On the linguistic consequences of Russia's invasion of Ukraine

Panel

*Prof. Helena Halmari*¹, *Prof. Arto Mustajoki*²

1. Sam Houston State University, 2. University of Helsinki

Ukrainian and Russian are two closely related East Slavic languages, with a lot of shared vocabulary and structure; however, Russia's invasion of Ukraine in February 2022 has upset the relatively stable linguistic status quo between these two languages. Typically, extralinguistic events—such as wars, migrations, and changes in social and political power relations—have separated or brought together speakers of different languages. Language contact leads to language change, but language separation also does. Some of the world's languages have grown to resemble one another more under prolonged and amicable contacts; on the other hand, formerly mutually intelligible dialects have also split into mutually non-intelligible languages when contact has been severed by concrete barriers (rivers, oceans, and mountain ranges) or psychological barriers (social distance or simple dislike of the speakers of the other language). An obvious (albeit distant) example is the split of Proto-Indo-European into several different language families because of geographical distance, migrations perhaps triggered by a search for survival. A more recent example is the diversification of Serbo-Croatian into Serbian, Croatian, Bosnian, and Montenegrin during and after the Yugoslav Wars.

In this panel, we bring together linguists to address various aspects of the following question: What are the linguistic consequences (pragmatic, sociolinguistic, and structural) of the February 2022 Russian invasion of Ukraine? Within this larger question, the panelists address questions such as the following:

- How has the war changed Ukraine's language-political situation? How are the language choices changing in Ukraine? Are people shifting to more use of Ukrainian? Are Ukrainian and Russian now diversifying because of the war? Have the Ukrainians started to emphasize the features of their language that separate it from Russian? During the crisis in Ukraine, what is the role of the contact registers of Ukrainian and Russian, referred to as *surzhyk* (Ukrainian: суржик)?
- What kinds of global changes in language practices are taking place because of the Russian invasion of Ukraine? Have the attitudes toward Ukrainian and Russian (both locally and globally) changed? Has the world's interest in learning Ukrainian increased? How has the war affected the writing and pronunciation of proper names (e.g., Volodymyr vs. Vladimir; Kharkiv vs. Kharkov)?
- How have different countries responded to the language needs of the Ukrainian evacuees? How have these countries answered, in terms of their language practices, to the challenge of the Ukrainian diaspora?

Language creativity in everyday Japanese discourse

Panel

Prof. Andrew Barke¹, Prof. Momoyo Shimazu¹

1. Kansai University

This panel assumes a social-constructivist perspective as it empirically explores how linguistic resources are selectively chosen and utilized by Japanese speakers and/or writers in creative and dynamic ways in their everyday discourses.

According to Boden (2001), ‘Creativity’ is the “ability to come up with new ideas that are surprising yet intelligible, and also valuable in some way” (p.95), and in discourse, language creativity involves a speaker’s or writer’s employment of orthographical, phonological, morphological, syntactic and/or lexical features of a language in dynamic and often unexpected or socio-pragmatically marked ways to, among other things, reconfigure or reshape social relationships (Jones 2016). It can include ‘language play,’ which involves the manipulation of language forms “as a source of enjoyment, either for ourselves or for the benefit of others” (Crystal 1998:1), but it can also involve the strategic use of formulaic or prosaic utterances, or even silence, in order to mean more than what is said (Jones 2016).

From the social-constructivist perspective, the creativity of interlocutors plays a critical role in the construction of social reality (Archakis & Papazachariou 2008) and language is seen as an important tool in that process that interlocutors manipulate in creative, dynamic and indexical ways in their moment-to-moment interactions (Cook 2005).

Focusing on examples of creative language use in everyday situations has the potential to reveal the complex, dynamic, and innovative nature in which speakers use language to manage their social relations with others. Although there have been a number of studies related to language creativity in Japanese literature (e.g. Maynard 2007) and online written discourse (e.g. Robertson 2022), discourse analysis studies that focus on the creative use of Japanese linguistic resources in everyday interactions remain few.

Contributors to this panel include Xiangdong Liu (Western Sydney University), Yoko Yonezawa (The University of Sydney), Yun Meng (Niigata University), Todd Allen (Kansai University), Momoyo Shimazu (Kansai University) and Andrew Barke (Kansai University). Topics covered include creativity in internet naming practices, political speech strategies, intercultural workplace communication, interpersonal pub talk, linguistic landscapes, and use of honorifics.

Language diversity and homogeneity

Panel

*Dr. Kazuko Tanabe*¹, *Dr. Yuko Iwata*²

1. Japan Women's University, 2. Meiji University

Language is not permanent. It is neither stable nor fixed. It has been and remains one of the most volatile features of human society (cf. Fischer 1999). In the past two decades, the rapid progress of globalization has engendered an increase of diversity in societies, cultures, and languages around the world. Vertovec (2007, 2010) takes the view that we have moved from an era of multiculturalism into a new era of 'super-diversity' due to the integration by immigrants since the early 1990s:

'Super-diversity' is characterized by a tremendous increase in the categories of migrants, not only in terms of nationality, ethnicity, language and religion, but also in terms of motives, patterns and itineraries of migration, processes of insertion into the labour and housing markets of the host societies, and so on (cf. Vertovec 2010, Blommaert and Rampton 2016).

Meanwhile, Fischer (1999), considering the future of languages, claims that unprecedented language change is certain to occur in the next two centuries. He also states that the few dialects and languages that will survive will also be homogenized and leveled, ultimately resulting in the realization of a global society. This will be evidenced by the emergence of an International Standard English devoid of characteristic features.

This study employs an empirical approach and analyzes the language diversity and homogeneity in various languages including Japanese, by investigating the data. The leveling phenomenon is occurring in various languages around the world, causing each to lose some of their most distinctive features. The declining use of kinship terms in Japanese is an example. Japanese kinship terms often reflect gender and age differences, such as *onī-chan* (elder brother) and *onē-chan* (elder sister). For many years, Japanese kinship terms were regarded as typical in that appellations used within the family are chosen from the standpoint of the youngest member of the family (Suzuki 2019), but this pattern has gradually become atypical in the contemporary era.

One example of a speech variety which has gained prestigious status after decades of stigmatization is dialects in Japanese. Since the Meiji era (1868~1912), the Japanese government had been promoting the standard Japanese speech as one of the strategies to modernize the country after centuries of the feudal times. This language policy required Japanese people to master the standard Japanese at schools and upgraded the status of the standard variety while the dialects was stigmatized as inferior to the standard one. The spread of the standard Japanese language was further facilitated by the 'new' media, the television, in the 1960's, through which Japanese people became familiar to the standard Japanese. When almost all the Japanese residents have acquired the standard variety, the dialects have become rare because not everyone can speak it and become paradoxically prestigious due to its authenticity.

It seems fair to say that language change is always driven by conflicting movements. In this panel, while examining examples of language diversification and homogenization, we will argue that the distinction between typical and atypical is in fact very fluid. (499 words)

Learning and teaching Chinese as a foreign language: A cross-cultural pragmatic perspective

Panel

***Prof. Fengguang Liu*¹, *Prof. Daniel Kadar*², *Prof. Juliane House*³**

1. Dalian University of Foreign Languages, 2. Dalian University of Foreign Languages & Research Institute for Linguistics, 3. University of Hamburg

The aim of this panel is to explore the area of learning and teaching Chinese as a foreign language (CFL) through the perspectives of cross-cultural pragmatics. Over recent years, Chinese has gained prominence in foreign language learning and teaching, and both pragmatics and applied linguistics has witnessed a surge of research focusing on CFL. Yet, we believe that more research needs to be dedicated to the cross-cultural pragmatics of CFL. Cross-cultural pragmatics can help researchers to investigate language learning and teaching from new angles due to its bottom-up and strictly language-anchored nature, which allow the analyst to observe CFL without relying on sweeping overgeneralisations and cultural stereotypes that have unfortunately gained momentum in this area (e.g. “Chinese students struggle to realise a certain pragmatic phenomenon due to their face-sensitivity”).

Here we distance ourselves from the strong contrastive hypothesis that linguacultural differences automatically trigger L2 learning difficulties. Still, we believe that contrastive pragmatic differences between Chinese as an L2 and the learners’ L1 should not be neglected if one wishes to examine the understudied issue why and how Chinese pragmatic phenomena may puzzle speakers of other languages who learn Chinese as a foreign language. For instance, as House et al. (2022) argued in a recent study dedicated to the learning how to realise the speech act Greet in a foreign language, if one expects the other to utter a greeting and the greeting fails to come, or one is greeted when no such greeting is expected, gut feelings of irritation may emerge. A contrastive pragmatic analysis of Chinese and learners’ L1 may help us understand cross-cultural differences of pragmatic conventions which may trigger such instances of foreign speaker puzzlement in CFL.

In the proposed panel we aim to dedicate special attention to the learning (and teaching) of the realisation of speech acts. We will use the speech act typology proposed in Edmondson and House (1981) and Edmondson et al. (2022) as a methodological anchor in the panel. We intend to invite Professor Wei Ren as a discussant and recruit experts of CFL as speakers by advertising the panel both in international and Chinese mailing lists.

Let the face respond: Conversational functions of facial gestures in turn-beginnings of responsive actions

Panel

Dr. Alexandra Groß¹, Dr. Carolin Dix¹

1. University of Bayreuth

Aiming at investigating the *responsive face* this panel takes up previous multimodal CA research on responding in conversation as well as on the conversational functions of facial gestures (positions and movements of eyelids, lips, tongue, cheeks, nose, forehead). We put the focus on the use of facial resources as pre-beginning elements (Schegloff 1996: 92-93) and in turn-beginnings of responsive actions among different sequence types.

In this respect, the panel brings together two research strands: Firstly, it follows the growing EMCA research on multimodality (e.g. Mondada 2016). Besides manual gestures (e.g. Stukenbrock 2014), gaze (e.g. Auer 2021) and interpersonal touch (e.g. Li 2020), the conversational use of facial gestures has been put into focus over the last years. Multimodal CA studies analyze them in their local conversational contexts as part of multimodal practices (e.g. Goodwin & Goodwin 1986, Peräkylä & Ruusuvuori 2006, Kaukoma, et al. 2015), some of them put emphasis on responsive actions (e.g. Gudmundsen & Svennevig 2020, Dix & Groß, *subm.*).

Secondly, the panel takes up research on conversational practices of responding in conversation. Here, the relevance of pre-beginning elements (Schegloff & Lerner 2009) as well as turn-beginnings have been highlighted (e.g. Heritage 2018). Whereas the use of verbal and vocal practices of responding in conversation – especially responses to questions – have been extensively investigated (e.g. Stivers 2022, Raymond 2010, Deppermann, et al. *subm.*), i.e. in terms of epistemic domains (Heritage & Raymond 2012) and preference (e.g. Robinson 2020), it still remains a desideratum to systematically take into consideration how facial gestures contribute to the formation of responsive actions, i.e. how they comply with conversational demands and how they shape the quality of the upcoming conversational path.

The presentations of the panel take up some of these open questions by looking at how facial gestures are used in face-to-face and screen-mediated settings and by comparing their responsive use in spoken languages and sign languages. Besides the main focus on responsive actions, the presenters will also address the status of facial gestures as embodied discourse markers in a more general sense, and discuss the combined use of facial gestures and verbal response particles (such as *oh*, Heritage 1998). We will further target some methodological questions such as the automatic tagging of facial gestures by the use of KI.

Magical speech acts

Panel

***Dr. Carsten Levisen*¹, *Dr. Nico Nassenstein*²**

1. Roskilde University, 2. Johannes Gutenberg University Mainz

Some words are magical. They have the special capacity of bringing change to the world, and to bring this world into contact with invisible worlds and spheres, from divine realms to rituals of deep history and cosmology. Magical words can bless, heal, and unite. They can prevent, predict and protect. But there's also a dark side to it: Magical words can curse, cause harm, they can cause division, death and misfortune – upon individuals, and entire communities. Magical words have power, and are linked to concealing practices and unveiling secrets at the same time. Across linguacultural traditions, we find a variety of words and ways of speaking that have a such transformative potential, sometimes in the form of linguistic formulae, speech routines, secret registers of language, manipulated forms and structures, mimetic performances, or entire magical languages.

This panel brings together scholars engaged in research on “magic” in anthropological linguistics and linguistic pragmatics. Magical speech acts are in a sense, the “ultimate type of speech acts”, i.e., people are truly “doing things with words” when they are altering reality through agentive speech, manipulating the world, causing things to happen, and transforming people and places, for better or for worse. Exploring the practices and effects of magical speech acts, we focus in this panel on experience-near realities and the emic perspective that allows us to ask questions such as “what do people take themselves to be doing?”, or “what is the world like to people?”. We acknowledge that the words “magic” and “magical” are not without flaws, especially when contextualizing them in the older anthropological literature. Along with other English terms such as “sorcery”, “witchcraft”, “occultism” these are often not doing justice to the emic perspective, and often contain readings of ostracism and Orientalism. For this reason, language-specific concepts, including speech act verbs and hard-to-translate vocabularies in the magical domain are of special interest to the panel. At the same time, the panel also takes an interest in the development of pragmatics as a discipline, and in expanding it from its modernist, Anglocentric (Eurocentric) moorings. Paving the way to new intersections of knowledge creation in question spaces of contention and contraction, i.e., secular and postsecular, colonial and postcolonial, modern and postmodern, we will use “magical speech acts” as our heuristic starting point for a joint exploration, and as a metaphor for a long-neglected meeting place between pragmatics and anthropological linguistics with a topic that has a long tradition in anthropology, but must be revisited, too.

The panel is of special interest to pragmaticists working in frameworks such as cultural pragmatics, postcolonial pragmatics, historical pragmatics, as well as anthropological linguists broadly conceived. The panel also welcomes historians of magic, and contributions from literary studies, religious studies.

Topics may include:

blessing and cursing; divine invocations; rituals and formulaic speech; magical discourses and narratives; word avoidance and taboo; indexicality of magic words and practice; *magic*-like cultural concepts and keywords; literary and historical magic; healing discourses, wellbeing and protection; secret repertoires, secret languages

Meaning-making in the family: Crossing methods and disciplines

Panel

***Prof. Luk Van Mensel*¹, *Prof. Eline Zenner*²**

1. XJTLU - UNamur - KU Leuven, 2. KU Leuven

This panel aims to (re-)generate a discussion on meaning-making in family interactions by bringing together scholars working from different disciplines and applying different methodologies.

How family members interact has been of interest for decades to a wide range of (discourse) scholars, with research varying in terms of disciplinary framework, scope, linguistic focus, and methodology. First, concerning framework, researchers have studied family language from the perspective of pragmatics, interactional sociolinguistics, developmental sociolinguistics, linguistic anthropology, linguistic ethnography, conversation analysis, discourse analysis, and subdomains such as language socialization or family language policy. Second, in terms of scope, we see that family discourse has been studied *sui generis* (e.g. parenting, sibling talk), but also as a specific locus for speech events more generally (e.g. conflict talk, praise), or as a window into broader sociolinguistic phenomena (e.g. language maintenance, (de)standardisation). Third, in terms of linguistic focus, we see that most research has been conducted in monolingual settings, though the past decades reveal a substantial (and growing) amount of research on multilingual family interactions (understanding ‘multilingual’ as a combination of ‘named’ languages, sometimes including sign languages, see also the work on code-switching and translanguaging). Additionally, research has been conducted on multivarietal/multivernacular (intra)language family discourse, and on the multimodality and multisensoriality of the discourse constellation, including on-line communication or communication with non-human entities. Finally, in terms of methodology, the variety of approaches has evidently led to a wide range of qualitative but also quantitative and mixed-methods studies. This wealth of approaches and perspectives on family discourse reveals the strong potential of the family for linguistic studies, yet has also made it challenging to find synergies and obtaining a clear overall picture of the current state of the art. This panel includes contributions that together juxtapose different takes on the study of family discourse, and look into:

- the conceptualization of the notion of ‘family’ itself, the impact of lifespan change within the family, and the relation to the outside world (cf. the ‘porosity’ of family talk);
- the contribution of heteroglossic perspectives on family discourse, including a wider range of modalities in family discourse, also attending to the impact of new technologies;
- methodological challenges in data collection particular to family language studies, such as biased sampling and ecological validity, and the importance of mixed methodologies in studying family language discourse.

Membership categorisation and interpersonal relationships in social interaction

Panel

***Dr. Valeria Sinkeviciute*¹, *Ms. Andrea Rodriguez*¹**

1. The University of Queensland

Interpersonal relations are at the core of social interaction and crucial to how we construct meaning. By examining interactional management of relationship categories that become visible through (embodied) actions, we can observe how members of society organise their social knowledge and orient to social orderliness (Hester & Francis 2004). Membership categorisation analysis (MCA) (Sacks 1992; Hester & Eglin 1997) offers analytical tools to explore such phenomena, as it studies “the commonsense routine workings of society” (Fitzgerald et al. 2009:47), how members of society “proffer their category work as common, cultural knowledge” (Stokoe 2012:283, emphasis original) and in what ways categories “make sense in their [members’] everyday lives and social interaction” (Idevall Hagren 2000).

The purpose of this panel is to explore, using Membership Categorisation Analysis (MCA), how social categories and relationships are co-constructed by members of society in their interactional practices. This panel aims to address the following key questions:

- How do members show the normative and moral character of categories and the recognisability of category-implicative actions?
- In what ways do members reflect or deviate from the obligations, rights and motives regarded as appropriate for the relationship categories of which they are incumbents?
- In what contexts and in what ways do relationship categories invoke accountability and remedial action?
- How do members orient to multiple layers of categorization work?

This panel brings together researchers that use Membership Categorisation Analysis (MCA) to examine various aspects of social interaction – casual and institutional, face-to-face or digitally-mediated – in their analysis of interpersonal relationship categories. Precisely, the talks explore such data sets as doctor-patient conversations, friends and family talk, public encounters, job interviews and letters to editors. The topics covered in the talks include (but are not limited to):

- Action ascription
- Accountability
- Epistemics
- Identity
- Morality
- (Im)politeness
- Socialisation

Miscommunication and repair in interaction with voice agents and social robots

Panel

*Dr. Wyke Stommel*¹, *Dr. Saul Albert*²

1. Radboud University Nijmegen, 2. Loughborough University

Voice agents and social robots are increasingly used across interactional settings including homes, healthcare, and semi-public or commercial spaces. While survey evaluations of voice agents in these settings are generally positive, a recent review of the state of the art highlighted that “no system is able to lead a half-decent coherent conversation with a human” (Kopp & Krämer, 2021). In fact, miscommunication in interaction with virtual agents and social robots is recurrent, multilayered and highly intertwined with its specific context and the shortcomings of the underlying infrastructure and theoretical assumptions of language technologies (e.g., Stommel et al., 2022). This means that fundamental interactional structures like repair are not yet available to conversation designers to build into their voice/virtual assistants. Can conversation analysis be of any help in understanding and resolving these major, proliferating flaws across systems?

EMCA has a long tradition in the examination of human-machine interaction, but the field seems to be somewhat scattered (cf. Mlynar et al., 2021). This panel brings together recent conversation analytic studies of interaction with voice agents/virtual agents/social robots in often complex settings to understand members’ orientations and strategies to deal with trouble in (multimodal) interaction with various systems. This panel also aims to discuss:

- methodological questions inherent to studying voice agents and social robots as participants/participating in interaction;
- CA’s relationship with conversational design (cf. Stokoe et al., 2021);
- what clues these analyses can give us as to the missing pieces of language technology infrastructure that might be required to emulate repair procedures.

Mobility disabilities in interaction: A research agenda within atypical interaction

Panel

Prof. Gitte Rasmussen¹, Dr. Brian Due²

1. University of Southern Denmark, 2. Copenhagen University

This panel presents papers that deal with so-called atypical interaction but wish to expand the understanding of ‘typicality’ and ‘atypicality’ from being, usually, an issue of language and cognition to also include other forms of sensory and bodily impairment displayed in interaction. The papers deal with impairments that cause mobility disability which is a topic for pragmatics as the (in)ability to produce action and perceive actions is the forefront of these encounters.

Research in the established field of atypical interaction pursues, overwhelmingly, interests in how speech, language, and communication disorders impact interaction that involves co-participants with speech, language, communication, hearing, and cognitive impairments (Wilkinson et al. (2020). Methodologically, it applies thorough Conversation Analytic findings to investigate if and how disorders influence the organization of e.g., turn-taking and repair-organization.

An interest in a slightly different approach to atypical interaction is gaining ground (Rasmussen, (under review)). It focuses on interactions that involve other kinds of impairments, including sensory and mobility disorders (see e.g., Robillard, 1996 and Due & Lange, 2018), and moreover, it approaches the area with an ethnomethodological conversation analytic (EMCA) approach to multimodality. As EMCA research in normalized interaction (see e.g. Broth & Mondada, 2013), it investigates interaction with interests that go beyond, but by no means exclude, descriptions of an (a)typical conversational ‘machinery’ (Sacks et al., 1974).

This panel pursues interests in the question of if and how the presence of sensorial and mobility impairments may impact multimodal interaction and how the impairments are accountable in social interaction.

Modelling cultural and contextual influence: Patterns, templates and schemas in utterance interpretation

Panel

*Dr. Elke Diedrichsen*¹, *Prof. Frank Liedtke*²

1. *Technological University Dublin*, 2. *University of Leipzig*

In communicative situations, interlocutors rely on context in order to successfully process linguistic utterances. Models of the context dependency of utterance meaning have been proposed in semantics and pragmatics (Fetzer 2022), including relevance (Sperber and Wilson), Austinian proposition (Récanati), core and emergent common ground (Clark 1996, Kecskes and Zhang 2009).

For utterance-context integration, interpreters rely on standardised patterns (Carston 2002). Situation-bound utterances (Kecskes 2010) are highly conventionalized, prefabricated pragmatic units tied to standardised communicative situations.

Mey (2001, 2010) observes that pragmatic acts and the speech acts accompanying them are *situated* acts. By playing within the limits of the situation, pragmatic acts establish, confirm, and recreate its setting. *Pragmemes* are general situational prototypes of pragmatic acts.

The situated nature of utterances involves the cultural background shared by societies or smaller groups of people. A cultural perspective on pragmatics is warranted and highly topical, as the availability or absence of shared cultural knowledge affects communicative interactions (Kecskes 2014). Sharifian (2017) offers a culturally based outlook on pragmemes, in which a cultural pragmatic schema is presented as the overarching culturally acquired cognitive influence on speech acts, pragmemes and practs. Goddard and Wierzbicka (2004) define a *cultural script* as a cluster of established practices, guiding the understanding of interactional moves. In order to capture the utterance-context-relation systematically, *pragmatic templates* have been introduced as holistic clusters of pairings between utterances on the one side and elements of a proper utterance situation on the other (Liedtke 2013). Van Dijk (2008) suggests *context models* incorporating influences that are relevant for participants in producing and interpreting utterances. Mazzone (2009) models utterance interpretation as a case of pattern recognition in context. The relation between form and meaning of utterances is modelled as *constructions* in Construction grammar (Goldberg 1995) and *constructional schemas* in Role and Reference Grammar (Van Valin 2005). They are adjusted to account for cultural and situational factors that apply in the production and comprehension of language (Diedrichsen 2022, Nolan 2022).

The contributions to this panel explore ways of systematically modelling utterance-context-pairings as part of the pragmatic competence of speakers and hearers. We are bringing together approaches that address cultural and/or contextual/situational influences on utterance production and interpretation, their complex dynamics and interdependence, and their effect on linguistic choices in a variety of communicative settings.

Multilingual pragmatics. A focus on pragmatic awareness in multilingual instructional settings

Panel

Prof. Pilar Safont¹, Dr. Laura Portolés¹

1. Universitat Jaume I

Pragmatic instruction has received a great deal of attention in the last three decades (Kasper and Blum-Kulka, 1993; Bardovi-Harlig, 2013; Taguchi, 2019). Several individual variables have been identified (Alcón, 2018; Sánchez-Hernández and Alcón, 2018, Taguchi, 2012) and the intercultural nature of learners' pragmatic behaviour has been raised (Kecskes, 2014; McConachy, 2019). Nevertheless, the analysis of multilingual learners from a multilingual perspective remains a challenge. Most studies dealing with multilingual pragmatics have considered pragmatic production (Alcón, 2012; Martí and Portolés, 2019; Portolés and Safont, 2016; Safont, 2021) but raising learners' pragmatic awareness is regarded as a fundamental teaching strategy (Halenko and Jones, 2011; Portolés, 2015; Usó-Juan and Martínez-Flor, 2020) that contributes to their pragmatic development. In fact, a number of experimental and exploratory studies show the benefits of instruction for increasing pragmatic awareness (Atabekova et al, 2021; Derakshan and Shakki, 2020; Lin and Wang, 2020; Timpe-Laughlin, Green and Oh, 2021). Within instructional settings, learners' motivation also seems to positively correlate with pragmatic awareness (Zarrinabadi and Rezazadeh, 2022). However, the role that learners' multilingualism, their attitudes to languages or their translingual practices play in increasing their pragmatic awareness deserves further attention. For this reason, we shall devote the present symposium to the analysis of multilingual learners' and teachers' pragmatic awareness and its relationship with multilingual instructional contexts.

On that account, the contributions to this panel cover some of the above reported needs. The studies included here deal with the pragmatic awareness of students in multilingual instructional settings and they tackle the role of gender, age, sociolinguistic status of languages involved, school language programs, translingual practices or language attitudes. The panel shall elicit fruitful discussion and offer a chance to exchange findings that help us explain the effect of specific variables on the development of multilingual pragmatic awareness in instructional contexts.

Multimodal and prosodic markers of information structure and discourse structure

Panel

***Prof. Pilar Prieto*¹, *Prof. Frank Kügler*²**

1. ICREA-Universitat Pompeu Fabra, 2. Goethe Universität Frankfurt

Human communication is a multimodal system in the sense that the sounds, words and utterances are usually accompanied by prosodic and body signals such as co-speech gestures (e.g., McNeill 1992). Spoken language has generally been investigated as a unimodal phenomenon and more work is needed in the assessment of how visual and prosodic cues jointly contribute to the construction of meaning in discourse. From a multimodal perspective, it is well-established that manual co-speech gestures are strongly connected to speech from three different perspectives, namely semantic, pragmatic, and phonological (Kendon 1980; McNeill 1992). Indeed, according to McNeill's (1992) three "synchrony rules", gestures are co-expressive with the semantic and pragmatic meaning expressed in speech, and prominent phases of co-speech gesture (i.e., the *stroke*) occur just before or simultaneously with pitch accented (or prosodically prominent) syllables in speech. Even though work in the last decades has highlighted how prosodic and gestural features of language contribute in a systematic way to the marking of discursive and interactional functions in discourse (e.g., Kendon 1995, 2004, Swerts & Kraemer 2021, Brown & Prieto 2021, Debrelioska & Gullberg 2020, among others), more precise work is needed as to know in which ways they jointly signal information and discourse structure across languages and thus help construct discourse meaning.

This panel will discuss a variety of work from different labs that are currently assessing the multimodal encoding of information structure or discourse structure from different perspectives and in different languages. Presentations will assess how multimodal markers encode information structure, sentence types, discourse structure and/or speech acts, both in signed and non-signed languages. Our panel is intended to contribute to advance our knowledge on how multimodal markers help encode discourse meaning, and more generally help forging a paradigm in which pragmatic theories are based on language as a multimodal phenomenon.

Multimodal stancetaking – the (a) typical case of taking a stance?

Panel

Prof. Cornelia Müller¹

1. Europa Universität Viadrina, Frankfurt (Oder)

This panel offers a cross-disciplinary space for discussion and sharing of research on the multimodal shape of stancetaking. Despite a rich and diverse literature on stance and stancetaking (Du Bois 2007; Englebretson 2007; Dancygier 2012), the role of gesture, posture, and prosody, as aspects of this communicative activity remain only scarcely studied. Although Du Bois' paper on the stance triangle mentions gesture several times as one of the expressive forms that contribute to stancetaking and suggests speaking of stancetaking as an activity rather than of stance as a phenomenon of lexical semantics and textlinguistics his insight did not foster a systematic inclusion of gesture, speech, and body movement in the study of stancetaking. Some of the few exceptions come from anthropology and conversation analysis (Goodwin et al. 2012; Ochs & Schieffelin 1989), gesture studies (Bressem & Müller 2017), including shrugs and head tilts (Debras & Cienki 2012) and prosody (Freeman 2015). More recently, and in a plea to integrate conversation analytic and interactional perspectives on stance with the usage-based approach of cognitive linguistics, Feyaerts, Brône, and Oben (2017) lay out the significance of multimodal aspects of stancetaking specifically with regard to alignment. Dancygier's (2012) cognitive linguistic work highlights the semantic complexity of stance which becomes further complexified by the interplay of several modalities and by considering stance as an interactional activity, rather than as a process of an individual speaker. Against this backdrop, the panel presents contributions from different theoretical and methodological backgrounds to jointly explore the shape of stancetaking as a dynamic orchestration of gesture, posture, speech, and prosody in the multimodal activity of taking a stance.

Multimodality, metaphor, magic: Typical and atypical narratives across cultures, pre- & post-pandemic

Panel

*Prof. Rukmini Nair*¹, *Prof. Laura Downing*²

1. *Indian Institute of Technology Delhi*, 2. *Universidad Autonoma de Madrid*

Researchers have long stressed the centrality of ‘atypical’ events in the structuring of narrative interaction. Events that depart from the baseline of tellers’ and hearers’ everyday experience tend, that is, to have both short-term and long-term cognitive impacts (Chafe 1977; Briggs and Mantini-Briggs, 2016; Nair, 2003, 2021). Or, as Labov (1972) put it, it is always relevant to say ‘I saw a man fall off the bridge today’. The recent pandemic is etched into cultural memory precisely because it comprises multiple iterations of such ‘danger of death tellables’ on a global scale. Narrative, of course, is a creative, causal discourse universal that encompasses both fictional and factual imaginings. In doing so, it affectively – and often ‘magically’ - links past and present anxieties with future hopes. Thus, it has served as a robust communicative anchor in our current crisis-prone, pandemic-shadowed age.

In addition, technologically enhanced modes of communication have ensured that multimodal convergences are increasingly common in the public as well the private spheres. On this panel, we consider narratives that multimodally combine written messages with visual images at different cultural sites in Asia and Europe. Since such an impetus towards interactional – and, in this case, interactional - multimodality is apparent in both pre-Covid and post-Covid narratives, we further focus on two specific time periods: the first comprises the period 2015-2020 when there was no pandemic but the world was nevertheless beset with worry (climate change, depressed global markets etc.). This immediately preceding period provides with us a temporal baseline against which we can place the second ‘post-pandemic’ period that dates from mid-2021 on.

A crisis like the Covid-19 pandemic seems to throw into sharp relief the longstanding symbiotic relationship between the genre of narrative and the rich tropes of metaphor and metonymy. This panel seeks to explore this deep linguistic affinity through the metaphorically laden, technologically support multimodal modes of communication that gained so much traction during the pandemic. Institutions of government, education and finance in almost every country, relied fundamentally on such virtual multimodal means, while individuals widely used social media tools to keep in touch with friends and family. Indeed, it would not be too far-fetched to argue that the multimodal metaphors, such as the ‘war’ metaphors, that came into being during the pandemic created innovative pathways towards developing new, often subversive, narratives of community that researchers will analyse for years to come. Typically, prismatic and future-oriented ‘metamagical themas’ (Hofstadter, 1985) also characterise these once ‘atypical’ virtual metaphors.

Unlike monomodal metaphors that ‘are I...predominantly rendered in one mode’, multimodal metaphors ‘are metaphors whose target and source are each represented... in different modes’. (Forceville 2009: 23-24). On this panel, we are concerned with decoding this key distinction within Conceptual Metaphor Theory and Discourse Studies (Lakoff and Johnson 1980; Hidalgo-Downing and Kraljevic Mujic 2020), that appears so reflective of our times. Overall, our aim is to understand typical and atypical uses of narrative multimodality and metaphor use in current g/local contexts.

Narrative, argumentation and multimodality in (post-)Covid science mediation

Panel

Prof. Geert Jacobs¹, Ms. Sofie Verkest¹, Mr. Seppe Goddaert¹

1. Ghent University

This panel explores how science is discursively mediated in today's highly digitized and networked post-Covid mediascape. Lockdown and teleworking, for example, have accelerated ongoing processes whereby in-person experience and face-to-face interaction are complemented with or even substituted by virtual platforms and audiovisual media. The dramatic rise of video and podcasts and how this impacts organizations' long-standing relationships with legacy media provide just one, much-publicized illustration of this development. While some of this is by no means new, and major technological affordances have been in place for over a decade now to cope with issues of reduced mobility and security, the recent pandemic has definitely been a catalyst in promoting radical transformation.

Following up on previous scholarly work on collaborations in science, media, education, and politics, this panel investigates how the changes described above play out in mediational practices in science. In particular, the panel dives into new and emerging organizational practices for disseminating and mediating scholarly insights. This includes:

- Documenting novel ways of mediating science and examining if and how they bring out and, possibly, promote shifting underlying conceptualizations (or reconfigurations) of the essential nature of the scientific enterprise.
- Unraveling the potentially complex discursive processes of negotiating boundaries of science with other disciplines and of managing scholars' fluid, dynamic identities as these new mediation formats take shape.
- Analysing new practices of participation, collaboration, and engagement as they emerge in and around science.

We define science in the broad sense of the word, not only including the exact sciences but covering a wide range of academic disciplines.

The panel's prime interest is in the discursive dimension of science mediation, which can be operationalized as the wide range of discourse features of the toolbox used by scholars as well as in alternative organizational practices for disseminating scholarly insights to enhance the encounter between the public and the content. Following Declercq et al (2021) we approach mediation as a form of engagement and collaboration.

Methodologically, we opt to integrate text, practice, and interaction, and assign an active role to the language user. This includes but is not restricted to linguistic ethnography, interactional sociolinguistics, and (multi-modal) discourse analysis.

In our view, science mediation includes both formal and informal, verbal as well as non-verbal, visual, and embodied/physical interaction, hence the opportunities for a distinctly multimodal perspective that embraces non-verbal semiotic modes.

In exploring novel mediational practices in science, we set out to draw on Thomas's (1999) distinction between narrative and argumentative mediation, which implies exploring not just the structure but also the contexts, interactions, and processes of narrative and argumentation as they are embedded in specific institutional settings (Rocci & Pollaroli 2018).

The following will be contributing to the panel: Charles Briggs; Colleen Cotter; Miguel Ruiz Garrido and Juan C. Palmer-Silveira; Seppe Goddaert; Pieter Maesele and Jonas Nicolaï; Stef Slembrouck; Sofie Verkest; Ulrike Vogl and Ursula Vogl.

Narratives on COVID-19 experiences in the digital age

Panel

Dr. Kazuyo Murata¹

1. Ryukoku University

The COVID-19 pandemic has drastically transformed our everyday lives. In response, there has been an increased research interest towards narratives of the COVID-19 pandemic, asking what strategies the general public has generated in order to cope with this challenging situation. A majority of these studies address pandemic narratives of politicians and mass media, examining ideology and the social construction of meaning while delving into the ways in which discourse transmits and produces power reference (Jones, 2021; Lee, 2021). Yet, pandemic narratives by the general public still await investigation.

This panel addresses the question of “what” and “how” the general public narrates the COVID-19 experience amid the quotidian transformations of the pandemic, attending to the voices of digital natives. Papers in this panel employ both quantitative and qualitative research methods, drawing insights from multiple approaches under the framework of interaction studies, including narrative study, discourse analysis, interactional sociolinguistics, and critical discourse analysis.

Regarding disaster narratives by the general public, Iwasaki (1997) has pointed out the common use of specific grammar and vocabulary in disaster narrative; empirical findings considering the content of disaster narrative have been applied systematically to the field of disaster education, disaster prevention, and urban planning (Ishihara, 2020). However, the majority of studies tend to center on disaster in the past. This panel seeks to fill the missing piece by examining narratives of an ongoing disaster, drawing a comparison between narratives on COVID-19 and disasters of the past.

There are six presentations in the panel. The five presentations analyze the same data set in Japanese, and the last presentation deals with different data in English. The first presentation quantitatively analyzes 30 pairs of Japanese youth narratives on Covid-19 by employing text mining techniques. The second presentation analyzes the same data set qualitatively and shows that various types of social divisions are being constructed dynamically and collaboratively by the participants. Using the concept of positioning theory and small story, the third presentation will shed light on the ways in which empathy and exclusion are constructed in the narratives. The fourth examines the story recipient’s affiliative response in troubles-telling sequences with conversation analysis approach. In the fifth presentations, strategic-style shift in narratives will be analyzed qualitatively from a relational perspective. The final presentation explores how COVID Long-haulers are legitimizing their experiences with post-COVID syndrome through looking at social media and survey and interview data.

Navigating a conversation with a stranger through laughter

Panel

Prof. Shoichi Iwasaki¹

1. UCLA

Since the foundational study by Jefferson (1979, 1985), laughter in conversation has attracted consistent interest among researchers who seek to understand the system of interaction. Recently, Glenn and Holt (2013) have advanced our understanding of this phenomenon greatly from a variety of perspectives. According to the authors, laughter is an indexical sign pointing to a 'laughable' which can be located in the environment of the interaction. Though 'laughter' may seem an uncontroversial category, it is actually a complex array of phenomena covering different shapes (*hi, ha, he* etc.), repetition patterns (*hehe, hihihihhi* etc.), and degrees of intensity (from an 'equivocal' to a 'heartily laughter' and in between) among other formal characteristics. From an interactional point of view, the sequential positioning of laughter is especially important as it can occur at the turn initial or final positions as well as concurrently with a turn and an utterance. Laughter may work to manage turn taking, and to signal a speaker's psychological states such as amusement and nervousness.

With this growing sophistication of laughter research as a background, our panel proposes to advance the research on laughter by analyzing a newly acquired set of data under the "Multilingual Covid-19 Conversation Project," in which five to thirty conversations in six languages (Cantonese, Mandarin, Japanese, Korean, Thai and English) were recorded on Zoom over one and a half year period since June, 2021, and more are being recorded. Most participants are young adults who were not acquainted prior to the meeting. This zoom recorded data thus provides us with a new environment in contrast to that of face-to-face conversations among people with a close relationship in a relaxed condition where laughter is often observed and studied.

According to our preliminary findings, laughter plays an important role serving as an 'off-record' strategy to maintain orderly interaction with a stranger in a publicly viewable environment. In our data, laughter is observed particularly frequently at the outset of a conversation and at the turn exit environment where some stance indication is expected. These are sensitive interactional environments especially when participants have not established strong 'personal common ground,' and must heavily rely on a general 'communal common ground' (Clark 1996a, b). With laughter, speakers can negotiate their social relationship with their interlocutors and epistemic and affective stance towards a 'stance object,' e.g., a government policy on Covid-19. (DuBois 2007).

Another contribution of this panel is its crosslinguistic/cultural perspective. Since delicacy of interaction may be culturally dependent, laughter behavior may show subtle differences in different languages. Some presentations will focus on multiple language perspectives on interactive patterns.

Most presentations on this panel will look at laughter using the data from our on-going research using such theoretical perspectives as interactional linguistics, CA, common ground, and politeness theory, and identity study.

New trends in reformulation: Theory, methods and challenges

Panel

***Dr. Salvador Pons Borderia*¹, *Dr. Shima Salameh Jiménez*², *Dr. Adrià Llibrer*³**

1. University of Valencia, 2. Complutense University of Madrid, 3. University of Salamanca

This panel explores new trends in reformulation, given the special interest shown by recent publications (Gabarró, 2017; Kim, 2021): these works reveal a need for addressing reformulation through new types of data, other languages not previously addressed, or alternative theoretical frameworks.

In the last forty years, reformulation and reformulation markers have been widely described in Romance and some Germanic Languages (Gülich & Kotschi, 1983; Roulet, 1987; Rossari, 1994; German; Robles, 2017; English; Del Saz, 2003). As a result, reformulation has been defined as a pragmatic function distinguished from other functions such as correction or conclusion (Pons, 2017).

Nevertheless, recent work in reformulation points to some new issues which will be addressed in depth in this panel:

a) Negation and reformulation. The relationship between reformulation and negation has long been considered (Du Bois, 1974; Foolen, 1991). Different approaches to negation in discourse involve correction and reformulation as discourse strategies: metalinguistic negation (Horn, 1985; Sadock & Zwicky, 1987), cancellability-tests for *q*-based implicatures (Horn, 1989), non-descriptive, metadiscursive denial (Nolke, 1992; García Negroni, 1998), polarity items in echoic utterances (González, 2008), or even approximative adverbs (Pardo, 2021). For these reasons, three main research questions arise:

1. How do negation and reformulation intertwine in discourse?
2. How (and if) this relationship varies across languages?
3. Which type of linguistic categories develop reformulation meanings?

b) Reformulation in non-Indo-European languages. Reformulation has hardly been described for Eastern or African Languages (Chinese, Japanese, Swahili, Amharic, etc.). The study of reformulation in non-Indo-European languages provides a more complete picture of reformulation as a universal process shared across languages. This, in turn, triggers some new research questions:

1. Are there universal features in reformulation?
2. Are there clear boundaries between reformulation and other functions in non-Indo-European languages?
3. Do reformulation markers stem from the same origins in non-Indo-European languages?
4. Do new features of reformulation arise in non-Indo-European languages?

c) Reformulation and variation studies. Reformulation studies have not addressed variation as one of their key concerns. Yet a focus on variation in dialects, sociolects, genres, registers, etc. triggers some new research questions:

1. Is it possible to find different reformulation structures across dialects? (e.g., Arabic dialects, Italian dialects, etc.)
2. Which features are shown by reformulation markers in sign language? Can these features be systematized? Are there other mechanisms to express reformulation? (e.g., special gestures)

d) Reformulation and experimental approaches. Reformulation can be approached with experimental tools focusing on both comprehension and production (eye-tracker, time-response measurements, etc.) (Salameh 2021). Experimental results provide researchers with new data shedding light for understanding reformulation. Some research questions to be answered are:

1. Can reformulation be measured through new experimental techniques? (EEG, visual word paradigm, etc.)
2. Does reformulation show similar or different processing patterns compared to other functions?
3. Do processing patterns in reformulation markers differ across languages?

All the specific questions related to issues (a) to (d) have been addressed by the accepted contributions included in this panel. The theoretical and methodological results obtained confirm that reformulation is still a growing research field.

On pragmatics and ‘Peach Tree Dishes’: Discourses of far-right extremism, conspiracy, and solidarity

Panel

*Dr. Catherine Tebaldi*¹, *Dr. Dominika Baran*²

1. University of Luxembourg, 2. Duke

Although often dismissed by both academics and progressive voters as nonsensical and irrelevant fringe ideas, far-right conspiracy narratives in fact present complex, multimodal, and affective discourses that contest, co-opt, and connect to mainstream and official knowledges, and as such become increasingly normalized, accepted, and influential. Responding to the 2023 IPrA conference theme of exceptionality and ordinariness, this panel explores the conflicting (meta)pragmatic regimentation and unruliness of digital discourses of far-right politics, of our complicity in them (Verschuere 2021) or contestation of them. Digital, multimodal discourses can co-opt the language of the ordinary to promote exceptional conspiracy narratives as, for example, meat eating in Marjorie Taylor Greene’s recent evocation of the supposedly outrageous notion of growing meat in a “peach tree dish” (sic!) which aligned the replacement of meat with the replacement of white men. Alternatively, they banalize the language of progressive values: COVID anti-vaccine advocates have co-opted the slogan of reproductive rights activists, “my body, my choice,” in protest signs in Ireland, UK, US, and elsewhere (Strange 2021), while in Poland, anti-genderist politicians and media have sought to resignify the LGBTQ+ symbol of the rainbow as an index of sinful, immoral, and unpatriotic ideologies (Baran 2022). Perhaps most perplexingly, the reactionary right sometimes takes up the language of critique (Tebaldi 2021) and creates a popular, pseudo-linguistic analysis around the ordinariness of words, claiming that it is the progressives who twist and denaturalize the “true” meaning of words and concepts such as, for example, “marriage,” “freedom,” or “patriotism.” Given the global influence of rightwing languages of hate, this panel aims to examine and demystify their discursive operation in various national, regional, and local contexts, but also to engage with existing counter-discourses that seek to disrupt rightwing attempts at co-opting and perverting progressive terms and ideas. This latter focus is crucial because, as Borba (2018) convincingly argues, “hatred is past oriented” (177) whereas “acts of hope” (174) look to the future and to the potential for checking and pushing against acts of hate. Consequently, we invite contributions to the panel that include but are not limited to: theoretical exploration of contestations and different uptakes of discourses, exploration of rightwing protest discourses (e.g. anti-vaccine, anti-reproductive rights, conspiratoriality, and others), the new solidarities produced between but also, crucially, against these, and attempts at disrupting these rightwing uptakes through oppositional discourses of hope.

Performing compliments in a variationist perspective

Panel

***Prof. Marina Castagneto*¹, *Dr. Chiara Meluzzi*²**

1. University of Molise, 2. University of Milan

Language communities of native speakers are not homogeneous wholes and some pragmatics phenomena are particularly sensitive to variation: the linguistic act of compliment is one of them.

The literature on compliments has often presumed the uniformity of communicative strategies by speakers belonging to the same linguistic community (e.g. US or Chinese cultures, conceived as a whole). Conversely, a different theoretical and methodological approach is represented by variationist pragmatics (Schneider & Barron 2008).

To date, few studies have been dedicated to the pragmatic variation of compliments (Lin et al. 2012, Mulo Farenkia 2012, Placencia & Fuentes 2013), and almost none on regional varieties within a specific language, apart from the pioneering work of Schlieben-Lange & Weydt (1978) and, recently, Castagneto & Ravetto (2015). Scholars' attention has instead addressed social variability of compliments and compliment use on social media (e.g. Maíz-Arévalo 2013, Placencia & Eslami 2020).

As compliment is sensitive to any kind of linguistic factors of variation, only a variationist approach will allow to define compliment as a speech act, differentiating it from partially overlapping acts (e.g., flattering, praise).

The panel will discuss compliments' variability across four main dimensions:

- 1) national varieties of specific pluricentric languages, or regional varieties of one language, and related politeness models;
- 2) social varieties of one language, depending on one or more macro-social factors (gender, age, social class);
- 3) perception of compliments across modalities;
- 4) linguistic usages and politeness models.

Participants will also discuss on the following topics:

- interaction of macro- and micro-social factors in compliment management;
- socio-pragmatic variation in compliments' forms and routines;
- compliments' variability across data types (e.g., naturally-occurring discourse vs. elicited data);
- application to language teaching and learning of pragmatics.

Poetics of Phaticity: Contacting and Distancing in Contemporary Social Life

Panel

*Dr. Shunsuke Nozawa*¹, *Dr. Makiko Takekuro*²

1. Hokkaido University, 2. Waseda University

In his 1923 discussion of “phatic communion,” Bronisław Malinowski emphasized the role of language as a “mode of social action,” suggesting that it is not simply used to convey referential information but also serves to create and maintain social “ties of union” (1923). The notion of “phatic” was then reformulated in Roman Jakobson’s “event”-based model of communication (1960), in which it serves to highlight “contact” as a necessary aspect of communicative functionality (see Zuckerman 2021). This line of thinking has seen renewed interest in the last decade or so, prompting scholars to mobilize analyses of communicative “channels” (or media) — how they are narrated, established, maintained, destroyed, and fantasized — in order to explore negotiation of social value, interpersonal politics, emerging identity, and other themes (see e.g. Kockelman 2010, Lemon 2013, Slotta 2015, Nozawa 2015, Zuckerman 2016, Manning 2018, Smith and Barad 2018, Wilf 2021). It is a sobering realization that, just as we are about to observe the centennial of Malinowski’s coinage, we find ourselves in the midst of the global covid pandemic where phaticity — the drama of contacting and distancing — has become front and center in characterizing the contemporary zeitgeist (Fleming and Slotta 2020).

Inspired by this reemergence of the phatic concept, our panel explores articulations of contacting and distancing in the contemporary social life as it relates to language and communication. With a premise that contact/communion is interactional and predicated on how things, people, and other actants come to be located in the here-and-now of communicative event, or in other words “poetically” structured in ongoing processes of interaction and interpretation, we address the question of poetics of phaticity. As we expect that contact can also be coterminous with disruption, avoidance, discontinuity, and other signs of discordance (Takekuro 2018), how might such poetic regimentation of contact relate to operations of power? How do acts of contacting and distancing generate or presuppose desires and anxieties about communication in different scenes of social life? Creatively drawing on these questions, the presentations for our panel cover a diversity of topics ranging from public discourse on contagion, phaticity in political speech, interaction in educational settings, rural communities and tourism, and rural communities, and media representations. Taking a discourse-centered approach to phaticity in communication, some of the papers in our panel analyze interactional textuality of contact, while others attempt to incorporate a multimodal analysis of several semiotic domains such as physical representations (especially gestures) and spatial arrangements.

Politeness and impoliteness in French and in comparison with other languages

Panel

***Dr. Nicolas Ruytenbeek*¹, *Dr. Shima Moallemi*², *Prof. Els Tobback*³, *Prof. Chantal Claudel*², *Prof. Kerry Mullan*⁴**

1. KU Leuven, 2. Université Paris Nanterre, 3. Universiteit Antwerpen, 4. RMIT University

In France, work on linguistic (im)politeness in French originated in the research on cultural variation and invariants in verbal interactions carried out by Catherine Kerbrat-Orecchioni since the 1990s. Using this framework, pragmatics was used to address speech acts from a cross-cultural or intercultural perspective (Kerbrat-Orecchioni 2000). This research angle has given rise to the examination of a variety of speech acts including compliments (Kerbrat-Orecchioni 2005), offers and requests for information, requests (Béal 2010) and invitations (Traverso et al. 2018). Such pragmatic approaches to (im)politeness in French have also resulted in fieldwork in commercial sites such as bakeries, butchers, pharmacies, florists, shoe shops, etc. in France (Kerbrat-Orecchioni 2001) and their comparison with speech act realizations in communities such as Syria (Traverso 2006), Lebanon and Tunisia (Dimachki and Hmed 2002). Recent developments on (im)politeness in the French-speaking world include comparative work based on corpora from electronic communication (Claudel 2021), in social media (Tobback 2019) or which take speaker behaviour as a starting point (Moallemi 2019).

The present panel proposal further develops this research axis by gathering researchers working on the expression and perception of (im)politeness in French as well as in a comparative perspective between French and another language.

Practices of knowledge management in helping interactions

Panel

Dr. Susanne Kabatnik¹, Prof. Eva-Maria Graf², Prof. Thomas Spranz-Fogasy³

1. Greifswald, 2. Klagenfurt, 3. Leibniz-Institute for the German Language, Mannheim

Balancing knowledge asymmetries and establishing intersubjectivity as preparatory work for change are core elements of ‘helping’ in helping interactions (Graf & Spranz-Fogasy, 2018). Verbal helping (Pick & Scarvaglieri 2019, in press) thereby is a central component of institutional helping interactions (such as medical, psychotherapeutic, counselling and coaching conversations) (see Graf et al. 2014 on interaction types, Graf et al. 2019 and Pawelczyk & Graf 2019 on change, and Scarvaglieri et al. in press on relationship management in these contexts). Knowledge is generated and updated by the interactants in the sequential unfolding of such institutional helping communication. In this process of mutual documentation of understanding (Spranz-Fogasy 2010; Deppermann 2015), i.e., grounding, the interactants establish a common ground (Clark 1992; Deppermann 2018) that builds the knowledge basis for helping. Co-constructing and managing (problem) knowledge thereby determine the solution (finding) knowledge as procedural knowledge. In this context, different epistemes are crucial, i.e., both, the professional knowledge of those providing help and the biographical, emotional and/or problem- or illness-related knowledge of those seeking help. These manifest themselves as epistemic status in the conversation (Heritage 2012; 2013). Discursive practices such as questions or formulations (Weiste & Peräkylä 2015) as well as narratives (Deppermann 2018), but also explanations, justifications, or excuses (Scott & Lyman 1968; Heritage 1998) are central to the processing of knowledge. Furthermore, participants negotiate their epistemic stance, i.e., the interactants’ attitude towards a certain object of knowledge (Deppermann 2018). Such epistemic stance is expressed with specific interactional practices of knowledge communication and linguistic forms, such as *oh*-prefacing in English (Heritage 1998, 2018) or the use of modal particles in German (Reineke 2015; Blühdorn et al. 2017).

The panel aims to bring together up-to-date CA research on practices of knowledge transfer and management as one of the most important communicative tasks in helping interactions. The focus is on analyzing the sequential organization and linguistic realization of such practices involved in knowledge management as well as on different interaction types of helping and how practices of knowledge management unfold in them.

Pragmatic approaches to visual discourses in online interactions

Panel

***Dr. Carmen Pérez-Sabater*¹, *Dr. Agnese Sampietro*²**

1. Universitat Politècnica de València, 2. University Jaume I

One of the most striking characteristics of contemporary online communication is its multimodality, i.e., the presence of different semiotic codes in the same “product.” Users can easily include images (photos, memes, stickers, drawings, etc.), emojis, videos, and audio files and edit and modify them in their digital interactions. As such, these visual elements become part of the interaction, which is characterized by several possible layers of multimodality relating such discourses as typed text, emojis, images, video, and animated GIFs, among others (Siever & Siever, 2029; Yus, 2022).

Despite its relevance, multimodal communication is under-researched in comparison with textual communication. Some of the features that have attracted the interest of researchers are emojis, stickers, GIFs, and graphical icons. Emoticons first (faces composed by punctuation marks such as :-)) and later emojis (pictographic images) have been extensively studied under the lens of pragmatics in the latest years. Researchers have analyzed their use in many social media platforms (e.g., WhatsApp, Twitter, Facebook, WeChat, Instagram, bulletin boards) and languages (e.g., Arabic, Chinese, English, French, German, Spanish) (see, for example, Al Rashdi, 2018; Bieswanger & Pappert, 2019; Sampietro, 2016; 2019; Pérez-Sabater, 2019, 2021).

However, despite this recent academic interest in emojis, the pragmatic functions of other visual elements/cues, such as photos, stickers, GIFs, and short video clips, have been largely ignored by digital communication scholars. So far, studies have found that other graphical icons are primarily used to react to a previous textual message (Dainas & Herring, 2021). Research on their function in interaction, the cultural variation in their use, and their understanding is still in its infancy.

This panel explores the function of different graphical icons in digital interaction from a pragmatic perspective. Concretely, its contributions include investigations of various visual elements, namely GIFs, stickers, emojis, pictures, hashtags, and typography, drawing on different data/applications, such as Twitter, WhatsApp, and Instagram. The oral presentations included in this panel also study diverse contexts, from informal interactions among friends to political discourse and online grooming.

In sum, the contributions cumulatively enrich our understanding of how users deploy a variety of visual resources in digital interactions taking into account the three fundamental “layers” of cyberpragmatic analysis (Yus, 2022): the users, the context, and the interaction.

Pragmatic aspects in food-related communication

Panel

Prof. Daniela Cesiri¹, Prof. Francesca Coccetta¹, Dr. Katia Peruzzo²

1. "Ca' Foscari" University of Venice, 2. University of Trieste

Food is an important means for human societies not only because it provides nutrition but also for its socializing function. The rituals accompanying its preparation and consumption have always favoured social bonding in any kind of human civilization. Indeed, communication about food and nutrition is omnipresent in our daily life and, in more recent years, it has proceeded through both traditional and new media. The former includes printed cookbooks, TV and radio shows, while the latter exploits the affordances of digital channels such as YouTube, social media, virtual tasting experiences through websites, food blogs, etcetera. In this context, culinary experts, chefs, and amateurs contribute to shape the message, thus acting as both creators and receivers of food-related content. This, in turn, includes a certain degree of interaction among the participants in the communicative situation (e.g., in food blogs or in social media). The responsibility of the creators of the message in this case lies in the correct transmission of specialist knowledge as well as in the accurate conveyance of culture-specific elements that are usually associated with certain dishes or culinary traditions.

The panel explores the pragmatic implications of communication concerning food preparation and consumption. Particular attention is paid to the exploration of the ways in which concepts related to food are dealt with in digital genres, ensuring the dissemination of culinary knowledge and the preservation of local cultures and food-related habits. More specifically, the panel addresses multimodal aspects in food-related communication in digital genres such as food blogs but also specific textual genres such as recipes in social media and websites addressing adults as well as children. Furthermore, the panel investigates food-related communication through animation, advertising campaigns, with some reflections on how the Covid-19 pandemic has affected our habits. Finally, particular relevance is given to pragmatic aspects in the translation of food-related vocabulary in genres such as fictional prose and TV series.

Pragmatic development, sense conventions and the puzzle of non-literal uses

Panel

Dr. Ingrid Lossius Falkum¹, Dr. Nicholas Allott¹

1. University of Oslo

A puzzling feature of pragmatic development is the mixture of ability and difficulty pre-school children have with non-literal uses of language (e.g., metaphor, metonymy, irony, implicature). While children are in many respects expert communicators from early on (Matthews 2014; Zufferey 2015; Grigoroglou & Papafragou 2017) and spontaneously produce metaphors (Billow 1981) and metonymies (Falkum 2019) they often have difficulty going beyond the conventional senses of words to arrive at the speaker's intended meaning (Long, Shukla & Rubio-Fernandez 2020; Falkum, Recasens & Clark 2017).

This could merely suggest that (some) figurative use is harder to interpret than literal use. However, there is recent evidence that children's performance with non-literal language goes backwards around 5 years old. Falkum, Recasens and Clark (2017) found a U-shaped development in metonymy comprehension, with 3-year-olds and adults performing better than 5-year-olds, who tended to interpret metonymic uses literally. This finding was reproduced by Köder & Falkum (2020), and the U-shaped trajectory (UST) may also be found for other figurative use. A number of authors have proposed a 'literal stage' in metaphor comprehension after early ability with metaphor (Levorato & Cacciari 2002; Vosniadou 1987; Winner 1997; for early ability see Billow 1981).

This finding, if robust, promises to shed light on a number of issues in the development of pragmatics, and suggests a number of research questions. For example, it weighs against the influential view that literal and (some) figurative utterances are processed the same way (e.g. on metaphor: Giora 2008; Sperber & Wilson 2008; Wilson & Carston 2007). It obviously poses the question: what is special about development around 5 years old? Possible answers might draw on the development of Theory of Mind (Westra & Carruthers 2017, Kissine 2021) or of comprehension of and interest in norms (Rakoczy & Schmidt 2013; Paulus & Schmidt 2018), since children's abilities in both areas show radical improvement around this age.

This panel features contributions that address puzzles relating to the uneven development of non-literal uses, both theoretically and empirically.

Pragmatic Variation in Pluricentric Languages

Panel

Prof. Cesar Felix-Brasdefer¹, Prof. Klaus Schneider²

1. Indiana University, 2. University of Bonn

Research on linguistic pluricentrism has mostly concentrated on national varieties of a language, as well as on dominant and non-dominant varieties (Schneider & Félix-Brasdefer 2022). Pluricentric languages, such as Arabic, Chinese, English, French, German, and Portuguese, have been generally defined as languages having different national varieties, each with a standard codified register. Intra-lingual pragmatic variation is systematically studied in variational pragmatics (Schneider & Barron 2008; Schneider 2020). This approach is focused on the intersection of pragmatics and dialectology and examines differences that can be correlated with macrosocial and microsocial factors that influence communicative language use. Relevant macrosocial factors include region, gender, age, ethnicity, and socioeconomic status, while microsocial factors include social distance/degree of familiarity, social power, and situational variation. Region, whose impact on language use has received more attention in research than any of the other factors mentioned here, has been theorized as a multifaceted concept pertaining to five levels in geographical space: supranational, national, subnational, local, and sublocal (Schneider & Barron 2008). Region is, therefore, not limited to the traditional understanding in dialectology, but used here as “an umbrella term for a hierarchy of spatial entities” (Schneider 2010, p. 248).

This panel examines pragmatic variation at the level of national varieties of seven different pluricentric languages, i.e., languages with several interacting centers and norms of their own (Clyne, 1992). The languages covered are Arabic, Chinese, English, German, French, Spanish, and Swedish, among them two non-Indo-European languages and some understudied Indo-European languages. The national varieties also include three post-colonial varieties (Namibian English; Nigerian English; Cameroon French). We investigate and problematize to what extent place plays a role in pragmatic variation. The panel focuses on the analysis of language use at different levels of analysis: formal, actional, sequential, interactional, organizational, stylistic, and prosodic. Methodological principles and methodological choices are also discussed, specifically data types and data collection instruments. The panel is organized in three sessions, with a total of nine presentations, including Q & A for each presentation. There will be opening remarks and a final discussion.

Pragmatics of the '(a)typical clause' across languages

Panel

***Prof. Ritva Laury*¹, *Prof. Tsuyoshi Ono*²**

1. University of Helsinki, 2. University of Alberta

In both scholarly papers and textbooks, linguists have presented the typical clause as consisting of an active, transitive verb and its overt arguments. For example, consider the following, constructed clause given in the section on structural analysis in a popular introductory linguistics textbook (Yule 2006: 80).

Her father brought a shotgun to the wedding

The dominant grammatical tradition, passed on in linguistic training and reflected in our terminology, is in fact mostly based on Indo-European languages. Our conception of typical clauses, for instance, is based on studying constructed data which is heavily influenced by written language primarily from that language family (for discussion, see Linell 2005; Ono, Laury and Suzuki 2021).

However, it has been shown that the typical English clauses in conversation, the most basic use type of human languages, tend strongly to be intransitive; Thompson & Hopper (2001) showed that two-participant clauses such as the example above, account for only 27% of all clauses in the conversational data they studied, with one-participant clauses accounting for 73%. Furthermore, in many languages, overt mentions of participants involved in the action or state expressed in the clause are rare (for Japanese, see, e.g., Ono & Thompson 1997; for Indonesian, see Ewing 2019). Thus it appears that the clause types often thought to be the most common are actually atypical even in the most commonly studied languages.

Our panel examines clause types in everyday language use from a variety of theoretical orientations in a wide range of geographically, typologically and genetically unrelated languages. The presentations are based on data from Anal Naga, Burmese, English, Finnish, Indonesian, Japanese, Karbi, Korean, Mandarin, Mano, Nuuchahnulth, Swedish, Turkish, and Upper Kuskokwim. We ask questions such as how the concept of 'clause' should be defined and whether the celebrated status given to it is deserving, given its manifestation in actual data across languages (Ono et al. 2019), how 'nonverbal' clause types should be understood (Haspelmath 2022), and whether the concept of 'predicate' might be more useful in crosslinguistic study than the concept of 'clause' (Thompson 2019). Most importantly, we examine how these typical and atypical 'clauses' are employed in everyday language use in the diverse set of languages in our panel.

Prosody, gesture, and conversation

Panel

***Dr. Margaret Zellers*¹, *Dr. Maria Graziano*², *Prof. David House*³**

1. Christian-Albrechts-Universität zu Kiel, 2. Lund University Humanities Lab, 3. Kungliga Tekniska Högskolan

Face-to-face conversation is a process that integrates spoken language as well as a variety of bodily movements moment-by-moment. The multimodal nature of conversation means that interfaces arise between acoustics (in particular prosody), visible bodily movements (especially gestures), and the structural organization of conversation. Prosody refers to the aspects of the speech signal that (may) occur over stretches longer than an individual speech segment or phone, with most prosodic research focusing on pitch, intensity, and duration. A gesture can be defined as a movement, typically of the hands, but also of other parts of the body, that accompanies speech and has a communicative value. Conversation can be described as spontaneous, non-task-driven, spoken social interaction involving two or more participants. The binary interfaces between prosody and gesture, prosody and conversation, and gesture and conversation, are receiving increasing amounts of attention. However, an investigation of the intersection between all three of these systems is still in its infancy.

The relationship between gesture and prosody differs in the context of different conversational actions. Many studies have found that gesture and prosody function in parallel in the context of prominence marking, which is essential for communicating information-structural aspects such as new/given and contrast/correction. Others have found that the interaction of prosody and gesture is crucial to manage smooth turn-taking among conversational participants. As the most common everyday use of spoken language, conversation provides an ideal setting to investigate the relationship between prosody and gesture across a variety of different communicative functions, in terms of both linguistic functions and conversational actions. This panel features research at this three-way intersection from a variety of methodological perspectives, specifically taking perspectives on the following:

Relative independence or interdependence: since despite the differences between the two modalities, gesture and speech often show extremely close temporal and semantic coordination, to what extent are these modalities integrated? To what extent does coordination between the modalities vary depending on the communicative situation?

Complementarity versus coordination: what is the scope of gesture and prosody in communicating conversational meanings/actions? To what degree do gesture and prosody arise complementarily versus in a coordinated way and what is the degree of redundancy? How are these modulated by different functional needs in conversation?

Methods of description: what types and granularities of parallel annotation of prosody and gesture are needed in order to be able to carry out effective analyses? How can these be applied to spontaneous speech with its high degree of variability?

Rapport management in onsite and remote interpreting

Panel

***Prof. July De Wilde**¹, **Dr. Jelena Vranjes**¹, **Mr. Dries Cavents**¹*

1. Ghent University

When transferring the speech of interlocutors who have no access to each other's language, interpreters never act as mere 'conduits' transferring the message automatically. Instead, they act as fully-fledged social agents co-constructing meaning. In conducting this type of interpersonal work, rapport is of key importance. The management of interpersonal relations in interpreting research has been studied in terms of 'facework' (Pöllabauer 2007), '(im)politeness' (Mapson 2019) and, more recently, under the broader notion of 'rapport management' (Mapson & Major 2021). We understand rapport management as the process of promoting, maintaining and threatening harmonious social relationships in interactions, motivated by considerations of face, behavioural expectations and interactional goals (Spencer-Oatey 2008). Interpreters may omit, mitigate or strengthen deliberate discourse strategies (such as requests, verbal aggression, compliments) directed at the primary participants or at the interpreter themselves. Furthermore, the interpreter's active involvement in interaction management changes the behavioural norms related to turn-taking and challenges direct contact between participants. However, while previous studies provide rich insights of rapport management in dialogue interpreting on a verbal level, much less is known about multimodal aspects of rapport management. In managing rapport, both verbal and non-verbal behaviour (gestures, mimics, gaze) are essential (e.g. Davitti & Braun 2020). Moreover, in the context of the COVID-19 pandemic and the increased importance of different forms of distance interpreting (e.g. video-remote and telephone interpreting), the question is raised as to the exact impact of the interpreter's reduced presence on the interpreter's and primary participants' management of rapport.

The aim of this thematic panel is to provide a forum for ongoing research on the imbrications between rapport, multimodality and communication technologies. The panel therefore brings together scholars providing insights from different perspectives. In particular, contributions to this panel will discuss topics such as:

- Multimodal rapport management and face-work in different settings such as police interviews, court, maternity care etc.;
- The difference between onsite interpreting and distance interpreting (telephone, video remote etc.);
- The primary participants' perceptions of rapport management and rapport building.

Re-considering discourses of war and peace: 21st century transcultural perspectives

Panel

*Prof. Cornelia Ilie*¹, *Prof. Manfred Kienpointner*²

1. Strömstad Academy, 2. University of Innsbruck

History has shown that ideological struggles, political polarizations, armed conflicts, and counter-peace processes are impacting not only the international power balance and peace, but also individual and collective beliefs articulated in interpersonal and intergroup interactions. This panel sets out to explore and discuss the underpinnings, implications and consequences of diverging / shifting discourses of war and peace that extend across time and space. Such discourses often reveal divergent perceptions, biased interpretations and disagreements, reinforced by antagonism, resentment and aggression (Allan 2004, Dardis 2006, Herber 2007, Lule 2004). Exploring the ways in which war is portrayed discursively, scrutinized rhetorically, and debated argumentatively, both offline and online, can help us understand the interactional and socio-psychological mechanisms, as well as the immediate or medium/long-term outcomes of pro-war and anti-war discourses, belligerent rhetoric, political propaganda and overt/covert manipulation on the mindsets of individuals and public opinion (Bugarski 2009, Hodges 2013, Rampton 2003).

Going beyond traditional conceptualizations and definitions of the terms war-peace, the panel contributors use cross-disciplinary approaches (Zaman (2009) for a deeper understanding of war and peace in a historical, political and cultural perspective. The main issues participants will reflect on, analyse and debate are the following:

- Argumentation and counter-argumentation strategies in war and peace discourses
- (Re)conceptualizing war, peace and nonviolence in a diachronic perspective
- Problematizing the underpinnings of war discourses in online environments
- (Re)contextualizing and re-interpreting narratives of war and peace
- Seeking to re-write history through re-descriptions and re-interpretations of war narratives
- Metaphorical ways of understanding and representing war and peace
- Hidden agendas in the mediatization of narratives about war and peace
- Generating and spreading fake news in times of war and unpeace

Reading Bauman & Briggs’s “Poetics and performance” three decades later: How can a/typical interactions, spaces and temporalities critically inform pragmatics?

Panel

*Dr. Daniel Silva*¹, *Dr. Daniela Palma*²

1. Universidade Federal de Santa Catarina, 2. Universidade Estadual de Campinas

In 1990, Richard Bauman & Charles Briggs published an influential review article on poetics and performance as critical loci for analyzing social life (Bauman & Briggs, 1990). This article has been an important source for studies on communicative practice, for a number of reasons. We may tentatively list: First, Bauman & Briggs join the effort of other scholars in that historical period in examining poetics and performance beyond their alleged “parasitic” role on “such ‘core’ areas of linguistics as phonology, syntax, and semantics, or upon such anthropological fields as economy and social organization” (p. 19). Second, they debate, and reinvigorate, the very status of poetics on the study of the performativity of language. Decades before, Austin (1962) had advised his readers that such “etiologies” of language such as “us[ing] speech in acting, fiction and poetry, quotation and recitation” (p. 92) would fall outside the study of (typical) serious performative language. Third, Bauman and Briggs not only discuss that “acting”, “quoting” and “reciting” are typical performative moves in everyday “serious” performances but also point that these moves “de-center” verbal forms and performers alike, for one’s verbal performance largely relies on citing and objectifying pre-existing generic speech forms. In this sense, they term ‘entextualization’ “the fundamental process... of render[ing] discourse decontextualizable” (p. 73). Fourth, and fundamentally, they discuss that the process of producing texts as extracting decontextualizable units across interactional settings is embedded in various institutional and social practices of building authority, inequality, and control.

If we consider IPrA’s 2023 theme, “The shape of interaction: the pragmatics of (a)typicality”, Bauman & Briggs’s pioneering text brought the “atypical” (e.g., poetics and performance) to bear on the “typical” (e.g., ordinary language). 32 years later, this panel invites scholars to critically revisit Bauman & Briggs’s proposal vis-à-vis our field sites, political scenarios, and epistemic projects. As part of the activities of the research project “Trajectories of peripheral lives: Violence between the ordinary and extraordinary in (auto)biographical narratives and poetics” (funded by Fapesp), the panel asks participants to critically engage with the legacy of this decentered view of discourse and the subject – which is by no means a product of these authors alone but part of an ongoing dialogue with multiple voices, including from the margins. Further, the panel welcomes research that engages the minutiae of poetics and performance to problematize what is framed as “typical” in interaction – often while dismissing as atypical minority forms of belonging in language, race, gender, sexuality, and politics. As scholars interested in critically understanding the “shape of interaction”, some fundamental questions that we may ask ourselves and our empirical materials are: What does it mean to “decenter” texts as entextualized practices and precipitates of power in a particular (ramified) empirical site? How is poetics construed in the interactions I examine? How do participants challenge “reified texts” – that is, particular modes of entextualization crystallized as “typical”, “unchallenged”, “default”, “canon”? How may we critically receive Bauman & Briggs’s (1990) proposal vis-à-vis our contemporary epistemic and (geo)political challenges?

Recruitment of environmental resources for interactional purposes in the early years

Panel

***Dr. Amanda Bateman*¹, *Prof. Friederike Kern*²**

1. University of Waikato, 2. University of Bielefeld

The panel will bring together Child Interaction researchers to explore the affordances environments provide – or restrict – to interactions between children, their peers and their caregivers. Main interest will be to gain a better understanding of the (cultural) ways multimodal resources are used to co-construct complex interactions in the early years.

Recruitment of tangible resources in interaction are often embodied and are key in everyday accomplishments between people (Goodwin, 1994, Goodwin and Goodwin, 2000). Prior ECE research notes that the natural outdoor environment affords opportunities for children to initiate interactions through orientating their talk to noticeable environmental features (Waters & Bateman, 2013) and enter into verbal contracts to engage in culturally appropriate ways in protected spaces (Bateman & Roberts, 2018).

Inside the early childhood environment, the entrance hall has been found to offer affordances for parents, children and teachers to meet where code switching between home and preschool languages offer rich opportunities for language learning (Bjork-Willen, 2017), and parents make an effort to attune their children's bodies to the structural affordances of a spatial environment while using manual guidance to do so (Kern, 2018).

Emotional displays are often observable in environmental spaces, and attended to pragmatically. Where young toddler children express emotional upset regarding difficulty mastering complex terrain, teachers offer verbal directives about how to move their body, encourage independence and empowerment (Bateman, 2021). Further emotional support through engaging with environmental resources is observable for children who have experienced trauma through natural disasters such as earthquakes, where exploring damaged spaces provides opportunities for talking about trauma in inductive and practical ways (Bateman, Danby & Howard, 2013).

In all of these spaces, we see the synthesis of gesture, talk and emotion, offering an intertwining of multimodal resources that work to co-construct complex interactions that empower children to be confident in their autonomy over their bodies to move through space.

Recycling and reshaping previous turns in multimodal interactions

Panel

*Dr. Vanessa Piccoli*¹, *Dr. Biagio Ursi*²

1. Université Paris Nanterre, 2. Université d'Orléans

A large number of studies on naturally occurring conversations have shown how interactants continuously adjust to one another, adapting their actions/turns to coparticipants, to interactional contingencies and to multiple action trajectories (Haddington et al. 2014; Lindström et al. 2021, among others), through a variety of semiotic resources (Goodwin 2018). Recycling stretches of previous talk may be an indicator of the collaborative nature of conversation, since it signals “what new information has been taken up by the other and so added to common ground” (Clark & Bernicot 2008: 352). This is especially important in interactions where intersubjectivity is hard to achieve, due to epistemic or linguistic asymmetries (e.g., plurilingual encounters, atypical interactions). For instance, in classroom interactions, matching gestures are mobilized to display interactive co-engagements and to create learning opportunities (Majlesi 2015).

As Traverso (2017) observed in plurilingual healthcare settings, recycling conversational materials can take the form of rephrasing or embodied reuses; even when verbal intercomprehension is blocked, multimodal reformulations contribute to the progressivity of the conversation. When participants repeatedly recycle an earlier multimodal contribution, a conversational routine emerges (Chernyshova et al. 2022), i.e., a new configuration becomes a recognizable, available and shareable resource by participants. By reshaping previous turns in different sequential environments, participants assure coherent and respecified realizations over extended action trajectories or interactional activities.

This panel aims at exploring recycling and reshaping practices involving multiple semiotic resources in talk-in-interaction. Particular attention will be drawn to the reusing of previous embodied turns as a relevant conversational phenomenon in sequence organization (openings and closings, backlinking, etc.). Based on multimodal interaction analysis, panel contributions scrutinize the temporal mobilization of linguistic structures and the routinization of “multimodal gestalts” (Mondada 2015). More specifically, they highlight the instructional and meaning-making functions of multimodal routines in dance lessons, interpreter-mediated consultations, doctor-patient conversations, as well as visually impaired interactions.

Besides the panel organizers, the following researchers have confirmed their participation: Oliver Ehmer (Osnabrück), Piera Margutti, Vittoria Colla & Valeria Barbieri (Modena), Monica Simone, Chloé Mondémé & Renata Galatolo (Bologna & Lyon), Véronique Traverso (Lyon).

Referential practices in action: a usage-based perspective on canonical and non-canonical uses of pronouns referring to persons

Panel

Dr. Jens Lanwer¹, Prof. Wolfgang Imo², Prof. Evelyn Ziegler³, Prof. Melitta Gillmann³

1. University of Münster, 2. University of Hamburg, 3. University of Duisburg-Essen

It is a well-known fact that pronouns referring to persons can be used not only in their canonical, prototypical meaning (e.g. “I” as a speaker-deictic pronoun, “one” as an indefinite generic pronoun etc.), but also in non-canonical ways (e.g. “I” as a generic pronoun or “one” referring to a definite person, often the speaker him- or herself) (see, for example, Auer/Stukenbrock 2018, De Cock 2011, De Cock/Kluge 2016, Imo/Ziegler 2019 or Kitagawa/Lehrer 1990). These observations are based on empirical analyses of (mainly spoken) language use. However, a systematic, usage-based account of such non-canonical uses is still lacking; in particular, one that takes into account aspects such as (a) the division of labor between different pronoun types within a language or variety, (b) the exigencies of the variable communicative ecologies of referential practices (from face-to-face interaction to writing a novel), and the relevance of variation in referential practices between members of different speech communities (including a comparative perspective). This panel, which addresses these aspects from a usage-based perspective, will focus on the following questions: What practices with personal pronouns can be identified? How is pronoun use related to the modality and materiality of language use? Can action-related properties of pronouns be identified? In what ways can pronouns be viewed as solutions to communicative problems and how do they contribute to the construal of situations? Which semantic or referential properties (such as genericity and specificity, definiteness and indefiniteness, exclusivity and inclusivity, agentivity and non-agentivity) are relevant in the process of person reference? Which contextualization devices do participants employ in the non-canonical use of pronouns? Contributions to this panel cover different situational settings of pronoun use, such as medical interaction or parliament debates, as well as different languages, such as Swedish, Spanish, Finnish, Japanese, German or Lingála.

Research involving languages you don't speak: Reflections on 'spaces of linguistic non-understanding'

Panel

*Dr. Marie Jacobs*¹, *Ms. Ella van Hest*¹

1. Ghent University

In the era of superdiversity, many (socio)linguists aim to study phenomena related to multilingualism and language diversity. This panel aims to encourage reflection regarding the methodological, epistemological, and ethical difficulties and opportunities of doing qualitative research that involves languages the scholar does not have any (or only limited) knowledge of.

To facilitate this discussion, we draw on the concept of “spaces of linguistic non-understanding” (spaces of LNU), i.e., “instances in which the researcher, while collecting and/or analysing data, encounters (stretches of) interaction which unfold in languages outside their own repertoire” (van Hest & Jacobs, 2022, p. 20). This phenomenon concerns talk or text which the researcher observes but cannot understand. The presence of such spaces of LNU can be tangible during data collection (e.g. when conducting participant observation of interpreter-mediated service encounters, when asking interview questions with the help of an interpreter, when observing translanguaging practices that involve languages, lects, styles or registers that you are not–or not completely–proficient in) and/or analysis (e.g. when transcribing, translating and analysing linguistically diverse data, when consulting a translator to help process data).

Although spaces of LNU are–at first–incomprehensible, they do shape the researcher's understanding of the situation at hand. This is challenging with regards to the status of the knowledge generated in the research project: conducting research that involves spaces of LNU renders researchers vulnerable to illusions of (mis)understanding. This panel is, however, not only interested in the pitfalls of working with multilingual data or in the measures taken to gain analytical control over such linguistic sequences, but it also aims to explore the analytical opportunities which such research entails. As the presentations will reveal, unexpected rewards may present themselves when the potential unknowability of spaces of LNU are acknowledged and explored. We will discuss questions such as: How to make sense of encounters which involve locally incomprehensible stretches of talk? How to ensure the ethics and the reliability of the study when working with translated transcripts? How to provide a contextualised analysis of spaces of LNU and the perspective of research participants that speak a language outside your own linguistic repertoire, without perpetuating the societal inequalities non-understanding often involves? How do spaces of LNU shape, transform or even enrich the ethnographic relationship between participant and researcher? What can be gained by being self-reflective about linguistic limitations and ethnographic vulnerabilities?

In answering these questions, our panel fuels the scholarly debate on how to conduct research in times of globalisation by bringing together methodological reflections from a variety of settings (ranging from mundane conversations and family talk to speech in medical, bureaucratic and judicial contexts). We conclude that, as many research settings are increasingly characterised by the presence of multilingualism, researchers cannot shy away from linguistically diverse realities but do need theoretical grounding and analytical tools to capture and investigate everyday realities.

Reshaping interaction in higher/tertiary education (HTE) under the challenges of inclusion

Panel

***Prof. Christiane Hohenstein*¹, *Prof. Magdalene Lévy-Tödter*², *Dr. Agnieszka Sowinska*³, *Prof. Bettina M. Bock*⁴**

1. ZHAW School of Applied Linguistics, 2. FOM University of Applied Sciences, 3. Nicolaus Copernicus University, Toruń, Poland (Department of Experimental Linguistics) & Universidad Católica del Norte, Antofagasta, Chile (School of English), 4. University of Cologne

The panel addresses IPrA's special theme **The shape of interaction: the pragmatics of (a)typicality** by asking how academic communication is or can be (re)shaped as an interaction that strives to be inclusive. Inclusive interaction in higher/tertiary education (HTE) entails but is not restricted to e.g. subtitling, audio description, sign language translation, simplified language ("Easy Languages") and Universal Design for learning. Students experiencing barriers bring with them their own resources and sensitivity for interacting, communicating and acquiring knowledge. The panel brings together scholars whose research deals with communicative vulnerability and accommodation strategies, experiencing minority status, the pragmatics of asymmetric, inclusive, accessible, and bias-free communication in academic interaction and related research on Universal Design. Methods include multimodal analyses of interaction data, analyses of institutional talk/text/discourse/media situated in HTE/universities, and research comparing international advances in academic inclusion. The panel also focuses on methodological and theoretical reflections, bridging gaps between linguistic pragmatics and disability studies in HTE. New contradictory developments in interaction in higher education, such as aspiration for more participation and increasing language anxiety will also be explored. The panel is going to answer the following research questions:

- Which adaptations in actual academic interaction can accommodate students who experience communicative barriers, e.g., auditory or visual, for various reasons? What can we learn from their experience of "minority status"?
 - Which types of interactions in HTE bear which risks of exclusion and hindered participation, and how can these situations and settings be described from interaction data?
 - As interactions between people with and without impairments are often described as "asymmetrical" or "atypical": In what way are those interactions in HTE contexts actually different from "typical" interactions? How do categories like the ones mentioned shape the research on interactions?
 - How do terms such as "inclusive", "barrier-free", "accessible", and "(dis-)ability", shape institutional communication? And how can inter- and transdisciplinary approaches reach more clarity on the terms and help reshape interaction in HTE?
 - In which ways can issues of diversity – e.g., culture, multilingual societies, the individual students' linguistic competencies in L1 (first language) and L2 (foreign or second language) and their intersectional needs – be integrated into an approach that has a broad understanding of inclusion and relates inclusive communication to accessible, intercultural and bias-free communication?
 - What kind of competencies are acquired on the part of translators, mobility trainers and others with intermediary roles?
 - How can knowledge on socio-cultural, linguistic and pragmatic aspects of inclusive communication be explored, shared and transferred internationally in HTE, given the great divides that exist, depending on historical and institutional (pre-)conditions, more or less advanced inclusive institutions and education systems, and provisions in recognition of the UN Convention on the Rights of Persons with Disabilities?
-

The panel is organised by the International Network on Inclusion and Inclusive Communication in Tertiary Education (NIICTE), established at the 2021 IPrA conference. Its purpose is to strengthen interdisciplinary collaboration on inclusion, with a view to how linguistic pragmatics can inform practices of inclusion and inclusive communication in HTE.

Responses to news: Cross-linguistic perspectives

Panel

***Dr. Michal Marmorstein*¹, *Prof. Beatrice Szczepek Reed*², *Dr. Xiaoting Li*³**

1. Hebrew University of Jerusalem, 2. King's College London, 3. University of Alberta

This panel explores the ways in which participants in talk-in-interaction display their orientation to prior turns as 'news'. The presentations take a cross-linguistic perspective, considering newsmarks, news receipts, and other types of news responses across languages. Responses to news are an interactional resource with which participants overtly manage their emerging transition from not-knowing to knowing. Responses to news can also assess the type of knowledge that is conveyed on scales from ordinary to noteworthy, acceptable to questionable, and credible to contestable. Moreover, responses to news can accomplish affiliative work. Given the multi-layered interactional work accomplished by news responses, they appear to be a fruitful site for the study of participants' display and negotiation of knowledge and stance (Stivers et al. 2011).

Based mostly on English data, existing literature commonly distinguishes between news receipts and newsmarks. News receipts (e.g. English *oh*), are backward-looking, and as free-standing items they typically accomplish sequence closing. In contrast, newsmarks (e.g., English *really?*, *is it?*) invite more talk about the news and can manage divergent expectations (Heritage 1984; Jefferson 1981; Maynard 1997; Stivers & Enfield 2010; Thompson et al. 2015). The sequential implicativeness of newsmarks is related by some to their semantics. For instance, English *really* is described as a means to question the validity of an informing (Thompson et al. 2015: 77). However, news responses in other languages and emerging from different lexical sources have been shown to accomplish different orientations to prior talk. For example, Arabic *wallāhi* ('by God') has been shown to treat prior talk as remarkable (Marmorstein & Szczepek Reed, 2021). In Mandarin, *shi ba* 'be PRT' (which can be translated as 'is it?') can function as a newsmark or display affiliation (Liu & Yao, 2021). The panel brings together cross-linguistic work which presents different facets of the co-construction of news as epistemically, affectively, and interactionally relevant.

Revisiting ideologies of English in the Nordic countries

Panel

Dr. Dorte Lønsmann¹, Dr. Janus Mortensen¹, Ms. Marianne Haugaard Skov¹

1. University of Copenhagen

In this panel we discuss ideologies of English in the Nordic countries as a particularly interesting case in relation to English and globalisation. Since the end of WW2, the Nordic countries (Iceland, Norway, Finland, Sweden and Denmark as well as several semi-autonomous areas) have been heavily exposed to English, which is introduced early in the Nordic school systems and has a large presence in the everyday lives of the population. We are interested in how language ideologies around and about English are tied to ongoing social change in the form of globalisation, migration and mediatisation. The panel contributions discuss how recent societal developments in the Nordic countries have generated increasingly complex and conflicting ideologies related to English. By investigating these ideologies about English, the panel will contribute with new insights into the responses to and beliefs about the processes of social change which the use of English goes hand in hand with.

The panel brings together a variety of perspectives with the aim of exploring the complexity and diversity of ideologies of English across the Nordic countries, and with a contribution from the Baltic region as well. The neighboring Baltic countries (Estonia, Latvia and Lithuania) provide an interesting contrast to the Nordic countries, as they have been under the Soviet Russian sphere of influence, and the use and ideologies surrounding English have only recently come to the fore, but potentially so much the stronger.

The papers in the panel show that for some groups, English is associated with opportunities for the individual and for society to engage with the globalised world and the globalised economy; for other groups, English is associated with identity work and performance as members of global communities of practice; for yet others English represents a barrier for participation in society and a possible threat to national languages and culture in the face of hegemonic Anglophone influence. The papers explore these different ideologies and how they are linked with individual traits e.g. age, profession, linguistic background and community of practice membership as well as with historical differences between the nations. Furthermore, as a language not everyone has equal access to, English is linked with processes of inclusion and exclusion, and the panel will explore how ideologies of English contribute to inclusion and exclusion in different contexts. Together, the eight papers in the panel and the closing discussion will explore how ideologies of English are linked with social change, social identity and social inclusion.

Robust and flexible interactive language technology for human empowerment

Panel

***Dr. Andreas Liesenfeld*¹, *Dr. Hendrik Buschmeier*²**

1. Radboud University Nijmegen, 2. University of Bielefeld

Beyond flashy PR and AI hype, language technology has the potential to change many people's lives, as it makes available new interactional resources and communicative modalities. Better hearing aids for deaf users or disaster early warning systems for small language communities, for instance. However, commercial technology providers design for the masses and rarely take an interest in marginalized user groups, so there is a lack of work on life-changing pragmatic technologies that provide artificial senses, streamline the shape of interaction, or empower users to exercise agency in social life.

Building interactive language technologies for diverse user groups requires understanding human interaction beyond common ability assumptions. And building inclusive technology beyond mainstream user groups requires a critical look at foundational principles of interaction. At the intersection of studies of human interaction and interactive language technology, this panel invites contributions by researchers that share an interest in building better tools to support human empowerment (e.g. Buschmeier 2018, Cassell 2020, Dingemanse and Liesenfeld 2022, Pitsch et al. 2009).

Starting from human-centered approaches to such technologies, we focus especially on tech that facilitates interactions that, for people involved, may straddle the boundaries between typicality and atypicality, fluency and disfluency, empowerment and disempowerment. These seeming opposites represent the space in which any interaction takes its shape. The challenge is to use insights from pragmatics, conversation analysis, human-computer interaction and neighboring fields to characterize the shape of human interaction with diverse user groups in mind, and work towards applying these insights in a new generation of robust and flexible language technologies.

Topics covered in this session include: mixed-method approaches to miscommunication in human-AI interactions; patterns of universality and diversity in human interaction; human-in-the-loop approaches to language technology development; multimodal communication and interaction; developments in human-centered AI; human agency and pragmatics in the face of ubiquitous computing.

Shaping humour in interaction

Panel

Dr. Esther Linares-Bernabéu¹, Prof. Leonor Ruiz Gurillo²

1. University of Valencia, 2. University of Alicante

Humour is a multifaceted phenomenon that relies on human attributes such as perception, cognition and emotions. It is an everyday reality and occurs in all sorts of contexts and, for this reason, humour is a subject that has awakened the interest of scholars from a wide variety of disciplines, and, consequently, studies on humour have been carried out in different fields of science such as linguistics, sociology, psychology, education or medicine, to name a few.

In particular, there is a burgeoning interest in humorous discourse from a linguistic and interactive perspective and research on this issue has brought fascinating results (see Norrick & Chiaro, 2009; Chovanec & Tsakona, 2018; Yus, 2018; Mullan & Béal, 2018; Haugh & Weinglass, 2018; Sinkeviciute, 2019; Attardo, 2020; Mullan *et al.*, 2020; Chang & Haugh, 2020; Ruiz-Gurillo, 2021; Gironzetti, 2022). In this vein, this panel deals with the role of humour in different interactive settings. Contributions to this panel will take a pragmatic angle when analysing different interactive humour genres and they will show that humour is an intrinsically human phenomenon based on ambiguity that crosses many lines and boundaries, including gender, age or ethnicity.

Focusing on the shape of humour in interaction, several types of genres may be distinguished, taking into account humorous realizations (Tsakona, 2017). For instance, there are communicative contexts where humour is expected (i.e., jokes, Stand-up comedy, memes), and participants are in humorous mode. Likewise, there are other situations in which humour acts as a discursive strategy (i.e., conversation, WhatsApp, Twitter) and the interlocutors sustain and co-construct humour along several turns, both in online and offline settings. Finally, it is also interesting to analyse how humour is negotiated in genres where comicality is not expected (i.e., blogs, online forums).

Social meaning and Its place in pragmatics and sociolinguistics

Panel

***Prof. Marina Terkourafi*¹, *Prof. William Salmon*²**

1. Leiden University, 2. University of North Texas

The notion of “social meaning”– understood here as aspects of an utterance that convey information about a speaker’s social identity – has long been explored in the literatures of sociolinguistics and linguistic anthropology. It is only recently, however, that scholars in semantics and pragmatics have taken up the question of social meaning and of how it might fit into the taxonomies of the semantics and pragmatics fields. For example, in an English speaker’s ordinary use of *ain’t*, simple negation is expressed, but there is also something more, which might inform listeners of the speaker’s regional identity, social class, mood, personality, or a whole host of other identity characteristics. What kind of information is this, and how does it align with the meaning investigated in semantics and pragmatics?

Not limited to controversial forms such as English *ain’t*, social meaning is ubiquitous in language and language use. Furthermore, it not only conveys social information about its users but can also be relied upon by interlocutors in order to interpret linguistic forms at a semantic-pragmatic level. Inspired by recent work such as Eckert (2019), Beltrama (2020), Salmon (2022) and others, this proposed panel will investigate social meaning and its place in the meaning systems of pragmatics and sociolinguistics. The panel will engage with questions such as the following:

- 1) How is social meaning conceptualised by different scholars and how compatible are these conceptualisations?
- 2) How can social meaning be categorised in a taxonomy of (pragmatic) meanings, and are new categories necessary?
- 3) How similar or different is social meaning from related notions proposed in neighbouring fields, such as expressive meaning (formal pragmatics), indexicality (linguistic anthropology), performativity and perlocutionary effects (philosophy of language) and more?
- 4) In what ways is social meaning used by interlocutors in semantic-pragmatic interpretations?

Social meaning is currently being approached from multiple angles (experimental, anthropological, formal) and frameworks, and our goal is to have as many of these represented in the panel as possible. Overall, the goal of the panel will be to assess the boundaries and contents of the term “social meaning,” the meaning taxonomies into which it might fit, and its potential to lead to new analyses of socially constrained variation in interpretations.

Sociopragmatics of conflict talk and dispute resolution: Mitigation, reparation, and mediation practices

Panel

***Dr. Carolina Figueras*¹, *Dr. Inés Olza*², *Dr. Marta Albelda Marco*³**

1. University of Barcelona, 2. University of Navarra, 3. University of Valencia

Conflict talk represents the type of conversational activity in which two or more participants engage in confrontational actions conveying different positionings towards the same issue. The dynamics of a hostile exchange often brings about an array of negative emotions (Hartwick & Barki, 2002; Greco, 2008). The sequential nature of conflict talk implies that the opposing interventions are organized in successive turns. Conflict talk unfolds as an adaptative process with different stages: initiation, continuance, management and (maybe) resolution of the conflictive matter (Grimshaw, 1990).

Whereas, in recent years, the structure and components of conflict talk have been the focus of attention in the areas of conversational and discourse analysis, sociolinguistics, and pragmatics (cfr. Evans, Jeffries & O'Driscoll, 2019; Koester, 2017), much less attention has been devoted to the range of mitigation procedures that are applied to alleviate, resolve, or repair the effects of verbal confrontation between the parts in conflict. In fact, when a dispute ensues, participants may opt for two different routes: to escalate or to deescalate the conflict. The present panel focuses, precisely, on the procedures that either intensify or mitigate the hostilities between two or more parties (cfr. among others: Caffi, 2007; Olza, 2017; Figueras, 2021; Albelda & Estellés, 2021). Within the mitigation set of practices, we aim to examine two main types: the ones directed toward the reduction of the distance between stances, viewpoints, or positionings, and the ones which target the negative emotions of antagonism and stress associated to verbal conflict.

We seek to shed light on how conflict is managed and negotiated in diverse communicative settings, either directly by the parties in dispute, or through a mediated intervention with a professional (legal advisor, psychotherapist, mediator, etc.) (Garcia, 2019). The following contexts are within the scope of our interest:

1. Ordinary face-to-face conversation
2. Online supportive interactions
3. Doctor-patient interactions
4. Mediation processes
5. Family therapy
6. Intercultural mediation

Solitude speech: Empirical challenges

Panel

*Dr. Mitsuko Izutsu*¹, *Dr. Katsunobu Izutsu*²

1. *Fuji Women's University*, 2. *Hokkaido University of Education*

The aim of this panel is to bring together papers that address language-related issues on solitude speech (or monologue), namely, the use of language with no ostensible intention of speaking to others. Solitude speech can be vocalized or unvocalized; vocalized private speech is often assumed to be “internalized” into unvocalized one through the acquisition of language (Vygotsky 1934/1986). Vocalized solitude speech is likely to occur without any addressees, and if with any addressees, it only appears in the form of an aside or as a response cry (Goffman 1978). The presence of an observer (Labov 1972) is so influential that it may hinder the production of the speech. Unvocalized solitude speech is known as “inner speech” (Vygotsky 1934/1986), and as the name suggests, it does not have a substantial form. Thus, the data used for the research of solitude speech are not easy to gather in the spontaneous form of language, which causes the research field to fall far behind conversational studies (see Diaz 1992 for methodological problems of private speech).

Despite such difficulty, various attempts have been made to collect speech samples of solitude speech. For vocalized solitude speech, Hasegawa (2005, 2010a, 2010b, 2011) collected the data of “soliloquy” in an experiment that asked the subjects to speak aloud their thoughts while alone in a room. Izutsu, Kim, & Izutsu (2022) conducted a questionnaire survey to elicit utterances that the subjects consider they would produce in situations of Goffman’s response cries (see Koguma & Izutsu 2022 for a similar line of research). Du Bois (2009, 2011) created a corpus of solitude speech, which was collected remotely from a subject wearing a portable digital recorder. The verbal manifestation of solitude speech can also be extrapolated through the examination of diaries (Hirose & Hasegawa 2010) or the on-stage monologue of dramas (Caluianu 2021).

Though invisible by nature, unvocalized solitude speech can also be investigated through the literary representation of thought in interior monologue, off-stage monologue (Caluianu 2021), or reported discourse (Takahashi 2021). In psychology, various methods have been developed to explore the nature of inner speech: for example, “descriptive experience sampling” (DES) (Hubert & Heavy 2006) and electromyographic recordings of lip and tongue movements (Sokolov 1972).

Our panel is aimed at sharing recent findings on solitude speech, taking into consideration what kinds of methodologies can be used to elucidate various issues of solitude speech. It will seek to address questions including the following:

- How is it possible to collect authentic linguistic material of solitude speech?
- Other than authentic speech samples, what kind of data is available for the investigation of solitude speech?
- Are there cross-linguistic measures that help compare solitude speech samples in different languages?
- How are linguistic (lexical and morphosyntactic) facts observed in languages useful for further understanding of solitude speech (e.g., “displayed monologue” in Spronck 2021)?
- How is solitude speech linguistically differentiated from speech for communication?

The papers in this panel will explore these questions through the investigation of specific issues on solitudes speech.

Sound patterns in interactions between human and nonhuman animals

Panel

***Prof. Beatrice Szczeppek Reed*¹, *Dr. Katariina Harjunpää*²**

1. King's College London, 2. Tampere University

The panel explores the prosodic and phonetic design of vocalizations made in the context of human-nonhuman interactions. Such sound patterns may be found in human talk designed for nonhuman animals and also in nonhuman animals' vocalizations. Interspecies interaction has received increased attention in recent decades. Several studies in Conversation Analysis and related areas have investigated pet-directed talk for how it contributes to interactions between humans, such as Bergmann (1988), Tannen (2004), and Roberts (2010), who focus on pets as 'thematic resources' (Bergmann 1988: 305) that humans draw on to manage their interactions. Other work has begun to unpack interspecies interaction as an object of study in its own right, for example, at the vets (McMartin, Coe & Adams 2014; Lohi & Simonen 2021) but also in everyday interactions (Mondémé 2019; 2021; Harjunpää 2022). The sound patterns of human-nonhuman interactions have so far been under-explored, despite their central role in the performance of the human-nonhuman relationship (but see Simonen & Lohi 2021; Cornips 2022; Harjunpää 2022). Some attention in this area has been on comparing pet-directed talk with 'baby talk' (Mitchell 2001). The panel seeks to bring together work that sheds light on fundamental issues regarding the nature of the sound patterns that can be identified in interactions between human and nonhuman animals; the role of sound patterns in the organization of human-nonhuman interaction; and what the use, delivery, and sequential positioning of sound patterns tells us about the engagement of nonhuman animals as co-participants. Sound patterns may include the prosodic and phonetic delivery of verbal turns by humans as well as nonlexical vocalizations by human or nonhuman participants.

Stance-taking, differentiation and (a)typicality in discourse: Ideologies of language, personhood, and competence in multilingual communities

Panel

***Dr. Jacqueline Messing*¹, *Dr. Kathe Managan*²**

1. University of Maryland-College Park, 2. University of Louisiana Lafayette

This panel will examine scalar notions of typicality and a-typicality through an analysis of narrative, performance and discourse data we have each collected as part of ethnographic observation and archival research. Our fieldwork includes qualitative interviews and recordings of socially-occurring interaction and public performance, both in real life and online during the pandemic. We focus on ideologies of language, personhood, and competence in multilingual and multimodal communities across differing cultural contexts. The social actors in our discourse include college students and political campaigners in the U.S., comedy sketch participants in Guadeloupe, bilingual-intercultural teachers in Mexico, a deaf-hearing signing community in Ireland and Ukrainian speakers codeswitching in Russian on Facebook. We explore speakers' stance-taking in interaction, ideological differentiation, and other pragmatic strategies they employ to compare and position themselves, and others, with respect to contested notions of typicality and a-typicality. Speakers in our field sites participate in local pragmatics and sometimes contest ideological stances through position-taking towards goals of seeming more or less "local," "Indigenous/non-Indigenous," "Native/Non-Native English Student," "old-fashioned" or "traditional," "deaf or hearing," "modern" or "diverse."

In each field site, ideological discourses about linguistic multimodality, nationality, race, discrimination, modernity, gender and notions of expertise circulate through the nation-state and communities at multiple scalar levels (Irvine & Gal 2019). Our analyses will consider: What constitutes a "pragmatic a/typicality" in communities where Kréyol/French, Nahuatl/Spanish, Ukrainian/Russian, Non-Native Englishes and sign languages are spoken? How do ideologies of linguistic purism affect bilingualism? How do ideologies of native/non-native English speaker categories shape interactions between international design students? How does language modality accommodation underlie notions of typicality and atypicality of personhood in a given community?

Storytelling about and over food

Panel

Dr. Polly Szatrowski¹

1. University of Minnesota

This panel focuses on how storytelling about/over food is used to support assessments, categorize and identify food, and negotiate identities. According to Lakoff (2006:143, 165) “[w]hat we can and cannot eat, what kinds of edibles carry prestige, how much we are expected to know about what we eat ... are aspects of individual and group identity” and “‘minor identities’ like culinary preferences and sophistication contribute significantly to our sense of ourselves”. However, if identity is viewed as discursively constructed meanings constituted by the interactive performance of a multi-faceted dynamic mix of identities (Butler 2004, Bamberg, De Fina & Schiffrin 2012, Brunner 2021), these “identities are not created by the food that they eat per se. Rather, ... [they] are established, shaped and shared through the talk about food” (Koike 2014:182) and used to negotiate interpersonal relationships (Karatsu 2012).

Interaction over food prompts frequent multimodal storytelling using the food as a joint locus of attention. Building on research on storytelling in interaction (Sacks 1992, Labov 1973, Jefferson 1978, C. Goodwin 1984, Maynard 1987, M. Goodwin 1990, Norrick 2000, Szatrowski 2010, Karatsu 2012), the panelists investigate:

- What kinds of stories about/over food are told by whom?
- What triggers the stories in the interaction?
- How do stories influence the assessment and categorization of food?
- How are the stories contextualized and used to establish, share, and shape identities?

The data come from focus groups on food in English and conversations during Taster Lunches in English, Japanese, and German. In English focus groups participants use stories to soften their negative stances by positioning themselves as “others”, create distance and avoid taking responsibility for food evaluations. In German Taster Lunches, food is used as a starting point for stories that anchor speakers’ evaluation and establish their (non-)expertise. Storytelling expresses individual/joint stance(s), showcases identit(ies), and can place food in a personal, historical, or fictional setting and express humor. Stories in Japanese Taster Lunches related to the appearance, taste, smell, shape of the food, use of eating utensils, eating order, etc., while others were triggered by an amusing association with something in the meal/conversation. The stories often refer to aspects that are important in participants’ culture/social groups (Bourdieu 1984, Ochs & Shohet 2006). Stories about past food experiences support food evaluation. Congruent responses and second stories confirm evaluations and create shared identities, while stories that support differing evaluations lead to varying identities.

Results contribute to the growing body of research on multimodal stories told in interaction by elucidating how stories related to food and eating are triggered and developed in interaction through language, the body, and the food, and are employed to negotiate individual/group identities and interpersonal relationships. They also contribute to cross-cultural understanding, food development and marketing.

Student practices in educational interaction

Panel

***Dr. Myrte Gosen*¹, *Dr. Karianne Skovholt*², *Dr. Marit Solem*²**

1. University of Groningen, 2. University of South-Eastern Norway

This panel highlights student practices in educational interaction. While the traditional take on classroom interaction is based on *the teacher* as being the one who is actively taking the lead in interaction, there is an additional need for more knowledge on how *students* interact in different educational contexts. This panel gives the floor to scholars from different educational settings to present their work with various perspectives on student practices in educational interaction.

Recent work on teacher practices provides important insights in how teachers behave interactionally in the 21st century classrooms. Studies focusing on more discussion-based approaches (e.g. Gosen, Berenst & de Gopper, 2015; Willemsen, 2019) for instance illustrated that teacher practices entail initiations that elicit reasoning or discussion, such as open invitations (Willemsen et al, 2018), requests for opinions (Van Balen et al, 2022) and utterances with downgraded epistemic stance markers (Houen et al, 2019; van der Meij et al, 2022). Recent work on student initiatives in classroom interaction includes Batlle Rodriguez & Murillo Wilstermann, 2018; Dolce & Van Compernelle, 2020; Duran & Sert, 2021; Kardas Isler et al, 2019; Merke, 2018; Skovholt, 2018; Solem, 2016a; 2016b; Waring, 2011. This panel offers room for similar contributions with analyses of student practices in whole-classroom interactions.

Besides that, studies with a focus on peer interactions (e.g. Herder, 2020, Jakonen & Morton, 2015; Pulles, 2021) that offer closer insight in students interacting amongst each other without continuous presence of a teacher are well represented in this panel. From kindergartners working together to university scholars collaborating in an online environment, the contributions in this panel focus on student practices in these different settings in which they interact with peers.

All together, we are aiming to create an overview of contributions with an interest in student practices in a different range of educational settings. In addition, all the contributions take a view on learning as it is happening in these settings. This ranges from learning to write, to learning to assist each other, to the learning of an L2. The overarching goal of this panel is to discuss the current state of research with a focus on student practices, as well as to discuss future research needed in this particular direction. Tom Koole, with great experience in teacher and student practices in classroom interaction (e.g. Koole, 2007; Koole 2010; Koole, 2012; Herder et al, 2022; Pulles et al, 2022; Van Balen et al, 2022; Willemsen et al, 2018) agreed to act as a general discussant during this panel.

Symptomatic speech: A challenge for pragmatic approaches

Panel

Dr. Maria Francisca Lier-DeVitto¹, Dr. Lucia Arantes¹

1. PUC-SP

It could be stated that Pragmatics has become a common source of investigation for Language Acquisition and Language Pathology researchers, as well as for clinicians. The reason for such a theoretical-descriptive option or convergence could be attributed to the fact that Pragmatics has been traditionally concerned with communication principles and with the nature of specific social interactions. Therefore, the focus of that field of studies is directed to both the language users' intentions to convey meaning and the addressee's ability to grasp them, i.e., to interpretation skills. This panel aims at examining whether the pragmatic theoretical framework and methodological models have been consistently applied and incorporated in the above-mentioned areas. This panel addresses questions related to the way interaction and communication concepts have been approached in some representative Language Acquisition studies and, more specifically, in those carried out in the Speech Therapy clinical field. It is here assumed that both children's utterances and symptomatic speech logically involve asymmetric dialogical contexts. It should be said that although psychologists, linguists and clinicians have taken therapeutic interactions under consideration and tried to characterize specific interactional contours in order to delimit their particular structural facet (Mondada, 1997; Labov and Fanshel, 1977; Gale, 1991), issues proper to either children's speech and symptomatic speech have not been extensively discussed. It is argued here that the extremely unusual nature of the linguistic compositions that define either children's speech or pathological speech determine the unique communicative quality involved in each interactional situation they are implied. No doubt, it seems important to consider the existing inner difference between adult-child and therapist-patient dialogues. Indeed, children's speech and symptomatic speech promote deep unbalanced interactional events. It is also claimed that this subject matter has not, so far, been properly and rigorously discussed by researchers who resort to Pragmatics when dealing with such asymmetric interactions. Alongside a theoretical exploration concerning how concepts and principles from Pragmatics appear in representative works from both areas of Language Acquisition and Speech Pathology and clinical areas, children's speech and as well as symptomatic speech data collected during clinical sessions will be analyzed and discussed in order to demonstrate the unique nature of asymmetrical interactions caused by strange atypical speech compositions such as those produced by children and pathological speech. The methodological option adopted places side by side data analysis and the arguments raised and developed. The theoretical position here assumed is linked to the European Structuralism (Saussure, Jakobson, Benveniste) and Psychoanalysis (Freud, Lacan) as fundamental theoretical bases regarding language and the subject speaker, as far as pragmatics is concerned, Austin and Grice, Levinson, Parret and Verschueren are authors consulted and studied. This panel aims at establishing an empirical exploration of the above mentioned theoretical questions.

Tales from the South: Doing narrative analysis beyond the canon

Panel

***Dr. Liana De Andrade Biar*¹, *Dr. Naomi Orton*¹, *Dr. Liliana Bastos*¹**

1. Pontifícia Universidade Católica do Rio de Janeiro (PUC-Rio)

Scholars in the field of narrative analysis have long argued in favour of a shift from the study of “prototypical” labovian narratives to those that flout the canon. However, definitions of what may be considered typical/atypical and worthy of study still tend to be set in the privileged research centres of the Global North. This panel therefore seeks to unite those working beyond such boundaries in order to reflect on the shape of narrative and interaction in the Global South.

The field of narrative research tends to be committed to the social and political agenda of decolonial contemporary applied linguistics (as per Moita Lopes, 2006), aligned with pragmatic perspectives of interaction and discourse analysis. We further take the view that, guided by such an agenda, narrative analysis has the potential to stretch disciplinary boundaries - enabling scholars to unite detailed microanalysis of narrative practice with methodological tools derived from disciplines such as anthropology and sociology to philosophy, facilitating collaborations with researchers from beyond their own immediate field of study.

By zooming in on the sites of engagement in which storytelling takes place, researchers may thus focus attention on any number of the interactional goals for which narrative may be exploited: from the production of identity and the contestation/reinforcement of beliefs, values, labels and political structures to the creation of coherence, cultivation of relationships/affiliations and stirring of audiences into action. By understanding narrative as a situated practice which offers snapshots of the wider discursive struggles in which social actors are inevitably engaged, narrative analysis as a microanalytical tool allows scholars to reflect on such issues and the ways in which they may be indexicalised and negotiated at the level of interaction.

With this in mind, this panel showcases contributions guided by this perspective and which seek to shift the spotlight from so-called “developed” countries and the Western discourse and epistemes produced there, to the fringes of the globalised system, so that the “Master Narratives” and canonical definitions of the Global North may be reshaped (Boaventura Santos, 2007).

The papers featured have largely been developed in research centres in the Global South and discuss the ways in which scholars have adapted theoretical contributions from the field of narrative analysis or have formulated new concepts in order to prioritise the examination of issues faced by those whose stories have long been silenced.

Sites of investigation are varied in nature and span the following issues: access to public health and power dynamics in clinical settings; state violence, gendered violence and the erosion of human rights; forced migration and institutional racism; protest and social movements; media and newslike narratives; neoliberalism and meritocracy, amongst others. The panel further proposes reflections on the relations of power which inevitably inflect research proceedings and the ways in which these work to shape interaction in research settings.

Telling/not telling stories in discourses about Japan under atypical situations

Panel

Prof. Kaori Hata¹, Dr. Akira Satoh¹

1. Osaka University

Several years ago, we could not expect what's going on in the world right now. Since the beginning of 2020, we have learned that all human beings are still vulnerable to infectious diseases such as COVID-19. Since 24 February 2022, we have also learned that a world war is not necessarily a thing of the past. 2022 Russian invasion of Ukraine dramatically changed the international relations not only in the West but also in the East. These atypical situations often uncover what is normally concealed, including, prejudice, discrimination, and inequality, that is, something we can't speak openly at ordinary times. This panel deals with telling/not telling stories in discourses concerning Japan (and sometimes in comparison with other neighboring countries such as South Korea, China and Russia) under situations deviating from normal expectations, found in media, government statements, interviews, and daily conversations.

According to Georgakopoulou (2011), stories include not only full-fledged narratives studied in Labov (1972) but also tellings of ongoing events, future or hypothetical events, shared or known events, allusions to previous tellings, deferrals of tellings, and refusals to tell. In this panel, although we examine various types of stories, we pay special attention to refusals to tell and stories on taboo.

Many of these stories are about prejudice and discrimination based on diseases, nationalities and races, and they allude/refer to untouchable issues in Japan, such diseases as leprosy (also known as Hansen's disease) and schizophrenia, strict immigration policy, the struggles between Japan and Korea due to the memories of the previous war, and so on. For example, one of the presentations investigates the interactions among multiple Japanese participants living in the U.K., who are potentially victims of discrimination as Asian telling in real or hypothetical stories when COVID-19 was raging around the world. It also analyses telling/not telling of stories about a boycott of Japanese products in Korea when tensions between the two countries rose. Some Japanese women married to Koreans tend to refuse to tell the stories with her Korean partners in order to avoid disputation, while others positively discuss and research the issue together to find the common ground. In such a case, taboo is alluded in various linguistic/non-linguistic manners and strategies to be maintained as something forbidden to tell in the society.

Through these presentations about various 'telling/not telling' stories, this panel will multilaterally reveal how taboos are hidden in communities at ordinary times and how they surface at extraordinary times.

The complex relationship between pragmatics and theory of mind: Empirical evidence across populations and theoretical consequences

Panel

Prof. Valentina Bambini¹

1. iuss

This panel explores one of the most relevant topics for the understanding of the cognitive status of pragmatics, namely its relationship with theory of mind (ToM).

Following the Gricean idea of the centrality of intentions in the definition of the speaker's meaning, theoretical approaches have often emphasized the mindreading roots of pragmatics [1,2]. However, empirical evidence is scattered [3]. Neuroanatomically, pragmatic tasks and ToM tasks recruit partially overlapping brain regions [4], but in the behavioral response these two domains are not robustly linked. Very early pragmatic skills seem to heavily rely on social cognition aspects such as joint attention [5], but data on older children depict a more complex scenario where inferential pragmatic skills are related to a multiplicity of factors, not limited to ToM [6,7]. Interestingly, recent data suggest that early pragmatic skills might predict later ToM skills, rather than viceversa [8]. In atypical populations, both children and adults, ToM difficulties often coexist with pragmatic difficulties [9,10], but their predictive role is debated [11]. Also, there might be differences across pragmatic tasks [12], from more grammar-related (e.g., scalar implicatures) and vocabulary-related (e.g., metaphor) to more social uses of language (e.g., irony), and even across different classes of the same phenomenon (e.g., physical vs. mental metaphors [13]).

Such a variegated landscape calls for a unified discussion, which is vital to get a clearer view of the cognitive status of pragmatics at the theoretical level and to account for empirical data. This is the purpose of this panel, which brings together scholars investigating the relationship between pragmatics and ToM from a multiplicity of angles and with an eye to the multiplicity of pragmatic phenomena.

The cross-cultural pragmatic study of intercultural encounters: (Strictly!) language-anchored inquiries

Panel

***Prof. Juliane House*¹, *Prof. Daniel Kádár*², *Prof. Meredith Marra*³**

1. University of Hamburg, 2. Dalian University of Foreign Languages & Research Institute for Linguistics, 3. Victoria University of Wellington

The aim of this panel is to bring together research dedicated to the cross-cultural pragmatic investigation of intercultural encounters. As the organisers of this panel argued in two recent books (House and Kádár 2021; Edmondson et al. 2022), a key strength of cross-cultural pragmatic research is that it allows us to investigate intercultural encounters in strictly language-anchored and bottom-up ways. Cross-cultural pragmatics offers rigorous and replicable methods to study intercultural encounters with the aid of language-based evidence only, and without relying on non-linguistic analytic concepts such as ‘values’ and ‘ideology’. As such, cross-cultural pragmatic research also neatly complements intercultural pragmatics because it utilises a very different methodological and ontological universe than the latter.

Notwithstanding the potential of cross-cultural pragmatic research in advancing the analysis of intercultural encounters, to the best of our knowledge little attempt has been made to bring together cross-cultural pragmatians to systematically study intercultural encounters from a strictly language-anchored point of view. This panel aims to fill this knowledge gap. We will request panelists to devote particular attention to aspects of cross-cultural pragmatic methodology with relevance for the study of intercultural encounters. In particular, we encourage panelists to focus on the problem of how it is possible to interconnect instances of pragmatic misunderstanding which emerge in intercultural interaction with linguaculturally embedded conventions that trigger such instances of misunderstanding.

The cross-cultural pragmatics of language and politics

Panel

***Prof. Daniel Kadar*¹, *Prof. Juliane House*², *Prof. Zohar Kampf*³**

1. Dalian University of Foreign Languages & Research Institute for Linguistics, 2. University of Hamburg, 3. Hebrew University of Jerusalem

The aim of this panel is to provide a platform for engaging in cross-cultural pragmatic research in the area of language and politics.

The organisers of this panel recently argued (see House and Kádár 2022: 132) that language and politics is an emotively and ideologically loaded area. Because of this, it is important for the analyst to attempt to leave behind personal sympathies and antipathies, ideological presumptions, etc. in the study of political language use. Contrastive cross-cultural pragmatics offers itself as a particularly useful field for the study of political language use. This is due to the contrastive take of cross-cultural pragmatics, which allows researchers to relativise both their own viewpoints and the phenomena they set out to investigate. Cross-cultural pragmatics also enables more anti-essentialist and non-ethnocentric interpretations of instances of political language use.

Our goal in the proposed panel is to capitalise on the above-outlined strength of cross-cultural pragmatics and bring together high-calibre scholars who have worked on language and politics. The goal of the panel is not only to compare political language use in a wide range of linguacultures, including typologically distant ones (e.g. German–Japanese, English–Chinese, etc.), but also to extend contrastive explorations onto the comparative analysis of various genres and modes of communication of political language use. We hope that the panel will not only open new vistas of pragmatic research on language and politics but also provide new synergies between scholars working on pragmatics and other areas such as discourse analysis, communication studies, and media. To achieve this objective, we intend to advertise the proposed panel both on Linguistlist and mailing lists of other academic communities.

The feedback society: Discourses, identities, modalities

Panel

*Prof. Sylvia Jaworska*¹, *Prof. Camilla Vasquez*²

1. University of Reading, 2. University of South Florida

Mechanisms for evaluative feedback have become enmeshed into the fabric of nearly every aspect of contemporary society. Spanning a wide range of contexts, social relationships and modalities, the production – and reception – of feedback is always a discursive activity. Conceptualized broadly, feedback can take many forms, for example: diverse types of performance reviews in workplace organizations (Correll et al., 2020); evaluations of products and services in online consumer reviews (Vásquez, 2014); patients' assessments of healthcare services (Baker et al., 2019); as well as academic peer reviews (Paltridge, 2017), to name a just few. Several of these feedback activities are underpinned by neoliberal ideologies related to organizational efficiencies, professional effectiveness, or the constant project of improving the self. Feedback activities are never ideologically neutral: they often entail power relations, gatekeeping, or other forms of control and surveillance. Feedback also involves subjectivity and any act of evaluative feedback may involve unexamined biases, whether of a personal or structural nature. Recognizing that acts of evaluation are never *only* about the object or focus being assessed – but are also productive sites for identity construction and the positioning of selves – discursive feedback always includes stancetaking (Du Bois, 2007; Kiesling et al., 2018). Providers of feedback may engage in epistemic stancetaking (Parini & Fetzer, 2019) to position themselves as experts, authorities, or otherwise entitled to offer assessments and to make judgements. Often, feedback also involves considerations of face, (im)politeness and other forms of relational work that might be influenced by the socio-cultural context in which feedback was produced and received. As an increasing number of our social and professional activities take place in networked contexts, many genres of feedback today involve the use of multiple modes and materialities of communication. This panel brings together researchers interested in feedback as a discursive practice. We invite scholars studying not only diverse genres of feedback, but also those who adopt diverse methodological approaches to the study of feedback. Of special interest are forms of feedback that take place in professional contexts; types of feedback (and/or responses to feedback) that appear in digitally mediated or otherwise networked spaces; and genres of feedback that involve multiple modalities and/or materialities. Contributions address some of the following questions:

1. How is authority or expertise constructed in feedback?
2. What entitlements are signalled by the individual(s) offering evaluation?
3. How do feedback-givers align with others, construct various forms of sociality, or engage in relational work within their evaluative texts or activities?
4. In what ways do specific genres of feedback reflect cultural differences?
5. In what ways is feedback-giving influenced by social factors including age, gender, race, ethnicity, socio-economic status?
6. How are various racial, ethnic, gender biases and stereotypes embedded and reproduced in feedback?
7. How do mechanics of power and control play out in the discourse of feedback and how can those be discursively challenged or resisted?
8. How are diverse modalities (and/or materialities) exploited in discursive feedback?

The impact of participants' orientation in space on the functions of gaze in interaction

Panel

*Ms. Barbara Laner*¹, *Dr. Elisabeth Zima*¹

1. *University of Freiburg*

Recent years have witnessed an increased interest in the study of gaze in interaction. However, most studies have focused on static, often semi-experimental settings in which the participants face each other (e.g. Rossano 2012, Kendrick & Holler 2017, Auer 2018). There is significantly less work on the gaze patterns found in other types of F-formations (vis-à-vis, side-by-side, and L-shaped F-formations, Kendon 1990). The aim of our panel is to shift focus to these lesser studied configurations (see e.g. Mondada 2014, Stukenbrock & Dao 2019) and to explore whether and how the functionality of gaze is dependent on participants' spatial arrangement (as argued by Auer & Zima 2021). This includes the question as to when and for which interactional purposes, participants in atypical F-formations and mobile settings gaze at each other. In these formations, the bodies of the participants are prototypically directed into the space before them and unless they turn their heads, they are not gazing at each other. Thus, their transactional segments usually only peripherally overlap, or at times, there is no shared *o-space* (Kendon 1990: 233ff.) at all, i.e. whenever the participants gaze to their sides.

The contributions to this panel address gaze patterns in various spatial configurations (static and mobile; side-by-side, vis-à-vis, triangular etc.) and interactional settings (dinner table conversations, orchestra rehearsals, museum visits, VR environments). Many contributions combine external cameras and eye tracking data to analyze interactants' gaze behavior but the range of technologies used to study gaze (or the lack thereof) even extends to VR glasses. Given this divergence in F-Formations, interactional tasks, and ways to capture and analyze gaze, we expect this panel to make a significant contribution to the discussion about the influence of the setting and the participants' orientation in space on the functions of gaze in interaction.

The pragmatics of body, mind and technology – different approaches to theorizing and analyzing digitally mediated interaction

Panel

*Dr. Andreas Candefors Stæhr*¹, *Prof. Lian Malai Madsen*¹

1. University of Copenhagen

Research on social relations, personhood and communication in current mediatized societies can adopt different strategies when trying to capture, describe and understand how digital technologies figure in human life. One strategy is to emphasize the newness of current conditions and how this entails new conceptualizations and terminological vocabulary. Another strategy is to look at current conditions through existing theoretical perspectives and consider how these can be applied to enlighten and explain human social life and interaction in digitally mediatized societies.

An example of the first is the posthuman perspective that emphasize the intersection of body, mind, technology and materiality and deconstructs the divide between human and machine in various ways (Pennycook 2018). This is, for instance, done by drawing on terms such as “*the extended mind*” (Clark 2008) - a notion that offers an alternative way of understanding human actions and thought by pointing to how technological devices expand the ways humans experience and understand everyday life and store memories. This line of thought is closely related to Mitchel’s (2003) notion of “*mobile cyborgs*” which suggests that there are no clear boundaries between “internal cognitive processes and external computational ones” (Mitchel’s 2003:38). Examples of the second strategy are Rampton’s work on digital surveillance and governmentality based on the works of Gumperz and Foucault (Rampton 2016, 2022), the application of conversation analysis to digital communication platforms (Meredith and Potter 2014) or adaptation of Goffman’s approach to the presentation of self in analysis of internet communication (Dell 2002). These two tendencies relate to wider debates in language research about the academic economy forging once widespread and popular agendas and concepts to be denounced and replaced with new ones, which are proposed as better to address new circumstances in a more accurate and perceptive way.

In this panel we ask: Is new always better? When and why are new approaches necessary? We invite papers representing both strategies in order to explore the possibilities and limitations of existing and new theorizations and analytical tools addressing the relationship between body, mind and technology related to digitally mediated interaction and human use of technological devices. We welcome both application of and reflection on analytical approaches to situated communication and more general theoretical discussions of the relationship between cognitive and affective processes, communicational experience and practices and technological devices in human social life.

The pragmatics of digital disinformation

Panel

Prof. Zhuo Jing-Schmidt¹

1. University of Oregon

Digital media has transformed the way information is produced, communicated, transmitted, and consumed (Castells 2009). A byproduct of these transformations is the rampant spread of disinformation in the digital media space where the boundaries between user-generated content and traditional mass media have become ever more blurred (Terzis et al. 2020). This panel takes the lens of linguistic pragmatics on digital disinformation where disinformation is defined as information intended for deliberate deception.

This panel is intended to draw scholars working on discourse in social media, digital language, media communication, and anyone interested in the role of language use in social media where disinformation looms large and poses threats to truth that is central to democracy and a civic society. The complex nature of the phenomena calls for interdisciplinary approaches in addressing the relevant research questions.

The pragmatics of human-machine interaction

Panel

***Dr. Rita Vallentin*¹, *Dr. Miriam Lind*², *Prof. Britta Schneider*¹**

1. Europa Universität Viadrina, Frankfurt (Oder), 2. Johannes Gutenberg University Mainz

Even though the field of human-machine interaction (HMI) is blooming and both computer science and linguistics provide increasingly detailed insight into the communicative abilities of voice-based devices and the ways humans engage with emerging technologies, pragmatic aspects of actual in-the-wild interaction are rarely addressed. Existing pragmatics research on HMI largely addresses two areas, politeness and communication breakdowns/repair strategies. Studies on politeness in HMI are predominantly done for English and don't reach beyond the use of greetings, *thank you* and *please* which are then dismissed as "mindless politeness" (Lopatovska/Williams 2018) and indirectness (Briggs/Williams/Scheutz 2017). The repair of communication breakdowns is largely a human responsibility and takes place through repetition, reformulation, and adjustments of prosody/articulation (Beneteau et al. 2019). Other aspects of pragmatics, e.g. implicature and presupposition, deixis and reference, information structure, affective and evaluative linguistic practices remain unaddressed. This panel provides a first step towards a richer engagement with the pragmatics of human-machine interaction. Contributions will address a variety of aspects of pragmatics in the sense of language use in everyday HMI, taking "a general functional perspective on (any aspect of) language, i.e. as an approach to language which takes into account the full complexity of its cognitive, social, and cultural (i.e. 'meaningful') functioning in the lives of human beings" (Verschueren 2012).

The pragmatics of the referential process and its interpretation

Panel

Dr. Carmela Sammarco¹, Dr. Alfonsina Buoniconto¹, Dr. Debora Vena¹

¹. Università degli Studi di Salerno

This panel aims to promote and compare theoretical and empirical studies investigating the co-construction of reference (Abbott 2010; Brandom 1984; Evans 1982) with particular emphasis on the pragmatic conditions that determine its (mis)understanding by the interpreter (Morris 1938) of a speech act performed through different modalities (written, spoken, dialogic-conversational, etc. (Voghera 2017)).

Studies on comprehension show how the necessary ability (Balota *et al.* 1990; Verhoeven & Van Leeuwe 2008) to decode the surface elements of an utterance is not *per se* sufficient for an effective comprehension (Corno 1991; De Mauro 1985; Ferreri 2019; Kintsch 1998; Lumbelli 2009; Orrico & Sammarco 2021; Piemontese 1996). This is particularly true for reference comprehension (Buoniconto 2022). It is now established that, from a pragmatic point of view, reference is the action of verbally pointing to “a certain object or individual that one wishes to say something about” (Carlson 2006). In order for this action to be successful, the addressee of the message needs to be able to recognize the relation existing between a linguistic expression and its referent, be it an extralinguistic (Halliday 2014) or a metatextual entity (anaphoric encapsulators) (Berretta 1990; Conte 1991; 1996; 1999; Korzen 2015).

Thus, reference construction has a strong interactional-mediational nature (Auer 1984; Calaresu 2018, in press; Clark 2004, 2022; Enfield & Stivers 2007; Jucker *et al.* 2003; Sidnell & Enfield 2017) and context dependency: not only does the speaker select reference expressions following addressee-oriented procedures, but, since referring expressions need to be worked out contextually, the identification of a referent by the addressee may be different from that originally intended by the speaker.

In spite of the increasing awareness on the interactional nature of reference (co)construction, as well as of its place at the semantics/pragmatics interface (Carston 2017), a systematic investigation on how this linguistic operation unfolds is still to be sought for. The panel means to gather studies shedding light on reference comprehension from different theoretical perspectives (text linguistics, discourse analysis, translation studies, semiotics, language teaching, language acquisition, language education, clinical linguistics, socio- and psycholinguistics, etc.) and applied to different study domains (spoken, written, text readability, L1/L2 interlanguage, language disorders, etc.).

Interpreter-oriented variables that could be taken into account are:

- (a) the co-presence or non-presence of the speaker and the receiver in the enunciative situation;
- (b) the amount of information that the receiver and the speaker share;
- (c) the interactional ability of the receiver.

Point (a) relates to the different strategies for comprehending and/or constructing the reference in the spoken and written modalities respectively (different degree of textual planning, greater or lesser specificity of the reference). Point (b) relates to the shared encyclopedic and experiential background which both receivers and speakers may use to fill informational gaps. Finally, point (c) relates to the physical abilities and disabilities (hearing impairment, aphasia, learning disorders) involved in interaction, which necessarily condition the speaker's linguistic choices to eliminate elements that may be an obstacle to comprehension and make inferences less implicit.

The pragmatics of trusting (artificial) others

Panel

***Prof. Kerstin Fischer*¹, *Dr. Bracha Nir*²**

1. University of Southern Denmark, 2. University of Haifa

Trust is a necessary ingredient for much, if not all, social interaction (e.g. Weber, Weber & Carter 2003), cooperation (McCabe, 2003) and sense of belonging (Baumeister & Leary 1995). Furthermore, we usually assume others to be truthful (e.g. Grice 1975), honest (Bellucci & Park 2020), trustworthy (e.g., Sheard 2015), and able to fulfill their promises (Friedrich & Southwood 2011).

More recently, artificial communicators are pushing into our social lives, such as health apps, life coaches, message bots, personal assistants, AI-powered human resource management systems, autonomous cars, and even social robots, asking for our trust (or their developers do, cf. Anton et al. 2020). Methodologically, this provides us with the unique opportunity to investigate what influences trust, and how it is negotiated and regulated in interaction, since one of the interaction partners can be entirely controlled. While many psychological determinants of trust (e.g. Lokshina et al. 2020; de Visser et al. 2020) have been identified, the aim of the proposed panel is to investigate what linguistic, nonverbal and pragmatic strategies are related to building trust, how trust is built dynamically in interaction, what aspects of the context influence these dynamics, and what strategies could be used to make people trust the system less, given that it may indeed not be trustworthy. We approach these and other issues from a multidisciplinary perspective, with linguists, sociologists, communication scientists, philosophers, psychologists, information and computer scientists, engineers, and digital media designers contributing to our understanding of the pragmatics of trusting (artificial) others.

We will discuss linguistic, nonverbal and pragmatic strategies related to regulating trust, studies on context factors involved in trusting, and dynamic accounts of trust negotiation in interactions between humans, and between humans and artificial interaction partners.

The roles of new speakers in the revitalization of endangered languages

Panel

*Dr. Yumiko Ohara*¹

1. *University of Hawai'i at Hilo*

Increased attention to the situation of indigenous languages has been seen not only in academia but also in the venue of international politics. After 2019 was designated to be International Indigenous year, the United Nations further declared the period of 2022 to 2032 as the International Decade of Indigenous Languages, a move intended to promote awareness of the endangered status of many of the world's languages. At the practical level of language preservation and revitalization, however, these declarations have led language activists to struggle with the challenging issue of how to encourage people, many of whom have become accustomed to majority languages, to learn and employ indigenous languages.

Walsh and Lane (2014) highlight some of the issues involved in facilitating an increase in 'new speakers' of indigenous languages, including the fact that acquisition generally occurs outside of the home, that the majority have made an active choice to acquire the language, and that the acquired variety is often viewed by community elders as different from traditional speech and thus unnatural. Further emphasizing differences in how indigenous languages are acquired, Wilson suggests, based on his work with the Hawaiian language, that instead of infants and young children "College-educated young adults are perhaps the most important of all demographic groups relative to the advancement of language revitalization." (2018: 83).

To be sure, the situations of indigenous languages vary widely throughout the world and there is thus no one pre-determined way to engage in the revitalization process. Some languages still have a comparatively large speaker base while others do not. Some languages, such as Hawaiian and Māori, are recognized as official languages while others such as Uchinaaguchi and Jejueo are not and are still categorized by their governments as dialects of dominant languages. At the same time, though, most endangered languages share similar sociopolitical histories that have led to the power differences that serve as the basis of language endangerment.

Through presentations that consider sociopolitical histories as well as current situations, this panel will bring together researchers and activists to consider the process of promoting new speakers of indigenous languages. The panel intends to consider a diverse range of indigenous language situations and it also encourages panelists to explore cases of both successful and unsuccessful indigenous language acquisition. It is through the investigation of the successes and failures across a wide range of languages that the panel hopes to raise further awareness about language endangerment and advance efforts to preserve and revitalize indigenous languages.

The shapes of the interaction between social cognition and language use: Socio-cognitive processes in different discourse activities

Panel

Prof. Edwiges Morato¹, Dr. Erik Miletta Martins², Dr. Patrik Vezali³, Dr. Nathália Freitas¹,
Dr. Rafahel Parintins²

1. Universidade Estadual de Campinas, 2. Universidade Federal do Rio Grande do Norte, 3. Universidade Federal dos Vales do Jequitinhonha e Mucuri

This panel (organized by the COGITES Research Group (Cognition, Interaction and Meaning - UNICAMP, Brazil)) intends to gather researchers who see routine or institutional social-interactive practices and related discursive activities as prolific *loci* to better understand the functional, mutually constitutive, interrelation between language use and human cognition. In this Vygotskian- Tomasellian framework, we advance discussions on how language organizes and is organized by social cognition and how this dialectical relation affects the shapes of interactions.

In a more specific way, we are interested in shedding some light on the following question: how can discursive activities (such as referring strategies, social categorization, topic management and progression, linguistic metaphorization, argumentative strategies) trigger and/or be triggered by associated models of social cognition responsible for underpinning inferences which shape (a)typical interactions in routine or institutional contexts of language use.

Panel contributors bring data in which discursive activities not only reflect expected interactional models but seek to somehow engage interlocutors to reflect upon, and sometimes even reconfigure, the occurring model or even other models of interaction. The contributions investigate socio-cognitive processes like contextualization, conceptualization, and framing and their functional aspects capable of mobilizing a variety of discursive activities such as the ones mentioned above.

Our interest is to see how these socio-cognitive processes occur in a variety of contexts, whether they are “typical”, from a linguistic and pragmatic point of view - public speeches to daily interactions - or “atypical” language that emerges from pathologies like aphasia and Alzheimer disease. Finally, we gather discursive analyses that shed light on the linguistic and social nature of human cognition as well as the cognitive nature of social practices and language use.

The speech action of commenting across discourse types

Panel

*Dr. Robert Külpmann*¹, *Prof. Rita Finkbeiner*¹

1. Johannes Gutenberg University Mainz

Commenting is a kind of verbal behavior that is omnipresent in human communication. In everyday conversation, we frequently comment on contributions to discourse, on shared perceptive stimuli, and on all kinds of situations. With the advent of social media and multimodal communication channels, it seems that commenting has become even more important in social interaction. Comments can be made using a broad variety of linguistic forms, ranging from graphematic means (e.g., round brackets) to particular word classes (e.g., sentence adverbials) and sentence types (e.g., exclamative sentences), as well as non-linguistic means such as emojis or gestures. Comments may also take the form of whole genres, e.g., in legal, academic, or news discourse.

Most scholars would agree that by commenting something, a speaker performs a kind of speech act (e.g., Searle 1965, Posner 1972), or, more broadly speaking, speech action (Sbisà & Turner 2013: 1). It is far from clear, though, how the presumed speech act(ion) of commenting is to be defined. While most speakers will be able to apply an intuitive, everyday notion of commenting, a common linguistic definition is lacking. For example, some approaches take comments to be higher-order speech acts (Grice 1989: 362), others would treat them as one of multiple simultaneous functions of interactional turns (cf. Levinson 2017: 203), and yet others as larger (inter-)actional patterns or communicative practices (cf. Sbisà & Turner 2013: 5).

This panel brings together scholars from various pragmatic frameworks who investigate the speech action of commenting from various methodological, empirical, and theoretical perspectives (e.g., discourse analysis, corpus linguistics, the minimalism/contextualism debate), across different discourse types and media (e.g., COVID 19 discourse, gender discourse, social media), and in a broad variety of languages, such as Spanish, French, English, German, Turkish, Hebrew, and Chinese, in order to gain a better understanding of the theory and practice of this pervasive, but highly under-researched speech action. Research questions to be addressed in this panel include:

- How can we linguistically define the speech action of commenting?
- In which kinds of contexts, discourse types, or media do speakers comment on which kinds of stimuli?
- What types of knowledge (general knowledge, text type knowledge, frame knowledge, common ground etc.) do addressees need to understand comments?
- How can we distinguish comments from speech acts such as assessments, replies, explications, conclusions, criticisms, appraisals etc.?
- How are comments related to interpersonal phenomena such as humor, (im-)politeness, or stance-taking?

Types of conventionalization of communicative expressions and processes of their emergence and disappearance

Panel

*Prof. Masaki Ono*¹, *Dr. Koichi Nishida*²

1. University of Tsukuba, 2. Yamaguchi Prefectural University

We discuss the types and processes of conventionalization of communicative expressions with focus on the productive and updating effects of the speaker's considerateness to the addressee(s). For example, greetings are highly conventionalized, but some are so conventionalized that they are not used any more (at least in face-to-face conversation). This is the case with *sayonara* 'good-bye' in Japanese. This panel attempts to clarify the conditions in which the considerateness motivates and also discourages the speaker to use conventionalized communicative expressions.

Previous studies on linguistic conventionalization, as those on grammaticalization and pragmaticalization, have tended to focus on the emergence of specific expressions, rather than on their obsolescence. This emergence-orientation is one-sided, and needs to be complemented by the study on the process of how conventionalized expressions go out of use. In addition, considerate expressions have been mainly discussed in terms of personal relations between the speaker and the addressee(s), but their acceptability varies with age, gender, group affiliation, and speech situation. This means that they are conventionalized to different degrees in different context types or registers: the more limited range of registers a given considerate expression has, the less frequently it is used in other registers where the considerateness in question is detrimental to communication. Thus, our working hypothesis is that conventionalized considerate expressions go out of use where they come to involve pragmatic difficulties.

Japanese is rich with partially obsolete conventionalized expressions. Of particular interest are the pragmatic difficulties brought about by the mismatch between already conventionalized expressions and young people's needs as well as the needs from new styles of communication such as SNS. For example, *tumaranai-mono-desuga* 'although (this is an) uninteresting item (for you)' is a conventionalized introductory remark for giving a gift, but it is almost obsolete among those in their 20's or younger. Like *sayonara*, the introductory remark belongs to a formal register, and causes pragmatic difficulties to the people who put more importance on their in-group identity with their partner(s) than on formality and modesty. On the basis of observations of actual usage, historical change, and register-specific collocations, we show how and where pragmatic difficulties cause conventionalized expressions to fade out and at the same time cause new ones to emerge in their place. Our panel is intended to show that considerations of considerateness in specific registers help replace and update conventionalized expressions from a cross-linguistic point of view.

Who pays? Traditional gender roles as performances of normality in mainstream media

Panel

***Dr. Maximiliane Frobenius*¹, *Dr. Cornelia Gerhardt*²**

1. WWU Münster, 2. Saarland University

While linguistics and the social sciences have long questioned essential concepts of gender and binary heteronormativity (e.g., Butler 1990, Cameron and Kulick 2003), mainstream media still seem to perpetuate traditional gender roles. There appears to be a clash between the theoretical advances made and “normality” as portrayed in the media, or, to use a loaded term, between “woke” and mainstream culture.

This panel investigates those media products that show “regular” folk doing “being normal”, discursively reproducing apparently acceptable patterns of behavior (Garfinkel 1967). We assume that successful media products such as long-running TV formats portray such patterns and make them available for analysis. To give two examples of reality TV formats broadcast in Germany: the show *First dates* (filmed and aired in various other countries around the world), featuring blind dates in a restaurant setting, regularly includes a negotiation of who pays, often ending with the men footing the bill. Phrases like “the guy pays on the first date,” or “this is how I was raised” reflect the candidates’ understanding of their role, indexing (Ochs 1990) notions of chivalry and tradition. Deviant cases seem to require more interactional work, while same sex couples cannot effortlessly follow established patterns. The product-testing show *Hot oder Schrott* (known as *Big box*, *little box* in the UK) systematically has women doing “interactional shitwork” (Fishman 1978) and helping maintain their male partner’s face. When deviating from such patterns, they are considered “not nice”. In both cases, interview sequences allow the participants of the shows to reflect on their behavior giving access to moral accountability. The papers in this panel enquire into the apparent divide between performances of gender roles in everyday life as transmitted through mainstream media products and discourses about gender in linguistics and other social sciences. They target representations, that is challenges or reproductions, of heteronormative relationship models in scripted TV productions, as well as the co-construction of gender roles in unscripted TV dialogue. The role of pragmatic markers in the creation of intimacy, and the verbal and multimodal means used in dating situations will be spotlighted. This panel features research using multimodal, qualitative and quantitative corpus-based methods in the analysis of media products, giving access to the performance of and resistance to traditional gender roles as constructions of normality.

“Keywords” in sociopolitical debates: approaches to struggles about meaning in discourse

Panel

*Prof. Philippe Hambye*¹, *Prof. Barbara De Cock*¹, *Ms. Coline Rondiat*¹, *Ms. Nadezda Shchinova*¹

¹. UC Louvain

Some terms that are highly dominant in current-day societal debate (such as *populist*, *woke*, *cancel culture*, *sustainable development*, *fake news* or *integration*) seem to be used with a variety of meanings depending on the context and/or the position of the speaker. While these words are frequently used as if their meaning was conventional and clear, this meaning appears at the same time to be extremely vague, and is often the subject of explicit controversy. Yet, such “keywords” (Williams 1985; Jeffries & Walker 2017) or “formules” (Krieg-Planque 2010) play a central role in political and media discourse: they participate in processes of classification/categorization which are related to political orientations and ideologies (Heller & McElhinny 2017, p. 4-9). Indeed, establishing who or what fits into one of the categories these keywords refer to – e.g. saying who is “populist” or not, what counts as “sustainable development” or not – is a way to differentiate and hierarchize objects (ideas, individuals, groups, practices, etc.), and hence to legitimize or disqualify them. Therefore, the way they are used in specific pragmatic contexts – associated with other words in lexical networks or with certain targets and realities –, makes such keywords the *locus* of a “semantic struggle” (Kranert, 2020) to define and delimitate these words and categories.

This panel wishes to foster a dialogue between researchers studying these phenomena in different linguistic contexts (see e.g. Schröter *et al.* 2019) and with different methodological approaches. It includes contributions that look into the meanings of terms that could be considered keywords, and that also look into how these meanings are being constructed in discourse and/or in interaction.

“Only joking”: Negotiating offensive humour in interaction

Panel

*Dr. Chi-He Elder*¹, *Dr. Eleni Kapogianni*², *Dr. Isabella Reichl*²

1. University of East Anglia, 2. University of Kent

This panel addresses the topic of ‘offensive humour’: a catch-all category that includes teasing, sarcasm, put downs and jocular insults (see e.g. Sinkeviciute 2021). Specifically, it focuses on attempts to produce amusement by denigrating a specific person or group of people, characterised through a seemingly faux negative attitude towards a target but without a claimed malicious intent.

The panel addresses a range of interconnected themes relating to offensive humour. It discusses both theoretical and practical challenges, including the deniability of offensive and controversial messages, how speakers can negotiate their level of intent for having communicated an offensive message, as well as the degree to which speakers can be held accountable by others when they can always claim to be ‘only joking’.

These challenges are framed via different pragmatic practices via which offensive humour can be delivered, from covert hints to wild exaggeration, and the interactional affordances they allow. It offers perspectives on different modes of delivery, acknowledging the different interpersonal challenges that face to face interaction presents compared to offensive jokes made on social media sites such as Reddit, Instagram and Twitter. It also addresses how a speaker’s public persona, such as of stand-up comedians or politicians in the public eye, can influence the uptake of offensive jokes, such as the degree to which they are offered plausible deniability, or how audience reaction can inform public opinion.

In sum, this panel brings together insights from current work on humour, offensive language, teasing and non-serious talk, misunderstandings, communicative intentions, commitment, accountability and deniability to address these issues, and we look forward to a rich discussion of how language functions as the critical vehicle for committing offensive humour, as well as how it is perceived, negotiated and/or ignored by participants in interaction.

(A)typical use of smart speakers: Usage patterns of stationary voice-assistants during the process of domestication

Panel contribution

Prof. Stephan Habscheid¹, Mr. Tim Hector¹, Dr. Christine Hrnca¹

1. University of Siegen

Smart speakers – stationary “Intelligent Personal Assistants” with voice-user-interfaces – are becoming more and more popular in private households. Technically, such systems enable “hands-free” processing by permanently listening to the home environment and react verbally once addressed with a “wake-word” (such as “Alexa”). The devices offer features that align with domestic activities and also play a central role in regulating smart-home-applications, e.g. smart bulbs or heaters (Ammari et al. 2019).

The devices and their features are to be integrated into everyday practices of the household members: beginning with the first set up, the user and the device start a “joint journey” of domestication (Brause/Blank 2020) – “joint”, because it is not only the users that adapt to the system’s demands, but also the devices that can be adapted to users (e.g. changing preferences, recognizing voice characteristics of the individual users, get connected with accounts).

Along this journey, the users form strategies and routines to linguistically produce requests to the devices. These strategies and routines emerge with sensitivity to the situation and the practical accomplishment (Porcheron et al. 2018) on the one hand but also become sedimented on the other – just as different contexts of application do (Bentley et al. 2018). In the research project Un-/desired Observation in Interaction: “Intelligent Personal Assistants”, we investigate these devices and shed light on accompanying linguistic practices of household members by means of (multimodal) sequence analysis. In eight households, we therefore collected video- and audio data of the actual use of smart speakers: from the first installation over the first few weeks of usage up to a last collection phase 4-6 months later.

On the basis of our data and a methodological reflexion on typicality, we will distinguish gradients of (a)typicality: The very early usage during the first installation (and shortly after) as an atypical use, in which users behave obstinately, test limits and make fun of it, a typical, routinised use, in which users apply the devices for known purposes without much trouble, and then once again atypical, “advanced” use cases of “heavy users” who exploit the more or less entire functional spectrum of the devices. Furthermore, we want to discuss the “non-use” of the gadgets over time as an (a)typical phenomenon.

Displaying and solving trouble related to digital devices: Understanding non-experts' smartphone use

Panel contribution

Ms. Helena Budde¹, Prof. Florence Oloff¹

1. Leibniz-Institute for the German Language, Mannheim

This presentation will focus on less experienced users of mundane technologies (such as smartphones or tablets) and what their situated learning practices within smartphone courses for adults reveal about typical difficulties in handling and understanding digital devices. With the increasing availability and use of smartphones and the growing digitalization of commercial and administrative services within the past 15 years, also older and previously “non-digital” adults have to increasingly acquire basic skills regarding mundane technologies. Previous research has been particularly interested in how (very) young participants are introduced to and use mundane technologies in their daily (institutional) routines (Lahikainen et al. 2017, Parry et al. 2017, Sahlström et al. 2019). The acquisition of digital skills at a more advanced age has been mainly investigated based on surveys or interviews (e.g., Selwyn et al. 2006, Quan-Haase et al. 2016, 2018), meaning that the situated learning of mundane technologies by older adults has rarely been considered (but see Weilenmann 2010, Råman 2022). Therefore, from an interactional perspective, the precise challenges that less routinised users of mobile devices might encounter when engaging with these technologies have not been sufficiently explored.

Based on video recordings of six introductory courses to smartphones (Android & iPhone) from different adult education centres in Germany, we will explore moments in which the course instructors (and sometimes fellow students) have been mobilised by a participant regarding a problem they encountered while handling the device (related, e.g., to the navigation on the interface, or to the localisation of a specific item or function on the phone, cf. Råman & Oloff 2022). Using conversation analysis and multimodal interaction analysis (Stivers & Sidnell 2005, Mondada 2007, 2016, Streeck et al. 2011, Deppermann & Streeck 2018), we will explore how non-expert smartphone users make an initially opaque technological problem publicly available as a trouble (Kendrick & Drew 2016), and how they then make a more expert user, typically the teacher, inspect the device and identify the problem. In order to take into account possible processes of understanding from the non-expert users' side, we will also analyse how the solution to the problem is then implemented and by whom, and how the students acknowledge and receipt this solution (e.g., Heritage 1984, Golato & Betz 2008). More generally, we will reflect on the way the presence and absence of ordinary technological routines surfaces in this institutional setting, and how this can give new insights for conveying digital skills to “less typical” users.

Emotional displays when blind people encounter problems with new technology

Panel contribution

Dr. Ann Merrit Rikke Nielsen¹, Dr. Brian Due²

1. University of Copenhagen, 2. Copenhagen University

People with visual impairment (PVI) increasingly use mainstream technologies, such as smart phones and digital assistants featuring AI in their everyday lives. The PVI's limited visual access can prove challenging when learning to use these technologies. This paper explores how PVI manage their conduct when they encounter problems with using new technology and how this leads to e.g. frustration, anger or self-consciousness, observable in interaction as emotional displays (Local & Walker, 2008; Ruusuvuori, 2012). The paper examines the interaction between the researcher, the AI, and the PVI in the face of two types of problems: when things go wrong due to faulty technology and when things go wrong due to the participants inability to utilize the technology correctly due to their visual impairment. Data are video ethnographic recordings of people born with or with late blindness who are testing or using the Google Home assistant in their homes and the Seeing AI app for shopping for the first time. Participants are equipped with the new technologies but their use of it is naturally organized in situ, producing the data as semi-experimental. The users can be considered 'atypical' not just due to their visually impairment but also due to their novices status with respect to technology used, leading to recurrent trial-and-error sequences. By applying EMCA (Streeck et al., 2011) to video recordings of these settings we explore PVI's practices for managing conduct in the face of challenges with the use of new tech as well as their multimodally displayed emotional stance when partaking in these complex activities. This paper discuss the methodological consequences of designing research projects that put participants "on the spot" in new types of situations affects and contributes methodologically with reflections on and suggestions for conducting video ethnographic studies of atypical populations and use of new tech. The paper also contributes to EMCA research into emotional displays as observable in interaction.

Learning the ‘new normal’: Adapted practices in telework

Panel contribution

Dr. Elina Salomaa¹

1. University of Jyväskylä

In the spring 2020, the COVID-19 pandemic forced knowledge workers to telecommute and to change their working practices in an exceptionally fast pace. The effects of the pandemic have been seen leading to a ‘new normal’ where remote work plays an increasingly important role in society (see Due & Licoppe, 2021). In this regard, by focusing on the transition phase from face-to-face meetings to remote meetings, it is possible to shed light on how the employees managed to adapt their working practices to technological environment and thus to turn their new working practices from ‘atypical’ to ‘typical’.

This paper examines how specific organizational goals are successfully accomplished through new or adapted practices. The data come from the context of a development project in a Finnish business organization and include video-recordings from both face-to-face workshops before COVID-19 and remote workshops during the pandemic. Drawing on multimodal conversation analysis, I focus on the fragments where participants are asked to share their news, ideas, and feelings one-by-one. This common practice both in face-to-face and remote workshops can be part of an assignment accomplished in the workshop or a more independent task, usually at the beginning of the workshop. Relying on the prior research (e.g., van Braak et al., 2018) that has shown how the progressivity of talk may be difficult to manage in virtual multi-party meetings, this study zooms in to the practices and techniques the facilitator of the workshop and the other participants used to secure progressivity of ongoing activity.

The study shows how the facilitator had a central role not only in proceeding with the agenda of the remote workshops but also in instructing the use of technology and guiding the participants to interact in a technology-mediated environment. At the beginning of the remote work, through orienting to the other participants and sometimes herself as well as a new user of a video-conferencing platform, the remote work was constructed as a shared challenge requiring new routines. The findings demonstrate how on-site practices, such as proceeding with the seating order, were managed to adapt to the technological setting by drawing on the affordances of the platform (e.g., chat function and a participation list). By using these resources, the facilitator could secure both the progressivity of the ongoing activity and the intersubjectivity between participants in video-mediated meetings. However, only some of these new practices stayed in use, while others disappeared as users became more familiar with the technology and remote practices (see also Mlynář et al. 2018).

Orienting to a problematic text: a longitudinal study of technology-mediated collaborative writing

Panel contribution

Ms. Reetta Ronkainen¹

1. University of Jyväskylä

Writing in workplace meetings typically features the use of textual and digital objects. Often, writing is also a collaborative and longitudinal process. Collaborative writing requires constant negotiation on what is written (e.g., Nissi & Lehtinen 2022; Balaman 2020). As a new technology, shared screens have brought about two changes: joint visibility and shared responsibility for the text (Asmuß & Oshima 2012, Nissi 2015). Collaborative writing has been studied both in co-present and technology-mediated situations in the context of single encounters such as meetings. However, even though writing in organizations is often a longitudinal process, until now, research has focused mostly on the situated practices of collaborative writing and ways to advance interaction, while longitudinal writing trajectories have not received much attention (see, however, Pälli et al. 2009).

Drawing on research on writing-in-interaction (Mondada & Svinhufvud 2016), this study takes a longitudinal approach to the editing process of an institutional text, and traces how a part of it was framed as problematic. Using ethnographically informed multimodal conversation analysis, I discuss how over the course of several meetings two groups responsible for connected parts of the text discussed, revised, and finally deleted the problematic segment. The study focuses on the interactional practices through which the participants display their orientation to the text as problematic, and on the meeting-by-meeting trajectories of these practices. The data were collected over a period of a year and a half at a Finnish education agency, which was updating a policy text at the time, and the participants represent different governmental agencies and education providers. The working group was divided into five subgroups, each working independently on a part of the text. All meetings were held in Teams using screen sharing, with a changing facilitator coordinating the writing. The data were recorded using a screen capturing program.

The analysis shows how trouble sources in the ongoing interaction emerge and are indicated, for instance, by silence at moments when a verbal response is preferred. The participants also orient to the unavailability of analogue affordances such as hand-written drafts. The analysis of the trajectory also shows that before the solution is found, the participants achieve a shared understanding of the nature of the problem. The study sheds light on the effect technological mediation has on the writing process, and contributes to understanding collaborative writing practices and technologized work.

Running into a robot : “mocking up” as a way to typify an unexpected encounter

Panel contribution

*Dr. Heike Baldauf-quilliatre*¹, *Dr. Lucien Tisserand*²

1. ICAR Lab, 2. CNRS, ICAR

Our analyzes draw on data that come from an interdisciplinary project about turn-taking practices in HRI. As part of the project, a Pepper robot (Aldebaran) has been placed near the reception desk in a university library. The users did not have instructions and were not encouraged to act with the robot in some particular way. It was foreseen that the robot would inform or assist them according to previously identified needs.

Entering a library and standing in front of a social robot is admittedly not very frequent, though it does not necessarily lead to an atypical interaction. Library users could act with the robot accordingly to the desk setting and treat it as a non-human agent. They could develop an *interactional format* that is based on experiences in *service encounters* with humans (e.g. Asmuß 2007). But this is overwhelmingly not what they do in our data: we will show how library users treat the robot as an intruder which leads to a *participation framework* that differs from service-encounter-interaction.

Interestingly, users stopped and interacted with the robot even if they mostly did not display any need of assistance. They showed that its presence did not carry any social affordances orienting towards a service encounter, even claiming that they did not understand what they should do. They treated the robot as useless, but amusing and categorized it as an entertainer or as an entertaining object; thus, they oriented to a gaming interaction.

Following a multimodal CA approach we will show some of the “games” the users play with the robot (as a participant or an object) and the rules they follow. They might treat the robot as a “buddy” who is addressed and positioned as such. They might play a “service encounter” game by producing questions or requests that test the robot’s capabilities and its knowledge. The interaction is then designed like a quiz where the library user is not in the *unknowing position* (Heritage 2012) but instead the quiz master addressing the robot as a participant who is applauded when he finds the right answer. As “rules” of these games we have identified so far that (i) there cannot be more than one action in a turn, (ii) there must be a right and a wrong answer/way to answer and (iii) the “doing acting” must be seen as such by other humans.

The last rule points to an aspect we want to highlight particularly: most of these games are related to a participation framework (Goodwin & Goodwin 2004) where groups of users interact simultaneously or one after the other with the robot. The users monitor that what they do is perceptible by their fellow humans and that it can be seen as part of a particular game. In our presentation we argue that these game exchanges are a way to typify (Garfinkel & Sacks 1969) the initial atypical situation created by the robot’s presence in order to make sense of it.

The Atypical Interactant in a ‘Smart Homecare’ Participation Framework

Panel contribution

*Dr. Saul Albert*¹, *Ms. Lauren Hall*¹, *Prof. Elizabeth Peel*¹

1. Loughborough University

‘Smart’ technologies are often advertised as assistive devices for ‘atypical’ users. For example, Amazon Echo’s 2019 adverts show their *Alexa* virtual assistant ‘enabling’ elderly or disabled users to participate in everyday activities like sharing music or going for a walk. This promotional strategy uses a techno-medical model of disability by showing how a product can ‘fix’ a disabled person. Technology-led research often adopts a similar model by designing for specific impairments or emphasising the cost-savings of replacing human carers. An Interactional approach, on the other hand, starts with the participation framework of people’s everyday homecare routines.

We draw on a corpus of >100 hours of video recorded by a disabled person and their care worker using a virtual assistant for everyday tasks: eating breakfast, getting out of bed, getting ready etc. We show how they configure the participation framework of a smart homecare setting to involve the virtual assistant in ways that prioritize the active involvement of the disabled person. Our analysis focuses on the frequent troubles of mishearing and misunderstanding by the smart speaker, and on what the implementation of repair in this setting can tell us about the role, interpretation, and potential uses of smart homecare technologies.

For example, in Extract 1, Ted and Ann have recently reconfigured their smart home system, changing the name of the voice-activated plug that controls the heater from ‘plug two’ to ‘heater’. Ted summons *Alexa*, but initially forgets the plug’s new name.

Extract 1: Watch video: (<https://bit.ly/repairex1>)

- 1 TED: *Alexa* (0.6) turn off plug- (1.4)
 2 turn off [heater.]
 3 ALE: [A few t]hings share the
 4 name plug which one did you want?
 5 TED: Heater.
 6 (2.5) ((Ted looks up towards Ann))
 7 ANN: *Alexa* (0.6) turn off heater.
 8 (1.4)
 9 ALE: Okay.

Ted cuts off his turn in line 1 at “plug-” then replaces the reference to “heater”. But *Alexa* treats the initial TCU of the command “turn off plug-” as complete by initiating repair, in overlap with Ted’s “heater”. The resulting repair sequences reveal how Ann and Ted recognize and manage *Alexa*’s limited ability to use repair. Without further detail at this stage, it is notable that while Ann’s summons “*Alexa*” in line 7, and her re-doing of Ted’s disfluent turn from line 1 successfully achieve repair, she uses a strong prosodic emphasis that hearably chastises *Alexa* for this ‘failure’. By blaming *Alexa* while repairing Ted’s disfluent turn, Ann inoculates her repair from being heard as other-correction, which might call Ted’s competence into question. *Alexa*’s ascribed incompetence as an interactant thus provides a resource for upholding Ted’s competence, prioritising his participation in the homecare routine.

This paper contributes to research on the role of technology in ‘atypical’ interaction by examining a situation in which the technology takes on the stigma of atypicality. Building on our analysis, we argue that this approach provides a model for assistive technology research and development that moves away from a techno-medical

model and focuses on how typicality (and atypicality) are achieved interactionally.

Tracing routinization in interactions with smart speakers

Panel contribution

***Dr. Mathias Barthel**¹, **Dr. Henrike Helmer**¹, **Dr. Silke Reineke**¹*

1. Leibniz-Institute for the German Language, Mannheim

We trace the development of the typicality of users' strategies and routines in using smart speakers. Adopting a (micro-)longitudinal interactional linguistic approach, we examine types and formats of requests to the devices over time, analyzing user-device interactions we recorded consecutively during the first weeks of use by initially-inexperienced users. We replicated Porcheron et al.'s (2018) Conditional Voice Recorder (CVR), recording audio snippets of requests to the device and their pre- and post-context. Additionally, we examine the device's respective log-files (i.e. lists of transcribed and recorded requests). So far, we have collected CVR-data in 5 German-speaking households, comprising about 300 audio snippets.

Previous studies on human-technology interaction observed how users locally adapt their conduct to the device in order to get things done (e.g., Pelikan/Broth 2016, Reeves et al. 2018). By comparing different requests to smart speakers over time, we do not only focus on local adaptations of users based on single case analyses but systematically examine "change over time across occasions, that is, *across* different instances of interaction" (Wagner et al. 2018: 4). To monitor and describe the accompanying routinization process, we adopt a mixed-methods approach, combining single-case sequential analyses with quantitative analyses of the recorded requests.

Longitudinal studies on the development of gaining expertise over time so far often focus on complex skills and systems (like learning a new language (e.g., Hellerman 2008, Berger/Pekarek Doehler 2018)) and generally report an increase in complexity and a diversification of interactional practices for accomplishing an action or project (Wagner et al. 2018). Studies on interactions with comparatively 'limited' systems like voice-controlled technological devices suggest the opposite: reduced complexity and less diversity over time. Indeed, first examinations of our data show that speakers initially formulate open requests with a more complex syntax, bigger variety of lexical items, and for rather 'individual' use cases (e.g. "aLExa, wir möchten ein SPIEL spielen? (0.4) für (.) FÜNFjährige." (Alexa, we want to play a game for five-year-olds.)). These requests are more 'atypical' in that they are often accompanied by disfluencies, repairs and other "frustrations in communication" (Antaki/Wilkinson 2012: 533). After several weeks, speakers seem to use comparatively fewer and more routinized formats for more task-oriented, standard procedures and typical use cases like playing a specific song, setting a timer, or telling the time.

We systematically investigate which kinds of changes over time are observable in terms of:

- the design of open and routinized formats (grammatically, lexically, prosodically, and with regard to the interactional environment)
- the types of individual vs. typical use cases
- politeness towards the device
- moments of 'playing' with the device, e.g. by testing its limits
- the number of failures after requests

We will discuss in how far (in)experienced users behave "(a)typically" and what exactly constitutes the routinization process: Gaining expertise in formulating (even complex) requests or decreasing complexity by limiting uses to a few typical standard requests that have been learned to work. Our results will shed light on the systematics and current limitations of human-device interaction in private settings.

**(A)typicality in narrative
forms and practices
(organized by Neal
Norrick)**

Direct reported speech in funny stories: observations from Italian radio phone-ins

Panel contribution

Dr. Daniela Veronesi¹

1. Free University of Bozen-Bolzano

As a central activity of human sociability, storytelling in interaction has been examined since the '80 by several disciplines, including anthropology, conversation analysis and interactional linguistics. While recognizing that narratives result from an interactive process with teller and recipient playing an active role (Goodwin 1984; Duranti & Brenneis 1986; Lerner 1992; Ochs et al. 1992; Norrick 1997; Quasthoff & Becker 2005), scholars have focused on tellers' contributions such as pre-announcements, recipient design, and reported speech (Holt 1996, 2016; Norrick 2016), on listeners' 'story-interventions' through continuers, questions, collaborative completions and heckling (cf. Monzoni & Drew 2009), as well as on conarration and epistemics (Mandelbaum 1987; Norrick 1997; 2020a; Monzoni 2005).

Within the field, humorous discourse has also been investigated with analyses of conversational joking and humor in narratives (Norrick 2002; 2004; Ervin-Tripp & Lampert 2009), usually in ordinary face-to-face contexts, while little is still known about non-scripted humorous storytelling in media settings. A case in point is radio phone-ins, studied primarily with reference to overall structure (Hutchby 1996; Thornborrow 2001; Dori-Hacohen 2015), problem exposition and advice-giving (Traverso 2008; Hutchby 1995), audience participation (Hutchby 1999), membership categorization and intimacy (Fitzgerald & Housley 2002; Rubino 2016), dual-hosting (Ames 2013), and irony in political broadcasts (Livnat & Dori-Hacohen 2018).

From this background and adopting a Conversation Analysis perspective, in this study I examine a collection of 50 short narratives (ca. 2 hours) from an Italian entertainment radio show, in which listeners are invited by the two show co-hosts to share their experiences on a variety of topics presented within a play frame (Bateson 1972; Norrick 2010) – as in “Weird attempts at sanitations during the Covid-lockdown” and the like.

In view of institutional features of radio broadcast such as intentionality, sociability, performativity and interactivity (Hutchby 2006), I analyze how the hosts, as unknowledgeable listeners (Norrick 2000b), sustain callers' live tellings of personal anecdotes and co-construct their narratives, in that I focus, among a large array of hosts' typical moves – continuers, questions, laughter, repetitions, assessments, advices, pre-recorded applause – on the practice of direct reported speech (Clark & Gerrig 1990) as particularly common in storytelling (Holt 2000, 2017; Rae & Kerby 2006; Bangerter, Mayor, & Pekarek Doehler 2011). This practice is also pervasive in my data, as produced by callers, but also and most relevantly as accomplished by the two hosts, in the midst of callers' narratives, both in form of (expanded) repetitions and as *ex-novo*, imaginary turns-at-talk attributed to callers/further story participants. I thereby explore how the hosts' direct reported speech is designed and implemented in distinct sequential environments (opening and preface, story development, climax, closing) in the service of different interactional tasks.

Final considerations are devoted to how, through direct reported speech, the hosts – as K- listeners (Heritage 2010) but also as participants in control of the interactional management of the phone-in conversation – enliven and sustain callers' storytelling, thus enhancing their potential humor and rendering them as “funny” for the listening audience.

Gesture expressivity in storytelling interaction

Panel contribution

Dr. Chris Rühlemann¹

1. Albert-Ludwigs-Universität Freiburg

Storytelling is driven by emotion. Its key function is not to share information about events but to share the emotions evoked by the events, a process referred to as emotion contagion. How emotions in storytellings are expressed verbally has been shown by Labov. How they are expressed nonverbally is still seriously under-researched. This paper aims to shed light on the role of gestures in emotion expression in storytelling. Specifically, the paper asks whether an increase can be observed in gesture expressivity toward the story climax. The data come from the Freiburg Multimodal Interaction Corpus (FreMIC). Storytellings were identified and gestures in them were annotated for a number of criteria including gesture size, force, speed, etc. Based on the Gesture Expressivity Index, the development of gesture expressivity from story beginning to story climax is measured. It is found that typically gestures gain in expressivity as the storytelling progresses toward the climax. Counterexamples and reasons for their lack or loss in gesture expressivity are discussed.

Identity of a story? Similarities and differences in oral history narrative typicality

Panel contribution

*Dr. Jiří Kocián*¹, *Dr. Jakub Mlynář*², *Dr. Karin Hofmeisterová*¹, *Mr. Hryhorii Maliukov*¹

1. Charles University, 2. HES-SO Valais/Wallis University of Applied Sciences and Arts Western Switzerland

Oral history (OH) has become one of the important procedures to connect personal stories with historical events, while undergoing recent transformations and developments under the conditions of digital “(de-)contextualization” ([5], [3]). A result of OH digitalization is the simultaneous accessibility of several interviews conducted with the same narrator under altered circumstances.

Presenting a primarily methodological contribution, this paper deals with typicality in narrative practices by examining the “identity of a story” in repeated OH tellings. We address a phenomenon that was previously described as *clusters of ideas* [1] and as *narrative strategies* [4], related to “typical” passages in OH retellings. We provide detailed analysis of interviews with E. B., a Holocaust survivor who had narrated her life story for the Fortunoff Archive (1979) and for the Visual History Archive (1997). She tells the recognizably “same” episode both times, illustrating changes introduced by the Nazi Germany’s invasion to Czechoslovakia. Consider the excerpts below:

“... the German had taken over directing the traffic, and it was kind of a really plastic illustration of the conflict of power. The two of them standing there and the German taking over. We have had no warning at all.” (FA)

“... there was this German soldier who took over directing traffic from the Czech policeman, and the Czech policeman stood there and didn’t know what to do. So, nobody had known, we had no warning, I do not know why, because we had radios.” (VHA)

Distinguishing narrative and interactional layer of OH interviews [2], we propose a conceptual scheme for comparative analysis. On the *narrative layer*, the life story segments before and after give clues for sense-making and reflexively constitute the narrative environment, leading to “structural variation” in the life story. *Interactionally*, the specific features of OH as a situated praxis contribute to the story’s identity within collective memory processes, leading to “discursive variation” in the life story. *Structural variation* underlines similarities and differences in the sequential ordering of the components of the life story; *discursive variation* regards each narrative component as locally produced (linguistically/multimodally) during the interview. The variation along these dimensions is detectable due to the coherence established through the institutional framework, which provides the warrant for comparability and incorporates the development on a societal temporal scale.

Narrating the present into the past

Panel contribution

Dr. Tanima Bagchi¹

1. Indian Institute of Management Indore

This paper analyzes narrative structures wherein a plot situated in present time is interspersed with past events, analyzing three Bengali feature films – *Nayak* (1966), *Aakaler Sandhane* (1980), and *Agantuk* (1991) – from a sociopragmatic perspective. In a dream sequence in *Nayak* (1966) the main character visualizes himself surrounded by money and later falling into a pit where he dies. This sequence addresses the audience while the Teller is backgrounded: spatiotemporal distance increases between Teller and Addressee and decreases between Tale and Addressee. Later, he narrates his dream to with two layers of narration – firstly, decreased distance between Teller and Addressee within plot itself; secondly, decreased distance between Tale and Addressee (here, audience). The first layer confirms authority of Teller over Addressee and another power exerted by Addressee through validation of the narrative. In a second layer of narration, the scene is testimony to authority of Tale over both Teller and Addressee because the plot remains unaffected, irrespective of any change in power dimensions of Teller and Addressee. When the main character utters,

hmmm dekhlam je ami takar chorabalar moddhye dube jachhi shonkor da icche korlei amae tulte parto kintu kintu tullo na aar...ami...uff sei bibhotsho byaepar

(translation. ‘hmmm, I saw that I am drowning in a quicksand of notes. Brother Shankar could have saved me but he did not. And...I...uff, such a fearful situation!’)

narration starts with past tense of the verb *daek^ha* ‘to see’ as in ‘*dek^h-l-am*’ (see-PST-1) and continues with present perfect tense as in ‘*dub-e ja-c^h-i*’ (drown-CNVB go-PRS.PROG-1), again reverts to past tense as in ‘*ic^he kor-l-e-i*’ (wish do-PST-3-EMPH) and in ‘*tul-l-o na*’ (bring up-PST-3 NEG). A similar structure is observed again later when main character narrates a past incident which triggered the beginning of his career,

Jyoti aekbar aekta bhalo offer niye ashe oi debi choudhuranir tate baaper part korto mukundo lahiri aar amar okhanei lobh edike pujo eshe gachhe club e khub jor rehearsals cholchhe

(translation. ‘One time Jyoti had come with a good offer regarding Debi Choudhurani. Mukund Lahiri was to play the father’s role, and that made me greedy. Meanwhile Pujo was here, and rehearsal was in full swing at the club.’)

while most of the verbs appear in present tense, for example: a) *niy-e ash-e* (take-CNVB come-PRS-3) ‘brings’; b) *esh-e ga-c^h-e* (come-CNVB go-PRS.PRF-3) ‘has come’; c) *chol-c^h-e* (walk-PRS.PROG-3) ‘is continuing’, the statement about Mukund Lahiri has a past tense of the verb ‘do’ as in ‘*kor-to*’ (do-PST) ‘did’. This switching from present tense to past tense and back corresponds to higher involvement of Teller as compared to scenes where focus is another entity. To summarize, while typical narrative in Bangla involves both Teller and Addressee leveraging their individual powers in successful rendition of Tale, plots involving narration of past events assign higher authority to Tale leading to an (a)typical spatiotemporal relationship between three essential elements of a narrative.

Sharing mishaps and errors: Narrative comments on internet cooking sites

Panel contribution

Prof. Neal Norrick¹

1. saarland university

In my paper I investigate comments on internet cooking sites reporting errors and mishaps on the way to an account of failure narratives generally.

Examination of narrative comments on cooking sites finds reports of success typical and reports of mishaps atypical. Comments are responses to recipes, and they pattern like second pair parts: Reporting success in response to a recipe (any set of instructions) is like saying yes and agreeing with a foregoing suggestion, as treated in preference theoretical descriptions, and the typical form is short and direct. Admissions of errors pattern like dispreferred turns with delays, hedges, and accounts. Even when the miscreant accepts blame, dispreferred features appear, but attempts to disavow blame are more highly marked.

In keeping with the strategy of brevity and directness, minimal narrative chunks rely on the rich context of shop talk in a community of practice to establish reference and create coherence. Shared presuppositions about cooking, ingredients, using recipes and enjoying food enable construction and interpretation of such condensed comments.

I made this today and YUM!!! It was so delicious and my husband loved it!

By contrast, reports of frustrations and mistakes contain the prefaces, hedges and accounts typical of dispreferred turns, as exemplified below. Comments reporting failures display two alternatives: one accepting blame and saying what went wrong, another assigning blame to the recipe. This comment includes acceptance of blame, while the recipe remains unassailable.

1 It's my fault.

2 the recipe does say to marinate the shrimp for 10 minutes..

3 since it was step 1 that's what I did first,

4 and the shrimp basically "cooked" in the lemon juice

5 while I was busy cooking the orzo.

6 The flavors in this dish were super yummy,

7 but overall my dish was a flop because my shrimp were so rubbery.

In line with preference theory, this report of failure is longer, less direct, hedged and sprinkled with accounts like "since it was step 1" and "I was busy with cooking the orzo." Note details of what she did wrong, and her goal of helping others avoid the mistake. Comments divulging errors work less like confessions or pleas for sympathy than sharing experiences in a community of practice.

By way of comparison, I consider parallel comments from other websites and everyday conversation as well as "Screw up stories" on the internet, often concerning mistakes at work, where much more is at stake than in trying out recipes at home.

Overall, I find significant differences in narrative strategies between accepting and disavowing blame. Important factors are perception of relative damage done and stance toward the audience as fellow sufferers, members of a community of practice or casually interested observers looking for a laugh. In any case, analysis in terms of preference organization profitably applies to narratives of success and failure on instructional websites, and this extends to narratives of mistakes in other internet interactions and everyday conversation.

Social norms for narrative tellability within a WWII-remembrance community of practice

Panel contribution

Dr. Kim Schoofs¹, Prof. Dorien Van De Mieroop¹

¹. KU Leuven

Communities of practice (CofPs) are centered around particular “socially relevant traits and activities” (De Fina, 2007, p. 378), in the course of which typical practices emerge. These practices often comprise the construction of “a linguistic style” (Eckert, 2006, p. 683) which can consist of “specialised terminology and linguistic routines” (Holmes & Meyerhoff, 1999, p. 176). In this study, the focus will not only be on the linguistic style, but also the narrative style of a highly specific CofP – i.e. the CofP related to the testimony culture originating from WWII. Specifically, we scrutinize which social norms exist in the CofP with regards to storytelling and in particular narrative tellability.

The concept of tellability stipulates it is only worthwhile to tell stories that pass the lower tellability-boundary by being sufficiently surprising or important (see Sacks, 1992, pp. 773-783), yet not *too* surprising as they may otherwise cross into the “dark side of tellability” (Norrick, 2005, p. 323). In particular, we scrutinize tellability-boundaries in a corpus of WWII-testimonies narrated by Belgian concentration camp survivors. As the social space of the camps was “a distorted reflection of the normal social space outside the camps” (Suderland, 2013, p. 163), these WWII-narratives offer us a window into how a storyworld defined by a unique and highly complex set of social norms can affect the specific CofP’s tellability-boundaries.

Methodologically, we apply a narrative as social practice approach (De Fina & Georgakopoulou, 2008) to tap into the reflexive link between the social norms within the WWII-remembrance CofP and the tellability of its members’ stories. In particular, our analysis first focuses on the interactional treatment of typically taboo topics (e.g. scatological themes) and from this emically oriented study of the negotiation of these topics, we could derive these topics did not cause narratives to cross the upper tellability-boundary, but instead received in-depth interactional attention. Second, other negotiation sequences between narrators and their interactants revealed CofP-specific tellability norms which – if not aligned with – did cause narrators’ stories to breach the upper tellability-boundary. In particular, these CofP-norms require narratives to appear truthful and for identity work to align with a clear victim-perpetrator opposition. Overall, our analysis thus revealed the WWII-remembrance CofP to be ruled by a complex and specific set of tellability norms.

Strategic (A)Typical Narratives of Food Trends on Instagram

Panel contribution

Dr. Kelsi Matwick¹, Dr. Keri Matwick²

1. University of Florida, 2. Nanyang Technological University

This paper analyzes top food trends on Instagram, the photo and video sharing social media app, through the type of content and strategies used in creating posts and viral content, which have resulted in new forms of narrative evidenced by its serial imitation. Since its launch in 2010, Instagram has emerged as a popular social media app with its own influencer culture where the main audiences are the millennial and centennial generations. To respond to evolving consumption habits, food influencers have developed new strategies to gain followers. A multimodal discourse analysis of posts from some of the most popular food trends from 2021-2022 illustrates a variety of typical narrative strategies used to promote recipes, ideas, and products to get noticed, such as creative recipes and visually stunning posts but also atypical, specifically the deliberate use of branded music, humor, and audience engagement that encourages sharing. We seek to demonstrate creative new forms of narrative evidenced in the logic and language of the influential social media platform Instagram.

The construction of meaning in personal experience narratives emerging from Portuguese radio phone-in programs

Panel contribution

Prof. Carla Almeida¹

1. *Open University of Portugal*

Based on a *corpus* of verbal interactions carried out on radio in Portugal, we will analyze the construction of narratives in Portuguese radio phone-in programs. The present work is based on the study of the organization and functioning of oral interactive discourse processed in conversational narratives (Norrick 2000; Schiffrin 2006) and, within these, the discourse present in narratives of life experience (Ochs & Capps 2001). We will study specific discourse phenomena, such as accounts (De Fina 2009: 239) and the “alignment phenomena” (De Fina & Perrino 2011: 9). We will study the interactional context in which these narratives emerged in radio phone-in programs. So, the semantic and pragmatic aspects of the construction of personal experience narratives are analyzed: interviewees’ practices of juxtaposed speech, repetitions, the use of the approximate expression “e tal” (‘and such’), the use of “pronto” (‘ready, quick’) as a discourse marker (Silva 2006), the occurrence of identities in talk, and the production of evaluative assertions. In this context, acts of self-praise (Speer 2012) with mitigators and the use in Portuguese of the declarative verb “dizer” (‘to say’) in the third person of the plural are discourse strategies made by the interviewees to invoke common places to deal with dilemmas brought by the questions that occur during the conversation in talk radio (Almeida 2012). Interviewers’ evaluation comments that denote attentive listening and co-narration (Norrick 2001:78) are also analyzed, allowing for the management of interactional exchanges (Almeida 2019). This work seeks to demonstrate that personal experience narratives occurring in Portuguese radio phone-in programs are the result of collaborative work in jointly constructing the sense given by the host and the caller and they are part of a testimonial and emotional discourse. These narrative forms show the “conversational involvement” (Gumperz 1982:3) of participants and they are specific discourse practices taking place within these interactional contexts.

Typicality and Narration in the Toasts of Georgian Immigrants in the United States

Panel contribution

Dr. Inola Matthews¹

1. City University of New York, Lehman College

In my paper, I investigate narratives presented in the toasts of Georgian immigrants at a feast party (*supra*) with their relatives and friends living in the United States and the Republic of Georgia.

When proposing a toast (also called a speech), the speaker expresses certain thoughts and feelings towards the person or people the toast is addressed to. The toast (*sadghegrdzelo*) given by the Georgian toastmaster (*Tamada*) is usually full of emotions and is subject to improvisation that makes it more colorful and original. It requires adherence to strict rules but also reveals the individual style of each speaker proposing a toast. Georgian toasts usually offer explicit expressions of feelings and learned lessons, as well as reference to the people who are present, those absent from the *supra*, and family members. Toasts typically include narratives, reported speech, proverbs and rhymes, foregrounding the eloquence of the speaker proposing it. In addition, Georgian toasts typically interweave narrative passages with speech acts of thanking, hoping, blessing, and wishing, as in:

We got to know Temuri first. Whenever he came to visit us, we were so happy! It was like a celebration. It should be continued like that when seeing each other.

Examination of narrations in my corpus of toasts revealed a tendency to generalize in structures through phrases like “a few times,” “would come,” and also “whenever,” as in this excerpt. At the same time, individuals familiar to the participants or even attending the event appear in the narratives.

The degree of formality of the event dictates the level of typicality in *Tamada*’s behavior, the structure of the toasts given during the *supra*, as well as the behavior of the people present. During informal gatherings with close family members and friends, one can witness relaxed rules with regard to the toast style and structure, narratives shared by the participants, as well as their overall involvement in the event. In order to show the peculiarities of Georgian toasts as a communicative genre, I discuss the toasts given by Georgian immigrants living in the United States through the analysis of formality, typicality, and cultural values projected in the toasts of the immigrant people.

Nakagawa, Tsuyoshi Ono)**

A grammar of utterances connected to situation

Panel contribution

Prof. Toshiyuki Sadanobu¹

1. Kyoto University

Traditional linguistics has considered language to be separated from the situation of an utterance (Hockett 1960). However, the connection to the situation of an utterance should be considered extremely important to language. This is because, at least in contemporary standard Japanese, utterances that would seem unnatural in terms of traditional grammar can seem natural if they are more strongly linked to the situations in which they are uttered.

A sentence utterance that lacks sufficient fitness to its context and situation may seem natural if the connection between the utterance and the situation in which it is uttered (specifically, the authority of the speaker, the degree of immersion into the conversation, and expressiveness) is strengthened. For example, while the sentence utterance “*?Ato sankagetsu de shogatsu desu*” (“? It’s three months until the New Year”) uttered to bring up a new subject abruptly with no relation to the preceding context would sound unnatural because it violates the maxim of relevance (Grice 1975), it would sound natural in the form of the sentence utterance “*Ato sankagetsu de shogatsu da*” (“It’s three months until the New Year”) spoken by a higher-ranking person who has authority. In addition, the sentence utterance “*Ato sankagetsu de shogatsu desu nee*” (“It’s three months until the New Year, isn’t it?”), which is more expressive thanks to the use of a sentence-final particle, also would sound natural.

Such a strong connection to the situation of the utterance is not particularly necessary in a sentence that has sufficient fitness to its context and situation. For example, a lower-ranking person may say to a higher-ranking person “*Soko, dansa arimasu*” (“There’s a step there”) as the first utterance of an adjacency pair even without any particularly strong degree of expressiveness. It is when making up for something missing that a strong connection to the situation of the utterance is needed.

Focusing on the connection to the situation of the utterance also is important in differentiating between sentence utterances and utterances that are not sentences. For example, the unnatural feel of utterances such as “*Da*” and “*Daro*” can be explained using the rule of sentence grammar that a sentence requires a free word. But if these are placed in a position with a high degree of immersion into the conversation, as the second utterances in adjacency pairs, and connected to highly expressive sentence-final particles or a rising intonation, then they could seem perfectly natural (“*Da-yo-ne*” or “*Daro?*”) even though they still lack free words. This is because they are present naturally outside of the scope of sentence grammar, as something other than sentences.

By using surveys and observation of natural conversation, this presentation argues for the need to develop a grammar that includes connection to the situation of the utterance as a principle, separately from traditional sentence grammar.

Continuing and Non-Continuing ‘Sentences’ in Tellings in Japanese Everyday Conversation

Panel contribution

*Dr. Yasuyuki Usuda*¹

1. National Institute for Japanese Language and Linguistics

This study investigates some features of continuing forms of utterance in tellings in Japanese. In Japanese narratives, utterances tend to be produced in continuing forms, but at some points, non-continuing forms are used, which is generally understood as the completion of the ‘sentence’. Among the utterances shown in the excerpt, the lines marked by ‘#’ are in the continuing forms, while ‘->’ are in the non-continuing form (see Iwasaki 2013).

In the following excerpt the participants are talking about the behavior of their aunt-in-law who is known for her drinking habit.

1 B kono mae ne:

A while back,

2 A un.

Yeah.

(0.4)

3 B naruto de ne

at Naruto,

(1.2)

4 A ano: shijukunichi yatta toki ni.

on the shijukunichi.

5 B [un.

yeah

6 A [houyou wo.

At the celemony for the deceased.

7 A un.

Okey.

(0.4)

8 -> B de (.) are yappari (1.3) arukooru ga naito ne tte (0.4) inage no oneesan ga yutta no yo.

And the sister from Inage said, “We need alcohols anyway.”

9 A un.=

Yeah.

10 B =soshitara

Then,

(0.8)

11 # B mo- mottekureba iijanai tte yuttara

(I) said to her, “You can bring it, can’t you?” and

12 # (.) nai no yo sorega tte.

she replied, “There aren’t.”

(0.4)

12 # B zannen toka ittara a (0.7) hitotsu gurai atta kamo shirenai tsutte.

(I) said “It’s a pity, ” and (she) replied, “Oh, there may be at least one.”

(0.3)

13 # B de uchi no (0.4) danna n ga ni moratte hh.

Then my husband gave it to her,

14 -> B de hitori de nondete sa a ii indesuka toka i(h)i(h)na(h)ga(h)ra(h) hitori de nondeta.

and she drank it alone, asking "Oh, is it OK?"

15 A hahaha

The lines in continuing forms are in the middle of the telling, where the components of the event are presented in a chronological order approaching the end. Therefore, it can be suggested that the continuing forms are used as resources for joint construction of turn-taking of the telling based on an understanding of the continuation of the narrative. In other words, the syntactic continuity of the continuing forms can make it understandable that the narrative is still continuing.

Then, it can be questioned what the two lines in non-continuing forms are for. In the excerpt, non-continuing forms are employed at the final line of the entire telling (14) and the final position of the preface (8). In line 8, the settings of the telling has just been told and the main content of the narrative is yet to be told. Therefore, we have found non-continuing forms to end sections of the telling, similar to what Chafe (1987) says about English narratives.

In sum, when the telling is ongoing, continuing forms tend to be used to demonstrate the continuity of the telling, while in some position non-continuing forms are utilized. From the data, non-continuing sentence may be used in a position that the section is divided.

Japanese noun modifying clauses are more like sentences: structure and use in conversation

Panel contribution

*Dr. Natsuko Nakagawa*¹, *Prof. Tsuyoshi Ono*²

1. National Institute for Japanese Language and Linguistics, 2. University of Alberta

Japanese relative clauses, often called noun modifying clauses (hereafter NMCs), have been portrayed with constructed examples like the following:

1) [yasu ga yaita] **keeki** o tabemashita

Yasu NOM baked cake ACC ate

‘(Someone) ate (the) cake Yasu baked.’

The clause in the square brackets modifies the NP *keeki* ‘cake’ and identifies a specific concrete referent. The NP is marked with the accusative particle *o* and serves as the direct object in the main clause (i.e., the cake eaten). Our examination of conversation data (four conversations totalling 40 minutes, randomly selected from *The Corpus of Spontaneous Japanese 2004*) reveals a different picture. In our data, 2) is a typical example of an NMC, where R answers the question how she prepares meals:

2)

1 R: a=no= tabemono o katte

‘Well, buying food’

2 nde [denshirenji de chinshite tte iu] **kanji**

and microwave with zap QUOT say feeling

‘and (it’s the) feeling of zapping (it) with (the) microwave.’

3 L: hee

‘Ahh.’ (D01F0002)

The clause in the square brackets in line 2 modifies the NP *kanji* ‘feeling’ which occurs without being part of a larger clause. This results in the answer ‘Well, buying food, and like zapping (it) with the microwave’ where *kanji* ‘feeling’, similarly to English *like*, is used to present the meal preparation in a more hedged manner.

It should be noted that the head *kanji* is considered a light head as it contributes a relatively small amount of meaning compared to a head like ‘cake’ in 1). In our data, the 10 most frequent head nouns (accounting for 75% of head nouns) are light, including *koto* ‘thing’, *toki* ‘time’, and *hito* ‘person,’ replicating the findings by Takara 2012 and Ono and Thompson 2020. We further found that many of these NMCs function more like main clauses (i.e., sentences). For example, in 2), the light head *kanji* ‘feeling’ ends R’s answer without being part of a larger clause, suggesting its completeness. This is demonstrated further by L’s immediate acceptance *hee* ‘Ahh’ in line 3.

The above observation is further supported in our data in that NMCs often contained elements such as interrogative pronouns (termed WH pronouns). These elements, not representing presupposed information, are known to be tied to the function of main clauses, such as *nani* ‘what’ which seeks specific information, further demonstrating that NMCs function more like sentences in conversation.

Thus, conversation data reveals that Japanese NMCs, though subordinate grammatically, often stand alone and function similarly to main clauses, thus more like sentences. These findings underscore the idea that grammatical constructions need to be studied in actual use not only to describe their function but also to establish their structure as actually employed by speakers (e.g., Laury and Ono 2019). Language use constantly challenges the standard units and categories that have been taken for granted not just in models and methods based on static views of language but also in studies that focus on use.

Mobilizing syntactic rules for discourse organization: A case study of utterances starting with a dependent element in Japanese

Panel contribution

*Dr. Fumino Horiuchi*¹, *Dr. Toshihide Nakayama*²

1. Daito Bunka University, 2. Tokyo University of Foreign Studies

In traditional linguistic studies, discourse is often thought to be made of a combination of grammatically complete linguistic expressions, i.e., ‘sentences’. However, as pointed out in many studies of grammatical patterns observed in spoken conversation, conversational discourse contains numerous utterances with grammatically incomplete or deviant forms. The following is an example of a grammatically deviant utterance, where the utterance starts with a grammatically dependent case particle.

(1) o gojukko ‘50 of (them)’

OBJ 50-pieces

The fact that we can observe utterance forms that are not ‘complete’ according to the syntactic rules established for written discourse does not of course mean that spoken conversation is not governed by syntactic rules.

In this presentation, we examine the grammatically deviant utterance pattern that starts with a dependent element (as illustrated in (1) above) and argue that the apparent ‘deviance’ is due to a difference in the way syntactic rules are utilized between written and conversational discourse. Specifically, syntactic rules are primarily used in written discourse to build complex sentence structures, whereas in conversational discourse they are actively mobilized to organize interactional structures.

According to common grammatical descriptions of Japanese, a case particle is a grammatically dependent element that must occur with an accompanying noun phrase in the structure of [noun phrase + case particle]. However, in the above example (1), the utterance appears to ‘violate’ established grammatical rules in that (a) a dependent particle, the object case particle *o*, occurs without a head NP and that (b) the utterance starts with the dependent particle. However, this is hardly an isolated exception or performance error. Instead, as we will show in this presentation, this pattern represents a strategy that is systematically employed to organize interaction, i.e., closing and setting aside the ongoing interaction in order to shift the topic. One typical situation in which this construction is used is when the speaker is trying to realign the discourse topic after the interaction has become side-tracked. For example, the utterance (1) above occurs in a context where two people are sharing a story with a friend about buying a 50-piece pack of candles. Then the conversation gets side-tracked into a discussion about what kind of candles they are. At the end of the side-tracked exchange, the speaker produces (1) to close the discussion of the details about the candles and realign the topic to the fact that they bought numerous candles. The isolated case particle effectively guides the hearer to interpret the preceding exchanges as the unmentioned head. The preceding exchange is forced to be packaged as a head NP and is closed as a topic. This ingenious way to exploit dependent particles to organize discourse suggests that we do not use grammar only for building sentences; instead, we can exploit many aspects of grammatical structure, including structural dependencies, to organize discourse.

Morpheme-based sentence co-construction in Japanese conversation

Panel contribution

*Dr. Daisuke Yokomori*¹

1. Kyoto University

It has been long reported that, in conversation, one sentence can be collaboratively constructed by multiple speakers (Lerner, 1991; Ono & Thompson, 1996; Lerner & Takagi, 1999; Kushida, 2002; Hayashi, 2003; Helasvuo, 2004). In the literature on the phenomenon “joint utterance construction” or “co-construction” in interaction, much attention has been paid to the role of syntactic structures such as bi-clausal constructions (e.g., if-then) and argument constructions (e.g., SVO). A less documented aspect is that sentence co-construction can be realized inside one lexical unit, relying on morphological structures. The present paper aims to describe the ways in which morpheme-based sentence co-construction occurs in Japanese conversation and thereby to shed light on the dynamic and fluid nature of sentence construction in naturally-occurring interaction. An examination of 38 cases collected from *Corpus of Everyday Japanese Conversation* (Koiso et al., 2022) shows that there are at least two types of morpheme-based sentence co-construction in Japanese. One is where a speaker produces a bound morpheme marking epistemic modality such as *-yooda* ‘seem’ or *-hazuda* ‘must,’ connecting it back to a verb in a preceding turn by a different speaker. As shown in examples (1) and (2), this type of sentence co-construction occurs after the preceding speaker has come to its completion and constitutes a weak confirmation of the just-provided proposition. Another is where a speaker starts his or her utterance with an inflectional suffix such as *-teru* (progressive) or a compounding suffix such as *-kakeru* (inchoative), forming one lexical unit with a verb in a prior turn, as shown in (3) and (4). This type occurs during the interlocutor continues talking and contributes to jointly produce one utterance unit together, claiming speakership without launching a new utterance unit. In both types, it has been shown that the agglutinating morphology in Japanese serves as a resource to finely coordinate sentence construction to deal with various interactional tasks that speakers are faced with.

The Multiple Clause Linkage Structure of Japanese speech

Panel contribution

Dr. Takehiko Maruyama¹

1. Senshu University

In Japanese sentences, subordinate and coordinate clauses are marked by non-final predicates in isolation or predicates of various inflections followed by conjunctive particles. Clauses immediately following these may be main, subordinate, or non-final coordinate clauses. A structure in which a clause is grammatically linked to another is called a clause linkage structure (Van Valin 1984; Haiman, Thompson 1993; Hasegawa 1996).

The clause linkage structure is one of the basic sentence structures that are generally observed in various languages. What is characteristic of the clause linkage structure in Japanese (and perhaps SOV languages in general) is that sometimes extremely long clause chains are formed by the concatenation of clauses using a surprising variety of clause linkage markers.

Just as indefinitely long sentences can be generated by the recursive embedding of complement clauses, there is no limit to the length of sentences produced by the application of clause linkage. While from the point of view of prescriptive grammar extremely long clause linkage structures are to be avoided, very long utterances with multiple clause linkage structures do appear in spoken Japanese. Nevertheless, there have been almost no research that quantitatively investigates and describes the extent to which this phenomenon can be found in different registers of Japanese.

In this presentation, I will quantitatively and qualitatively describe the distribution of the multiple clause linkage structure within actual spoken and written Japanese. I will examine three Japanese corpora: BCCWJ, CSJ, and CEJC, which correspond to text corpus, monologue corpus, and conversation corpus, respectively. The following two research questions are posed:

- What types of clauses are connected to form the multiple clause linkage structure and in what order?
- What factors bear on the variable use of the multiple clause linkage structure?

By identifying distributions of multiple clause linkage structures in three corpora, a model for the incremental production of multiple clause linkage structures will be introduced.

Are you being rude, sarcastic or both? Sarcastic questions as a tool for conveying impoliteness

Panel contribution

Ms. Efrat Levnat ¹, Prof. Agnes Celle ¹

1. universite paris cite

Sarcasm is one of the most sophisticated linguistic phenomena, implicitly and humorously conveying contempt (Savini & Caragea, 2022) while showing the speaker's dissociation from others (Lozano & Mendoza, 2022). Despite its importance in understanding human cognition and interaction, how sarcasm is encoded remains an open question. We aim to illuminate this by studying sarcastic interrogatives.

Sarcasm is a scalar meaning inversion communicating transposition of a pretended commitment. While allegedly making an assertion, the sarcastic speaker assumes an evaluative standard, implicating its violation (Camp, 2011). Some constructions, like questions, are particularly sensitive to sarcasm because they lend themselves extremely well to meaning inversion. While the conventionalized function of questions is information seeking (Sadock & Zwicky, 1985), the sarcastic speaker performs meaning inversion, indirectly showing criticism, ridicule, insincerity, humor (Camp, 2011) and impoliteness.

We focus on three interrogative constructions that convey both literal and sarcastic meanings, exploring how they encode sarcasm:

- Split interrogatives[1] (*who are you, my mother?*)
- Alternative questions (*are you sleeping or dead?*)
- Disjunctive polar questions (*are you stupid or something?*)

We search a spoken, non-scripted, TV-corpus (COCA)[2], and a written, forum-based, web-corpus (NLDS)[3], manually analyzing 2,264 utterances.

First, we compare the distribution of sarcastic questions between the corpora. Results suggest that sarcasm is much more prevalent in the written web-corpus than in the spoken TV-corpus. Next, the role of context in conveying sarcasm is studied. Questions that can be understood sarcastically regardless of their surrounding (written or spoken) context are marked as context-independent. Results suggest that context doesn't play a significant role in the sarcastic interpretation of these interrogatives. Lastly, the distribution of question types is examined. Results indicate that split interrogatives are the most sarcastic construction of the three.

Examination of the web-corpus reveals that these sarcastic questions are often used to show impoliteness and rudeness. This observation differs from a previous study (Jorgensen, 1996), which found that sarcasm is commonly used to be more polite when criticizing close friends, especially concerning trivial mistakes. In such cases sarcasm saves face for the speaker, because direct criticism of a trivial mistake makes them appear insulting and rude. This different usage of sarcasms in conveying (im)politeness can stem from two factors.

First, the discursive arena and its participants. Jorgensen (1996) examined everyday spoken language used by close intimates. Contrastingly, we examined an online web-forum about religion and politics, in which participants are strangers prone to arguments, thus use sarcasm to be impolite and hurtful. Secondly, the criticism in question is different. Jorgensen (1996) states that speakers use sarcasm to be more polite mostly in conveying trivial criticism. However, in the web-forum criticism is usually very personal and non-trivial, hence used for impoliteness rather than politeness.

Findings are intriguing, novel and non-trivial, offering new insights regarding the discursive arenas and strategies in which speakers use sarcasm, thus making an important step forward in understanding its essence.

How norms of proper behaviour are defined, constructed and maintained on discussion fora: the case of one Macedonian internet forum

Panel contribution

*Ms. Fevzudina Saračević*¹, *Prof. Liljana Mitkovska*²

1. *Ss Cyril and Methodius University in Skopje*, 2. *AUE-FON University in Skopje*

Internet fora as discussion platforms allow for mainly informal communication among people who share similar interests. Most fora are open to viewing, but only registered users who accept to comply with a set of rules can contribute posts and thus participate in discussions. Despite the fact that such communication is asynchronous, semi-public, anonymous, and many-to-many, discourse on the fora still manages to remain coherent and meaningful most of the time, and in effect leads to the creation a community with shared values and expectations.

This study is an attempt to examine how this is achieved: how discourse is managed in argumentative discussions in which discussants express their opinions and stances on a controversial topic on which opposed opinions are inescapable, but they must do so in a way acceptable to other discussants and in compliance with forum rules. If not, users risk being ignored, ridiculed, attacked, or even banned, since discussions are regulated by forum moderators as well as by forum users themselves.

In this research, we take a pragmatic approach to interpersonal discourse, specifically following the pragmatic study of interpersonal language as defined through the concept of *relational work* (Locher & Watts, 2008; Locher & Graham, 2010). We analyse one Macedonian internet forum, *femina.mk*, specifically three discussion threads which consist of no more than 1,000 posts and whose initial post contains a statement of opinion. For this study, we focus our attention on the relations constructed among discussants, the creation of like-minded groups, and the communication within and between emerging groups. We examine the level of politeness in posts and its impact on the need for discussants or moderators to intervene with meta-comments about behaviour in order to (re)define how norms are discursively constructed and negotiated.

We intend to show that although the forum can be considered a community on its own and members are supposed/required to follow certain rules of behaviour, each discussion is still subject to more local principles, defined by the topic, the initial post, the participants in it and their evaluative positions. All these factors interact and are constantly being negotiated during the discussion, with fluent identities, roles, power hierarchy and solidarity (Arendholz, 2013).

Additionally, we aim to contribute to a more global picture of forum-talk, by studying discourse in Macedonian. These findings can be compared to research in other languages to see whether basic pragmatic principles are equally valid and how sociocultural and language differences are displayed.

In or out? perceiving identities through translanguaging practices in the Hong Kong protest

Panel contribution

*Ms. Vivian Yip*¹

1. *City University of Hong Kong*

While scholars have theorised how social actors agentively perform their identities and challenge national boundaries through creative linguistic practices characterised as *translanguaging* (Li & Zhu, 2013; Duff, 2015; Canagarajah, 2013), less attention has been paid to how these practices – and their consequences for identity – are perceived by participants themselves in relation to particular local contexts (see: Rymes & Smail, 2020). Drawing on Hong Kong netizens’ metalinguistic comments in online forums about “loose Cantonese romanisation” (LCR), I aim to reveal how this practice – which has previously been categorised by scholars as “translanguaging” (Li et al., 2020; Jones and Chau, 2022) – takes on particular local meanings and is used to establish in-group and out-group categories in the context of the Hong Kong social movement in 2019.

The data for this study come from discussions of LCR on the online forum LIHKG – the main online space through which netizens organised demonstrations during the social movement. While LCR is a common “romanisation” practice by which Hong Kongers deal with the requirements of writing vernacular Cantonese (a variety of Chinese) via alphabetic keyboards – it took on new social saliency when netizens proposed to use it as an “in-group” form of communication for those involved in anti-government protests. I examine the resulting online metalinguistic commentary about who is perceived as understanding LCR, and how this (lack of) understanding relates to imaginations of group identities in relation to the protest movement.

In order to unpack participants’ views on the social meaning of “understanding LCR”, I discuss their comments in terms of the “metapragmatics of inaccessibility” building on scholarship that has defined accessibility of linguistic forms in relation to the access one has to particular spatiotemporal configurations, i.e. chronotopes (Blommaert, 2015; Karimzad, 2021). I analyse how netizens make metalinguistic comments about the imagined types of people who do (or do not) have access to the linguistic forms related to LCR and to its associated chronotopes. The findings reveal that these metapragmatics of (in)accessibility with respect to LCR are central to the formation of in-group and out-group identities, but also that these metapragmatics are contested and negotiated through interactions between netizens. Furthermore, netizens evaluate the varying degrees of (in)accessibility of LCR in relation to particular chronotopically situated protest events and Hong Kong local culture – further complexifying the formation of multiple exclusionary Hong Kong identities. In this way, this study adds to our understanding of how “translanguaging” practices are used not only to contest, but also to construct, boundaries between different imagined groups of people.

Interpersonal function of concessives in the R/ChangeMyView argumentative discourse.

Panel contribution

*Dr. Thomas Messerli*¹, *Prof. Daria Dayter*²

1. University of Basel, 2. Tampere University

Within social media more generally and Reddit more specifically, the subreddit changemyview (CMV) holds a special place: Rather than following trends of outrage culture and polarisation, r/changemyview's original posters invite commenters to change their view and reward those that persuade them with an award called 'delta'. Topics of submissions and persuasive comments range from films to gender, from politics to household chores, and usually provoke lively discussion rich both in transactional and relational communication.

For a series of contrastive studies, we draw on examples from our large corpus of CMV posts and comments, structured according to whether a particular comment has been awarded a 'delta' or not (and therefore has been judged successfully persuasive by the original poster).

An earlier investigation of a small sample of posts in each category has demonstrated that, first of all, an analysis of relational work in original submissions is not feasible due to the lacking context. As a result, the present study focuses on two categories of Reddit posts only: non-delta-awarded comments; and delta-awarded comments. Secondly, the earlier research has shown indications that while delta comments are overwhelmingly "non-polite" or appropriate, non-delta comments show a variety of relational work strategies. Finally, it has been shown that concessives and appraisals of potential competing views play an important role in persuasive discourse on CMV.

In the present paper, we build on these findings by looking specifically at concessive moves (identified using corpus methods) in a large sample of delta and non-delta comments. Using a corpus-derived taxonomy of concessives followed by first, second or third person pronouns, we examine whether their addressee-ship corresponds to the interpersonal goals. We classify the utterances according to the relational work function they play vis-à-vis other commenters and post authors: polite, non-polite, or impolite. The findings demonstrate that the interpretation of the relational function of language is highly context dependent, and concessives can fulfil all three functions. This underscores the crucial importance of qualitative, linguistic theory-informed analysis of persuasive discourse to obtain insights about interpersonal effects of persuasion.

Misunderstandings involving a mismatch between expectation and perception of politeness on Reddit

Panel contribution

*Ms. Alisa Kavetska*¹

1. Jagiellonian University in Krakow

The study presents a qualitative analysis of misunderstandings in text-based conversations which arise from a mismatch in the expectation and perception of politeness of the interactants. Theoretical analyses are conducted within the framework of relevance theory and in particular the comprehension heuristic, postulated in the relevance-theoretic framework to underlie meaning production and reception, called on to explain also different types of communicative failure (Sperber & Wilson 1986/95; Wilson & Sperber 2012). A special attention is given to breakdowns related to (un)intended non-propositional effects (Moeschler 2009; Wilson and Carston 2019; Yus 2017, 2021) and communication of affective attitude (Yus 2021) on discussion forums.

Being deprived of many paralinguistic cues present in face-to-face communication and providing a limited access to the interlocutors' cognitive environments (Yus 2011, 2021), digital communication is notoriously susceptible to misunderstandings of different types. This is so because non-propositional information is normally conveyed non-verbally, and this behaviour is not readily available to Internet users, which may influence the way politeness is expected and understood. Following Jary's (1998) argument, the notion of politeness in this study is conceptualised as the attribution of intentions underlying communication and not as something being communicated, hence only manifest infringement of sociocultural norms is taken to result in impoliteness becoming part of the communicated content.

Several cases of politeness-based misunderstandings were identified on the online forum platform Reddit by applying key search terms signalling that the addressee acknowledged the incompatibility between the aspects of the addresser's verbal behaviour and the addressee's assumptions about the addresser's attitude, i.e. that the addresser was held "in higher or lower regard than he had assumed" (Jary 1998: 11). These are taken to be instantiated by repair expressions like "I didn't mean to be rude", "I didn't want to offend you/to sound offensive", etc. The bottom-up/data first analytic approach was followed.

The preliminary analysis reveals that such factors as language proficiency, linguistic underdeterminacy and cultural differences in politeness expectation as well as different text-altering strategies can contribute to a misinterpretation of users' affective attitude and perceived impoliteness. In addition, it is shown that (un)intended failure to conform to the established relational work norms (Locher 2013) within a discussion forum community often leads to communicative breakdowns and negative non-propositional effects, like the feelings of offence and hostility.

Negotiating relational work and (im)politeness: The use of creative forms of address and terms of reference in female-only/dominant subreddit communities

Panel contribution

*Dr. Shengnan Liu*¹

1. Lancaster University

On 14/04/2022, following a guideline targeting problems incited by online fandom communities issued by Cyberspace Administration of China (CAC), a community consisting of roughly 680,000 members (豆瓣鹅组, Douban Goose Group) on Douban.com was banned. Douban.com is a Chinese online database and social networking service launched since 2005. Initially founded as a fandom community in 2010, Douban Goose Group had accumulated a large female-dominant membership. Overtime, many members have engaged in heated discussions on feminism and gender issues. Following the ban, some members sought refuge on Reddit.com, and formed new female only/dominant subreddit communities (as explicitly prescribed by the rules of each subreddit). This paper focuses on three subreddits formed by previous members of Douban Goose Group —r/LiberalGooseGroup (a female dominant subreddit with 7896 members), r/DoubanGoosegroup (a female only subreddit with 43,637 members) and r/DoubanFeministGroup (a female only subreddit with 5118 members) to study how relational work and (im)politeness are negotiated within each community of practice through the use of creative forms of address and terms of reference. Previous research has studied forms of address in relation to politeness (Nevala, 2004; Hamzeh Mousavi, 2020), and power and solidarity (Yusra et al., 2022). However, the use of forms of address and terms of reference in relation to impoliteness is rare. This is not surprising as previous research on address terms mainly focus on interpersonal conversations where impolite address terms are not likely to be frequent. In the case of the chosen female only/dominant subreddits, the discussions among members demonstrate a clear preference of in-group (mostly females) and exclusion of out-group (mostly males) through the uses of creative (im)polite forms of address and terms of reference such as 鹅们 (fellow geese), 姐妹 (sisters), 娇妻 (trophy wives), 蝮螭 (a creative derogative term for “国男”, i.e. Chinese men but with the Chinese radical “虫” meaning worms), 驴 (donkey, a derogative term for married women coined by self-proclaimed radical feminists) etc. Such terms were created intentionally and used repeatedly in the chosen subreddits to negotiate relational work and (im)politeness with in-group and out-group and have become characteristic of the language use of these female-only/dominant communities. This is in line with Locher and Watts' (2005) proposal that relational work comprises the entire continuum of verbal behaviour from direct, impolite, rude or aggressive interaction through to polite interaction. This study aims to address three questions: i) What are the most frequent forms of address and terms for reference used to negotiate relational work and (im)politeness in each community? ii) How are such terms used to negotiate relational work and (im)politeness? iii) What are the differences of the uses of such terms among the communities and why? To address questions i) and ii), #LancsBox (Brezina et al., 2020) — Lancaster University corpus toolbox is adopted to analyse the frequency and collocation networks of such creative forms of address and terms of reference. Question iii) is answered through critical discourse analysis (CDA).

A Contrastive Study of Chinese and American English Stand-up Comedy

Panel contribution

*Ms. Jie Zhang*¹

1. University of Wisconsin - Madison

Stand-up is a modern form of comedy that originated in Western society. It features a single comedian's predominant use of verbal humor, accompanied by some acting, but not always, to entertain the audience. In addition, the jokes told are often at someone's expense and can appear aggressive on the surface. Inspired by Western stand-up comedy, Chinese stand-up began to rise and has continued to thrive over the past decades. However, few studies have been done to reveal how stand-up is performed in Chinese culture and society, how it differs from the Western world, and what the differences might tell us. This study is the first attempt to compare Chinese and Western stand-up comedy from the pragmatics perspective.

Two sets of data were collected: the American data were obtained from seasons 9, 10, and 11 of *Comedy Central Stand-up Featuring*, and the Chinese data were randomly taken from the first two episodes of *Rock and Roast Season Five*. Both shows enjoy great popularity in American and Chinese society, respectively, and can be easily accessed on the Internet through YouTube. All the videos were posted online in 2022. Finally, the data, consisting of 36 five-to-ten-minute-long stand-up routines performed by various comedians from each program, were primarily analyzed using a content-based/thematic approach with the aid of Nvivo, a qualitative data analytical tool. This thematic approach allows me to identify each show's most salient features and compare them. My analysis of the data involves at least three tiers of coding procedures. The transcriptions were coded into various nodes and further grouped into broader categories in the second and third coding cycles. Additional steps such as merging, deleting, and renaming the codes were involved in finalizing the coding organization.

As a result, several themes emerged from the coding process. First, regarding discourse features, teasing and third-party putdown humor stood out as the most frequent verbal acts in both programs. Further analysis of teasing instances reveals that teasing could be categorized as self-directed, hear/audience-directed, and third-party-directed, depending on the target. The putdown humor mainly levels at a third party, but it differs from the third-party-oriented teasing in that it contains genuinely offensive meanings toward the third party. Moreover, the contrastive analysis shows that Chinese stand-up comedians are more engaged in self-directed teasing. In contrast, American comedians are more inclined to target third parties. Second, in terms of topics, American stand-ups tend to disclose private matters and comment on sensitive topics, such as sex, religion, politics, drug, death, race, gender, and social class. In contrast, Chinese comedians rarely touch upon these topics. Lastly, it is observed that stand-up comedy has the potential to serve various functions, such as educating, encouraging, criticizing, and representing.

The results suggest that the sociocultural context may shape the way stand-up is performed in China. However, thanks to its relatively lower threshold, stand-up comedy welcomes everyone to participate and can be a prospective form to embrace and promote cultural diversity and mutual understanding.

Conflict or Solidarity? Discursive Practices and Social Functions of Complaints in Chinese and English TV Series

Panel contribution

Mr. Shuyang Ye¹

1. University of Wisconsin-Madison

The speech act of *complaining*, especially its social/interpersonal function, is still under-studied for social interactions and intercultural communication. Previous contrastive pragmatics research has focused more on complaints with negative interpersonal meaning/functions in confrontational settings, which are potentially face-threatening acts (FTAs), but much less on the positive functions of complaints, which might be able to enhance rapport/solidarity between interlocutors. Evidence of pragmatic norms in many languages also reveals that even potentially FTAs could at times enhance solidarity, rather than only engender conflicts. Thus, both negative and positive social/interpersonal functions (Halliday, 1978) of complaints are worth exploring through their discursive practices within/across different linguacultures.

Based on the two comparable TV drama datasets—*Huanlesong*, ‘*Ode to Joy*’ (Chinese) and *Sex and the City* (American English), this paper adopts *qualitative* methodologies to identify and summarize the normative structures/discursive practices regarding the language use of complaints among intimate friends in daily contexts for each linguaculture. The speaker-hearer relationships in the given contexts and the social/interpersonal functions of relevant utterances (including responses to the prior complaints) are analyzed in an *interpretive* way following the methodological tradition of *Discourse Analysis*. Other *qualitative* approaches including *Comparative Case Study* and *Narrative Analysis* are also used for further examination of televisual characterization and narrative development in this particular genre.

In the TV dialogue, the Chinese speakers tend to make much more hearer-oriented (than non-hearer-oriented) complaints, which may not necessarily result in social conflict based on the intimate relationships between characters (*social distance*). Instead, solidarity could be created between characters especially females (*gender difference*). Although the Chinese employ more direct head act strategies for complaints, they prefer to add external linguistic build-ups (esp. grounder/justification) as a compensation to attend to the hearer’s face and enhance social harmony. On the other hand, much less hearer-oriented complaints (potentially FTAs) are observed in American English discursive practices; therefore, potential conflicts may be avoided or counteracted in this way. Unlike the Chinese speakers, the American English speakers do not seem to recognize the positive interpersonal functions of potentially FTAs even for intimate relationships. Additionally, more direct strategies for non-hearer-oriented complaints are also found in the English dataset, thus enhancing solidarity between interlocutors. One interesting finding is that in the same “reminder” context (during friends’ informal talk), Chinese tends to use strong linguistic forms to show the complainer’s sincere solicitude for the complainee/hearer, which may enhance their friendship in the long run, whereas English tends to use relatively soft or indirect speech act strategies plus internal/external modification to “politely” trigger conflict-related interpersonal functions.

In conclusion, this paper sheds new light on the process of meaning making in TV series discourse and different functions/effects of speech-behavior practices on the construction or destruction of social/interpersonal relationships within or across relatively distant language/cultural groups just like Chinese and American English (as in the East-West divide). This may further help us avoid intercultural misunderstandings.

Cross-cultural speech act creation on Twitter: an examination of Spanish and English complaint production

Panel contribution

*Ms. Macy Floyd*¹

1. *University of Wisconsin-Madison*

Complaint realization in Speech Acts is an understudied area in Pragmatics (Hidalgo et al., 2014), especially in relation to cultures and languages with differing values. Speech Acts have been thoroughly researched (Austin & Urmson, 1962; Searle & Searle, 1969); however, there are no studies analyzing complaints in Computer-Mediated Communication (CMC) within Spanish and English. As two of the five most spoken languages, they are prime for comparison as low-context (LC) and high-context (HC) cultures. This research presents evidence that Complaint realization is significantly different when produced by Spanish and English participants using CMC.

The goals of this study were to identify differences in Complaints between cultures in CMC, to analyze supportive moves, and to evaluate if Complaint realization corresponded with values associated with HC and LC cultures (Bai, 2016). This research employed a mixed-methods approach as using qualitative and quantitative data should provide a comprehensive analysis (Moran-Ellis et al., 2006). 180 tweets were collected, and Head Acts and supportive moves were coded following House and Kádár (2021). Head Acts were scored for aggressiveness, while the quantitative portion included mean length of tweets, rate of occurrence of supportive moves and head acts, and a Chi-square test for significance of length of tweets.

In this dataset there are noticeable differences in Complaint realization in English and Spanish. English used more aggressive head acts, while Spanish used less forceful ones. English Tweets were ~37% longer and had a 28% higher rate of supportive moves. A Chi-square test between Head Act category and language demonstrated statistical significance between the two. Results of this study align with existing research on HC and LC languages, with English and Spanish Complaint realization patterning with values of each culture. This is important, as not understanding pragmatic norms across cultures may cause stereotyping or misunderstandings (Gumperz et al., 1981).

Requesting Behaviour in British and Greek Service Encounters.

Panel contribution

***Ms. Antonia Tsiakiri*¹, *Dr. Federica Barbieri*²**

1. ESL Teacher, 2. Swansea University

Requests, a directive speech act (Searle, 1969), are generally regarded as a potentially face-threatening (Blum-Kulka et al, 1989), and have therefore been studied intensely from a cross-cultural pragmatics perspective in several languages, including Greek (Sifianou, 1999). Economidou-Kogetsidis (2002) study of Greek and English requests in phone calls found a significantly higher degree of directness in requests by Greek callers, along with cross-cultural differences in style, morphology and structure. Sifianou (1989) showed that in several interactions English and Greek speakers judge each other according to their norms and interpret utterances as impolite.

Requests are ubiquitous in service encounters, and given their face-threatening nature there is potential for L2 English speakers to commit pragmatic failure. However, while studies have investigated requests in telephone interactions (Economidou-Kogetsidis, 2002) and newsagents (Antonopoulou, 2001), cross-cultural research in the requestive behaviour of L1 Greek speakers in service encounters is limited.

The present study aims to address this research gap by investigating requests strategies in Greek and English in service encounters (in the hospitality sector) in Greece and the UK. Specifically, 34 service encounters were audio-recorded in 22 medium-priced restaurants and cafés in Greece and Wales. These service encounters represent interactions among 39 and 22 Greek and British English speakers. Interactions between waiters and the participants during the main ordering process were audio-recorded and transcribed. Requests were extracted from the transcribed interactions, and coded following an adapted version of Blum Kulka's (1989) taxonomy.

Findings reveal that Greek speakers relied primarily on direct strategies. NAMING (‘Μια πατάτα τηγανιτή’: One fried potato) was the most common strategy indicating strong in-group relations. Directness, friendliness and informality characterize Greek interactions and speech act production. Only a small proportion of Greek requests included a supporting move; however, internal, modification, such as minimization (‘Και ένα τζατζικιάκι’: And one tzatziki +dim), was used. In contrast, British speakers used conventionally indirect strategies, indirectness and formality. The majority of requests were formed using ABILITY, and reinforced with modality and the interrogative form in order to minimize threat, e.g. ‘Could we have two pink smashes?’ Over half of the requests included a supporting move (usually, ‘please’).

Overall, the findings are consistent with previous studies suggesting that Greek speakers utilize positively-oriented requestive strategies, while British English prefer negatively-oriented ones (Sifianou, 1999). Requests are influenced by each language orientation and display different levels of directness, which can lead to pragmatic failure.

“Her behaviour was disgusting”: Emotion and morality in online complaint discourse

Panel contribution

***Dr. Lindsay Yotsukura*¹, *Mr. Ayodele Akinola*², *Mr. Jonathan St-Onge*³, *Mr. Will H W Thompson*³, *Dr. Simon DeDeo*⁴, *Mr. Sanshiroh Ogawa*¹**

How do people complain online? Recent research examining complaint discourse by consumers in computer mediated communication (CMC) has focused on online hotel reviews on sites such as TripAdvisor, Expedia, and Yelp, examining basic features such as positive and negative evaluative comments, and references to expectations (Vásquez, 2011). Substantial variation has been identified in linguistic and semantic features, as well as ratings, sentiment, and usefulness (Xiang et. al. 2017), and how specific online platform affordances affect the degree of negativity in reviews (Ruytenbeek et. al., 2021). While some research has been conducted on complaints in airline reviews (e.g., Rita et. al. 2022), it has focused on responses by, and impact on, the industry, rather than on the linguistic elements of how consumers express themselves. Moreover, most research has evaluated CMC complaints in English, but not in other linguacultures.

Our paper presents the results of a computational-linguistic study of over 22,000 airline reviews posted on TripAdvisor between 2016 and 2023. To reflect a range of airline companies and consumer cultures, we collected reviews in different languages from passengers geotagged from Canada, Nigeria, and Japan who complained about flagship and budget carriers in Canada (AirCanada and AirTransat), Nigeria (Arik and Air Peace), and Japan (Japan Airlines and Peach Aviation), i.e., a separate set from those investigated in Rita et. al.’s study. Our research questions were as follows: (1) “complaint” is a diverse genre, ranging from frustration and disappointment to allegations of injustice, abuse, and emotional harm. What can simple linguistic features reveal about this spectrum? (2) how do different consumer cultures—in our data, Canadian, Nigerian, and Japanese—make distinct use of the genre?

Based on topic modeling and multilingual embeddings of negative reviews, we find that emotional and moral concepts vary depending on country/culture/airlines. (Im)politeness was the focus of more complaints regarding Canadian airlines, whereas a greater focus of complaints regarding Nigerian airlines was conduct of airline staff, and negative reviews of Japanese carriers had a relatively higher percentage of topics involving expectations. Many negative reviews adopted extreme case formulations (Pomerantz, 1986), possibly as a way to seek compensation from the airlines. Other reviews seem to function as public displays of disappointment and exasperation, without a compensation-seeking goal per se.

Making distance with the fetus; conversation analysis on prenatal genetic counseling

Panel contribution

***Dr. Michie Kawashima*¹, *Prof. Hiroki Maeda*², *Dr. Akane Kondo*³**

1. Kyoto sangyo university, 2. Rikkyo University, 3. Aiiku Clinic, Aiiku Maternal and Child Health Center

Relating with the fetus poses different kinds of interactional challenges. During pre-natal genetic counseling the challenge is even bigger since some parents face a task of discussing prenatal genetic testing for the fetus. This study attempts to deal with interactional management of “distance” with the fetus during the prenatal genetic counseling.

The study analysis is based on 12 video recordings of prenatal genetic counseling conducted by registered clinical geneticists (CGs) in a tertiary hospital in Japan. During the prenatal counseling, the clients were required to decide which prenatal genetic test they would prefer to take—noninvasive prenatal genetic testing (NIPT), amniocentesis, or any others. In our data set, some clients had been referred from local obstetricians because of abnormal findings (e.g., Nuchal Translucency [NT]). Since the likelihood of a miscarriage occurring rises during early pregnancies in NT cases, CGs are more careful about unpacking such possibilities during their talks with parents.

The distance management is taken place especially during a decision-making process for the possible tests and its implications. While explaining related evidences and data to decide which test to take, CGs attempts to stay neutral to support parents’ decision-making. One way of keeping the neutral stance is to present the options with objective information. For example, during the explanations of percentile of having certain kind of disabilities with NT condition of a fetus, the focus of discussion centers around numbers from the scientific data and how to interpret the numbers. The focus maintains certain distance from the fetus when discussing the general tendency and the interpretation of the frequencies. Maintaining such distance support both CGs and the parents to be impartial in the decision-making.

At the same time, the distance with the fetus is often drawn to a closer side when the participants are just about to decide what to do. For example, when the parents ask a question like “Does it apply to our baby?”, the discussion becomes more closer to the fetus by applying the objective information to the specific and their fetus. In different occasions, CGs can pose a closer stance like “An important thing is how you think of the baby” after discussing the objective numbers. By managing the distance with the fetus interactionally, the CGs and parents process their decision-making not only with the objective/medical reasoning but also personal stance toward the fetus.

Nominalizer *nun-ke* in Korean conversation: Impersonalizing through distancing

Panel contribution

*Prof. Kyu-hyun Kim*¹

1. Kyung Hee University

From a conversation-analytics perspective, the present study explores the interactional meaning of the Korean nominalizing construction involving the general noun *-ke(s)* ('thing'). As a "defective" noun form, *-ke(s)* is used with the adnominalizer/attributive marker *-(u)n*, *nun*, and *(u)l*, which each expresses anteriority, concurrence, and irrealia/not-yet-fulfilled state, respectively. On the basis of an examination of audio- and video-recorded ordinary Korean conversations, the present study illuminates the actional upshot of *nun-ke* constructions in terms of the practice of "distancing", enabled through formulating a verbal process into a form of "established fact/reality".

The "impersonalizing" import of the distancing practice organized by the *nun-ke* construction is observed most saliently as features of actions organized as various forms of "overplay" (Goffman, 1971). For instance, the mirative use of *nun-ke* emerges in the narrative contexts where the speaker presents the reported action/event as "tellable" despite the coarse granularity of description, often relying on the use of hyperbole or extreme case formulations mediating detachment and newsworthiness (M. Kim, 2015). The action/event is formulated as a fact/reality, whose deviant or extraordinary features are used as a basis for enticing the recipient to co-experience it as an externally positioned co-evaluator through sharing the speaker's loaded stance displayed to it, e.g., surprise, irony, or emotional stress attributed to it ("(You know what?) **It was the case that** the car suddenly cut in in front!") (cf. Sacks, 1992).

Other examples involve the use of *nun-ke* as a component of negative questions (formatted with *nun-ke ani*), where it renders them a resource for organizing a range of overplay in the form of "mock-actions". For instance, veiled as a request for confirmation, they may construct an act of the recipient or third party as the butt of mock-teasing, for which the speaker is not shown to be personally accountable ("**Isn't it the case that** you did not buy the TV because you wanted to spend time doing more productive things? (but now you are thinking of buying one?)" (K. Kim, 2022).

The findings are supported by *nun-ke*'s use in modal expressions such as *(u)n/nun/(u)l-ke(s) kat* ('it seems'), with which the speaker's epistemic claim is often "overly" (or unnecessarily) mitigated (e.g., "It **seems** that I am thankful to you all."/"It **seemed** pretty warm in the past few days."). Similar distancing effects are observed in the use of *(u)lke(s)* ('gonna'), marked with the irrealis mood. It is routinely used in the context where the speaker's promise of a future action is made in the form of an overstatement made "pro forma", i.e., adumbrated but not fulfilled immediately (e.g., mother to her child: "**We're gonna** leave soon (so stop bugging me).") (Suh and Kim, 1991).

The distancing practice that *nun-ke* implements organizes the participation framework in which the recipient is externally positioned as a trusted co-member to affiliate with and collaboratively register the speaker's variously overstated, nuanced, ironic stance displayed through overplay. Implications of the findings are discussed in terms of socialization process (Ochs and Schieffelin, 1989), action formation (Levinson, 2013), and cross-linguistic analysis (Sidnell, 2009).

Pragmaticization of the Japanese honorific suffix *-haru* as a resource to mark agentive “distance”

Panel contribution

*Dr. Emi Morita*¹, *Dr. Akira Takada*²

1. National University of Singapore, 2. Kyoto University

This study examines the use of the Japanese honorific verbal suffix *-haru* as a tool to acknowledge and negotiate social distance among participants in Japanese talk-in-interaction, especially in situations involving young children. This suffix appeared as an honorific marker in the mid 19th century in the Western part of Japan, which was a cultural and political center at that time. It is still commonly used in that region as an honorific suffix, and it can be used to create social distance between the speaker and the referent, as many honorific expressions do. However, our naturally occurring everyday conversational data reveals that its pragmatic function is also diversifying beyond that of a mere honorific suffix.

We observe that young children in the regions where the Western Japanese dialect are spoken start using *-haru* frequently in their talk as early as 3 years old, at a time when other verbal honorific suffixes and honorific forms have not yet appeared in their linguistic repertoire. Moreover, they use *-haru* in situations where there is no evidence to suggest that they are displaying “respect” or acknowledging some kind of differential social status of the referent. Moreover, not only are such non-honorific uses often not corrected by the caregivers, but often the caregivers, in the subsequent sequence, themselves use *-haru* for the same referent as child just did – indicating that *-haru* has been pragmaticized beyond its original honorific-only status.

In this study, we analyze the use of *-haru* in several different social actions performed by young children when they are: 1) describing a toy’s action in imaginary play; 2) describing the actions of their siblings (including infants and fetuses); 3) telling caregivers about the someone else’s doings; 4) talking about outsiders (such as a policeman, friends, visitor, etc.); 5) asking about a second person’s action. We notice that the use of *-haru* is not determined by the social status of referent, as would be the case with a genuine honorific, given that the same referent’s actions are not marked with *-haru* even within the same activity. Rather, our analyses of specific instances where *-haru* is used in quite different action types reveal how explicitly marking the measure of agency being attributed to the referent through the use of *-haru* accomplishes a number of very specific pragmatic effects (e.g., blaming, animating, ostracizing, etc.) that ‘distance’ the agency and responsibility of the speaker from the agency and responsibility of the person (or personified toy or animal) being spoken of.

In this way, this once honorific verbal suffix for denoting pre-established social distance has now also been pragmaticised as a way to proclaim distance one’s own differential measure of agency, social responsibility, and/or intentionality from that of another in reference to a certain specifically denoted act.

Social and spatial distancing in preschool groups in Sweden and Japan: Locating place of self and other in group activities

Panel contribution

Prof. Matthew Burdelski¹, Prof. Asta Cekaite²

1. Osaka University, 2. Linköping University

Across the globe, social distancing and personal space—while not new to academic interest (Hausendorf, 2014; Pütz & Dirven, 1996)—have boomed during and in the aftermath of the Covid-19 pandemic, impacting the ways people interact with each other (Katila, Gan & Goodwin, 2020; Mondada et al., 2020;). Young children exhibit a propensity to engage in social and spatial distancing in relation to others. This paper explores ways in which preschool children, ages two to three years old, in two cultural contexts—Sweden and Japan—engage in practices that seek to put social and spatial distance between themselves and peers. Based on approximately 100 hours of audio-visually recordings of naturally occurring interaction, the analysis shows how children mobilize a range of communicative resources, including verbalization, pointing, gaze, interpersonal touch, and material objects to produce pragmatic acts that attempt to re-locate other children from a physical space that they are currently occupying to an alternative physical space. Our analysis shows that these acts include directives (e.g., “You don’t sit here”), gestures (e.g., deictic pointing to mean “over there”), and interpersonal touch (e.g., pushing on another’s shoulder, stepping on another’s foot). It suggests that children’s pragmatic acts of social and spatial distancing simultaneously entail social proximity, including displaying resistance and alignment in forming social relationships. We argue that these acts reveal children’s dynamic and interactional understanding of bodies in relation to physical space, institutional norms, and the social and moral order.

Deconstructing Nuanced Perspectives in The Nigerian Boko Haram Experience: A Critical Socio-Pragmatic Consideration

Panel contribution

*Dr. Oluwatomi Adeoti*¹

1. Kwara State University, Malete

Terrorism, whether homegrown or transnationally imported, is a threat to the peace and stability of any location where it operates. It has been described and (re)presented in a variety of ways, particularly by political cartoonists who use sociopolitical and cultural knowledge of Nigerian events to capture terrorist activities and their consequences on Nigerians in specific frames. This study investigated how the cartoonists and, by extension, the Nigerian media perceive the Boko-Haram terrorists, how their activities are communicated to the audience, and how the effect of their activities is perceived by Nigerians. Twenty cartoons on terrorism (with a particular focus on Boko Haram) were purposively sampled from online sources such as Google, Facebook and online newspaper sites. They were subjected to critical examination using insights from various socio-pragmatic approaches as a theoretical basis. The study found that members of the Boko Haram sect are labelled as terrorists, extremists, enemies of the Nigerian state, anti-education, and invariably anti-progressives. This was accomplished through vivid language and graphic depictions of the sect's actions. The government was also charged with being partly responsible for the sect's activities, as the cartoonists emoted the implications of Boko Haram's operations by drawing from Nigerian sociopolitical realities to typify the consequences of these activities. The study concluded that the cartoonists used a rich stockpile of common ground to present the Boko Haram sect in specific frames, query or highlight the (in)sincerity of the government, and portray the devastation caused by the sect.

From Terrorists to Mere Bandits: Atypical Discourse Representations of the Diachronic Boko Haram Nomenclature in selected Nigerian Newspapers

Panel contribution

Dr. Daniel Nwogwugwu¹

1. Bowen University, Iwo

The continuous rise in the deadly activities of the dreaded Boko Haram sect in Nigeria calls for continuous concern. The media framing of the activities of this dreaded sect and the government's rapid mutations of the sects' nomenclature reflects, to a large extent, muted intentions and the levels of control on the audience's beliefs. Several studies have examined the sect's activities vis-à-vis their operations, newspaper framing and discourse issues, and linguistic strategies with less attention to the recently changing nomenclature and representations of this sect. Therefore, this study identifies the discourse representations of the diachronic Boko Haram nature in selected Nigerian newspapers. Data would be gathered from news headlines and content in two purposively selected newspapers, *Daily Trust* (published in Northern Nigeria) and *Punch* (published in Southern Nigeria), from 2014 to 2020. These newspapers are also selected because they are widely circulated in the Northern and Southern regions and report extensively on Boko Haram activities. The study period will reveal the continuous mutations in the nomenclature of the notorious sect. The analysis is guided by Ruth Wodak's Discourse Historical approach to critical discourse analysis and the transitivity aspect of systemic functional grammar (SFG). Data will also be subjected to critical discourse analysis. The findings will reveal the atypical discourse representations and diachronic nomenclature of the Boko Haram sect with depictions such as terrorists, insurgents, gunmen, bombers, abductors/kidnappers, negotiators, fundamentalists, and currently bandits. These discourse representations are through the material, mental, relational, and verbal processes. The paper concludes that an in-depth understanding of atypical representations and mutating nomenclature of the dreaded sect over the years will reveal the muted intentions and agenda set by the media on how citizens should interpret the sect's activities.

Linguistic Landscape of Public Signages in Nigeria Security Formations as Metaphorical (Re-)Construction of Readiness Culture in the Fight against Insecurity

Panel contribution

*Dr. Chuka Ononye*¹, *Dr. Christabel Onyema*²

1. *University of Nigeria, Nsukka*, 2. *Imo State University, Owerri*

The prevailing insecurity across Nigeria and the seeming inability of the Nigerian security forces to secure lives and properties of citizens have not only prompted all regions of the country to resort to such 'self-help' initiatives as *Hisbah Corps* (in the North), *Amotekun* (in the West) and *Ebube Agu* (in the East) (Nwoko, 2021), which have rather received widespread criticism (Olaniyi, 2011; Yahaya & Bello, 2020). Interestingly, this has triggered a conscious effort at reforming the Nigerian security operations to deal with this reality and regain citizens' confidence. One of the results is the formation of different security outfits in various states, the slogans of which are carefully chosen, privileging emotive words and concrete metaphors from English and indigenous languages, to represent the security challenges in various states/regions and strategies devised by the force in tackling them. Some of these outfits include *Operations Wabaizigian* (Edo State), *Kpochapu* (Anambra State), *Buje Ekun* (Osun State), *Yaki* (Kaduna State), *Hattara* (Gombe State), *Puff Adder* (Sokoto State), *Lafia Dole* (north-east region), *Safe Heaven* (Niger-delta region), etc.

In this study, we critically examine the extent to which, and in what ways, metaphorical thought is relevant to the understanding of the motives, uses and contestations of multiple forms of 'languages' as they are used in public signages of the Nigeria police and army (henceforth *the force*). Through this, we intend to explain how public signages on police/army vehicles and posts, for example, are cognitively structured in English and indigenous languages to conventionally apply to certain target domains that (re)construct a culture of readiness that has over the years observably been lost in the force. The study therefore seeks to answer two cogent questions: (a) what are the conceptual mappings used in the public signages, and how are they patterned? and (b) how do the cognitive mechanisms to regulate experience and trigger emotional conviction in the Nigerian citizenry?

We will apply qualitative method, which involves collecting qualitative data. First, the process of observation will be employed, and accompanied with such instruments as a video and still cameras to comprehensively document the force's public signages, such as on their vehicles and sign posts. The texts are translated and transcribed from native Nigerian languages and Nigeria Pidgin to English for wider consumption, annotated and organised in a Word processing document, and coded based on the research questions. Other ethnographic techniques such as one-to-one interview with selected public relations officers of the forces will be utilised to respectively obtain perceptions on specific institutional goals of the public signages. Data analysis will be completely descriptive and interpretive with insights from a synergy of Charteris-Black's (2004) Critical Metaphor Analysis (CMA) (which combines Conceptual Metaphor Theory and Critical Discourse Analysis), Kress and Van Leeuwen's (2006) Multimodal Discourse Analysis (MDA), and Landry and Bourhis (1997) concept of Linguistic Landscape (LL). We utilise the knowledge derived to advance a cognitive model that includes field-based evidences in realising what Nigeria's contributions at combating insecurity across Africa are.

Pragmatic Presupposition of Newspaper Headlines on Children's Involvement in Terrorism in Nigeria

Panel contribution

*Dr. Ezekiel Opeyemi Olajimbiti*¹

1. Federal University Lokoja, Nigeria

Terrorism discourse in Nigeria, with its different manifestations, nomenclatures, and dynamics, has continued to attract investigations, particularly on how to curb the act but the involvement of Nigerian children as child soldiers in this phenomenon has received less scholarly attention, although previous studies have pointed to it. This lacuna if investigated can unveil how and to what extent children are available to and engaged by terrorist groups. This paper addresses this gap by examining the pragmatics of media portrayals of child soldiers in the context of current terrorism in Nigeria. The data, consisting of 55 headlines from five Nigerian newspapers- *The Punch*, *The Nation*, *The Guardian*, *The Tribune*, and *The Premium Times*- between 2014 and 2021, were analyzed using the framework of pragmatic presuppositions. Findings reveal predominantly three presupposition triggers, namely recruitment, usability, and donation as signposts to child soldiers in Nigeria; which manifest existential and lexical presuppositions. The triggers index context of terror with the ostensible use of words characterizing activities such as bombing, killing, and attacking innocent Nigerians and inferring how children are deployed by different terrorist groups in the country because of their availability. With the presupposed component of intentionality, the headlines not only inform, condemn, lament, sensitize, and blame but also assert the indisputable involvement of children in terrorist acts. From the findings, it can be inferred, as a pragmatic orientation, that media reportage presupposes the vulnerability of Nigerian children in the hands of terrorists and assumes that they should be denied access to Nigerian children.

Keywords: Child soldiers, Terrorism discourse, Media portrayal, Presupposition triggers, Context of terror.

Recruitment strategies and loyalist ideology in terrorist rhetoric in Africa and the Middle East

Panel contribution

*Dr. Ayo Osisanwo*¹

1. Department of English, University of Ibadan, Ibadan

Terrorist groups in Africa and the Middle East publicise their rhetoric through the social media, using different ideologies and strategies to recruit new members, retain old members and achieve other gains. The recruitment strategies and ideologies deserve critical examination since existing linguistic studies have concentrated on media representations of terrorism, neglecting the examination of terrorists' rhetoric. This study, therefore, linguistically engages the speeches of terrorist leaders (ISIS, *Al-Qaeda*, *Boko Haram* and *Al-Shabaab*), with emphasis on their recruitment rhetoric in order to identify the discourse issues, rhetorical strategies, loyalist ideologies and explore the forensic propensities in them. Using transcribed speeches from online video clips, which comprised about 250,000 word-corpus, of four terrorist leaders in the world, covering mainly the GTI 2016-rating of the most affected places by terrorists, including **Africa (Abubakar Shekau of *Boko Haram*, Ahmad Umar of *Al-Shabaab*) and the Middle East (Abu Bakr al-Baghdadi of *ISIL/ISIS*, *Osama Bin Laden* of *Al-Qaeda*)** are selected. The transcribed speeches and the video clips, sourced from *Youtube*, *Facebook*, *Instagram* and other online platforms are subjected to quantitative and qualitative analyses. For quantitative analysis, corpus linguistics which enables the study of wider patterns and collocation of words, and allows analysis of multiple parameters at the same time, is deployed. For qualitative analysis, data is mainly subjected to discourse analysis, borrowing largely from CDA and other relevant theories which reveal the recruitment strategies like religious blackmail, promised remuneration to new converts, subtle threat, complimenting old membership; goals and loyalist ideologies like religious radicalism, anti-statism and pro-jihadism. The study, which should be of immense benefit to security outfits, the Nigerian state and terrorism-prone countries in Africa, will, expectedly, introduce a new dimension to the examination of terrorists' speeches and possibly give a counter orientation to the youths who are the most easily won victims of the recruitment.

Keywords: Terrorist rhetoric, Recruitment strategies, Loyalist ideology, Africa, Middle East

Terrorism in Flux: A Historical Pragmatic Tracing of Boko-haram Operations in Nigeria

Panel contribution

***Prof. Akin Odebunmi*¹, *Dr. Ruth Karachi Benson Oji*²**

1. University of Ibadan, 2. Pan-Atlantic

Terrorism in Nigeria, largely iconised by Jamā'at Ahl as-Sunnah lid-Da'wah wa'l-Jihād, and more popularly known as the Boko-Haram (BH) terrorist organisation, has demonstrated several operational manifestations both through its activities and its nomenclatures, which have implications for the understanding of the violence it unleashes and the Nigerian government's attitude to it. Several linguistic studies on BH in Nigeria have investigated its discourses more in terms of their communicative devices, pragmatic resources, and ideological orientations than in terms of the group's historically-tied nomenclatural and operational fluxes. This study takes up this omitted task by historicising BH's identity labels and connecting the occurrences of these to usage contexts, the activities of BH, and the dispositions of the media and Nigerian government to them. Data consist of 200 editions of two Nigerian-national newspapers, *Vanguard* and *Punch*, between 2017 and 2022. Insights from three theoretical platforms were found useful in data analysis: historical pragmatics, social-identity theory, and stance model. The newspapers, the headlines, and the news contents sampled were selected on stratified and purposive bases. Findings indicate that nomenclatural diachrony swings between BH's initial Arabic-Islamic-coloured preference and the government's blackmail-tainted and ideologically-grounded BH preference. Group nomenclatural preference and its attendant initial fuzzy ideology were matched with localised and controlled small-scale violence. With the label, "BH" widely mediated and ideologised, complicated with government offensives and clamp down, violence, contextualised in defensive religious extremism and equity question, rose and was weighed as full-scale terror. Thus, the label "terrorist" and "BH" took turns as alternative terms. Deep common ground knowledge between BH and Government, leaked through the media, softened government disposition and heralded labels such as "bandit", "gunmen" and "kidnappers", all integrated into epistemic evidential and affective stances disproportionately displayed by Government and the media.

The Pragmatics of terrorism in Ahmed Yerima' *Pari*

Panel contribution

Dr. Simeon Ajiboye¹

1. Bowen University, Iwo

Terrorism has been a phenomenon of main concern in the global space, and this has made it to be a subject of discourse among scholars in various fields of study. Previous studies on terrorism have focused on framing, ideology, identity construction, pragmatics mechanisms, and pragmatic functions from news headlines, media reports, and tweets, neglecting the discursive and discourse manifestation of terrorism in literary texts. This study, therefore, unpacks different discourses and discursive manifestations of terrorism in Ahmed Yerima's dramatic text *Pari*, which centers centrally and mainly on the acts and impacts of terrorism specifically, in Northern Nigeria. The study adopts a combination of Levinson's notion of Activity types and Sarangi's concept of Discourse types. The data, sourced from selected conversations in the texts, were subjected to pragmatic analysis. Five discursive manifestations of terrorism characterized Ahmed Yerima's *Pari*: rape, kidnapping, forced marriage, forced conversion, and destruction. Destruction manifests in form of killing and burning. These discursive manifestations occurred in the contexts of religion, violence, and family. Both the discursive manifestation and contexts projected poverty and government hypocrisy as factors responsible for terrorism, especially in Nigeria. The study concludes that understanding the discursive manifestation of terrorism through pragmatic resources will help not only in combating terrorism but will also help in finding a panacea to any acts of terrorism in Nigeria, and the world at large.

Doing humor in a linguistically heterogeneous peer group. Children's creative wordplay during on-task and off-task activities

Panel contribution

Mr. Nicola Nasi¹

1. *University of Bologna*

This study investigates children's humorous practices in a linguistically heterogeneous peer group, focusing on wordplay during both on-task and off-task activities in the classroom. Data were collected during video-ethnographic research in two primary schools in Italy and involve 8- to 10-year-old children with different linguistic and cultural backgrounds. The video-recorded peer interactions are analyzed with an approach that combines Conversation Analysis and the use of ethnographic information (Maynard 2006).

The study draws from the paradigm of peer language socialization (Kyratzis & Goodwin 2017), and builds upon previous research on children's language play (Cekaite & Aronsson 2004, Cekaite 2018) and shared laughter in the peer group (Strid & Cekaite 2021). The focus is on children's creative transformation of the verbal elements of previous turns in an attempt to make peers laugh. As the analysis illustrates, both native and non-native children recycle previous lexical items by ingeniously transforming some of their morphologic and/or phonologic characteristics. These humorous recyclings can be inscribed within the current didactic task, but they can also run parallel (and possibly transgressive) to it (Sterponi 2007).

It is argued that this kind of humorous wordplay is relevant to children's refinement of their metalinguistic awareness (Duranti 1997) and to the local co-construction of the social organization of the peer group. As regards the latter, through this practice children manage to build and maintain affiliative relationships with their classmates and to create a collective sense of the group (Corsaro 2003). The analysis has implications for teachers' professional practice: the affordances of specific didactic tasks seem to facilitate the emergence of this kind of practice, which is also favored by teachers' 'loose' normativity regarding the appropriate ways of using language in the classroom.

Language play and code-switching in bilingual preschoolers' playtime interaction

Panel contribution

Dr. Younhee Kim¹

1. University of Macau

Children's peer interaction has been regarded as a key locus where childhood peer culture is constructed and where children learn language as well as how to participate in social interaction (Cekaite, Blum-Kulka, Grøver, & Teubal 2014). Compared to adult-child interaction, unsupervised peer interaction seems to provide more freedom and less structure in the way play interaction develops and unfolds, which seems to lead to more instances of language play including non-word and nonsense word repetition. The current study examines bilingual preschoolers' spontaneous play interaction based on twenty-four hours video recordings. Preliminary analysis reveals porous nature of the transition between private speech/self-talk and mutual conversation. It is observed that while the children construct his or her own imagined world in their own private speech, it easily spills into the playmate's narrative scenario. Orientation to the playmate's play scenario is made most visible when one of them initiates a shift to joint play. Constant movement between repetition and improvisation constitutes one distinctive feature of the play interaction as well as code-switching practice. Orientation to multiple linguistic codes and respective worlds that it invokes are observed in their practice of negotiating transition between private speech and mutual conversation. Using different codes allows them to map and navigate through cultural landscapes as well as to deal with varying interactional contingencies. Two seemingly opposite features, i.e., massive amount of repetition and onomatopoeia words on one hand and intricate coordination of collaborative turns across different language codes on the other hand are observed in the interaction, based on which the study concludes with reflection on the value of unstructured play and ludic language, and inseparable link between language code and cultural domains it invokes. The focal children observed are Korean-English bilingual, based in Singapore.

Translanguaging in Welsh traditional storytelling activities

Panel contribution

***Dr. Amanda Bateman*¹, *Prof. Friederike Kern*²**

1. University of Waikato, 2. University of Bielefeld

The importance of understanding historical cultural connections to land and teaching of cultural histories and identity is imperative in the new Curriculum for Wales to support children's holistic wellbeing and positive national identity. Storytelling about traditional Welsh legends in early years classrooms can support such issues and is explored here in relation to the use of the Welsh collection of stories in *The Mabinogion* in a new entrant classroom in Mid-Wales.

An ethnomethodological paradigm highlights how a teacher and her class of five-year-old children make sense of their world in terms of the storytelling activity. Video data totalling two hours and eight minutes were collected over two days in a Welsh medium new entrant classroom in mid-Wales when the Mabinogion was being read. Specific moments of interest were transcribed and analysed using conversation analysis and membership categorisation analysis (Sacks, Schegloff & Jefferson, 1973).

Focusing on the beginning of a storytelling activity, we are especially interested in the translanguaging practices that are embedded in a rich multimodal environment. While the teacher makes efforts to set up an environment in which Welsh cultural and linguistic heritage can be multimodally reproduced to create a sense of belonging and identity (Bateman & Davies, 2021), several cases of translanguaging practices (Garcia & Wei, 2014) occur. In these, English is used as a linguistic code even though the teacher has established Welsh as the main classroom language. A closer look at the practices reveals two orderly aspects: (1) children's routine use of English, especially when providing *candidate answers* to the teacher's questions; (2) the regular translation of *place names* that are thus treated as objects oriented to as significant for everybody to know in English and in Welsh. Building on research on translanguaging as a pedagogical practice in Welsh classrooms (cf., e.g., Williams, 1996), the aim of the presentation is to explore the systematics of translanguaging as fluid, multimodal practices of making meaning (Bonacina et al., 2021) during the Welsh traditional storytelling activity, and situate them in the wider context of the Curriculum of Wales. Such practices built around traditional Welsh legends connected to place and identity support efforts for language revitalisation in ways that are key to the holistic development of the child, particularly for belonging and identity (Bateman & Davies, 2021)

Translanguaging, Language Creativity and Belonging in Boys' Peer Group Play in a Bilingual Spanish-English Preschool

Panel contribution

Prof. Amy Kyratzis¹

1. Department of Education, University of California

Children often adopt language practices to mark affiliation with a peer group (Rampton 2017; Zentella 1997). This paper explores how members of peer group of four boys, two having stronger English than Spanish language competencies, and two having stronger Spanish than English language competencies, socialize one another to English and Spanish language practices as well as heteroglossia and translanguaging (García & Leiva 2014; Kyratzis, Reynolds & Ewaldsson 2010), in classroom peer play interactions. Data are drawn from a multi-year videoethnography which followed the classroom friendship group interactions in a bilingual Spanish-English Head Start preschool classroom. One of the boys with stronger Spanish competencies led in play involving enregistering (Agha 2005) adult male voices (e.g., Padre and Compadre), indexing these as powerful peer registers appropriate for school and influencing even peers with less strong Spanish language competencies to adopt the registers. As the peers attempted to enter these plays, they would use features of the registers. They would also use Spanish language forms and translanguaging, combining English and Spanish resources to build Spanish phrases and heteroglossic ones (“I speak Español and Inglés”) by way of gaining access to the play and indexing belonging. Concomitantly, a boy with stronger Spanish competencies would also use English language forms and heteroglossic phrases, to participate in play influenced by American popular media and video games (e.g., Fruit Ninjas), (e.g., “Son bombs!”). Results illustrate how children’s multilingual play provides a site for their exploration of new language forms and registers and for their exploration of how language forms index social roles, identities, and belonging.

Young boys' heteroglossic practices in afterschool social networking: Creating social spaces for exploring linguistic varieties and language norms in heterogeneous peer group settings

Panel contribution

*Prof. Ann-Carita Evaldsson*¹

1. Department of Education, Uppsala University

This study applies a language socialization approach to the multilingual peer group as a socializing agent for children's language learning, creativity and sociality (cf. Goodwin & Kyratzis, 2011). It explores children's creative language use (language play, style-shifting, crossing, code-shifting, verbal performances) in a multilingual afterschool/social network setting where language users navigate between multiple and sometimes conflicting linguistic and cultural resources while enacting their multicultural experiences (Kyratzis, Reynolds & Evaldsson 2010). The analysis takes its point of departure in research on children's language creativity that underlines the interrelationship between language practices of bi/multilinguals in terms of heteroglossia (Bailey, 2007; Minks, 2010) and polycentricity (Blommaert, 2010). It demonstrates how a group of boys (with Swedish-Turkish-Kurdish backgrounds) make use of and manipulate diverse linguistic/ communicative features and styles, including i) an urban youth register and ii) heritage language forms (their social values and pragmatic uses) in a social media context, while orienting iii) to standard language norms for proper Swedish use and orthography. It is argued that such hybrid linguistic practices (Rampton, 2017) – located and enacted within everyday on/offline peer interactions contribute to cultural linguistic variety while simultaneously reproducing different normativities (both peer generated norms and standard norms for language use).

The selected data are based on a video ethnographic study in an afterschool program (for 7- to 9-year-olds) in Sweden with a multilingual policy, that offers daily spaces for children to socialize with peers and relate their home and school experiences. In this context children's friendship and creative language use are (re-) configured through their daily engagement with social media. The boys' on/offline communication involves mocking, joking and heteroglossic practices of speech and writing, language play with linguistic features (phonetic, morphological and syntactic) characterized by plurality, heterogeneity and polycentricity of semiotic and linguistic resources (Blommaert, 2010) and "multiple layers of normativities" (Agha, 2007). The findings highlight the aesthetic, interactive and socially constitutive role of young boys' creative agency and how children in playing with and juxtaposing features from different registers/genres for social entertaining purposes, simultaneously appropriate, explore and challenge existing language hierarchies and ideologies.

Clause linkage strategies in colloquial Ancient Greek: The case of *hóste* in documentary papyri

Panel contribution

Dr. Giuseppina di Bartolo¹

1. University of Cologne

Recent linguistic research has pointed out that phenomena emerging from spoken language often challenge the canonical dichotomy of syntactic hierarchies (among others Maschler et al. 2020; Van Valin 1984). That is to say, the categories of coordination and subordination are often found lacking in describing the full range of usages emerging in spoken language, including the dependency of clauses beyond sentence-level syntax.

This paper, which is part of a broader study on clause linkage strategies in ancient Indo-European languages, aims at contributing to the analyses on syntactic and discourse relations, addressing data from Ancient Greek. It specifically focuses on a corpus of Greek documentary papyri which belong to the most copious sources for the study of ancient colloquial varieties. With a continuity of more than a millennium, these sources allow us to detect general linguistic trends in texts from everyday life. They include constructions that challenge traditional structure-based linguistic analyses and show the emergence of new uses in clause combining patterns.

A case in point is provided by *hóste* ‘so that’, traditionally defined as a subordinating conjunction used for expressing consecutive relation. By means of examples, I will firstly show that *hóste* can occur with the imperative or the indicative in order to express results, exhortations or commands which do not depend on a previous matrix clause. In this respect, it does not introduce a subordinate clause, but rather it connects two syntactically independent discourse units, behaving like a discourse particle, operating beyond the sentence level syntax, and contributing to the whole discourse coherence (Mithun 2008; Ruiz Yamuza 2021). Secondly, I will consider the instances of the collocation *hóste* + *be.INF.PRS* in specific types of texts (i.e., sale contracts and receipts). Thirdly, I will explain to what extent the different types of analyzed *hóste* sentences can be explained as cases of insubordination (Beijering et al. 2019; Evans–Watanabe 2016). I will therefore address the factors which have led to these usages (Cristofaro 2016). The final data discussion, which includes a cross-linguistic comparison with modern languages, will highlight that Greek documentary papyri are not only significant sources for detecting synchronic varieties, but also a useful test bench for investigating more general linguistic phenomena which are found in modern as well as in ancient languages.

Clause-combining at the grammar-discourse interface in French

Panel contribution

***Dr. Wout Van Praet*¹, *Prof. Liesbeth Degand*²**

1. UCLouvain, 2. UC Louvain

This paper examines how clause-combining at the grammatical level maps onto relation types between units established at the discourse level. It focuses on adverbial subordination in French, with the aim to compare the interaction between syntactic integration and discursive dependence.

The data consist of 250 examples of adverbial subordination from LOCAS-F, a PoS-tagged and richly annotated corpus of spoken French. An exhaustive extraction of subordinating conjunctions was taken from the orthographic transcriptions, then paired with the corresponding soundbites (analysed in Praet).

To investigate clause-combining at the grammatical and the discursive level, two coding schemes are used. The **grammatical** scheme assesses the degree of syntactic dependence, based on the syntactic properties of clefting, pronominal proportionality, and fronting [1]. The degree of **discourse** dependence is established based on discourse-oriented features like speech-functional value, modality, prosodic integration [2-5].

In a second step, different types of grammatical and discourse linkage are charted through a cluster analysis, thus refining in a systematic fine-grained manner existing clause-combining clines.

Thirdly, the resulting configurations are related to the semantic function of the conjunction (e.g. cause, concession) and their domain of use (Ideational, Rhetorical, Sequential, Interpersonal) [3]. A multifactorial analysis will reveal which features (discursive, grammatical, semantic) are the best predictors of the domain in which a conjunction is used. Conversely, a hierarchical cluster analysis will provide the degree of “polygrammaticality” for the different conjunction lemmas, viz. the range of configurations a conjunction may occur in. A low degree of polygrammaticality is expected to be indicative of conventionalized grammatical status, while a high degree points to a bridging context towards new discourse uses.

Preliminary findings from a pilot study of 100 examples suggest an interaction between a clause’s syntactic (in)dependence and the discourse relation it establishes: grammatically fully integrated clauses typically establish ideational relations, whereas clauses expressing interpersonal relations are grammatically independent. Moreover, conjunctions expressing cause, concession and condition are more polygrammatical than those expressing temporality, which are characterised by greater grammatical and discursive dependence. Finally, when the same discourse function can be coded by conjunctions with similar meanings (e.g. *parce que*, *puisque*), the two tend to occupy different functional niches (with *puisque* used predominantly in the rhetorical domain). Ultimately, the findings in this study will improve our understanding of clause-combining at the grammar-discourse interface, describing how grammatical affordances of subordination are bent to new uses that come to expression in discourse.

Context-dependent grammar: The Japanese sentence-final *tteyuu* in Twitter

Panel contribution

*Dr. Michiko Kaneyasu*¹

1. Old Dominion University

Different communicative environments afford different patterns of interaction and language use. This study investigates how the affordances and constraints of Twitter as a communicative space interact with the sentence-final use of *tteyuu* [ʔteju:]. *Tteyuu* is a lexicalized combination of the quotative marker *tte* and the verb *yuu* ('say') and is considered a type of complementizer. In sentence-level grammar, it links a modifying clause to a modified head noun (*kay ga tokyo ni sunderu tteyuu uwasa* 'a rumor that Kay lives in Tokyo'). In spoken discourse, however, *tteyuu* also appears utterance finally.

In Kaneyasu (2023), I examined varied speaking environments and identified three related usages of the utterance-final *tteyuu*: (1) clarifying the preceding utterance in response to different local contingencies such as responding to a clarification question, (2) recasting the prior unit of talk in a way that highlights its relevance to the main communicative purpose of the ongoing speech activity, and (3) delivering a key action (e.g., discussion summary, story climax) for the ongoing speech activity. The first clarifying usage is most general in that speakers in all examined speech activity types utilize it. The second and third usages, in contrast, only appear within specialized speech activities, such as topic-based discussion and funny storytelling with activity-specific overarching goals. In addition, while the first and second usages are dependent on the preceding discourse, the third usage makes an independent move in discourse. From the perspective of language change, the specialized speech activities can be considered "bridging contexts" (Evans and Wilkins 1998), where the use and interpretation of recasting *tteyuu* give rise to activity-bound pragmatic inferencing that the *tteyuu*-ending utterance does something essential to achieving the activity-specific communicative purpose.

Twitter shares with spontaneous spoken discourse a temporally unfolding nature and a varying degree of colloquialism. It is therefore not surprising that we find the sentence-final use of *tteyuu* in tweets. At the same time, tweets offer a unique set of situational and organizational characteristics, which likely influences the use of linguistic and other multimodal resources. The current study examined 140 samples of sentence-final *tteyuu* in tweets posted in 2022. Its most common usage is to annotate something expressed in the preceding text and tweet, or a photo or screenshot appearing within the same tweet as the *tteyuu*-ending sentence. This usage has overlapping characteristics with the clarifying use and recasting use found in the spoken discourse: adding subsidiary information and explicating the noteworthiness of the given text or image. I will present examples of this and other usages and discuss how they relate to one another as well as to the communicative purposes and constraints of Twitter.

How does insubordination relate to subordination? A constructional cline of discourse uses of *comme si*-clauses in French

Panel contribution

*Mr. Víctor Royo Viñuales*¹, *Dr. Wout Van Praet*², *Prof. Liesbeth Degand*²

1. *Université de Liège - UCLouvain*, 2. *UCLouvain*

Previous studies have explored insubordination as the “conventionalized main clause use of what [...] appear to be formally subordinate clauses” (Evans 2007:367) and proposed different explanations for its linguistic arising in discourse. Those proposals range from the reanalysis of an elided main clause (Evans 2007) to an extension of the dependency scope from syntax to discourse (Mithun 2008, D’Hertefelt and Verstraete 2014), also including explanations in terms of hypoanalysis (Van linden and Van de Velde 2014).

This paper aims to understand the linguistic nature of insubordination by assessing how it relates to different subordination patterns. More precisely, it explores the discursive behaviour of *comme si*-clauses in order to identify which syntactic, semantic and prosodic parameters define insubordinate uses compared to their subordinate counterpart. Thus, our work ultimately aims to posit a cline of the different *comme si*-clauses in discourse and investigate how they relate to one another.

Our analysis pertains thus to three dimensions: i) **syntactic dependence** is assessed through several tests (e.g. proportionality and anteposition), providing different dependency patterns (Debaisieux 2016); ii) a **semantic characterization** is parallelly conducted to identify to which macro-function domain these clauses belong and which semantic value they convey (Crible & Degand 2019); and iii) **prosodic analyses** allow us to investigate how different intonational patterns correlate with the resulting syntactic-semantic configurations (Elvira-García et al. 2017). To these ends, our paper analyses a set of 642 *comme si*-clauses, randomly extracted from three corpora, i.e. frTenTen17 (online written data), ParCoLab (literary writing) and Orféo database (conversational speech).

We observed that the semantic types expressed by *comme si*-clauses do not evenly distribute over the subordinate-insubordinate interface. More precisely, it appeared that ‘manner’ clauses (1) are restricted to subordination and ‘denial’ clauses (2) to insubordinate cases – in turn, ‘cause’ (3) and ‘attribution’ (4) clauses are found in the two categories. Based on the notion of ‘bridging contexts’ (Evans and Wilkins 2000:550; Heine 2002), we claim that insubordinate *comme si*-clauses expressing ‘denial’ discursively arise from subordinate clauses encompassing both the expression of ‘manner’ and ‘denial’ (1), i.e. through hypoanalysis (Van linden & Van de Velde 2014).

- (1) *Je lui ai souhaité un bon anniversaire comme ça m’intéressait.* (ParCoLab)

‘I wished him/her a happy birthday as if I cared.’

- (2) A: *Je vais arrêter de fumer.* B: *Comme si t’allais réussir !* (TCOF in Orféo)

‘I’m gonna quit smoking’ ‘As if you would succeed!’

- (3) *La porte s’ouvre avant qu’il ne la touche, comme si quelqu’un l’avait tirée de l’intérieur.* ‘The door opens before he touches it, as if someone had pulled it from inside’ (ParCoLab)

- (4) *C’est comme si tu allais voir un film, sauf que c’est toi l’acteur.* (TCOF in Orféo)
-

'As if you went seeing a movie, except you are the actor.'

These findings were indeed supported by prosodic analyses, as i) different syntactic-semantic configurations were found to correlate with different intonation patterns and ii) a significant number of bridging examples like (1) proved to display a rising-falling tone typically associated with 'denial' in subordinate clauses.

Insubordination and discourse structure: on Spanish insubordinate conditionals

Panel contribution

Dr. Pedro Gras¹

1. Universiteit Antwerpen

Several functional studies have shown that grammatical constructions which express relations between clauses usually tend to occur in a specific discourse position (Fillmore 1989, Evans 1993). Adopting a Construction Grammar perspective, discourse position could be understood as a feature of a construction's form, analogous to the syntagmatic position of other constructions that work within the sentence boundary, such as attributive adjectives in relation to a noun, for example. In this line, Linell (2009) proposes that the external syntax of a construction must specify its restrictions regarding the contexts in which it can appear.

The goal of this paper is to discuss the role of discourse information in the representation of grammatical construction through the analysis of Spanish insubordinate conditionals, exemplified in (1).

(1) A. ¿Vamos a la playa?

'What about going to the beach?'

B. ¡Si está lloviendo!

Lit. If it's raining! 'But it's raining!'

From a formal point of view, these constructions pair two conflicting features: on the one hand, they superficially resemble conditional sentences, in that they are headed by the conditional marker *si* 'if'; but, on the other, they behave syntactically and prosodically as main clauses, in that they generally constitute a turn in conversation –without possible main clause material in the preceding turn—and have non-continuation prosody (Elvira-García et al. 2017). From a semantic point of view, these constructions introduce propositions that question some aspect of the previous turn, and therefore, tend to occur as dispreferred second parts of an adjacency pair (Montolío 1999). Indeed, this is what happens in example (1), in which speaker B questions the appropriateness of the speaker A's proposal to go to the beach.

Using interactional data from a corpus of colloquial conversations, each token has been analyzed according to the *discourse unit* in which the construction occurs (turn, utterance, preface, extension, etc.) and the *discourse positions* in which the construction is placed in relation to these units (independent, initial, medial, or final).

The results of the analysis show that it is not possible to assign to all tokens of the construction a single discourse position, but they occur in several positions, although not all occur with the same frequency. The results can be taken as evidence for a radial representation of constructions, in which the discourse information is not represented in the general schema, but in basic level constructions that exhibit different levels of prototypicality, according to their frequency.

Ob-Clauses in Old High German: Factors in the Divergence of Complement and Adverbial Clauses

Panel contribution

Mr. Michael Redmond¹

1. *Université de Neuchâtel*

The Present Day German (PDG) subordinator *ob* ‘if’ is most commonly associated with complement clauses forming indirect questions. It is also used in attributive clauses and in complex syntactic patterns and subordinators expressing irrelevance-conditionality, unreal comparison and concession (*ob...oder...* ‘if..or..’; *als ob* ‘as if’, *obwohl* ‘although’ respectively) as well as in in subordinate clauses expressing a range of illocutionary forces. Many of these types evidence historical conditional functions, which is the most prominent function of *ob*-clauses in Old High German (OHG), cf. (1), (Schrodt 2004). There are, however, other attested types similar to those found in PDG expressing complement clauses (2) and attributes, irrelevance-conditionality (3), concession and temporality (4).

1. Oba ír furlazet mannum iro sunta, thanne furlazit íu íuuar fater thie himilisco íuuaara sunta. [T 34,7]
‘If you forgive people’s sins, then your heavenly Father will forgive your sins.’
2. Tho quad her: oba her suntig ist ni ueeiz [...] [T 132,15]
‘Then he said, “I don’t know if he is sinful [...]”’
3. Tho antlingita Petrus, quad imo: inti oba sie alle bisuihane uuerdent in thir, ih nio in altere ni uuirdu bisuihan [...] [T 161,3]
‘Then Peter answered and said to him, “Even if they all betray you, I will never betray [you] [...]”’
4. Ob ih in kárkare wás, ir biríwetut thaz, wísotut min ouh in thíu, [O V.20,77]
‘As I was in prison, you regretted that, and visited me therefore,’

This study is an investigation of the relationships between OHG *ob*-clauses based on the *Otfrid*, *Tatian*, and *Notker* subcorpora of the *Referenzkorpus Althochdeutsch 1.1* (Donhauser/Gippert/Lühr 2018; Krause/Zeldes 2016). The polyfunctionality of *ob*-clauses is an indicator for historic morphosyntactic and semantic ambiguities, which may have lead to innovative interpretations and new clause-combining possibilities. Through the investigation of such ambiguities, the study is intended to reveal both similarities between types as well as factors in their divergence pointing to their hypothesised diachronic relationships. It is specifically hypothesised that, in addition to semantic factors associated with matrix verbs, syntactic factors play a particularly important role in the development of complement clauses, whereas innovation among adverbial clauses is motivated predominantly by semantic-pragmatic effects.

Notably, as in PDG, several types found in OHG appear to be disambiguated by lexical and syntactic means. One of the aims of this study is to identify formal markers found in innovative *ob*-clauses, asking the question if such formal features are a motivation for or consequence of emergent clause types, thus investigating the relationship between lexical, syntactic, and pragmatic strategies in clause combining.

Periodic style and the syntax of clause linkage in Early New High German and Early Modern Danish

Panel contribution

Prof. Pierre-Yves Modicom¹

1. Université Jean Moulin Lyon 3

While most core morphosyntactic features of Present-Day Standard Germanic languages were already in place in the written varieties of the late 16th century, written discourse in the early modern languages of Western and Northern Europe were under the influence of a rhetorical writing code often named “periodic style” (which I take to be a discourse tradition; Siouffi, 2019). In this kind of writing, the core syntactic units of written language are not the clause and the utterance, but the period and its components, the *protasis* and the *apodosis* and an optional constituent, the *clausula* (today’s protasis-apodosis conditional constructions are a remnant of this pattern). The aim of the talk is to investigate the rendition of Early New High German (ENHG) periodic structures in Early Modern Danish (EMD), using a 1587 ENHG chapbook, the *Historia von Dr. Fausten*, and its EMD translation (1588).

In **part 1**, I present the **major typological differences between both languages**. Both ENHG and EMD are V2 languages, but Danish displays consequent VO features and allows only limited scrambling; on the other hand, ENHG has stronger OV features and is a scrambling language; ENHG and EMD both allow left dislocation.

In **part 2**, I investigate **parallel extracts from the corpora**. I show that the clause is a more consistent and compact unit in EMD than in ENHG, where (multiple) left-dislocation appears to be a crucial feature of periodic constructions (which is not the case in the EMD subcorpus); in EMD, periodic syntax is essentially reduced to (i) correlative constructions with a conjunction and an adverbial correlate (*der p, da q*) and (ii) additive constructions using the linking word *og* (*p og q*). The item *og* is both an additive coordinator (“and”) and an additive adverbial particle (“also”) with a different syntax. In the corpus, clause-linking *og* is used only as a coordinator. ENHG makes a much more extensive use of subordinators, whereby these subordinators often behave like coordinators regarding the syntax of the clausal constituent they introduce (Lefèvre, 2017). The ENHG corpus also displays more recursive periods (with a sub-apodosis and a sub-protasis inside of each of the two major components; Rinas, 2019). This kind of recursive period is almost absent in Danish.

Conclusion: “periodic style” and the various types of grammatical strategies involved in the *Ausbau* of the corresponding rhetorical discourse tradition, including clause-linkage but not restricted to it, can be used to distinguish the typological profile of two languages: ENHG is representative of a discourse-configurational language. Information-structural and argumentative regularities overdetermine clausal grammar. Danish, on the other hand, is clause-configurational: information-structural and argumentative regularities hold only within the borders of clausal syntax.

Spanish ‘que’-constructions from an interactional-constructive perspective: patterns, levels, and degrees of (in)dependence

Panel contribution

Prof. María Sol Sansiñena¹

1. KU Leuven

Spanish *que*-constructions can function as syntactically dependent as well as insubordinate constructions (Evans 2007) and the empirical evidence shows that there are types and degrees of (in)dependence available for these constructions (Sansiñena 2015). Moreover, Spanish *que* ‘that’ has a multiple functional load in that it marks the finiteness of the clause but also signals a pragmatic meaning to the speech participant when it is used without a matrix verb. This study discusses the interconnectedness of diverse functions associated with *que* by addressing the phenomenon of ‘semi-insubordination’ (Van Linden and Van de Velde 2014) in Spanish, illustrated in (1), and discussing it against the pattern *que*-clause>, as in (2), and the case of so-called ‘causal’ *que*, as in (3).

1) [Friends signing a petition]

G03: *si me invento un DNI no lo comprueban no/*

G02: ***claro que lo comprueban Lucas***

‘G03: If I make up an ID, they won’t check it, right?’

G02: **Of course [that] they check it, Lucas’**

(MAESB2-02, COLA M)

2) [Friends watching TV]

J01: *ah cállate Pepa y Miguel vete que me duele la cabeza eh/*

G02: *si a ti te duele la cabeza es que*

1[a mí imagínate]

J01:1[***mira (.) que te pires tronco***]

‘J01: Oh, shut up, Pepa, and Miguel, go away, [QUE] my head aches, eh!’

G02: Right, if you have a headache, like

1[imagine how I feel]

J01: 1[**Look, [QUE] go away, man’**]

(MALCC2-07, COLA M)

3) [Friends talking about a minidisk recorder]

G01: ***cuidado (.) que se cae***

‘G01: **Be careful, [QUE] it will fall.’**

(MAESB2-01C, COLA M)

Specifically, this study focusses on the relations established between *que*-clauses and immediately preceding elements in the turn, as well as on what types of premodifying elements contribute to the interpretation of the *que*-clause. Based on the interactional-constructive analysis of conversational data extracted from the COLA and the oral components of the CREA and CORPES XXI, and considering the structure of the turn-intervention, I argue that the relation between the *que*-clause and the preceding element is essentially different depending on whether they constitute two turn-constructive units or only one. Moreover, the preceding element is classified according to its function in discourse, either as preface, element with illocutionary force, or modal element. Criteria to determine which of these cases we are facing include the number of TCUs in the turn, the potential for an intonation break between the *que*-clause and the preceding element, and the function of such element in

relation to the *que*-clause. This study presents a typology that is in its own right suggestive of a gradient between some semi-insubordinates leaning close to subordination and others approximating insubordination.

Stand-Alone Nominalization in Modern South Arabian

Panel contribution

Dr. Fabio Gasparini¹

1. Freie Universität Berlin

This talk will provide an analysis of the phenomenon of ‘stand-alone nominalization’ (Yap et al. 2011) – i. e. nominalization in a syntactically-independent context – in two Modern South Arabian languages (henceforth MSAL – Semitic, Afroasiatic), namely Mehri and Baṭṭhari. Data is taken from Rubin (2018), Morris (Forth.) and original field data.

Stand-alone nominalization can be understood as a broad case of insubordination (Evans & Watanabe 2016: 1). This innovative structure likely developed because of the diachronic loss of participial forms, which in turn are widely attested elsewhere in Semitic. The comparison between Mehri and Baṭṭhari is relevant because, although they are two closely related varieties of MSAL, they present some important differences which deserve a closer look.

Stand-alone nominalized clauses in MSAL are main clauses headed by an associative particle – *ǧ(ə)*= in the case of Mehri and *(ə)l*= for Baṭṭhari – commonly used as genitive/relative/attributive markers. I describe the particle as a nominalizer (Shibatani & Makhshen 2019), according to its substantial/determinative nature (Huehnergard & Pat-El 2018).

A stand-alone nominalized verb encodes a durative (1), progressive (2) or anterior (3) aspect depending on verbal Aktionsart and TMA properties:

(1) Baṭṭhari

el fēzʕ-ak

nmlz be_scared\pfv-1s

‘I am terrified’

(2) Mehri

ḥā=bū ǧə=yə-ṣḥáyk mán=əh

det=people nmlz=3m-laugh\ipfv from=3s.m

‘people were laughing at him’

(3) Mehri

ǧə=xtáwn ḥə=bán=ihəm

nmlz=circumcize\pfv.3pl.m det=son\pl=3pl.m

‘they circumcized their sons’

Nominalization is significant in relation to discourse structure and textual organization since such clauses are mainly used to convey background information (Gasparini 2021). The different patterning of nominalized clauses within the information structure of Mehri and Baṭṭhari will be dealt with in order to demonstrate how two related varieties can develop the same construction from the same input (i.e. the loss of the participle) while at the same time showing variation in its properties.

Subordination and insubordination in *if/si*-constructions: Evidence from spoken and written English and Spanish

Panel contribution

*Dr. Cristina Lastres-Lopez*¹

1. *Universidad de Sevilla*

This paper explores two patterns of clause combining – subordination and insubordination – in constructions introduced by *if* in English and their equivalents in Spanish, introduced by *si*. The analysis comprises, on the one hand, instances of subordination, namely, conditional constructions, as in (1) and (2). These include both prototypical conditional constructions in which the protasis indicates the cause and the apodosis expresses the consequence, as in (1), as well as other constructions which express a wider range of functions in discourse and in which the conditional meaning is weaker (Ford & Thompson, 1986; Ford, 1997; Warchal, 2010; Lastres-López, 2020, 2021), as in (2). On the other hand, the analysis also encompasses cases of insubordination (Evans, 2007), introduced by the same conjunctions, as illustrated in (3) and (4).

(1) Si la inyección económica no viene, lo vamos a pasar mal (CONTRAST-IT cnt_es_mun_dep_006)

‘If the economic injection does not arrive, we are going to have a hard time’

(2) So there’s two different patches there if you see what I mean (ICE-GB:S1A-076 #094:1:B)

(3) If anyone would like some ice cream (ICE-GB:S1A-073 #285:1:A)

(4) Si le viene bien trabajar (C-ORAL-ROM efamd114)

‘*If working is good for him’

Prior research has examined conditionals and instances of insubordination introduced by the same conjunctions independently. This paper will bridge the gap between these two constructions by examining cases of *if/si*-subordination and insubordination in parallel, analysing both spoken and written discourse. The aim is to offer new light on the characterization of these constructions and, more broadly, on clause combining patterns at the discourse-grammar interface. The theoretical framework adopted to explore the functional-pragmatic properties of these constructions is based on the three metafunctions distinguished in Systemic Functional Linguistics (Halliday & Matthiessen, 2014), allowing us to distinguish *if/si*-constructions at the ideational, interpersonal and textual levels.

The methodology adopted is corpus-based. Data from spoken discourse are extracted from the conversation subcorpora of the British component of the International Corpus of English (ICE-GB) (Nelson et al., 2002) and the Spanish component of the Integrated Reference Corpora for Spoken Romance Languages (C-ORAL-ROM) (Cresti & Moneglia, 2005). On the other hand, written data are retrieved from the English and Spanish components of CONTRAST-IT (De Cesare, 2018), which comprise data from online newspapers. Corpus findings unveil differences between the two modes and the two languages examined and allow us to determine how subordination and insubordination operate in speech and writing in English and Spanish.

The discourse-grammar interface in the development of new adversative connectives

Panel contribution

*Ms. Luisa Ferrari*¹

1. Sao Paolo State University

The discourse-grammar interface in the development of new adversative connectives

In the literature on clause combining, it is generally acknowledged that speakers/writers are constantly in search of new and more expressive means to convey contrast relations, which results from their highly intersubjective meaning. Their development, among several other phenomena, provides evidence of the emergent nature of grammar (Bybee, 2010).

In contemporary Brazilian Portuguese, two originally subordinating temporal connectives, *enquanto (que)* and *ao passo que*, both similar to English *while*, can be found in contexts where they seem to behave as coordinating adversative connectives. For instance, (1) shows the original temporal use of *enquanto*, whereas (2) corresponds to the new adversative use.

(1) **Em quanto** Larcy está falando, aparece Guilherme. (19th century)

[*While Larcy is speaking, Guilherme shows up.*]

(2) Osório atrairia para seu lado centenas de voluntários **enquanto** a ação dilatória de Caxias não lhe permite arranjar um só recruta. (20th century)

[*Osório would attract hundreds of volunteers while Caxias' dilatory behaviour doesn't enable him to obtain not even one supporter.*]

In this paper, my main goal is to investigate the evolution of *enquanto (que)* and *ao passo que* focusing on the pragmatic factors that lead them to be used for the expression of contrast and that cause their grammatical structure to be reanalyzed. The study aims to answer the main question of how the discourse-grammar interface can affect clause-combining patterns, driving a subordinate construction to be reorganized as a coordinate one. I consider language change to occur in the usage of language and to be mainly driven by pragmatics (Bybee, 2010; Traugott & Dasher 2002). Thus, I focus on the contexts in which the temporal meaning of *enquanto (que)* and *ao passo que* is enriched with inferences of contrast, over the period from the 18th to the 21st century. The data are taken from strongly argumentative texts and texts produced in spontaneous interaction, both these types of contexts favouring the development of contrast markers in general.

I argue that *enquanto (que)* and *ao passo que* undergo change in their patterns of clause combining in bridging contexts where they express a semantic-pragmatic relation that is grounded both in the meanings of simultaneity and adversativity. Although adversativity is still a pragmatic inference in these contexts, they exhibit several functional parallelisms and features that are typical of coordination relations. I suggest that the inferences of contrast are accompanied by an important change in how the events relate both in space and time, with a gradual dissociation between them being observed in both dimensions. Exploring the bridging contexts as well as the contexts in contemporary Portuguese in which the markers appear to express exclusively contrastive meanings, I will claim that their evolution provide evidence that pragmatic contingencies might affect category boundaries between coordination and subordination, which prove to be non-discrete clause combining patterns.

The semantics and pragmatics of insubordinate conditional clauses in Hungarian

Panel contribution

*Dr. Csilla Ilona Dér*¹

1. Károli Gáspár University of the Reformed Church in Hungary

Conditional insubordinate (independent) clauses are quite common in several languages of the world (Evans 2007, D'Hertefelt 2018), and can have many different pragmatic functions. Based on informant's opinion some of their types are missing in Hungarian: according to Brdar-Szabó (2006: 85–88) stand-alone dependent conditional clauses – compared to English (1) and German (2) – don't work as indirect directives (request, offers, wishes) (3). Instead, they appear as independent sentences starting with an optative particle (4):

(1) *If we could get rid of him!*

(2) *Wenn wir ihn (doch) bloß loswerden könnten!*

(3) **Ha meg tudnánk szabadulni tőle!*

conj verb.pfx know.cond.pres.Pl1 get.rid.inf him

(4) *Bárcsak meg tudnánk szabadulni tőle!*

part verb.pfx know.cond.pres.Pl1 get.rid.inf him

(Brdar 2006: 86)

However, corpus analyses indicate that there are insubordinate versions of these requests (5) and wishes in Hungarian, but they are rare, and in the case of wishes (6) they always start with the interjection *ó 'oh'*:

(5) *Ha megtenné, hogy megindokolja nekem, hogy miért van szükség pontosan ezekre a kitételekre*

'If you could please explain to me why exactly these passages are necessary'

(https://www.parlament.hu/naplo40/085/n085_0078.htm)

(6) *Ó, ha visszatarthatnánk az időt, de csupán a boldogot!*

'Oh, if we could hold back time, but only happy time!'

(MNSz2, doc#1496, Hungarian, lit)

The main aim of my research is to explore the prevalence, the constructional semantic types (cf. D'Hertefelt 2018) and pragmatic functions of stand-alone conditionals in Hungarian based on large corpora (MNSz2, BEA). In doing so, special emphasis is given to the variants that start with interjections (6) and discourse markers (7), because of their contribution to the independence of these constructions:

(7) – *Szívesen meghallgatnálak – mondta a kerítés. Hát ha igazán úgy gondolod...*

'I'd like to hear you, said the fence. Well, if you really think so...'

(MNSz2, doc#500, Hungarian, lit)

In addition to corpus analyses, questionnaire survey method is used to examine speaker attitudes to different insubordinate and non-insubordinate forms of wishes and requests in Hungarian.

“It seems you are offended by my joke”: Negotiating attributions of offence to humorous language

Panel contribution

Dr. Chi-He Elder¹, Dr. Eleni Kapogianni², Dr. Isabella Reichl²

1. University of East Anglia, 2. University of Kent

What happens when someone tells you that you are offended by a joke, even though you have not expressed your offence? Attributions of offence to humorous language provide an interesting testing ground for whether a speaker is held committed to having intended to display their offence, and how others can hold speakers accountable for being offended, even in the absence of their own linguistic display of such. In this talk, we consider the phenomenon of attributions of offence to ask:

1. Can a speaker be held responsible for ‘being offended’ even when the speaker doesn’t feel any feelings of offence?
2. To what extent can a speaker attempt to deny being offended, without in turn appearing to, indeed, be offended?

Addressing these questions can tell us about speaker meaning, commitment and accountability more broadly, as they contribute to our understanding of the role of speakers’ intentions in meaning attribution. On the one hand, appealing to speaker intentions is an intuitive way of delineating meanings that speakers are committed to (e.g. Moeschler 2013). However, speakers’ utterances can communicate a range of possible meanings of greater or lesser salience, and hearers can infer aspects of meaning that speakers didn’t intend to communicate (e.g. Ariel 2019). Work in interactional pragmatics has made use of the idea that hearers’ responses can evidence the inferences that they hold speakers accountable to (e.g. Haugh 2008, Elder & Haugh 2018). We present examples from a corpus of offensive jokes on Twitter, examining instances of participants attributing feelings of offence to others. We examine (a) the linguistic evidence that licences these attributions of offence, and (b) how the attributions of offence are subsequently negotiated, in order to shed light on the relative primacy of speaker intentions and hearer inferences in determining what has been communicated.

Doing humour: Humour as behaviour

Panel contribution

*Dr. Henri de Jongste*¹

1. Dortmund University of Applied Sciences and Arts

Doing humour: Humour as behaviour

“Doing humour” involves deliberately and playfully showing or narrating one’s own, and/or others’ non-normative, quasi-inappropriate behaviour, or its residue (the discernible product of humorous behaviour in the form of a humorous text or a sitcom). An essential factor in defining someone’s act or utterance as humorous by the hearer/observer is the attribution of a humorous intent on the part of the “speaker”. Attributing a humorous intent (Dynel et al., 2016) depends on hearers postulating a tension between what the speaker utters and what they really think, and reconstructing a likely motive for the difference; in other words, hypothesizing what the underlying intent in making the adaptation is, and defining this as humorous. This necessitates detecting the non-sincerity as well as the inappropriateness of the utterances and the playful breaking of the descriptive and/or injunctive norms involved (compare Bergson, 1900/2002; McGraw and Warren, 2010).

Such a process requires mind reading skills (Schurz et al., 2020), independent from the discourse, enabled by referring to a set of norms shared by speaker and hearer, and by context-related knowledge, such as event schemas, role schemas and/or personality schemas (Fiske and Taylor, 1991; Taylor et al., 1981), as well as empathy. The evaluation of humour is likely to depend on the nature of the creativity shown in the norm breaking (de Jongste, 2018); its acceptance may involve fundamental moral choices.

Linguists can study forms of humorous behavioural residue, such as canned humour, and its non-normative nature [e.g., as “non bona fide communication”, (Raskin, 1985)] as well as the humorous behaviour and playful norm breaking by the speaker, plus the nature of the detection and the acceptance of a humorous intent by the hearer.

Using recordings of conversational humour, I will demonstrate how texts can be inferenced as humorous and non-humorous, and how the inferencing process can be reconstructed. Such reconstructions are, however, always hypothetical, even though they can be solidified by supporting evidence.

Effects and functions of humour in selected talk shows

Panel contribution

Dr. Agnieszka Piskorska¹

1. University of Warsaw

This study scrutinizes humorous exchanges between the host and guests in four long-running television talk shows (*The Jonathan Ross Show*, *The Graham Norton Show*, *The Late Show with Stephen Colbert*, *Jimmy Kimmel Live!*). The goal of the analysis is to tease out the characteristics of the respective shows in terms the main social functions of humour (Ziv 2010) and a range of weak propositional or non-propositional effects (Wilson and Carston 2019; Ifantidou 2021; Wharton 2021) induced by humorous utterances, the two being hypothesized to be connected. In this way, the methodology applied here brings together the perspectives of the sociopragmatics of humour and relevance theory in order to address the question whether humour patterns of particular shows can be accounted for in terms of weak effects and corresponding functions.

A body of 100 humorous exchanges (25 from each show) were collected and analyzed descriptively with respect to the following parameters:

- who initiates a humorous exchange;
- who produces a humorous utterance;
- who is the victim (the speaker, the addressee, the third party).

Then, the following questions were addressed:

- what functions are fulfilled for the participants of the speech situation, i.e. the speaker (Ziv's 2010 "individual within a group", the participants of the show (Ziv's "relations within a group"), and the participants of the show and the audience (which is taken to correspond to Ziv's "society as a whole").
- what weak implicatures and non-propositional effects arise in the interpretation of the humorous stimuli.

The descriptive analyses of the conversations were subsequently compared within each show and across shows. On this basis, individual profiles of humorous effects and functions were obtained for each show and its host, with fairly consistent patterns between the above-mentioned parameters, especially the victim, function, and weak effects.

From humor in the lab to humor in the wild: neuro-linguistic studies dialoguing with the approaches of conversational humor

Panel contribution

Dr. Luca Bischetti¹

1. University School for Advanced Studies IUSS Pavia

Humor is purposefully used in conversation to accomplish a range of functions, including amusing and teasing others. Historically, verbal humor has been studied as fixed units with a taxonomical approach [Attardo, 1994]. Recently, scholars described the dynamics of humor in interaction [Dynel, 2009], as spontaneously generated in conversations [Haugh, 2014; Priego-Valverde et al., 2020]. Despite being studied “in the wild”, little is known about the processing stages of conversational humor. Moreover, the empirical study of different categories of humor used in conversation is still a research niche [Levisen 2008].

This contribution aims at reviewing previous works while bridging the domain of conversational humor and neurolinguistic perspectives on verbal humor. Concerning humor comprehension/processing, previous literature investigated humor response with behavioral or neuroscientific methods. Promising research lines in neurolinguistics are the recordings of brain electrical activity (with electroencephalography, EEG, Canal et al. [2019]) or facial muscles (with electromyography, EMG, Bischetti et al. [2019a]) during the comprehension of verbal humor, also of different types. In addition, studies began describing the impairment in understanding humor in a range of clinical conditions, from psychiatric (e.g., schizophrenia) to neurodegenerative conditions (e.g., Amyotrophic Lateral Sclerosis, see Bambini et al. [2020]). This experimental literature also investigated a range of individual differences in humor processing (Canal et al. [2019]; Bischetti et al. [2019b]), a promising frontier also for conversational humor.

As a whole, neurolinguistic literature on humor fostered limited exchanges with the field of studies on conversational humor. By presenting data on humor processing and the role of individual differences both in typical and atypical populations, this contribution will discuss points of overlap and possible exchanges between domains, aiming at linking the neurolinguistic approach with the framework of studies on conversational humor.

GIFs and conversational humour in Chinese instant messaging interactions

Panel contribution

*Dr. Jia Qiu*¹, *Prof. Xinren Chen*²

1. Jiaxing University, 2. Nanjing University

The development of technology has provided people with various forms of multimodal resources in technology-mediated communication (TMC), such as emojis, stickers, image memes, and GIFs, the popularity of which has started to attract increasing attention in pragmatics in recent years. While many studies have explored the social functions these novel resources may perform in communication in general, recent work has also demonstrated that they may contribute to the interactional accomplishment of conversational humour (e.g. Cruz-Moya & Sánchez-Moya, 2021; König, 2019; Messerli & Locher, 2021; Sampietro, 2021a, 2021b; Yus, 2021). However, compared to studies focusing on emojis and image memes, research on GIFs (see Bourlai & Herring, 2014, and Tolins & Samermit, 2016, yet neither of them specifically examining GIFs' role in humour) is still in its infancy and deserves further investigation.

In this study, we aim to explore systematically how GIFs, animated images widely available on different social media platforms and messaging apps, are used in conversational humour sequences in the context of Chinese instant messaging interactions. While our approach is mainly discourse-pragmatic, focusing on the features of GIFs, the pragmatic functions performed and multiple meanings achieved through employing GIFs in conversational humour sequences, we also attempt to explore how such interactional perspective can contribute to our understanding of some cognitive mechanisms underpinning the multimodal construction of conversational humour in TMC.

Keywords: conversational humour, multimodal construction, GIFs, (Mandarin) Chinese, instant messaging, technology-mediated communication (TMC)

Inference in conversational humor

Panel contribution

Prof. Laura Alba-Juez¹

1. UNED

Recent and present studies on conversational humor (Norrick 1993, 2003, Dynel 2008, Priego-Valverde 2016, Haugh 2014, Haugh & Priego Valverde forthcoming) characterize conversational humor as a co-construction among the participants and point to the need of analysis drawn upon cognitive-pragmatic and discourse-pragmatic approaches.

According to Attardo (2020), from a cognitive perspective conversational humor necessarily involves the recognition and resolution of incongruities, which give rise to the making of inferences for which normally the speaker will be held accountable. However, as Haugh (2017) points out, many of these inferences remain ‘embedded’ in the course of actions that the participants perform, and only some of them can be completely attributed to the speaker’s intention, for there is a wide array of inferences that are never exposed (and of which no one of the participants in the humorous practice are normally aware), to which scholarly research has not yet given enough attention.

In order to throw some light on the fuzzy zone of the inferential substrate of conversational humor, in this presentation I explore the types of inference and inferential frameworks that can be found in this type of discourse, and propose an interaction-oriented, sociopragmatic approach to its study so as answer the following research questions:

- 1) What kind of conversational practices serve as the basis and trigger for conversational humor?
- 2) What kind of inferential substrate can be found in these practices?
- 3) What types of inference are strategically invited by conversational humor practices? What are the strategies used in this case?
- 4) What types of inference are part of the inferential substrate but are not invited by the speaker?

The data used for this analysis consists of ten television interviews (a practice where humor is often used to build rapport and camaraderie among the participants) and ten episodes of two comedy series: *Curb your Enthusiasm* and *Seinfeld*. In these interviews and episodes, I have explored how humor relies on the working of both semantic or pragmatic inferences, the latter being obviously the most relevant in conversational joking. Here, I have looked not only into what is ‘implicated’, but also ‘implicitudes’ and ‘subplicit’ inferences (Bertuccelli Papi, 2000). I have also observed, as Ehmer and Rosemeyer (2018) point out, that these inferences can be based on various kinds of indexical cues and are not limited to verbal stimuli.

As a result of all these observations and analysis, I present a (non-exhaustive) typology of inferences, being conscious of the fact that, as Haugh (2017) has stated, implicatures are not simply cognitive constructs, but “social actions in their own right”. I also present a typology of the practices (e.g.: Joint imitation of a person, sarcasm) and strategies (e.g.: Being frank about moral taboos, taking language formulas at face value) in which the inferences are embedded, within a context-sensitive model that includes not only speaker and hearer, but also other possible participants (e.g.: the audience).

Making Learner Agency and Interactional Competence “Visible” by Examining the Dynamic Construction of Interactional Humor in a Multilingual Classroom

Panel contribution

*Dr. Yumi Matsumoto*¹

1. University of Pennsylvania

This study examines complex, dynamic interactional sequences in which multilingual students co-construct improvisational humor in an academic writing classroom at a U.S. university. Combining multimodal conversation analysis (e.g., Mondada, 2018) with ethnographic information (see Maynard, 2006), it demonstrates in depth the dynamic way that conversational humor emerges among multilingual students when the students encounter miscommunication (e.g., nonunderstanding, misunderstanding) with their instructor or peer in classroom interactions. It also illustrates the multiple activities besides humor construction that the multilingual students and their instructor engage in while the humorous sequences emerge. Particularly, this study attempts to elucidate how humor sequences are influenced by a complex network of interlocutors (e.g., classmates, instructor) and heterogenous interactional resources—including micro and macro components like gestures (e.g., pointing), facial expressions (e.g., smile), multiple languages (e.g., English, Arabic), nonunderstanding, interactional history among friends, and shared knowledge like public discourse—simultaneously within the classroom in an unpredictable manner. The analysis suggests that humor construction can be a powerful resource for expressing and enacting multilingual learner agency (e.g., Larsen–Freeman 2019) in adapting diverse linguistic and other multimodal elements within the classroom. Such analyses can project multilingual students as *competent* English users and demonstrate their pragmatic and classroom interactional competence (see Walsh, 2011). In fact, illustrating multilinguals as *competent English users* provides an alternative, non-deficit perspective of so-called non-native speakers in English as a second language classrooms, which aligns with more empowering views of multilingual English users (see also Taguchi & Ishihara, 2018 for recent second language pragmatic research based on “non-deficit” views toward multilinguals’ English use). This study can have important implications for research on conversational humor by examining it particularly among multilingual interlocutors. In fact, constructing conversational humor among multilinguals in and through interaction can be more complex and requires more negotiation and collaboration in identifying and building shared knowledge or achieving co-laughing *from scratch* than that among monolingual counterparts. That is because interlocutors, including students and instructors, come from different linguistic and cultural backgrounds, which provides unique interactional contexts from monolingual settings, where interlocutors have at least shared linguistic backgrounds. Furthermore, more investigations of humor in multilingual settings (e.g., English as a lingua franca contexts) are necessary since such investigations are still limited compared with those of monolingual contexts (Pullin, 2018). Finally, this study can also help further advance the field of conversational humor by taking *multimodal approaches* to analyzing interactional humor (e.g., Attardo & Pickering, 2011; Attardo et al., 2013; Matsumoto, Lee, & Kim, 2022; Tabacaru, 2019) because diverse heterogenous resources (e.g., smile, laughter, gaze) that involve humor construction do not become fully visible without multimodal analysis.

Micro-conversations and ephemeral community in YouTube humorous comments

Panel contribution

Prof. Salvatore Attardo¹

1. Texas A&M University-Commerce

Despite the asynchronous, largely decontextualized, nature of YouTube comments, we find micro-conversations between commenters and the creation of ephemeral communities of discourse which display many of the features associated with face to face communication (Herring, 2010). In this paper I will focus on humorous exchanges and the soft assembly of fleeting discourse communities. The examination of a sample of about 4000 YouTube comments on one video finds teasing (Haugh, 2017), echoic irony and sarcasm (Sperber & Wilson, 1981), and humor support (Hay, 2000), for example.

YouTube is predominantly not a community (Rotman et al, 2009). Most YouTube comments lack “an identifiable audience” (boyd & Heer, 2006, i.e., they are never answered and thus are essentially monologic in nature. However, commenting is recursive, i.e., comments can be commented upon, and, when they are replied to, they form a thread, Some develop a fairly “deep” tree of commentary (as comments on comments get commented on, recursively) (Jones & Schieffelin, 2009, p. 1062). These displays of online community are ephemeral, since they generally do not continue beyond the commentary sequence. However, within the comments we find a discourse community (held together by the common interest in the video and by the medium of the comments). Technically, Youtube comments would not fully meet Swales (1990) criteria for a discourse community, unless we want to consider YouTube comments as a genre and emoticons as lexis, but they come close enough to Swale’s definition to be considered “impoverished” or “fleeting discourse communities.”

First, the shared attention to the video being commented also provides a shared context. Obviously the stances of the users vis-à-vis the content may differ radically. Indeed, often the often remarked upon conflictual aspect of commentaries emerges precisely from this difference. Naturally, some context is provided by the handles of YouTube users (for example, the user handle “João victor” posts in Portuguese, thus triggering the inference they are Portuguese or Brazilian). Moreover, various linguistic and paralinguistic features (ranging from word choice to use of emoticons, etc.) allow inferences on the enregistered characteristics of the commenter. Some social ties are established by the use of vocative “@” used to address directly another commenter, directly addressing a comment to them. All these features, and many more, afford the soft assembly of a “context” within which the interaction can take place.

Multimodal teasing in face-to-face interaction: a corpus-based approach.

Panel contribution

*Ms. Clarissa de Vries*¹, *Prof. Bert Oben*¹, *Mr. Geert Brône*¹

1. *KU Leuven*

When asking how people construct and negotiate what is ironic in interaction, the multimodal context is crucial. This has long been recognized in theoretical work that argues that multimodal markers (especially prosody) are used to signal ironic intent (e.g. Clark & Gerrig, 1984; Grice, 1978). More recently, it has been claimed that the multimodal marking of irony has interactional functions as well (e.g. author, 2021).

In this contribution, we present an empirical investigation of multimodal irony in face-to-face interaction, focusing on a specific form of irony: teasing. During teases, which are potentially face-threatening, multimodal marking is hypothesized to play an important role in both communicating the pretense and monitoring uptake by other participants. Potentially this becomes even more obvious in sequences of teasing with multiple contributions, in which the target of the tease changes rapidly from one participant to the other, present in the conversation (internal teases) or not (external teases). We analyze multimodal resources that are deployed during these teases, such as gaze behavior, shoulder shrugs, and head movements, both at the level of the individual utterance and at the level of larger sequences with multiple contributions. In our analysis we are guided by the following questions:

1. How does the multimodal marking differ between internal teases and external teases?
2. How does the multimodal marking of ironic teases develop during sequences of teases when the target shifts?

We take a corpus-based approach, investigating spontaneous triadic interactions in which participants wear head-mounted eye-trackers (authors, 2015). With this methodology, we situate ourselves at the crossroads of psycholinguistic, cognitive, and interactional approaches to irony (Gironzetti, 2022).

In a first step, we found that gaze behavior differs significantly between internal and external teases (authors, in preparation). During internal teases, speakers show sustained stretches of gaze at the target, thereby not just verbally, but also visually targeting the co-present participant. Targets avert their gaze more often, and third participants often gaze at the target, monitoring uptake. In external teases, speaker gaze behavior is more equally distributed over participants, and addressees adhere to a more 'default' gaze pattern.

Following up, we aim to extend this analysis in two ways. Firstly, we systematically investigate other differences in multimodal marking of internal versus external teases. We hypothesize that targets (during internal teases) display multimodal resistance to the tease, using e.g. shoulder shrugs and head movements. Shared laughter of all participants, however, may be more prominent during external teases. Secondly, we will extend the analysis to sequences with multiple contributions, in which the target shifts. Here, we ask if participants adapt their gaze behavior as well as other multimodal marking to the change of the teasing constellation.

Taken together, these results will contribute towards building a more nuanced, and multifaceted picture of the multimodal marking of irony in face-to-face interaction.

Negotiating Common Ground in Conversational Humor: The Case of Indonesian Humor Talk Show

Panel contribution

*Mrs. Hyunisa Rahmanadia*¹

1. Eötvös Loránd University

The aim of this research is to take a deeper look at common ground as a critical factor in humor interpretation. In conversation, it is evident that the inference process plays an essential role in guiding the interpretation by the hearer. The process is also applicable when we talk about conversational humor. However, processing inference is not sufficient to understand why the inference result stimulates laughter in the hearer. This problem led the investigation to reveal how inference could become incongruent or surprising in the hearer's cognition. Here, common ground plays an important role. In this research, common ground is defined as the accumulation of knowledge that people assume to share which may include world views, shared values, beliefs, and situational context (Kecskes, 2014). The question then can be specified into what types of common ground enables humor interpretation, how common ground can be accessed to get the correct interpretation, and what linguistic devices help the hearer reach the necessary context. An in-depth qualitative corpus-based analysis using Indonesian talk show dataset has been conducted in an attempt to answer these questions focusing on the turn-taking humor conversation and the audience's reaction. The corpus consists of 239 turn-taking conversations from 2.904 words that are manually transcribed with annotation from randomly chosen humorous talk shows in Indonesian.

The relevance-theoretical approach (Sperber and Wilson, 1995) and socio-cognitive approach (Kecskes & Zang, 2009) are adopted in the analysis process. As a result, this research suggests that the investigated conversational humor is creatively created with the high frequency of activating the emergent common ground and bringing private knowledge to create incongruity to fill the conversation with unexpected or even unrealistic ideas that people never imagine. This investigation also indicates that the use of some pragmatic markers can directly influence the hearer to find the context intended by the speaker.

Keywords: conversational humor, common ground, relevance theory, socio-cognitive approach, pragmatic markers, Indonesian talk show.

Not bloody funny: Rhetorical resources for laughter in interaction

Panel contribution

*Dr. Christine Howes*¹, *Dr. Vladislav Maraev*¹, *Dr. Ellen Breitholtz*¹

1. University of Gothenburg

Despite previous attempts to the contrary, we argue that humour cannot be understood – or analysed – without considering the interactional and cognitive resources, including low-level repair mechanisms and higher-level inferences, which underpin any conversational exchange. Following Breitholtz and Maraev (2019), we claim that incongruity in jokes can be cast in terms of enthymemes (arguments occurring in a dialogue or text) and topoi (rules of thumb that underpin implicit arguments in interaction; Breitholtz, 2020). This perspective means that we can analyse non-humorous laughter events under the same framework. Laughter is often intrinsically linked with the performative aspects of humour, but is also an interactive phenomenon that should be studied within the same cognitive system. In this regard it is important to draw a distinction between laughers related to pleasant incongruities (the humorous type) and social incongruities, which are related to non-humorous laughter, such as nervous or embarrassed laughter (Mazzocconi et al., 2020).

We argue that although laughter can be evoked by a non-humorous event, it is still the case that the cognitive resources that are necessary for calculating incongruities are the same as those used in humorous situations. We look at how the same knowledge resources are used to underpin contrasting interactional experiences. For instance, topoi which are evoked in humorous situations may be the same as the ones that cause embarrassment. One such discourse situation is conversations about menstruation. We analyse a related joke from the BNC alongside with conversational data concerning non-humorous mentions of this topic. In addition we present some tellings of the joke in different conversational contexts (text-chat and zoom) to illustrate how presentations of the joke differ depending on the social context and medium used.

Sequential organization of conversational humor: comparison of conversations among friends and strangers

Panel contribution

Dr. Béatrice Priego-Valverde¹

1. Aix-Marseille University

Within the theoretical framework of Conversation Analysis (Sacks, Schegloff, and Jefferson, 1974) and Interactional Linguistics (Couper-Kuhlen and Selting, 2018), and focusing both on humor produced and on the reactions obtained, the aim of this study is to analyze the sequential organization of conversational humor, whether the participants know each other or not.

Most studies on conversational humor or teasing have focused on interactions between close participants (whether they are friends or members of a same family). Some researchers even go so far as to say that intimacy is, in some way, the ‘cradle’ of humour (Straehle, 1993; Boxer and Cortés-Conde, 1997). However, such an intimacy does not mean that humor appears by chance, nor in an anarchic manner. As already shown, humor is sequentially organized (see Drew, 1987 for teases). More recently, a few studies appear on teasing in getting acquainted people (Haugh and Pillet-Shore, 2018), highlighting that, not only teasing sequences can appear between strangers, but also that these humorous sequences are sequentially organized.

In line with this last study, hypothesizing that the nature of the relationship between participants can impact the sequential organization of humor, the aim of this study is twofold: (1) identify this organization in considering both its production and its reaction; (2) compare this organization in two kinds of face-to-face French conversations: between friends (corpus “Cheese!”) and during initial interactions between strangers (corpus “Paco”).

Analyzing both corpora (22 interactions lasting around 15 minutes each), 340 humorous sequences have been extracted. Based on previous work (Priego-Valverde, 2018), these humorous sequences have been ranged on a continuum from the minimal to the most elaborated sequence. 4 structures have been identified: isolated utterance (minimally answered, e.g., with laughter), successful sequence (humorously answered), co-constructed sequence (humorously answered which leads to further elaboration), and joint fictionalization (a co-construction based on a fictive scenario).

The first results show three findings: (1) humor is more frequent in “Cheese!”, both in its total duration (17% of the time, all interactions included, vs. 11% in “Paco”), and in its total number of the humorous sequences (190 in “Cheese” vs. 150 in “Paco”). (2) The 4 structures of the humorous sequences can be found in both corpora. (3) Their distribution seems to be different, suggesting that the more participants know each other, the more they tend to jointly construct their humorous sequences.

In this presentation, we will discuss the complexity of the links between humor and participants’ relationship which emerges from these first results. Indeed, this relationship does not seem to have an impact on the sequential organization of humor. This suggests that whether the participants know each other or not, the sequential organization of the entire interaction shapes the way humor appears and the way it is interactionally achieved. But since the distribution of the 4 structures is different, this result suggests also that the participants’ relationship may have an impact of the *preferred* humorous structure.

What's the preferred response to humour? Responding to conversational humour in initial interactions

Panel contribution

*Mr. Amir Sheikhan*¹, *Prof. Michael Haugh*¹

1. *The University of Queensland*

Linguistic studies of responses to humour commonly make a basic distinction between recognising humour and appreciating humour (Hay, 2001). The former is said to be grounded in cognitive mechanisms, including access to common ground, and regarded as a component of humour competence, while the latter is said to be a property of the situated context and thus primarily a matter of humour performance (Attardo, 2020). Notably, there also appears to be normative pressure for recipients to respond with laughter or some other mechanism by which they show, at least ostensibly, appreciation for humour in conversational settings (Norricks, 1993, 2003). In short, the preferred response to conversational humour is to affiliate with it through laughter and the like. It follows that cases in which recipients disattend humour in conversational interaction, the recipient in question can be taken as lacking the relevant (common) knowledge required for recognising the humour in question (a matter of humour competence), or that the recipient recognises the humour but is nevertheless disaffiliating with it (a matter of humour performance). In this paper, we argue that the lines between competence and performance are not so easily drawn when it comes to conversational humour.

Our analysis focuses on responses to conversational humour identified in 25 initial interactions taken from the Video-Mediated English as a Lingua Franca Conversations corpus (ViMELF, 2018) and the Intercultural Initial Interactions in English corpus (IIIE, 2022). Using the framework of interactional pragmatics, an approach to the analysis of pragmatic phenomena that is informed by research and methods in ethnomethodological conversation analysis (Haugh, 2012), we carefully examine how participants respond to humour bids, and the sequential and moral implications of those responses. We suggest in the course of our analysis that while the preferred response to conversational humour may indeed be to display appreciation of that humour in some shape or form (e.g. through smiles, laughter, agreement, furthering the humour etc.), this preference structure is mediated by the extent to which the recipient can legitimately claim an affective entitlement to laugh at the target being construed as a laughable through that humour bid. This (situated) right to laugh is, in turn, grounded in the interactional management of epistemic access and rights to relevant (background) knowledge, as well as in co-membership in relevant categories of persons that confer this entitlement to laugh. We conclude that theorising conversational humour necessarily thus requires attending to both its socio-interactional and socio-cognitive underpinnings.

Formulating location and distance in post-match Tinder chats

Panel contribution

Prof. Will Gibson¹

1. UCL, Institute of Education

Tinder is one of the most widely used dating apps in the world and yet the ways in which people communicate through it remains an under-researched area (but see Licoppe, 2020; Licoppe, 2021; Carles Roca and Gibson forthcoming). Drawing on ‘digital’ Conversation Analysis (Giles et al., 2015), this presentation examines how Tinder users conversationally manage the topic of the ‘distance’ between themselves and ‘matched’ interlocutors. Distance is a key issue for participants, and one that they set as a search variable in the application when looking for potential dates.

The data for this analysis consists of post-match Tinder chats from 50 users in Spain, The Netherlands, Denmark and France which were analysed through ‘digital CA’ methods (Giles et al., 2015) with a particular emphasis on locational formulations (Schegloff, 1972). The analysis found that participants recurrently ask about the other’s placement (living/working/present location) and/or formulate their own proximity to their interlocutor. In constructing these formulations users exhibit sensitivity to the activity of ‘getting to know one another’ (Roca Cuberes and Gibson forthcoming) and to the omnirelevant practice of ‘organising a date’. In this paper I show the various ways that participants bring up the topic of location and or the ‘distance’ between each other, and how they use these topics as a means of constructing either an impediment or opportunity for meeting. Participants routinely treat location as a sensitive topic, using conversational moves structures that frame it as a ‘delicate matter’ and, occasionally, as a flirtation move (Speer 2017). This analysis contributes to our growing understanding of how Tinder and other mobile dating applications are impacting on contemporary practices of dating.

Membership categorization analysis of post-match Tinder chat conversations

Panel contribution

Dr. Carles Roca-Cuberes¹

1. Universitat Pompeu Fabra

From the moment a match occurs on Tinder until the first date (if there is one), users who have decided to 'like' each other need to manage a sometimes considerable amount of communication. The main purpose of such communication for the matches is to get acquainted and decide on the suitability of their counterparts as potential dates. In this study, we explore post-match Tinder chat conversations to investigate the process whereby Tinder users get to know each other and (eventually) negotiate a date.

The methodology used in this study is the one developed by the ethnomethodological approach of MCA. MCA is a kind of formal analysis that investigates the procedures used by members to give meaning to other people and their activities. In line with ethnomethodology, the practical use of commonsense knowledge by members when they categorize one another is examined. Categorizing is in itself a form of description that comprises a mundane methodical practice whereby members render their ordinary activities observable and accountable. Through the invocation of membership categories, members have at their disposal a mundane apparatus that enables them to conventionally identify other people. Tinder users obviously also rely on this routine practice to establish (for practical purposes) the social make-up of their matches. However, the invocation of membership categories in post-match Tinder chat conversations allows users to accomplish certain tasks: getting acquainted and, depending on that, determining the suitability of their matches as potential dates. Expected results would show that the categories that older adults typically invoke in the process of getting to know their matches are a part of 'membership categorization devices' such as 'occupation', 'relationship status', and 'hobbies'. Young adults, on the other hand, tend to employ categories that belong to the membership categorization devices 'hobbies' and 'occupation'.

Online dating, gender, & power: Digital turn-taking and making the first move on Bumble

Panel contribution

Dr. Riki Thompson¹

1. *University of Washington*

The digitally mediated search for love and sex has become one of the most common ways for people to find each other as technologies and social media have become embedded in everyday life. In online dating, Bumble is the feminist app that promises to change the rules of dating through design features that put women in control of the message initiation aspect of digital courtship. Despite claims that Bumble's first move architecture is "levelling the playing field" through a turn-taking protocol that only allows women to send opening messages to men after matching, my research suggests otherwise. To provide a comprehensive understanding of digital communication on Bumble, I used methodological and data triangulation to enrich the analysis. First, I employed digital ethnographic methods (Varis, 2016) for collecting and analyzing data about people's experiences of matching and messaging to focus on situated communicative practices. Interviews with 45 Bumble users demonstrated that while Bumble's mission to empower women was often a motivation for downloading the app, users found that conversing and connecting was complicated by problematic aspects of app design and gendered online dating practices. Next, I used multimodal discourse analysis (Jewitt et al., 2016) to examine how gender, power, and online dating communication were constructed on Bumble's website. Lastly, I applied Microanalysis Of Online Data (MOOD) (Giles et al., 2015) to Bumble's "first move" architecture and messaging protocols to map out the digital conversation floor. While Bumble aims to empower women by giving them control of the floor through conversation openings and topic initiation, the model is based on an ideal model of cooperative principles of conversation rather than realistic experiences of everyday users. Interview data suggests that lack of response to conversation openings—be it through silence, unmatching, or timing out—is a common conversation problem. This research demonstrates that despite Bumble's mission to empower women, unreciprocated invitations to take the floor and time sensitive communication directives inherent in app design negatively reduce women's sense of agency and power in online dating interactions. In addition to improving our understanding of language, gender, and power in digital dating contexts, this research contributes to the growing body of literature in digital discourse studies that aims to provide more methodological tools for understanding digital intimacies and online talk (Licoppe, 2020; Mortensen, 2017).

“So fast on the keys, when do you have time to meet”: 4 ways invitations are generated interactionally in Danish Tinder chats

Panel contribution

Ms. Elisabeth Andersen¹

1. University of Southern Denmark

This paper outlines interactional methods used by Tinder users to generate invitations from the developing interaction in post-match Tinder chats. In a collection of 194 Tinder chats collected in Denmark in 2020, 19 interactionally generated invitations were identified and analyzed using methodology inspired by Conversation Analysis, i.e., focusing on the recognizability of social actions constructed through written text and viewing interaction as an accomplishment between the participants.

The organization of invitations in talk has been described using Conversation Analysis showing that participants use a range of strategies to avoid a rejection (Drew, 1984; Margutti, Tainio, Drew, & Traverso, 2018; Schegloff, 2007). This presentation builds on these findings and shows the work being done by Tinder users to pursue setting up a meeting with their ‘match’ in ways that may function to minimize the risk of feeling inadequate and rejected (Licoppe, 2021, p. 174), or ‘lose face’ in Goffman’s terms (Brown & Levinson, 1987; Goffman, 1955). This concerns 1) orienting to the response time of the ‘match’ as an indication of (lack of) interest, 2) introducing aspects of the here-and-now as providing favorable conditions for a meeting, 3) gathering knowledge about the match’s likings when it comes to leisure activities and dating settings, and 4) inviting an invitation by postponing a response to a not-yet-agreed-on future meeting. Based on analyses of selected examples, I discuss how these practices in different ways construct the invitation as a collaborate achievement and how they minimize the likelihood of rejection and the accountability and potential ‘face loss’ of the inviter in case of a rejection.

Complex Syntactic Patterns with German *Verba sentiendi* in Past Tense: Action Formation with *Meinen* ('to mean') and *Finden* ('to find')

Panel contribution

Ms. Sophia Fiedler¹

1. University of Neuchâtel

The German tense system is one of the most researched topics in German linguistics, especially concerning the distribution of *Präteritum* ('preterit') and *Perfekt* ('present perfect'). A recurring explanation in this respect is a diatopic distribution with a preference for the usage of present perfect in the *oberdeutschen Sprachraum* (=South of Germany), and for the preterite in the *niederdeutschen Sprachraum* (=Northern regions) (Fischer 2018). Recent research on Alemannic shows, however, that such a distribution may not (anymore) apply without exception: Analyzing naturally occurring oral data, Leonhard (2022) shows that the preterit is (re)used, at least in Alemannic. His results illustrate that examining the actual use of past tense in interaction may be fruitful, especially concerning their grammar-in-use.

This talk discusses a possible relation between the distribution of past tense in everyday talk and action formation (Levinson 2013). *Verba sentiendi*, which are frequent in present tense and tend to grammaticalize in 1st person singular (Günthner & Imo 2003) are apt structures for such an investigation of the interface between the grammar of clause-combining, tense distribution, and action formation: As Deppermann & Reinke (2017) show, *ich dachte* ('I thought') is, for instance, used in specific clause-combining patterns and for concrete practices that do not seem to exist in present tense.

The present paper extends this line of research by focusing on the past tenses of *meinen* ('to mean') and *finden* ('to find') in 1st person singular and their potential distribution according to action formation. I thereby investigate, following prior research on the grammar-in-use of complex syntactic patterns (Maschler *et al.* 2020), the interrelation of grammatical forms and interactional use. With an Interactional Linguistic approach, I analyze the FOLK-corpus of the Leibniz-Institut für Deutsche Sprache, comprising about 336 hours of everyday talk in institutional and non-institutional settings.

Initial analyses reveal that both past tense forms of *meinen* and *finden* are rare, compared to their present tense forms, and that the distribution of preterit and present perfect of both verbs does not seem to occur randomly. To give one example: *ich fand* ('I found') recurrently occurs as epistemic parenthetical, whereas *ich habe gefunden* ('I have found') does not.

Complex syntax as multiple projections

Panel contribution

Prof. Peter Auer¹

1. University of Freiburg

I argue that from the point of view of online (emergent) syntax, complex syntax should be seen as multiple projections within one complex project. Project-initial subordinated projects (so-called subordinated clauses) imply projections simultaneously active with the superordinated project (so-called main clauses), while project-final subordinated projects occur either as terminating the subordinated project or as expanding it. The online approach explains the non-symmetry of 'left' and 'right' positioning of subordinated clauses in conversational data. I will also show that some of the interactional affordances of pre- and postpositioning of subordinated clauses can be accounted for in a comprehensive and coherent way if the above-outlined temporal structure of multiple projections is taken as the starting point of analysis.

The paper grew out of work on large corpora of German conversational data. However, the general point it wants to make is a theoretical one.

Complex syntax for assessing situations: ‘Pseudo-cleft’ construction in Mandarin conversation

Panel contribution

*Mr. Di Fang*¹

1. Chinese Academy of Social Sciences

It has been widely acknowledged that many of the syntactic constructions arise from multiple recurrent interactional patterns for accomplishing social actions. Starting from naturally-occurring conversation – the primordial site of social interaction, a considerable body of research provides evidence for the gradual integration of fragments that results in well-formed complex syntactic constructions, among which is the pseudo-cleft construction (PCC).

Numerous studies have been conducted on PCC in conversational interaction of different languages with regard to its formulaic nature (Hopper and Thompson 2008; Mori 2014), interactional functions (Kim 1995; Hopper 2001; Maschler and Fishman 2020), and prosodic/multimodal configuration (Tao 2022). This paper will attempt to discuss the emergence of PCC in Mandarin by focusing on a specific yet pervasive activity – assessing a situation in the telling.

The investigation is based on 20 hours of naturally-occurring conversation in Mandarin, most of which happen between 2-3 families, friends or acquaintances. It is found in Mandarin conversation that speakers would firstly provide the assessing term (whether objective or subjective), and then elaborate the assessable – some kind of situation of a person/some people. Such an interactional practice gives rise to clause-combination patterns of different integration levels.

- A. Two separate clauses: Clause 1 [assessing term] + Clause 2 [assessable]
- B. A elaborating clause-combination: Clause 1 [assessing term], *jiushi* (that is) Clause 2 [assessable]
- C. Loosely attached PCC: assessing term + *de* (<NOMINALIZER>) (*jiu*)*shi* (<COP>), Clause 2 [assessable]
- D. Canonical PCC: assessing term + *de* (<NOMINALIZER>) *shi* (<COP>) + assessable

The interactional contingencies that lead to such patterns are then discussed. It is proposed that use of PCC features the pre-positioning of the assessing term, which provide an affordance for speakers to incorporate his/her assessment into the ongoing telling process, and to express both subjective feeling and objective evaluation over the extension of situation-presentation.

With the case study of PCC in Mandarin conversation, this paper adds to the understanding of complex syntax for specific social actions, suggesting that complex constructions such as PCC emerge from the recurrent interactional practices in our daily lives.

Discovering pseudo-cleft constructions in Estonian

Panel contribution

*Dr. Marri Amon*¹, *Prof. Leelo Keevallik*²

1. University of Tartu, 2. Linköping University

Pseudo-clefts are found in a variety of languages. Grammatical, textual and information-structuring functions of pseudo-clefts have been investigated in languages where they are grammaticalized. Recent accounts based on examples from talk-in-interaction have furthermore highlighted their specific discourse-structuring and projecting functions (Pekarek Doehler 2011 for French, Maschler&Fishman 2020 for Hebrew; Lindström, Henricson, Huhtamäki 2022 for Swedish).

This paper asks whether pseudo-cleft structures exist at all in Estonian. Grammars do not account for them, but structurally fitting examples can be found from both spoken and written usage, in particular from public speeches. Our study is based on 80 examples of pseudo-cleft constructions extracted from a corpus of political speech, namely verbatim reports of debates of the Estonian Parliament.

Functionally, they are similar to what has been described in other languages: *mis/mida* ‘what’-initial constructions project longer explanations and launch new topics, thereby highlighting the speaker’s stance and structuring the discourse. While we located a number of what could be considered canonical pseudo-cleft structures with all elements present like in the excerpt below (with ‘what’ bolded and the copula and the complementizer are italicized), we also included a range of instances where either the copula or the complementizer did not occur.

et **mida**:: (.) ma küll ütlen, (.) ää *on et* meie eelnõu (.)

that **what** (.) I PTC say.1SG (.) er *is that* our draft (.)

‘What I am saying, is that our draft

lahendab (.) nii tänaste (0.2) kui: (0.2)

resolve.3SG (.) so today’s.PL.GEN. (0.2) as well (0.2)

will solve the pension problem

tulevaste pensionäride (.) pensioniteema.

future.PL.GEN pensioner.PL.GEN (.) pension.problem.GEN

of today’s and future pensioners.’

Since studies on pseudo-clefts in spoken interaction have revealed a high degree of structural variability even in languages that make prolific use of them, we suggest that they are also in fact grammaticalized in Estonian.

Incremental clause-combining at the grammar-body interface

Panel contribution

*Prof. Jan Lindström*¹, *Prof. Simona Pekarek Doehler*², *Prof. Yael Maschler*³

1. University of Helsinki, 2. University of Neuchâtel, 3. University of Haifa

In social interaction, speakers employ various practices for extending syntactic units (and thereby turns at talk) by making syntactically simpler units structurally more complex in an incremental, step-by-step way. One such practice consists of adding a coordinated or subordinate clause *post hoc* to what was first produced as a main clause ending on a complex transition relevance place (syntactic, prosodic and pragmatic completion; cf. Ford & Thompson 1996), as in the following:

01 DOR: +men hå:re kommer att antagligen att bli bättre.

but the hair will probably become better.

dor +lifts arm to point at hair, holds hands up—>

02 (0.3)

03 DOR: □>°för att de°<□ +p- (.) produceras mycke +oxytocin.+

because (the body) produces much oxytocin.

dor >—hands up— +gaze down +hands down+

04 MIR: □jå, □

yeah

05 (0.6)

06 MIR: å hyn kanske (.) eller

and the skin maybe (.) or

Dorotea comments on how her body will respond during her pregnancy, saying that the hair, for example, will become better. After a slight pause she adds a ‘because’-clause accounting for the increase of oxytocin (l. 3). During this turn, Dorotea has done pointing gestures around her head. During the addition at line 3 she still makes gestures, but the loudness is diminished and she begins to gaze down, not looking at the interlocutors. At the completion of the clause-combination (end of l. 3), she retracts her hands to a rest position. In cases like this, we see how a clause-combining pattern is patched together on the fly in the course of turn- and action production. At the same time, the speaker’s embodied conduct seems to be essential for understanding where the major TRP was located (i.e. at the completion of the clausal complex and hand movements, l. 3).

While research in Interactional Linguistics has extensively studied the incremental design of syntactic trajectories and turns at talk (Schegloff 1996b; Fox, Ford & Thompson 2002; Couper-Kuhlen & Ono 2007), incrementally composed clause-combining patterns have not been so much in the spotlight (but see Stoenica 2020 and the papers in Maschler et al. 2020). Also, little is known about speakers’ embodied conduct in such incremental composition of turns and actions (but see Pekarek Doehler 2021, Stoenica 2020). In this paper, we seek to contribute to a better understanding of clause-combining practices by attending to speakers’ gaze, posture and gesture at the juncture of incrementally composed clausal complexes, thus also exploring the import of embodied cues for the recognition of possible TRPs. Thereby, we hope to contribute to current interests in continua of clausal integration (Beijering et al. 2019) and in the complexity of how grammar and body interface in social interaction (cf. papers in Pekarek Doehler et al. 2022). Our analyses are based on excerpts of video-recorded conversations in three languages, French, Hebrew, and Swedish.

Syntax and music for interaction: The [CTP + Music] Construction in Hebrew Musician-to-musician Discourse

Panel contribution

Mr. Yuval Geva¹

1. *University of Haifa*

Recent studies in interactional linguistics (Couper-Kuhlen & Selting 2018) and multimodal conversation analysis (Mondada 2014) explore the phenomenon of “music-in-interaction”. Studies in this emerging field seek to describe and analyze the situated and embodied nature of music making in a range of social contexts, such as singing instruction (Szczeppek Reed 2021) or orchestra rehearsals (Weeks 1996, Stoeckl & Messner 2021). As music does not easily lend itself to being communicated about solely using talk (Feld et al. 2004: 322), a recurring theme in these studies is examining the practices by which participants integrate depictive embodied-musical demonstrations into their turns-in-talk (Keevallik 2013, 2014).

This talk focuses on one such practice, as it is found in Hebrew musician-to-musician discourse: the use of a syntactic construction that may be termed the “[CTP (‘complement-taking predicate’) + Music]” construction. The construction features two fragments: a formulaic CTP-phrase (of doing, playing, or hearing), accompanied by projective (Auer 2005) prosody and embodied conduct; followed by a musical demonstration delivered via the voice or the playing of an instrument. For instance:

1 Doron: nagan ha-rok **ya'ase**,
 player def-rock **will.do**
 {puts hands to guitar}
 2 ..(♩ **plays de-accented phrase** ♩)
 3 ...ve-'ata **ta'ase**,
 and-you **will.do**
 4 Avi: (♩ **plays accented phrase** ♩)

“The rock player will do (demo), and you will do (demo)”.

Based on naturalistic data from musician-to-musician interviews and rock band rehearsals, I show that such constructions, considered elsewhere complex or bi-clausal quotative constructions (Yoeli 1964, Zuckermann 2006), are more adequately described as sedimented sequences of coordinated verbal and musical behavior. I show that they emerge as formulae for the accomplishment of routine interactional moves crucial to the process of music making: requesting, making assessments, and sharing musical subjectivities.

Teasing via the *lo*, *ki* ‘no, because’ construction in Hebrew face-to-face interaction

Panel contribution

*Dr. Anna Inbar*¹, *Prof. Yael Maschler*¹

1. University of Haifa

Teasing in everyday interaction involves mocking jibes or taunts often being framed as playful or humorous by participants (e.g., Drew, 1987; Haugh, 2014). Teasing underpins numerous interpersonal functions, among which are indicating moral transgressions (e.g., Drew, 1987; Everts, 2003; Franzén/Aronsson, 2013) and mitigating potential offence or embarrassment (e.g., Norrick/Spitz, 2008; Yu, 2013). Employing Interactional Linguistic methodology (Couper-Kuhlen/Selting, 2018), we explore deployment of Hebrew *lo* ‘no’ followed by a *ki* ‘because’-prefaced ironic utterance, i.e., one involving an inconsistency between the utterance and the actual state of affairs referred to. We argue that in Hebrew talk-in-interaction the [*lo*, *ki* + ironic utterance] structure is deployed for *teasing*.

For example, in the following excerpt, from a conversation between six close friends, Inbal, Omri’s partner, says that sometimes she cleans the sink and toilet, only to find Omri’s hair all over the place shortly thereafter. In response, Omri jokingly asks her whether there’s anything else she’d like to tell about his hair, to which Inbal laughingly responds, while moving over to Omri and kissing him profusely:

- 1 Inbal: *'ani 'ohevet 'otan*,
I love it,
2 *me'od*.
very much.
3 *...me'od me'od me'od me'od me'od me'od me'od*.
very very very very very very very much.
4 Omri: *lo*,
no,
5 *ki yesh*
because we have
6 *...ki yesh 'orxim*,
because we have guests,
7 *'at yexola*
you can
8 Inbal: *me['od me'od me'od me'od me'od me'od*.
very very very very very very much.
9 Omri: *....[yexola lesaper ma she-'at rotsa*.
you can tell whatever you want.

Since it is not morally acceptable to embarrass a person in front of guests, Omri’s ‘we have guests, you can- you can tell whatever you want’ (lines 6–7, 9) is clearly ironic. The implication is that Inbal *cannot* in fact, according to Omri, tell whatever she wants in front of the guests. This ironic statement is prefaced by two linguistic elements: the negator *lo* (line 4), which often accomplishes disaffiliative moves, such as objection, rejection, or disagreement, and the causal conjunction *ki* (lines 5, 6), often used to project an account. Since accounts have been shown to be regular components of disaffiliative moves (e.g., Pomerantz, 1984; Sacks, 1987; Ford/Mori, 1994; Ford, 2001; Couper-Kuhlen/Selting, 2018; Inbar/Maschler, forthcoming), we suggest that, as a result of repetitive use, the two moves have crystallized to form the *lo*, *ki* fixed chunk, which, followed by an account provided in an ironic manner, is employed for teasing. This practice may perform a variety of actions. In our

example, teasing via the [*lo, ki* + ironic utterance] structure is used to reprimand Inbal for having embarrassed Omri by revealing an intimate fact concerning his hair.

Based on data from the *Haifa Multimodal Corpus of Spoken Hebrew*, comprised of video recordings of 18 hours of naturally-occurring casual conversation, we explore the multimodal realizations of this construction and the actions it accomplishes in Hebrew face-to-face interaction, showing that the [*lo, ki* + ironic utterance] structure constitutes a recurrent and recognizable practice in Hebrew interaction.

Temporal clauses and insubordination in English: Evidence from conversation

Panel contribution

***Prof. Elizabeth Couper-Kuhlen*¹, *Prof. Sandra A Thompson*²**

1. University of Helsinki, 2. University of California Santa Barbara

In this paper we aim to determine whether temporal clauses can be shown to be ‘insubordinate’ in everyday American English interaction. In order to investigate grammatical insubordination in conversation, we begin with Evans’ characterization, “the conventionalized main clause use of what appear, on prima facie grounds, to be subordinate clauses” (Evans 2007: 367). On the basis of our interactional data, we will problematize ‘main clause use’ in this characterization, showing that to keep the spirit of Evans’ statement, we need to probe further to determine the ‘insubordinate’ status of English temporal clauses in interaction.

We first analyze an insubordinate *if*-clause in its sequential environment to determine what characterizes the insubordinate use of an adverbial clause in conversation (see also Ford 1997, Laury 2012, Lindström et al. 2016, 2019). This allows us to operationalize the notion of ‘insubordination’ as a specific practice for designing a turn and implementing a social action. Accordingly, we treat as ‘insubordinate’ a clause with a grammatically subordinate form that (a) is freestanding, that is, builds a turn-constructive unit on its own, (b) serves to carry out a discrete social action in its sequential context, and (c) has an independent interpretation, that is, is unproblematically interpreted and acted on by participants in the absence of a main clause. We argue that for insubordination in interaction, all three criteria must be present at once.

We then examine selected cases of temporal clauses from a collection of more than 200 exemplars, focusing specifically on those that might be thought to be insubordinate because they embody one or more of the above criteria. In every case, however, criterion (c) is lacking: that is, the temporal clause turns out to be part of a larger construction, with another clause or set of clauses nearby which is needed for its interpretation as a time frame. Even when a clause-to-be-framed is unexpressed, one must be inferred from prior talk in order for the temporal clause to be actionable; crucially, the temporal clause does not function on its own. We conclude that temporal clauses are not used insubordinately in English conversation, ending with possible reasons for this being the case and a call for further cross-linguistic investigation.

The complex syntax of the the-N-is structure in spoken English: When projection meets accommodation

Panel contribution

Dr. Florine Berthe¹

1. University of Pau and the Adour Countries

This paper explores the complex syntax of the *the-N-is* structure in spoken English. The label “The-N-is” is used to refer to what looks like a bipartite structure in which the first part contains a head noun, frequently *thing*, which can be pre- or post-modified, followed by a form of the copula *be* (i.e. *the idea is, the funny thing is, the thing about it is...*) while the second part consists of one or several clauses.

In the literature, such structures have been analysed in different ways. While some linguists consider them to be specificational copular clauses (Delahunty, 2011), interactional approaches analyse them as projector phrases (Auer, 2009; Günthner, 2011). As such, the first part of the structure, the *the-N-is* pattern, is used by the speaker as an interactive resource to foreshadow more to come. The aim of this presentation is to show that what is to come, which will be called the projected segment, varies in terms of syntactic complexity and this complexity can be accounted for by being looked at through the lens of accommodation.

This study is based on the analysis of a corpus of spoken British English which was created for a larger project looking at *th*-clefts and variations around the *the-N-is* structure (Berthe, 2021). It comprises both monological and dialogal genres (Radio podcasts featuring interviews or casual conversations, scientific communications, TED Talks and one parliamentary debate) and allows us to study around 500 occurrences of the *the-N-is* structure or variations around this pattern.

In the corpus, the projected segment can range from one clause to a series of clauses or even a complex stretch of discourse. Recurrent accommodation strategies, and, in particular, interpersonal adjustments (Gasiorek, 2016; Pennec, 2018) can be observed within the projected segment. Speakers appeal to their recipient’s knowledge, sometimes address their recipient directly, digress from their main topic to provide information necessary for the recipient to understand what is projected organise the projected segment in order to anticipate the recipient’s reaction, all the while building the projected segment.

When *e*/'and' contrasts & *ma*/'but' connects: Additive and adversative conjunctions in Collaborative turns

Panel contribution

*Ms. Virginia Calabria*¹

1. *KU Leuven*

Research on Italian *e*/'and' and *ma*/'but' has been carried out within the domains of traditional grammars, which describe them as conjunctions (Serianni, 2006), text linguistics, which conceptualizes them as connectives (Ellero, 1986), and pragmatics, which considers them discourse markers (Bazzanella, 2011). How these resources are deployed in naturally occurring interactions, however, has yet to be documented for Italian.

Starting from a view of grammar as an interactive phenomenon – i.e., both as a resource available to speakers and as their emergent achievement (Goodwin, 1979) that is situated in the temporality of interactional practices (Calabria & De Stefani, 2020) –, this paper investigates the additive conjunction *e*/'and' and the adversative *ma*/'but' in naturally occurring interaction, deployed by next speakers as linking elements relating to a prior speaker's turn-at-talk (cf. Laury, Etelämäki & Couper-Kuhlen, 2017).

Specifically, it analyses the use of these resources as introducing candidate continuations, candidate completions, and other-extensions in Collaborative Turns (cf. Lerner, 1991, 2004; Calabria, *forthcoming*). In Collaborative Turns, speakers draw on grammar and actions in prior turns to provide a grammatically and/or pragmatically fitted collaborative contribution. When speakers deploy this collaborative practice, contrastive, disaffiliative *e*/'and', and connecting, affiliative *ma*/'but' emerge in two ways: (i) speakers continue the contrastive or the additive action in the prior turn, e.g., by using a *ma*-prefaced contribution to carry on a contrast already started by the prior speaker (cf. interactional projection, Auer, 2005), thereby affiliating; (ii) speakers contribute a turn directly disaffiliating with the prior turn, e.g., by using an *e*-prefaced contribution (in fulfillment of a syntactic projection, cf. Auer, 2005), that targets the prior turn as missing something (cf. Bolden, 2010). Therefore, *ma*, which has also been described as a turn-entry-device (Bazzanella, 2011), can be used to display affiliation and claim understanding, while *e* can be also used to disaffiliate or subvert the prior speakers' words.

The actions speakers accomplish with *e* and *ma* candidate contributions, in the scrutinized corpus, pertain broadly to three domains: claiming understanding, agreeing and disagreeing, and building comic scenes (cf., among others; Lerner, 1991, Díaz, Antaki & Collins, 1996; Bolden, 2010).

The analysis is based on a corpus of 12 hours of Italian interactions in institutional (two business meetings) and ordinary (two dinner parties and one aperitif) settings and draws on Conversation Analysis (Sacks, Schegloff & Jefferson, 1974), and Interactional Linguistics (Couper-Kuhlen & Selting, 2018). A collection of 24 (out of a total of 184 collaborative turns) occurrences has been examined: 18 *e*- and 6 *ma*-prefaced candidate contributions. This paper explores usages of *e* and *ma* that challenge traditional grammatical descriptions, based on the lexical meaning of these conjunctions in Italian. It is, thus, a contribution to our conceptualization of “contrastive” and “additive” conjunctions, as well as to our understanding of practical and collaborative grammar. More importantly, this paper shows an example of “syntax-for-conversation” (Schegloff, 1979), highlighting how grammar shapes action formation in interaction and how interactional contingencies shape grammatical resources.

ze ma she-‘ani tsarix ‘that’s what I need’: ‘Reversed pseudo-clefts’ in Hebrew conversation

Panel contribution

*Prof. Yael Maschler*¹, *Dr. Hilla Polak-Yitzhaki*¹

1. University of Haifa

Employing Interactional Linguistic (Couper-Kuhlen/Selting 2018) methodology, this study investigates Hebrew [*ze ma she-* ‘this is what’+ clause] structures, reminiscent of structures termed ‘reversed pseudo-clefts’ in, e.g., English (Collins 1991, Oberlander/Delin 1996) and French (Lambrecht 2001). The corpus consists of 9 hours of video-recorded casual conversation among friends and relatives, manifesting 71 *ze ma she-* tokens.

Such structures are analyzed according to traditional Hebrew syntax as belonging in the realm of complex syntax, with *ze* considered subject of a nominal (copular) matrix clause and the [*ma she-* + clause] – a nominalized clause embedded as predicate. However, we argue that the *ze ma she-* construction has become a fixed chunk, grammaticized from repetitive discourse actions. Information Structure based studies of reversed pseudo-clefts claim that the demonstrative pronoun denotes Given information, while the clause, which contains the prosodic nucleus of the tone unit, denotes New information (e.g., Collins 1991), and that the discourse function of reversed pseudo-clefts is predominantly a summative one. We have found that the Hebrew structure serves mainly other functions, can even be deployed as a projecting construction (Auer 2005; cf. Küttner 2020), and may manifest additional prosodic patterns. Despite similarities in lexical and syntactic features with pseudo-clefts (e.g., Hopper/Thompson 2008, Maschler/Pekarek Doehler 2022), the functions of the *ze ma she-* construction are different. The construction is usually deployed in our corpus at a moment of (slight) dispute, and it implements one of five actions: ‘claim-backing’ (Antaki/Leudar 1990); getting back to a previous topic; framing prior-talk metalingually; disclaiming responsibility; seeking clarification. For example, tokens functioning as ‘claim-backing’ present evidence supporting the soundness of a previous disputable assertion, as in the following suggestion to heat up water in the microwave:

1 Ya’ir:’efshar lexa^mem mayim ba-mikro.

it’s_possible warm.inf water in-the-micro

....it’s possible to heat up water in the micro.

^left hand in PUOH-> l. 5

2 Inbal: .../@/

3 Omri: (0.34)#(0.67)ken?

yes

....really?

#tilts head-> l. 5

4 Ya’ir: ..%m m-%

..m m-

%moves hand in PUOH horizontally to the left while shaking head%

5 ze ma she-hu yode’a la’a#sot.^

this.m.sg what that-he know.prs.m.sg do.inf

that’s what it can do.

...

12 Ya’ir: ...hu mexamem ’otam.

he warm.prs.m.sg obj-3m.pl

...it heats them [the water molecules] up.

Following Ya'ir's suggestion (line 1), Omri doubts the plausibility of heating up water in the microwave with *ken?* 'really?' (line 3). In response, Ya'ir produces a [*ze ma she-* + clause] structure manifesting two primary stresses – one on the demonstrative pronoun *ze*, the other on the verb *do* – supporting the soundness of his suggestion: 'that's what it can do' (line 5). The construction is accompanied here by a head shake and moving the hand horizontally away from the body while holding it in the PUOH (Palm Up Open Hand) gesture (Kendon 2004).

We explore the correlation between the functions of the construction and its lexical, syntactic, and prosodic features, its sequential position, and the speaker's embodied conduct, thus shedding light on the interlaced nature of grammar, the body, and interaction.

« If you have a patrol at hand » – Insubordinate ‘if’-requests in emergency calls

Panel contribution

*Prof. Simona Pekarek Doehler*¹, *Dr. Anne-Sylvie Horlacher*¹

1. University of Neuchâtel

The notion of insubordination has received abundant attention in recent research, since Evans' (2007) seminal statement defining insubordination as “the conventionalized main clause use of what, on prima facie grounds, appear to be formally subordinate clauses”. Typical examples are what some refer to as ‘free-standing’ *because*- or *if*-clauses. Existing research associates insubordination with the management of interpersonal relations and speaker-hearer intersubjective alignment, relating it to requests, commands, hints, warnings, and the expression of epistemic, evidential or deontic meanings (papers in Beijering et al. 2019, Evans & Watanabe 2016). However, work on the issue has typically not been concerned with social-interactive data. Therefore, an interactional perspective can be anticipated to deepen our understanding of the functions of insubordination and its intersubjective working.

In this paper we investigate insubordinate ‘si’ (‘if’)-clauses in French interactional data within the framework of Interactional Linguistics (Couper-Kuhlen & Selting 2018). Existing work in this field, focusing on English, Finnish, Swedish, and German, and has shown that free-standing ‘if’-clauses may function as directives (Ford & Thompson 1986, Lindström et al. 2019), requests (Laury 2012, Laury et al. 2013, Lindström et al. 2016) or wishes and threats (Günthner 2020). Turning our attention to French, we investigate speakers’ use of insubordinate ‘si’ (‘if’)-clauses within a strongly asymmetrical situation: emergency calls to the police (Drew & Walker 2010). We document that, in such calls, citizens recurrently produce ‘si’-requests such as ‘if you have a patrol at hand’ through which they ask for a police patrol dispatch. One of the specificities of these requests is that they do not identify the requested action (not: ‘if you could send a patrol’), but instead mention the *sine qua non* condition for the addressee (the call-operator) to grant the request (having a patrol at hand). In other words, the very format of these requests provides the call-operator with a possible reason for a non-granting of the request by simply denying the existence of the *sine qua non* condition made explicit in the ‘si’-request. We show that through such ‘si’-requests, citizens index their own reduced deontic authority vis-à-vis the call-operator, typically in situations of low emergency and hence low citizen entitlement to solicit police intervention (Bolaños-Carpio 2019). We further document the relative lexico-semantic consistency of the format, and argue that this consistency suggests a certain degree of routinization, and is reflexively related to the mutual roles of the participants and the set of rights and obligations related to these. Finally, we observe that, recurrently, the ‘si’-requests are produced not as first but as second requests, after the citizen’s issuing of a first request that was not attended to by the call-taker; this suggests strong pragmatic dependency of the ‘si’-format on prior talk by the same speaker, which raises questions of continua of insubordination (e.g., Beijering et al. 2019, Maschler 2020). In sum, the study demonstrates how an interactional approach can deepen our understanding of insubordination and its functional motivations.

“We are completely stunned”: Corrective facework in hosts’ responses to AirBnB negative reviews

Panel contribution

Ms. Patricia Díaz-Muñoz¹, Dr. Carmen Maíz-Arévalo¹

1. Complutense University of Madrid

The transaction between hoteliers and their guests has experienced a massive change thanks to travel websites such as TripAdvisor, Booking or AirBnB. These platforms allow for a more direct relationship between both parties, i.e. guests and hoteliers, who perform relational work strategies even if the main communicative objective seems to be purely transactional (Bridges and Vázquez, 2018; Hernández-López, 2019). Even though most responses to guests’ reviews tend to be positive, verbal aggression and impoliteness are present to some extent (Hopkinson, 2018).

The present research analyses explicitly and implicitly aggressive responses to reviews with negative valence written on AirBnB by British and Spanish hosts, with a special attention to the corrective facework strategies (Guerrero et al., 2014; Maíz-Arévalo, 2019) employed by the hosts. Thus, the aim of this study is twofold: on the one hand, to examine how hosts repair their face and the reputation of their businesses and, on the other, to observe the differences and similarities stemming from the use of corrective facework strategies by British and Spanish hosts.

Hence, 100 responses to reviews with negative valence were gathered from AirBnB, 50 for each nationality, and analysed qualitatively with the help of the computer software NVivo, considering the strategies deployed by the hosts in order to repair their face and to revert the situation. Results show that most Spanish hosts’ responses are aimed at repairing their own face rather than their relationship with the guests, while British hosts acknowledge negative reviews and apologise more often than Spanish hosts, showing more concern with their guests’ face.

(Re)Claiming epistemic personhood in Spanish on Twitter: A corpus-based examination of responses to attacks to epistemic personhood

Panel contribution

Dr. Manuel Padilla Cruz¹

1. *Universidad de Sevilla*

Individuals are agents who participate in a variety of epistemic practices which involve, among others, dispensing information. As epistemic agents, one of their quintessential attributes is *epistemic personhood*. In the philosophical discipline of social epistemology, this is defined as the ability to author knowledge and involves being perceived as a knowledgeable and trustworthy informer (Borgwald 2012; Thorson and Baker 2019).

Epistemic personhood may be attacked, questioned and ruined by means of a variety of actions. A recent exploration reveals that such actions may include insults, exhortations, imprecations or the expression of disagreement (Padilla Cruz, forthcoming), as well as what is known in social epistemology as *dismissive incomprehension*. This amounts to a (feigned) expression of non-understanding of a piece of information owing to its alleged nonsensicality (Cull 2019). The purported effects of these actions comprise credibility reduction, silencing, gaslighting and/or pathologisation of the epistemic agent as an irrational individual (Bailey 2020; Cull 2019; Fricker 2007). Consequently, attacks to an agent's epistemic personhood may generate or exacerbate interactive conflict.

Unfortunately, the responses that epistemic agents give to attacks to epistemic personhood have not received due attention, either in face-to-face or technology-mediated contexts. Reportedly, the attacker's preferred reactions could be silence or lack of response, even if unlikely. Dispreferred reactions could include disagreement or counterattacks by the victim in order to reclaim epistemic authority (Padilla Cruz 2019).

This paper will report on a corpus-based examination of such responses by Spanish epistemic agents on the social network *Twitter*. Overall, the examination aims to analyse how these agents (re)claim epistemic personhood through digital discourse. More precisely, it seeks to ascertain (i) whether Spanish epistemic agents attempt to (re)claim epistemic personhood by alluding to or proving it, (ii) how they do that, (iii) whether they counterattack or undermine the attacker's epistemic personhood as a way of (re)claiming theirs, (iv) what strategies they deploy in so doing, (v) whether such actions are organised into specific digital discourse patterns, (vi) if epistemic agents mitigate or intensify their responses depending on the attacker's identity, (vii) what tactics they exploit in order to do so, and (viii) whether failure to respond is motivated by the attacker's identity or the nature of their attack.

Are all negative reviews alike? A contrastive study of conflictual language in product and experience-based reviews

Panel contribution

*Dr. María de la O Hernández López*¹

1. Pablo de Olavide University

In the age of digital communication, reviewing and rating products or experiences have become part of most users' lifestyle (Barton and Lee, 2013). Therefore, most digital companies have enabled this feature to their platforms, with a twofold function: 1) obtain information regarding the users' tastes and preferences, and 2) use reviews as an advertising campaign that is more efficient than traditional publicity.

Reviews have also become a complaint channel in which users vent their negative feelings after a negative purchase or booking experience (Henning-Thurau et al., 2004). In addition, the contents, as well as the way users express their opinions in reviews, may vary depending on the type of review (product or experience-based), the type of platform (business-to-peer or peer-to-peer, for instance), and where the review is posted (on the business page or outsourced in other pages). Little research has been done with regards to externalized reviews and contrasting both product and experience-based websites.

This study aims to bridge this gap by examining 600 negative reviews, written in Spanish, about Airbnb, Zara and Travelgenio posted in the external website TrustPilot. The aim of this study is to examine and compare: 1) the themes that users raise as the source of complaint or conflict; and 2) the conflict arising from the impoliteness triggers (Culpeper, 2016) found in each of the three data sets. By considering both a thematic and structural analysis, I aim to providing an in-depth examination of negative reviews in outsourced reviews, and their connection conflict and language aggression in contrast to previous literature, which focuses on in-site reviews.

The results show that users' conflictual language in externalized sites like TrustPilot is intensified, with escalated aggressiveness that may even include insults, as well as affiliation and empathy with other users in the same situation. Also, users complain about different issues in Airbnb, Zara and Travelgenio. While Airbnb users are mostly dissatisfied with the platform that does not mediate properly, Zara users focus on the interpersonal side of the experience, mainly with shop-assistants or online purchases. With regards to Travelgenio, dissatisfied users are much more aggressive, with direct accusations related to the company management and unmet expectations. These findings not only show that the online review genre is not homogeneous across platforms, but also that the type of review, the nature of each platform and the source of dissatisfaction will determine whether negative reviews escalate into conflict, and to what extent verbal aggression is present.

Colorism attributions and (non) verifications

Panel contribution

***Prof. Patricia Bou-Franch*¹, *Prof. Pilar Garcés-Conejos Blitvich*²**

1. Universitat de València, 2. University of North Carolina, Charlotte

This presentation examines the role of colorism vis-à-vis online processes of Latino identity attribution, (non) verification and challenge (Burke & Stets, 2009; Garcés-Conejos Blitvich, 2022). The Hispanic/Latino identity is a top-down census category imposed by the Nixon administration on those who can trace their roots to Latin America and Spain. For its part, colorism refers to prejudice or discrimination against individuals with a dark skin tone, typically among people of the same ethnic or racial group. Although Latino is properly an ethnic-not racial - label, it has undergone – along with Spanish -a process of racialization in the context of the U.S., whereby Latinos have become *de facto* the third main racial group, alongside whites and blacks, and speaking Spanish positions native speakers as non-white. This includes Spaniards who, as Europeans, have traditionally been categorized as Caucasians. This racialization process has been extensively researched (Cobas et al., 2015; Negrón, 2014; Flores & Rosa, 2015,). However, to our knowledge, scant scholarship has addressed how the attributed Latino intragroup addresses colorism issues (but see Garcés-Conejos Blitvich, 2018). Importantly, we would like to explore reactions to how the US position Spaniards regarding colorism and *Latinidad*.

Our study is guided by the following research question: how are whiteness and *de color* constructed within the Latino group, both from a U.S. and a European perspective? To answer this question, we compiled a corpus of user-generated comments (n = cc 2,500 comments/ +63,000 words) posted in response to a newspaper article published in the Spanish broadsheet *El País*. The article reported that some U.S. media had referred to Spanish actor Antonio Banderas as the only Oscar-nominated actor of color following the Academy being criticized for lack of diversity. Since Spaniards are considered Caucasian, the news triggered a strong reaction.

We adopted a corpus-assisted discourse studies (CADS, Partington 2004; Partington et al. 2013) approach, which included analysis of keywords and concordances (Baker 2010) of the data and a qualitative, thematic analysis (Fereday and Muir-Cochrane 2006) of a keyword-based, topical sub-corpus of comments. The analysis of online processes of Latino / *de color* identity negotiation draws from various identity as constructed in interaction frameworks (Burke & Stets, 2009; Jones, 2016; Gee, 2011, Bucholtz & Hall, 2005).

Preliminary results showed that online users engaged in non-verification processes of the ‘attributed’ Latino, *de color* identity. They mostly alluded to the globalization of imposed US racial and ethnic categories and to discussions of race alongside genetics and ethnic heritage, among others, thereby trying to objectivize their arguments.

Conversational Human Voice in answers to complaints in the telecommunications sector: a contrastive genre analysis of English and Spanish emails

Panel contribution

Dr. Rebecca Van Herck¹, Dr. Lieve Vangehuchten²

1. Radboud University Nijmegen, 2. University of Antwerp

Recent research (Van Herck et al., 2021) shows that, despite the rise of new media in a business-to-consumer context, companies still prefer to handle complaints privately. As such, many complaints are addressed via email resulting in a professional communication genre on its own. We performed a cross-cultural genre analysis to understand (1) the discourse structure of the moves within response mails to complaints and (2) the importance of the communicative function of Conversational Human Voice (personalization, e.g., sign with the employee's name; informality, e.g., colloquial expressions; inviting rhetoric, e.g., call to action). With this aim, we collected authentic organizational email replies to complaints from telecommunications companies active in England and Spain (47 and 44 emails respectively). The results indicate that the English and Spanish data sets show a similar discourse structure in terms of move frequency. The submoves that are prototypical for all data sets are *Greeting*, *Explanation*, *Conclusion*, and the closing submoves *Sign-off* and *Signature*. The data sets differ slightly in their frequency for the interpersonal submoves *Gratitude*, *Apology*, *Future contact*, and *Concluding sentence*. This suggests that organizational email replies to complaints have become a rather conventionalized genre in the two studied linguacultures. However, regarding the cross-cultural analysis of Conversational Human Voice and despite its importance in webcare (van Hooijdonk & Liebrecht, 2018), it seems that the role of Conversational Human Voice is underestimated in this genre. Indeed, the writers of both data sets seem to be guided mainly by their own linguacultural background. The Spanish corpus shows a sometimes overly informal and direct style that could benefit from more deference. In the English corpus, on the contrary, the recurrently detached and formal style should be enhanced with a more person-oriented approach.

Disagreement and reliability in comments for and against COVID vaccination on Facebook. Scientific vs personal evidence

Panel contribution

*Dr. Marta Albelda Marco*¹, *Dr. Dorota Kotwica*¹

1. University of Valencia

Part of the COVID-19 vaccination campaign of the Spanish Ministry of Health has taken place on Facebook (FB) social network. From the beginning of the campaign, this topic has provoked heated debate and conflict between two strongly polarized groups: pro and anti-vaccine advocates. In this paper, we study the nature of the evidence that social network users deploy to support their standpoint in comments published on the Spanish Ministry of Health FB page.

Our goal is twofold: (i) to learn which types of knowledge and sources of information (scientific, experiential, reported, inferred) pro- and anti-vaccine users exploit to boost their assertions and/or to discredit their opponents; and (ii) to explore if there exists a hierarchy of evidence that the public opinion considers the most reliable and valid (Mancera & Pano 2020, Fox 2001, Faller 2002).

For that purpose, we conducted a qualitative analysis of 100 comments published in response to a 2022 Spanish Ministry of Health's post promoting the vaccines. All analysed comments express disagreement and they contain evidential elements used as support for the speaker's own claims or as mechanisms for disregarding the opinions of the opponents.

The study is based on the notions of evidentiality and epistemicity (Chafe 1986, Bermúdez 2005) understood in a broad sense of sources of knowledge and information, and their reliability. Furthermore, the analysis of the data considers the previous accounts on disagreement (Bach & Harnish 1979; Locher 2004; Brenes 2009, 2015), and the literature on conflict, impoliteness and negative evaluation in social media (Graham & Hardaker 2017; Bou-Franch, P. & Garcés-Conejos Blitvich 2018; Sanmartín Sáez 2019).

The first findings of the analysis suggest that, in the COVID-19 vaccination debate, FB users choose different evidential elements to present their own opinions as righteous and unbeatable. In both groups (pro and anti-vaccine), there exists a generalized tendency to rely on sources that are more accessible to users, rather than more scientific or authoritative ones. Although the results show that there are no major differences between anti- and pro-vaccine FB users', pro-vaccine users tend to use more subjective sources.

‘No es mi presidente, es un delincuente’. Aggressive digital interactions on Pedro Sánchez tweets

Panel contribution

Prof. María Luisa Carrió-Pastor¹

1. Universitat Politècnica de València

Discourse analysis on Twitter reflects the way human beings communicate and interact in a digital environment. Depending on the topic and the account on Twitter, some digital interactions may suggest conflict, even aggression. In this proposal, the focus is on actual, naturally occurring conflict talk on Twitter. Then, digital interactions were studied considering the classification of the Appraisal theory proposed by Martin & White (2005), adapted to Spanish, a multimodal interpretation of language (Kress & Van Leeuwen, 2001), and conflict talk studies (Grimshaw, 1990). The objectives of this analysis were, first to categorise the aggressive language used in the replies to tweets, second to classify the visual elements used to show conflict talk on Twitter and, finally to identify some of the mechanisms by which conflict talk can be initiated, maintained or escalated, and terminated in Spanish on Twitter. For this, a corpus of fifteen tweets sent to Pedro Sanchez’s account and their replies and nested comments, almost 3,000 in total, was downloaded with the tool Export Comments and analysed. The corpus was chosen considering the number of replies received. It was observed in the analysis that the topic was not relevant to the replies; Pedro Sanchez’s tweets received hundreds of replies immediately, boosting conflict talk. After the analysis, the examples and occurrences found were discussed.

Divergence and incongruence increase coordination in interaction

Panel contribution

***Dr. Gregory Mills*¹, *Dr. Christine Howes*², *Prof. Eleni Gregoromichelaki*², *Prof. Patrick Healey*³**

1. Kingston University London, 2. University of Gothenburg, 3. Queen Mary University of London

A commonly held view in theories of communication is that convergence and congruence, both within- and between- interlocutors underpin and is the aim of “successful” communication. Dialogue models also typically assume that, as conversation unfolds, interlocutors become “more similar” across various dimensions. However, this view is too simplistic, not least because it goes against mathematical notions of information, recently also adopted in complex systems research in physics, biology, AI, neuroscience, and philosophy, where surprisal is the measure of the gain that can be achieved through the exchange of signals. Where constant learning, plasticity, and adaptation are the requisite factors for persistence under continual environmental change, dynamic processes of self-organisation under constraints from multiple sources are more significant than code-matching and message replication (Kauffman, 2019; Bickhard 2017).

Accordingly, recent models of grammar and interaction argue that, instead of convergence and congruence, it is divergence and incongruity that drive coordination in joint action (Healey et al., 2018a,b; Mills, 2014) through the realisation of novel affordances achieved via the juxtaposition of constraints originating from mismatched individuals (Gregoromichelaki et al, 2022). In everyday interactions, our predictions are constantly shaped on the basis of how our own and others’ behaviour reciprocally affect each other and the world, opening up new possible courses of action (affordances) unavailable to single agents due to lack of sufficient constraint. In dialogue, these predictions are about communicative actions, e.g. sounds, words, gestures, posture, facial expressions and eye gaze (Mills & Boschker, 2022). Individual expectations, which we argue can never fully be met, provide a background onto which the figure of incongruent feedback is integrated, ensuing in a surprising but rewarding outcome (more prominently in cases of humour, irony, etc. but, in reality, in every single instance of perception/action).

Such incongruities and their effects on interaction have been addressed in recent experimental work on miscommunication. Standard approaches to dialogue assume that signals produced by participants are congruent with the level of (mis)understanding: when communication difficulty occurs, there is the assumption that interlocutors will produce signals of miscommunication that are congruent with the nature of the problem. If there is a hearing problem, the interlocutor should signal “huh?” or “sorry what?”. Similarly, if a person misunderstands a direction instruction, e.g., “all the way at the end of the long path”, they might ask “all the what at the end of the where?”.

However, we have shown instead, that targeted incongruence, both within and across turns and participants, often increases coordination: If participants’ signals of miscommunication are detected and artificially transformed to make them less congruent with the nature of the communication problem, by making the (apparent) nature of the problem more severe, improved coordination is achieved in task-oriented dialogue (Healey, Mills et al., 2021; Howes and Healey, 2015; Mills and Redeker, 2022). We argue that this is due to the formation of a novel complex system emerging from the participants’ efforts and the affordances of the mediating technology. This system develops its own emergent organisation that is irreducible to its participating components.

Divergent senses and sensors in multimodal recipient design: Avoiding gestural mismatches in human-robot interaction scenarios

Panel contribution

Prof. Ellen Fricke¹, Dr. Jana Bressemer¹

1. Chemnitz University of Technology

What is the potential of the concept of recipient design (Sacks 1992) derived from linguistic Conversation Analysis (CA) applied to multimodal and multisensorial human-robot interaction in future hybrid societies? In particular, how can hybrid group settings consisting of participants with different senses and sensors be communicatively designed? What kind of mismatches occur and how can these be resolved – technically as well as semiotically?

This paper is relying on a concrete empirical scenario of human-robot interaction as a starting point (Gäbert et al. 2022). It aims at initial steps of an extended concept of recipient design that considers future hybrid settings of humans and machines on different levels of complexity.

Basically, the concept of recipient design is broad enough to cover the most diverse aspects of complex human as well as robot behavior (Avgustis et al. 2021; Pitsch 2020; Winner et al. 2019): (1) attributions of goals, intentions, abilities, knowledge, etc. to addressees, followed by a corresponding adaptation of one's own behavior; (2) attribution of sensory capabilities: e.g., with regard to a blind person or a robot that does not have optical sensors, one will have to use other types of signs as, for example, visible pointing gestures to localize an object; (3) assignment of particular context conditions; (4) attributions of linguistic ability or other semiotic competences; (5) establishing joint attention; (6) adaptation to inter-cultural differences and further aspects.

The scenario used in this paper is based on joint research (Gäbert et al. 2022; Hellara et al. 2022) in the Collaborative Research Center “Hybrid Societies” (www.hybrid-societies.org). It comprises an artificial gesture set for two human co-workers (visual mode) and a robot arm (non-optical sensor-based tracking only) and thus provides the interesting case of combining two types of addressees with (1) different sensory capabilities and (2) different semiotic competence whose contrasting recipient design may easily lead to mismatches in interactional adaptation.

For example, a pointing gesture towards an object is intuitive to the respective human (worker) performing it and to another human bystander (co-worker) as it directs the attention to the selected object and, thus, enables its identification. However, if the robotic arm does not have any optical sensors, such visual guidance of attention is not possible (Gäbert et al. 2022). The human interacting with the robotic arm must, therefore, take into account the different sensory capabilities of the potential addressees in the signs he or she uses. This particular dimension of recipient design has to be considered when constructing an artificial gesture set for humans and machines in hybrid group interaction.

Faith in Deepfakes: Plausibility and veracity in digital face manipulation

Panel contribution

Dr. Remo Gramigna¹

1. University of Turin

Just as there is fake news there is also fake digital content. In the era of disinformation, discerning facts from fiction, seeing and believing, real and fake, has become a real challenge. Whilst image manipulation has always been a technique commonly used for doctoring face images, today image manipulation has come to a new stage of development reaching its pinnacle with ‘deepfakes’. “Deepfake” is a fairly new technique that has revolutionized the way in which face images and representations are altered and manipulated in the digital era. Indeed, using a blend of Artificial Intelligence (AI) and Machine Learning (ML) techniques, deepfakes create fake videos and audio content that are very realistic, so much so that it can be hardly distinguished from authentic and genuine sources. Deepfakes are videos (or audios) of a person in which their face or body has been digitally altered so that they appear to be someone else. These videos purport people saying or doing things they never said or did. Indeed, the result is a digital mimesis of the original content which is close enough to its original source as to pass off as authentic and real. Today, such matters are at the forefront of discussion as the invention of deepfakes has created heated debates dividing the public opinion into two opposite fronts: the techno-enthusiasts, who anticipate and speculate on the great potential as aids to bolster education, the arts, and the film industry, and the techno-phobic, who raise concerns about the possible threats that may derive from a weaponization of deepfakes. The implications of this emerging phenomenon are plenty. By drawing on semiotic theory, this presentation takes a deep into the phenomenon of deepfakes, taking into account the uses and misuses as well as the peculiarity of this new synthetic media.

Group differences in crossmodal correspondences and multisensory perception involving music

Panel contribution

Dr. Bruno Mesz¹

1. Universidad Nacional de Tres de Febrero

In research on cross-modal correspondences and multisensory perception, differences between groups of individuals usually emerge. For instance, in a recent experiment on music-odor correspondences, we observed that high-pitch music was evoked by strong smells for some participants, but other group associated high pitch to odorants with a fresh/light smell character (e.g., sour, mint, citrus, green, and fruity). In another study on the impact of music on the experience of coffee tasting, both the taste of the coffee and the emotionality of the experience were modulated differently, for different subgroups of participants, by the presence of musical soundscapes.

Different kinds of crossmodal relation that have been proposed in the literature to date may imply the existence of potential divergences between groups with respect to the congruence of multisensory communication involving music. Congruence given by semantic correspondences, based on common linguistic terms used to differentiate aspects of sensory experience, will likely be influenced by the great variability across languages in representing auditory, visual, and olfactory dimensions. Emotional congruence of multisensory stimuli or messages will possibly be affected by cultural or gender differences that have been reported in terms of people's affective responses to music and other unisensory stimuli.

In view of these group differences I will propose ways to personalize multimodal interactions. As an alternative to this approach, I will comment on a case showing the theoretical possibility of designing emotionally congruent multimodal objects or messages for a general user or recipient, in spite of the interindividual diversity of "translations" across the senses.

Olfactory interferences in multimodal communication: from seduction to aversion

Panel contribution

Prof. Paul Bouissac¹

1. University of Toronto

Paul Bouissac (University of Toronto)

The research on multimodality bears almost exclusively on visual and acoustic modes of communication. The purpose of this paper is to call attention on the role of other sensorial components in both face-to-face and mediated semiotic interactions. Although the haptic dimension is not negligible, olfaction seems to have a more determining impact on the effective reception of multimodal messages. To approach this dimension of multimodality both intuitively and empirically, it is necessary to distinguish the olfactive baseline that defines the apparent “absence of smell” in the usual environment of the interactants – olfaction is a definite determinant of “familiar space” – from the salient olfactive information that may become a part of the interaction. Such molecular modifications of the atmosphere within which the interactions take place can be either accidental or artifactual. The multimodal marketing of various products makes use of this “stealth input” that plays on the association of certain smells with social status or other distinctive cultural categories. However, the power of olfaction cannot be entirely controlled and can undermine the intents of the interactant. Molecules generated by the ink of printed material or by various technological devices may play a part in the reception of multimodal messages. Body generated pheromones is also credited to impact subtly human interactions. The hypothesis of this paper is that a felicitous multimodal communication act depends in a significant manner on its olfactive dimension all the more so as the selective detection of molecular environment is the most ancient adaptation of the earliest organisms. Evolution is conservative and the more recent – on the evolutionary scale – adaptive processing of acoustic and optic information did not cancel the vital detection of olfactory information signaling danger or nutrient. Recent research on the pervasive role of olfaction shows that decisions can vary with the olfactory context, a phenomenon that is grounded on more fundamental empirical evidence showing, for instance, that “the valence and salience of individual odorants are modulated by an animal’s innate preferences, learned associations, and internal states, as well as by the context of odorant presentation” (e.g., Khan et al. 2022). In general, the question of whether olfaction is a determining factor in multimodal communication among humans is amenable to empirical investigation as it is a falsifiable hypothesis in the context of current research on cross-modal convergence and interferences (e.g., Galmarini et al 2021).

When divergence opens to the exploration of Alterity. Experiences of Infopoetry as abductive design

Panel contribution

*Prof. Salvatore Zingale*¹, *Ms. Arianna Bellantuono*¹

¹. Politecnico di Milano

This contribution will focus on *divergence* and *convergence* as semiotic processes within design activity.

Convergence occurs when, starting from different positions, there is a tendency towards a single goal or purpose. We, therefore, interpret convergence as moving towards an intended goal or effect.

Divergence is the opposite movement: moving away from a common point. Or, according to our interpretation, the detachment from established visions and beliefs that are obvious and unchangeable.

Design shifts from these two directions, which can be seen as the paths through which the sense of design is sought. Suppose convergence incorporates everything experimented with a method, procedure, respect for parameters, and, therefore, that which follows the path of deduction and induction. In that case, divergence suggests abduction: acting in unusual ways by associating ideas and exploring possibilities. At the same time, if convergence leads to the identification of an identity (values, objectives, and brand characteristics), convergence also brings about an encounter with alterity: that which appears alien, that which is culturally problematic, that which is still unknown, and which the project may unearth. Abduction is divergent thinking, driven by the need to find alternative solutions to the possibilities already explored and traditionally pursued. With abduction, the design aims at the valorisation of differences while simultaneously reflecting on the role that design can play as an inventive act, non-identitarian but projected towards alterity.

This theoretical premise will be supported by the presentation of a design practice that we have been experimenting with for years in the Data Visualization laboratory at the School of Design of the Politecnico di Milano and that we have called *Infopoetry*. It is a neologism that combines ‘information’ and ‘poetry’ on the lines of the better-known *infographics*. Infopoetry has a twofold purpose: (i) to *show* data and (ii) to make them *feel*, seeking the emotional involvement of the user. Compared to infographics, the designer is here called upon to *expose* himself as subjectivity and intentionality. Moreover, using metaphor as an element of mediation between the object to be visualised and its artefactual expression, the practice of Infopoetry is necessarily implemented by urging design thinking to find unusual ways of representation. The designer explains his or her point of view on the chosen phenomenon *via discourse* that aims to make tangible the aspects of the content plane considered most pertinent through an aesthetically appropriate level of expression.

The starting dataset is first interpreted according to the specific relevance chosen by the designer, then *translated* into a communicative image, resorting to various forms of expression, exploiting the tools of multimodality, multimedia and multisensoriality.

“J’imagine” as deverbial discourse marker in spoken French. Position in turns and interactions

Panel contribution

Mr. Stefan Schneider¹

1. Universität Graz

The presentation reports on a study concerning *j’imagine*, a deverbial discourse marker in the first person present indicative singular with medium frequency in spoken French (Schneider 2007). The verb *imaginer* is a medieval borrowing from Latin *imaginari* and/or *imaginare*. In the 13th century, its prevailing meaning is ‘form a mental picture’. Later, the verb adds cognitive meanings that background the picture aspect, among them ‘suppose’. In the 17th and 18th century, the diffusion of ‘suppose’ favors the emergence of the deverbial discourse marker expressing reduced speaker commitment.

The evolution leading to the deverbial discourse marker *j’imagine* has been studied by Schneider (2020a, 2020b). Except for remarks in Schneider (2007) and Gosselin (2014), detailed analyses of its use in contemporary spoken French are lacking. The present study seeks to fill this gap. The data stem from the CFPP2000 corpus of spoken French, a collection of verbal interactions recorded in Paris in 2005-2012.

The CFPP2000 contains 146 occurrences of *imaginer*, of which 67,1 % (n = 98) are in the first person present indicative singular and 32,8 % (n = 48) are deverbial discourse markers. In a first step, the distribution of the deverbial discourse markers was analyzed. Three basic positions were found: (1) preclausal after extraposed elements, (2) intermediate postverbal and (3) postclausal:

- (1) (Spk3) et pour votre fille *j’imagine* ça n’se pose même plus ? (Yvette Audin, 1504.200-1507.110)
- (2) (Spk1) ça dépend *j’imagine* des quartiers hein (Pauline de Bordes, 4619.294-4623.205)
- (3) (Spk1) non mais bon vous connaissez quand même tout Paris *j’imagine* (Julie Teixeira, Katia Teixeira, 327.013-329.864)

In a subsequent step, these positions are now being examined, specifically in the light of the hypothesis that the left periphery concerns the management of turns and text coherence, whereas the right periphery concerns the speaker’s viewpoints and the modification of illocutionary force (Beeching & Detges 2014; Haselow 2015).

An utterance-centered corpus-pragmatic approach to the categorization of information source in spoken Italian

Panel contribution

Prof. Johanna Miecznikowski¹, Ms. Elena Battaglia¹, Mr. Christian Geddo¹

1. Università della Svizzera italiana

Languages use diverse grammatical/lexical means to encode information source (Aikhenvald 2004, Squartini 2007) within the larger conceptual domain of epistemicity (Boye 2012), which is related to the assertive-interrogative functional space (Levinson 2012) and provides speakers with verbal means to claim/attribute epistemic access/primacy/responsibility in interaction (Stivers/Mondada/Steensig 2011).

In languages that do not impose evidential distinctions by grammar, to which extent is information about information source (made) available in interaction?

“InfinIta” (USI 2020-2024, SNSF grant no. 192771) looks for answers by focusing on spoken Italian, based on a corpus of 24 hours of video-recorded talk-in-interaction (“TIGR”). We view information source as a conceptual/pragmatic category and consider both linguistic evidential marking and less-researched evidential resources such as multimodal conduct (Mondada 2016), elements of the environment, implicatures based on the propositional content p/related to text/sequence structure, and argumentation. We hope to thereby obtain a realistic picture of how information sources are categorized within an interactional ecology.

Besides the sequential analysis of cases/collections, we adopt a corpus-pragmatic approach. Existing corpus-based investigations retrieve and annotate explicit evidential markers/constructions (e.g. Cornillie/Gras 2015, Pietrandrea 2018, Jacquin et al. 2022). Our annotation procedure, in contrast, is utterance-centered:

- (i) Identify all utterances in a corpus sample that are compatible with an evidential specification, i.e. assertions/conjectures/assessments with an epistemic commitment of at least K+/-;
- (ii) Per utterance, retrieve all resources that narrow down the set of source types for p;
- (iii) Per resource, describe (a) type of resource (marking, implicature etc.), (b) position with respect to p and (c) source type.

The annotation is performed on Jefferson-style transcripts in INCEpTION (Klie et al. 2018) using one layer of features+tagsets and viewing video-data through ELAN in parallel. Subsequent quantitative analysis will allow to describe the degree of specificity, redundancy and earliness (with respect to p) of source categorization. We present the annotation schema, report on its testing and address theoretical and methodological challenges.

Discourse functions of look and see as evidential and epistemic markers in Italian political discourse: a corpus based study

Panel contribution

*Ms. Tanja Trebucchi*¹, *Ms. Serena Coschignano*²

1. University of Bergamo, 2. University of Pavia

Political discourse is a persuasive genre: one of its main goals is to build a common ground with addressees and persuade them of the validity of some (ideological) content. This is often done through implicit linguistic means, harder for listeners to consciously detect and reject (Lombardi Vallauri 2019). Functional markers – external to the propositional content and with discourse-procedural or expressive purposes (Molinelli 2014) – can be used to convey epistemic modality and information source: see, for instance, the parenthetical use of perception verbs as “look”, “see”, “listen” and “hear” (Ghezzi/Molinelli 2015; Lo Baido 2018).

We focus on the second person singular/plural forms *guardi/guardate* (“look”) and *vede/vedete* (“see”) in a corpus of Italian political speeches from 2020 to 2022. The corpus, 7 hours of transcribed speech, is balanced for sub-genres: dialogues (interviews) and monologues (parliamentary speeches). The transcription was carried out with ELAN, also used to annotate functional markers according to their prototypical features (Heine et al. 2021). The corpus was tokenized and lemmatized on SketchEngine, whose KWIC visualization was exploited for comparing inflected forms across different texts.

We analyze what follows: the discourse functions of *guardi/guardate* and *vede/vedete* in Italian political discourse and the meaning they convey; their tendency, if any, to co-occur with specific speech acts, also comparing monological and dialogical settings.

Despite having the same semantic source, *guardare* and *vedere* seem to be used in different contexts for different purposes. Our data show a well-defined trend: the agentive *guardare* is more frequent in interviews, at the beginning of the turn, with an allocutive value inviting one to turn one’s mind to what is about to be asserted; the non-agentive *vedere* is more frequent in monologues, with an epistemic value, often introducing an implicit Face Threatening Act towards political opponents. This contrast can be explained through their different degrees of agentivity: *guardare* takes the imperative mood and implies a conscious effort by the addressee, who is metaphorically asked to take action to update their knowledge; *vedere*, in the indicative mood, invites the addressee to “experience” information persuasively presented as part of the common ground, even when it is not the case (Aikhenvald/Storch 2013).

Distribution and function(s) of parenthetical *mi sembra*/*mi pare* in spoken Italian

Panel contribution

Mr. Flavio Pisciotta¹

1. Department of Humanities (DipSUM), University of Salerno

In the literature, parenthetical *mi sembra* and *mi pare* ‘it seems to me’ have been classified as hedges, i.e., mitigators that take scope over the whole host clause (Caffi, 2007; Schneider, 2007), and are considered to only mark the speaker’s uncertainty, without referencing any specific information source.

Given the lack of dedicated studies on these two parentheticals, we want to provide a more in-depth description of the distribution and the functions of parenthetical *mi sembra* and *mi pare*. In particular, we hypothesize that these parenthetical verbs can also take scope over a phrasal constituent, as suggested by Kaltenböck (2010) for *I think*. Moreover, following some observations made on the construction with *mi sembra* as main-verb (Miecznikowski & Musi, 2015), we hypothesize that these parentheticals can also have an evidential, memory-related meaning.

We extract 139 total occurrences of the two constructions from the spoken Italian corpora KIParla (Mauri et al., 2019) and LIP (De Mauro et al., 1993). The occurrences are coded for four variables: the type of interaction they appear in, their position within the host clause, their scope (clausal/phrasal), and their epistemic or evidential function. We perform a quantitative and qualitative analysis of the occurrences.

Our preliminary results show that *mi sembra* and *mi pare* are more frequent in unplanned and less constrained interactions. Furthermore, we find occurrences in which the parenthetical takes scope on phrasal constituents: (1) c’è un pezzo che lui registra **nel cinquantotto mi pare** in un disco [...]

‘there’s a piece that he recorded **in nineteen-fifty-eight it seems to me** in a record [...]’

However, we expect these cases to be less frequent than the ones having a clausal scope. Instead, we expect many occurrences to show an evidential function. For instance, in cases like (1), the uncertainty marked by *mi pare* is due to the speaker’s difficulty in retrieving the correct information from their memory. We hypothesize this function will be present mainly in less planned interactions (e.g., free dialogical interactions), where the speaker has fewer available sources to justify their claims.

Evidential last I checked expressions

Panel contribution

*Mr. Ozan Mustafa*¹, *Prof. Gunther Kaltenböck*¹

1. University of Graz

Recent decades have seen the rise of evidential extra-clausal fragments which so far have escaped attention in the literature. These typically take the form '(the) last I/we + [VERB-ed]' and involve a verb of cognition or perception, as illustrated in (1)–(3).

(1) **The last I looked**, I think it went up about 4 points in the latest poll (COCA)

(2) But really, this country, **last I checked** was a free country (COCA)

(3) Now the 16-year-old, Jason Gelroth, remains in critical condition **last – last we heard**. (COCA)

Drawing on data from the *Corpus of Contemporary American English* and the *Corpus of Historical American English* (revealing 1,396 and 427 instances respectively), this paper investigates their typical forms and discourse functions, particularly in spoken interaction. It also considers their recent development and grammatical status. It will be shown that their overall epistemic/evidential function, reducing the speaker's commitment to the truth of the host clause based on limited available evidence, is further shaped by a number of parameters, viz. their position with regard to the host clause (initial 82.2%, medial 8.9%, final 8.9% in the spoken section of COCA), the specific verb used, and the semantic nature of the host clause. Thus, ironic use may arise, for instance, in connection with host clauses expressing unchangeable states-of-affairs or 'facts', as in (2).

In initial and final position, *last I checked* expressions also have important discourse-organisational and turn-taking/yielding function, with initial position being consistent with subjective use and final with intersubjective (e.g. Beeching & Detges 2014). Medial position, on the other hand, has information structuring function, while stand-alone uses represent speaker responses, as in (4).

(4) A: Sure she's alive?

B: **Last I saw**. (COCA)

As regards their grammatical status, it is argued that they are best analysed as constructions in their own right (e.g. Goldberg 2006) rather than cases of ellipsis. This is on the grounds that they do not allow for unambiguous reconstruction of a 'complete', non-elliptical form (allowing instead for multiple parent constructions, e.g. *The last time that I heard*, *When last I heard*, *The last thing I heard is*) and may exhibit their own formal and functional idiosyncrasies. It is these parent constructions that can also be identified as the historical source constructions out of which the expression has developed. The development itself is essentially one from core to periphery, and may involve a number of different parameters, such as loss of an NP head noun (e.g. *time*, *thing*), loss of the determiner, loss of a complement (*last I read [it]*) and increase in positional mobility.

Expressing a low degree of certainty in interaction: the French epistemic adverb *peut-être* ‘perhaps’ in a corpus of political debates and work meetings

Panel contribution

*Mrs. Ana Keck*¹, *Dr. Jérôme Jacquin*¹

1. *Université de Lausanne*

The frequent French adverb *peut-être* ‘perhaps’ is generally considered as an epistemic modal that applies a low degree of certainty to a propositional scope (Gosselin, 2010). The present paper focuses on the values and functions of *peut-être* as documented by a random sample of 150 tokens annotated in a 28h corpus of naturally occurring interactional data. This case study is part of an ongoing research project about epistemic and evidential markers in French-in-interaction, examined at the enunciative, interactional and multimodal levels. The goals of the paper are (1) to present our methodological approach for the systematic analysis of epistemic markers in interaction, and to provide (2) a quantitative overview of *peut-être* in contrast with other epistemics markers present in our corpus, as well as (3) a qualitative, sequential analysis that examines and illustrates the different aspects of *peut-être* found in our sample.

Existing studies of epistemic adverbs by Rossari et al. (2016) and Rossari (2018) highlight that *peut-être* and other adverbs such as *sans doute* and *certes* can have non-epistemic meanings, often with a rhetorical use. In English, Suzuki’s (2018) identifies different interpersonal functions of *perhaps* (e.g., hedging in questions, requests, and suggestions), while Rozumko (2019; 2022) shows that even though *perhaps* is mainly employed with a purely epistemic meaning, it can also be used as a discourse marker (for discourse-organizing functions) or as a downtuner (for interactional functions). Our goal is then to assess the extent to which these observations are also applicable to the adverb *peut-être* in spoken French.

In our corpus of spoken French interactions, 576 tokens of *peut-être* can be found, 156 of which being in the 9h sub-corpus of public debates, 68 in the 5h sub-corpus of TV debates, and 352 in the 14h sub-corpus of work meetings. *Peut-être* is by far the most frequent epistemic adverb in the corpus. To study the functions of *peut-être*, we look at three layers of contextual information: (i) the syntactic position of the adverb, (ii) the interactional context in which it appears and (iii) the type of informative content that is present in its scope. Regarding the syntactic context, *peut-être* frequently appears in cleft-sentences, in correlative constructions, and in concessive structures. Regarding the interactional context, *peut-être* can be employed in initiative positions, e.g., to mitigate a request, in reactive positions, e.g., to evaluate a previous informative content, and in undetermined sequential positions, to organize the discourse. Finally, our preliminary observations suggest that the nature of the informative content also plays a role in the interpretation of *peut-être*, e.g., whether the scope includes a personal deictic or a modal verb.

Based on the existing literature and our preliminary observations, our working hypothesis is that two main uses of *peut-être* could be distinguished: a “subjective” *peut-être*¹, which is used by the speaker to express only a downtuned degree of certainty about their own informative content or the content provided by another participant, and an “intersubjective” *peut-être*², which is used as an interactional resource, notably to soften face-threatening acts.

French markers of evidentiality in interaction

Panel contribution

Mrs. Gerda Hassler¹

1. University of Potsdam

In this paper, lexical markers of visual evidentiality (*visiblement*, *apparemment*), quotative evidentiality (*il/elle dit*) and hearsay (*on dit*) will be examined for their use in spoken French. In particular, we will investigate the question of to what extent the interaction between interlocutors influences the meaning and function of evidentiality markers. The following results will be demonstrated with corpus examples.

1. First, an extension of meaning to areas of evidentiality not originally covered can be noted. For example, *visiblement* is hardly ever used as an indication of the origin of the communicated content from the speaker's visual perception. Often the use of such markers is coupled with attention-demanding discourse markers: *ben une passe en profondeur aérienne écoute hein/visiblement ça marche/* (n5/fc4 'Well, an overhead pass listen, doesn't it/it seems to work').
2. Another result of the study is the finding that syntactically complex markers that formally consist of a subject and a predicate are given a simple meaning that does not always follow from the meaning of the constituents (*on dit mais: pourquoi: pourquoi faut qu'on parle anglaise si vous venez de Lyon*, 15j/946, 'they say but: why: why do we have to speak English if you come from Lyon').
3. It is also noticeable, for example, that the evidentiality marker *apparemment* is increasingly used in conversations to reinforce an affirmation or negation (*pas pour l'moment mais apparemment j'veais faire quelque chose*. 1b8/j0 'not at the moment but apparently I have to do something').
4. Evidentiality markers referring to the speaker's own cognitive activities often enter into relationships with discourse markers (*ben, hein*) which underline the willingness to cooperate (Ben moi aussi ben dis lui si elle en a [besoin] j'la dépanne 15j/ffj 'Well, I also tell her if she needs it, I'll help her out.').

The study was conducted on the corpus Clapi (*Corpus de L'Angue Parlée en Interaction*), a multimedia database of corpora recorded in real-life situations, in various contexts: professional, institutional or private, commercial, didactic, medical interactions, etc. and a set of query tools. It consists of 67 hours of searchable data that are transcribed and are also available for download. The results also include quantitative statements on the frequency of the individual evidential markers in the corpus, but the study is predominantly qualitative in nature and based on the methods of functional corpus-based pragmatics.

Interactional uses of evidential markers in Galician

Panel contribution

*Dr. Mercedes González Vázquez*¹

1. *Universidade de Vigo*

This presentation contributes to the analysis of the role of evidential markers in interaction through a case study of Galician, a Romance language spoken in northwestern Spain. The discussion focuses on the qualitative analysis of three evidential markers *disque* ('it is said'), *seica* ('it seems', 'it is said') and *polo visto* ('it seems', 'it is said') retrieved from a corpus of the current Galician language. We will try to answer the question of what interactional meanings related to intersubjectivity, negative politeness and lack of epistemic authority these markers convey.

Evidentiality has been treated as one of the ways of expressing epistemic stance towards the content of what is said and towards the hearer (Du Bois 2007). The stance-taking is detected in the degree of epistemic authority that the speaker ascribes to him/herself. This epistemic authority is based on the speaker's perception of the boundaries of his/her information territory (Kamio 1997; Clift 2006; Heritage 2012; Grzech *et al.* 2020).

In the corpus we collect cases of evidential markers that do not show a lack of certainty but lack of epistemic authority. According to our analysis, the interactional purpose of speakers who are certain of the propositional content can be threefold: to create common ground and intersubjectivity, to express negative politeness and to emphasise that the information, although certain, is outside the speaker's territory. As for intersubjectivity (Nuyts 2001), since the speaker assumes that he/she shares knowledge with the hearer, evidential units aim to establish common ground or mutual knowledge (Hintz & Hintz 2017). Regarding negative politeness (Brown & Levinson 1987), attention to the addressee's self-image leads to the levelling of epistemic authority between interlocutors and the avoidance of intruding on the hearer's territory. Finally, evidential markers are also used to manifest the lack of epistemic authority as a result of the information being outside the speaker's information territory.

Managing knowledge in financial dialogues: corpus annotation of epistemic modality and evidentiality in earnings conference calls

Panel contribution

***Mrs. Costanza Lucchini*¹, *Prof. Andrea Rocci*¹**

1. Università della Svizzera italiana

Earnings conference calls (ECCs) are a key oral genre in financial communication (Crawford Camiciottoli 2013), involving a presentation by managers followed by a Q&A session with analysts. In finance, access to information is a crucial asset both for companies and for the investing community. Notwithstanding the regular disclosure of information from companies, a clear *informative asymmetry* between managers and analysts persists, affecting the management of knowledge claims in the interaction, compounded with the constitutive uncertainty of *forward looking statements* about investments (Mc Laren-Hankin 2008). Rocci et al. (2020) show that evidentials in ECCs exhibit a strikingly different distribution between managers' and analysts' turns and strongly correlate with controversiality indicators. Their quantitative exploration of a large corpus of ECCs, however, skips manual annotation, relying instead on a list of presumed evidential expressions derived from the literature. To test and refine these findings, we conduct here a manual annotation of *epistemic frames* (cf. *evidential frames*, Miecznikowski 2020) in ECCs, including both source categorization (evidentiality) and degree of certainty (epistemic modality) examined from a communitarian (Stalnaker 1978), interactional viewpoint (Pietrandrea 2018) in a corpus of Q&A sessions of 10 ECCs. We observe the distribution of epistemic frames in question-answer pairs with respect to genre-specific sets of *discourse moves* and *question designs* (Palmieri et al. 2015). In particular, we seek to identify recurrent patterns of epistemicity marking that correlate with institutional roles (manager, analyst) as well as with discourse strategies as captured by moves and question designs. The paper reports the first results of an ongoing annotation effort, as well as the challenges of this process.

Qu'est-ce que (je vois que) tu fais ? De quoi (j'entends que) tu parles ? On the interaction of wh-placement and situational verbs in French partial interrogatives

Panel contribution

*Mr. Jan Fliessbach*¹, *Mx. Johanna Rockstroh*²

1. University of Potsdam, 2. University of Bremen

French partial interrogative markers (Q-phrases) can occur preverbally (QV) and postverbally (VQ). This variability has been studied from various sociolinguistic perspectives (Adli 2013; Coveney 2011; Elsig 2009; Thiberge 2020). Yet the designs of these studies did not allow for a detailed investigation of the pragmatic effects resulting from combinations of specific verbs and wh-placement, which could be expected from remarks in the literature on situational (Ehmer & Rosemeyer 2018: 80) and incorporating verbs (Mathieu 2004: 1108–1125). Using a workflow based on OpusTools (Aulamo et al. 2020), we extracted approx. 150.000 partial interrogatives from a large parallel corpus of French-Spanish film subtitles (Lison & Tiedemann 2016) which represents a close approximation of informal conversations (Levshina 2017). We selected 20 verbs for investigation and found that most of the verbs show a tendency for either QV or VQ. Particularly in some verbs of speech and occurrence (Levin 1993), QV and VQ interrogatives correlate with differences in the corresponding Spanish sentences, with QV translated with constructions and Pottisian expressives (Potts 2007) that indicate a negative evaluation. Based on these findings, we hypothesize that particular combinations of QV syntax and verbs of speech and occurrence are conventionalized for uses in which speakers inquire about a situationally accessible (visible, audible, etc.) entity, activity, or speech act. The mismatch between this accessibility and the assumption of “speaker ignorance” (Farkas 2022: 297) underlying questions can then in turn lead to an implicature of negative evaluation.

Reportive evidentiality in French-in-interaction: distribution and pragmatic functions of reportive evidentials

Panel contribution

*Ms. Clotilde Robin*¹, *Dr. Jérôme Jacquin*¹

1. *Université de Lausanne*

The present paper focuses on the forms, functions, and distributions of French reportive evidentials as they emerge in a 28h video-recorded corpus of Swiss-French natural data, documenting two different “institutional” settings (Drew & Heritage, 1992): (i) public and TV debates (14h;2007-2013) addressing various political topics; and (ii) work meetings (14h;2017-2018).

Reportive evidential markers signal that the information transmitted has been acquired indirectly through another entity, whether defined or not (Willett, 1988). In French linguistics, studies have focused extensively on the (non-)evidential nature of reported speech (Guentchéva, 1994; Kronning, 2002; Dendale, 2022); and specific markers, e.g., conditional mood (i.a. Kronning, 2002; Guentchéva, 2014; Dendale, 2014); “prétendre” [pretend] (i.a. Dendale, 1991, Anscombre, 2014); “selon” [according to] (i.a. Coltier & Dendale, 2004); “il paraît que” [it appears/allegedly] (i.a. Nølke, 1994; Rossari, 2012; Dendale, 2022); markers derived from SAY-verb, as “on dit” [it is said] (Anscombre, 2016), “les gens disent que” [people say that] (Marque-Pucheu, 2014) or “au(x) dire(s) de” [according to] (Dendale, 2019), are largely studied from a semantic and/or syntactic perspective and by using either invented or decontextualized examples. Notable exceptions are the studies by AUTHOR(S) (2022) on the evidential marker “tu dis/vous dites” [you say] in naturally collected data, and by Caillat (2012) and Doury (2004) on reported speech in French-in-interaction.

Expanding on this work, we propose a quantitative and qualitative study of these expressions *in context*. In total, 1249 tokens of reportive evidentials (corresponding to 76 lemmas) have been identified and annotated (morphosyntactic and enunciative realization, interactional/sequential and discursive environment, and multimodality). Preliminary quantitative observations show that these tokens are more frequent in TV debates (85 tokens/hour) than in public debates (37,7 tokens/hour) and work meetings (34,6 tokens/hour). In all three genres, the most used lemma is, by far, the verb “dire” [say] (n =820/1249). In public debates and work meetings, the second most used lemma is “demander” [ask], followed by “parler” [talk]. In TV debates, the second most used lemma is “parler” [talk], followed by “pour (X)” [according to (X)]. It is interesting to note that the use of evidential reportive markers differs from one genre to another depending on “who” is the original speaker of the reported information. In work meetings and public debates, speakers mostly report information acquired from someone who is not present, whereas in TV debates, speakers most often report information acquired from an interlocutor who participates in the debate (e.g., “you say/you said”).

On a more qualitative level, we will consider how these reportive evidentials contribute to the interactional construction of “epistemic stance” (K+/K- rights, Heritage & Raymond, 2005; Heritage, 2012). Indeed, more than just indicating the source of information, evidential markers are also resources for expressing and negotiating epistemic positions (González et al., 2017). Thus, through a sequential analysis of some relevant collections identified in the corpus, we will assess the role of these reportive evidentials in the organization of knowledge-in-interaction.

Uncertainty vs. dispreference of German “*ich weiß nicht*”: A mixed-methods workflow of a corpus-based interactional linguistic study

Panel contribution

***Dr. Henrike Helmer*¹, *Dr. Silke Reineke*¹**

1. Leibniz-Institute for the German Language, Mannheim

In our primarily methodological contribution, we aim at illustrating a typical workflow of a corpus-based (multimodal) interactional linguistic study on epistemic constructions that combines both qualitative as well as quantitative analysis.

We present a study on the German negative epistemic construction (*ich weiß (das/es) nicht*) ‘(I) don’t know (that/it)’, based on previous studies on its grammatical features and sequential pre- and post-context (Helmer/Reineke/Deppermann 2016; Helmer/Deppermann/Reineke 2017). Following new findings on the role of multimodal resources for different practices of equivalent epistemic constructions in other languages (e.g., French *je ne sais pas*, see Pekarek Doehler 2019, in press), we investigate the relevance of gaze, facial expression and body posture for three different functions of (*ich weiß (das/es) nicht*): produced as 1. an assertion and emphasis of not knowing, 2. an epistemic hedge or pragmatic marker downgrading the certainty or relevance of propositions in the context, and 3. a marker of dispreference, displaying disalignment or doubt or projecting an objection. The video data stem from the Research and Teaching Corpus of Spoken German (Forschungs- und Lehrkorpus Gesprochenes Deutsch (FOLK), Reineke/Schmidt 2022).

This study lends itself as a showcase example for illustrating a typical workflow and typical tools used in our corpus-based (multimodal) interactional linguistic approach. In recent years, increasingly bigger corpora of spoken language are built and made available and searchable through digital resources like corpus research platforms tailored to the specific properties of spoken language data (e.g., CLAPI for French, Spoken BNC for English, TalkBankDB for several languages, the Database for Spoken German (DGD) for German). Thanks to these developments, researchers today can use a relatively big amount of spoken data for their projects and queries of specific forms or constructions. These bigger amounts of data that are accessible on the other hand lead to new challenges in their further processing and qualitative analysis. This calls for elaborate workflows and the use of digital tools.

Our contribution addresses these issues and shows how qualitative researchers faced with rather big amounts of data can deploy corpus-technological possibilities and with their help adopt mixed methods approaches. We present our workflows as well as digital resources that we typically use while working on studies like the one mentioned above, e.g.:

- the Database for Spoken German (DGD, Schmidt 2017) as a corpus research platform that allows structured token queries and various filters that help to delimit a potentially big amount of data and results
- editors like EXMARaLDA and FOLKER to adapt transcriptions following the GAT2 transcription conventions (Selting et al. 2009)
- ELAN and EXMARaLDA for annotation of multimodal resources
- spreadsheets (Excel) for systematizing our collection as well as for qualitative coding
- RStudio for statistical analysis

Together with examples from our study on “(*ich weiß (das/es) nicht*)” we want to illustrate the potential of combining corpus-based and qualitative analysis.

**Digital play as
socio-pragmatic practice

Co-constructing sociability in online gaming communities

Panel contribution

Dr. Carolin Debray¹

1. University of Basel

Gaming is an increasingly mainstream pastime and gaming communities are becoming bigger and more diverse in regards to the social identities (age, gender, educational background, nationality, ethnicity, profession, etc.) and the linguistic backgrounds of their members. While interactions between gamers are often restricted by the technological affordances of different sites, the time pressures in-game and during game spectatorship, and the arguably limited common ground that exists between them, community is nonetheless constructed within this diversity through a variety of practices. Both linguistic innovation and ritualization constitute important processes that help to construct a linguistically distinct community (Ensslin, 2012) and with that help to construct community identities.

One instance in which large groups of gamers come together and interact is during game spectatorship: Here, gamers broadcast themselves playing a game via a stream, with sometimes tens of thousands of others watching. During the stream, the audience can interact with each other and the streamer through text-based chat, while the streamer usually speaks directly to the audience. Unlike in analogue television, sociability - the pleasure of being associated with others (Simmel & Highes, 1949), is a crucial component of the viewing experience. In this talk I examine the different linguistic resources gamers and spectators alike mobilise in order to construct a sense of sociability and strengthen community identity through a small corpus of transcribed spectator-gamer interactions.

Taking a socio-pragmatic approach, and drawing on the notions of joint attention and relational work (Locher, 2008), I examine the ways in which linguistic practices such as creative word formations, interjections and repetition are used to construct sociability in these interactions. I illustrate how streamers and spectators jointly co-construct a “play-frame” (Bateson, 1985) that further enhances sociability. At the same time, by using linguistic resources invoking a play-frame, participants remind each other that “this is (only) play”. This is important as it helps to mitigate the threat posed by frequent anti-social interactional behaviours and allows participants to guard against and to reconstruct sociability in the face of these threats.

Digital play for life-saving knowledge? The multimodal arrangement in VR applications for first-aid procedures

Panel contribution

Prof. Dusan Stamenkovic¹, **Prof. Janina Wildfeuer**²

1. Södertörn University, 2. University of Groningen

VR applications for medical simulations such as emergency situations offer new ways of distributing knowledge and providing practical skills for saving a life. Compared to the genre of serious games in which players are trained as experts or layperson first-aiders within an interactive gameplay, VR applications potentially represent an even more complex communicative environment. Additional semiotic resources such as touch, body movements and proprioception (cf. Martin et al. 2022) are used to construct the virtual world and instruct players to perform certain procedures. From a multimodal perspective (cf. Bateman et al. 2017), the communicative situations constructed by the virtual environment bring with them an increasing level of interactivity and ergodicity and it is particularly challenging to address these analytically. Especially the cyberphysical infrastructure provided in these applications add to the complexity by embedding holograms, 360-degree videos, etc. which need to be taken into consideration in the analysis of the instructional techniques.

While there is now research on e-learning strategies such as serious games (e.g. Boada et al. 2020) and mobile apps (e.g. Metelmann et al. 2018), not much work has been done with regard to the (multimodal) design of VR applications and how these can be used to teach resuscitation and other procedures. It will therefore be interesting to address this question from a qualitative perspective with future potential for empirical research on the effectiveness of these applications.

In this talk, we will address the analytical challenges by looking at two different examples of VR applications for first aid (Lifesaver VR, Resuscitation Council UK; Basic Life Support, Dual Good Health) and providing a foundational framework for the multimodal analysis of the communicative situations created in these two applications based on our previous work on video games (Wildfeuer & Stamenković 2022). The data to work with are recordings of the initial usage of the applications as provided by the production companies. We aim to not only show how recent developments in multimodality research are well-equipped for the effective analysis of these artifacts, but also how the analytical results can be practically implemented in the further development of these applications.

Expression of embodiment in a virtual environment: players projecting themselves into the digital world

Panel contribution

*Dr. Julie Bardet*¹, *Ms. Lydia Heiden*²

1. ENS/ICAR, 2. ICAR Lab

Video games typically offer to their players new, unknown places to explore. Some famous online games allow the players to discover and interact in and with whole worlds (e.g. League of Legends) or even (partially) create them (e.g. Minecraft). Players therefore have spatial positions in the virtual environment of the game that they can refer to, depending on the perspective they take: for example from inside the game world or from an observer's perspective. The term *embodiment* notably describes the player's experience of 'living' the virtual world and displaying a feeling of presence in it. Gee puts it as follows "players inhabit the goals of a virtual character in a virtual world" (Gee, 2008: 259). Online games offer not only a world where avatars and other characters can move in, but also different spaces and channels of interaction between the players.

Our corpus consists of triadic interactions in an online collaborative game which has been designed for the purpose of research. Players are part of a submarine's crew and have to repair some damages, while preventing the submarine from sinking since water flows into the different rooms at the end of each player's turn. Before starting the game, we gave the players the opportunity to explore the game interface via a tutorial. During the game, they either see the plan of the submarine from a bird's eye perspective (when it is not their turn) or they see the room they are currently in, from an immersive point of view (when it is their turn). In the first, the three players are represented by coloured circles allowing to locate them in the submarine and they can see the water level in the different rooms. The players can communicate with each other via their webcam image representation in the 'talking head' format (e.g. Morel & Licoppe, 2008).

Drawing on a qualitative, interactional analysis of screen recordings of players from several groups, we will show four different dimensions of embodiment in the context of this game: (i) verbal display of the players' projection of themselves and each other in the first person immersive view, for example by referring to their feet being under water, (ii) multimodal display of the players orientation in the game on the two dimensional submarine plan, for example by using directions and positions (left, right, up, down) linked to the flat screen image (iii) in case of involuntary deconnexion players making their reappearance explicitly relevant for the other players and ensuring mutual perceptibility and (iv) clear gaze orientation towards the webcam image of one of the two co-players as a display of address (in case of the speaking person) and attention (in case of the listening person). We explore how these types of embodiment can contribute to group cohesion and collaboration.

Identity Work by Australian Fortnite Content Creators: Commercial, Public and Private Identities

Panel contribution

Dr. Jonathan White¹

1. Högskolan Dalarna

This presentation deals with the identity work by Australian content creators playing the multi-player online game, Fortnite. There are many different levels of identity that are indexed in the videos.

One level relates to the game itself, and specifically the player's skill level and playing style. In the game, players choose an avatar (skin) where the species, gender and clothing are preset. Many content creators have become associated with a particular skin, and so any player using this skin may be referred to by the streamer's name (*that's a Lachlan*). Some have been given a special personalised Icon Series skin which indexes them as a player (Lachlan, Loserfruit and Lazarbeam), and skins associated with early seasons index more skilled players.

The streamers analysed are very well known to each other, and in fact used to live in a house together in Sydney, Australia, and so mix private and public identities by addressing one another by their real names and usernames (Lannan/Lazarbeam, Elliott/Muselk). The use of terms specific to the game (the ludolect, cf. Ennslyn, 2012) is another way of showing an identity as an experienced player.

An additional important finding is the commercial identity of the streamers. Many streams and videos begin with a call for viewers to subscribe, the number of subscriptions, and information about commercial products. Some videos are sponsored by companies, and other products can be mentioned (for example, Muselk advertises Bang energy drink), and streamers have their own merchandise.

Thus, we see streamers indexing their shifting identities as public, private and commercial individuals.

Locating enemies in cooperative online games: on markers and professional vision

Panel contribution

Mr. Federico Corradini¹

1. University of Modena and Reggio Emilia

Online multiplayer games usually involve distant players who do not share the same domain of scrutiny through the same screen, but may have asymmetries in visual access, depending on their position in the game space and the orientation of their camera. Visual asymmetry thus becomes a relevant practical problem in online gameplay, especially in non-linear games with complex three-dimensional maps like battle royales, where exploration and location of enemies and items are one of the key features of gameplay. In online cooperative videogames, collaborative practices are consequently used to enact and negotiate professional vision (Goodwin 1994).

In this study I provide an ethnomethodological and conversation analytic account of how gamers cooperatively collaborate in the moment-by-moment achievement of shared vision, to monitor and identify threats and enemies in the surrounding space, and consequently organize strategic action. While previous EMCA research on gaming has started to shed light on the relevance of and orientation to professional vision in the local organization of recognizable gaming actions (e.g. Reeves et al. 2009; Bennerstedt & Ivarsson 2010; Reeves & Laurier 2014; Brincher & Moutinho 2021), the focus has often remained either on a single player, or on the interaction with a spectator/physical co-player.

This proposal instead deals with interactions between three distant gamers who play as a trio in the popular battle royale game *Fortnite*, while also communicating via the vocal chat system of the game. The data, three hours of interactions in English and Italian, include the recordings of the vocal chat and the three players' screen, which have been synchronized so as to have access to each player's in-game (re)actions.

My analysis focuses on two aspects. One, the combination of multiple resources employed to make relevant aspects of the game world visible and accountable. Such "visual sharing" is achieved by combining talk with the use of "makers", i.e. user-manipulated audio-visual cues that appear on each player's interface to highlight a point in space and alerting teammates. Two, the subsequent collaboration and confirmation, not only of what is noticeable, but also of who is "notice-able", in the negotiation of visual competence, with consequent implications for the arrangement of the team's course of action. My results point to show an interactional orientation to gamers situated visual skill as a collaborative accomplishment.

Multimodal Practices in MOBA Games on the Example of League of Legend's Player Communication

Panel contribution

*Mr. Luca Ferrari*¹, *Dr. Hiloko Kato*²

1. UZH University of Zürich, 2. Department of German Studies University of Zurich / Game Design Zurich University of the Arts

MOBAs (multiplayer online battle arenas) are one of the most popular, if not the most popular, game genre in the online gaming industry. Especially in terms of linguistics, online games offer an interesting field of research that is in constant flux. Recently, we took a closer look at the world's most played online game (League of Legends) by analyzing 70 games with regard to the specifics of player communication. The game offers its players a variety of multimodal communication options that have a (seemingly) intended function but are often used very differently by the players. In conclusion, player communication in League of Legends heavily relies on multimodality, as players need to pay attention to multiple modes of communication simultaneously throughout the entire game.

Our contribution expands this existing analysis (Ferrari/Kato in preparation) by

a) taking the recently launched new additions to League of Legends communication system into account (patch 12.22 in November 2022). These changes already established new patterns and conventions of communication in terms of intended function and player usage. In this context, we also added material of streamers, online coaching sites and the discourse taking place on player community sites to our data collection. Our analysis shows how the players' gaming community are co-constructed especially while changes in and establishments of massively relevant communication happen.

b) integrating an additional fine-grained analysis of the data with an (ethnomethodological and conversation analytical) informed approach (EMCA), where we try to show that the players' communication is, in fact, a multimodal interaction, challenging the traditional distinction between face-to-face interaction in presence and textual communication in absence (Hausendorf et al. 2017). By considering the already existing analysis on players' representation (cf. Keating/Sunakawa 2010; Baldauf-Quilliatre/Colón de Carvaja 2015) the status of the players' agency as part of the cybernetic system of the game shall be examined as well.

Non-task-related joint activities in massively multiplayer online games

Panel contribution

*Dr. Yan Zhou*¹

1. Northwestern University

Human interaction is fundamentally cooperative and is based on joint attention (Tomasello 2008). Despite that some studies found anti-social effects of some video games (Greitemeyer 2018), collaborative massively multiplayer online (MMO) games have been shown to facilitate pro-social behaviors as they enable players from diverse backgrounds to accomplish collaborative goals in the virtual environment (Voida & Greenberg 2009). Scholars in Ethnomethodology and Conversation Analysis (EMCA) recently reported that interaction on MMO game is socially organized (Reeves, Greiffenhagen & Laurier 2017).

However, social interaction in MMO video games is more challenging than in the real world as MMO games are mostly designed with a first-person perspective, which provides limited visual access to the space and other players' activities (Manninen & Kujanpää 2005). How do players achieve various types of collaboration with the "constrained set of possibilities afforded by the game" (Bennerstedt & Ivarsson 2010)? This study aims to answer this question by conducting empirical analyses using EMCA methods.

Unlike Bennerstedt and Ivarsson (2010) who analyzes shared core game missions, this study focuses on collaborative social activities that are performed "just for fun" (from a participant), such as taking selfie in Ex.1. Data include five one-hour-long play sessions of *Sea of Thieves*, a MMO game where a team of players explore an open world via a pirate ship from a first-person perspective. Data is in American English.

Three important observations were made in the initial analysis. First, players seem to recreate real-world joint activities in the virtual world with the available resources. Second, players in this study complete joint activities by controlling their avatars in a sequentially organized manner. Third, players may coordinate interactional channels separately to complete multiple actions simultaneously. Third, despite the multitasking feature, In Ex.1, the three players have lost to another team. Bob initiates the joint activity of selfie by requesting Lucas *sit down here so we can take a screenshot*, which is equivalent to a group selfie after a social gathering in real life. Following a sequential order, Lucas responds verbally, *alright*, then makes his avatar runs towards the other two players' avatars. Prior to Ex.1, Lucas manages to multitask through different channels: his avatar has been shoveling dirt while Bob is telling a bear story, then he makes a verbal comment when the story ends while his avatar is still shoveling dirt on the screen.

Ex.1 Selfie.

08 Bob: Lucas, sit down here so we can take a screenshot.

09 Lucas: alright.

10 Lucas: ((Lucas runs towards the other two avatars who are sitting around a fire pit))

11 Bob: sit- sit on the other side.

12 Lucas: ((Lucas's avatar examines the seat and site down as Bob is producing line 11))

By studying non-task-related joint activities in MMO games, this study expands the scope of EMCA studies on social interaction and contributes to the understanding of how players complete pro-social joint activities in the virtual world. Empirical findings in this study also have direct implications for video game design.

Videogame system messages as turns: a new participant

Panel contribution

Ms. Sara Badia Climent¹

1. University of Valencia

The discourse generated during a Multiplayer Online Battle Arena (MOBA) videogame match differs in many respects from natural conversations. One of the most remarkable features is the set of oral- and written game system messages, showing real-time relevant information about the match. These messages influence the dialogue system and the structure of interaction during the match. This contribution is aimed at establishing the conversational role assigned to the game system and the shape of the interactional schemas where the system is involved.

This study is based on three strands of research: on the one hand, multimodality approaches (i.e., Depperman, 2013; Djonov y Leuween, 2017) take into account the confluence of multiple communication channels (oral, written and action) in digital genres (Herring, 2017). On the other hand, videogames are a kind of computer-mediated discourse (Yus, 2010; Herring and Androtsopoulos 2015, Herring, 2007; Jovanovic & Leuween, 2018), hence some of their features must be analyzed in tandem with the ones found in digital communication. Finally, given that this contribution aims at studying the role of the game system during a match, the communication processes in human-robot interaction Fischer (2010 & 2011) are also considered.

This contribution analyzes twelve League of Legend MOBA matches with different team compositions: full premade and teams with some randomly selected members. For every match, human-to-human and game system-to-human messages are compared, in order to determine if game system interventions (linguistic emissions) could be also considered turns (socially accepted linguistic emissions) (Val.Es.Co. Research Group 2014, Pons Bordería 2022). In order to do this analysis, both the linguistic interventions (oral and written) and the actions of the participants have been taken into account.

Also, special attention will be paid on the different dialogue schemas visual depictions of the kinds of interaction in conversations (Briz 2006; Espinosa-Guerri 2016) performed by the game system and by the speakers.

Finally, some conclusions will be drawn about the future of the interactional behavior of game system in MOBA games.

“right - left - yes”: the interactional and collaborative achievement of synchronization with the avatar in a Kinect dance game

Panel contribution

Ms. Isabel Colon de Carvajal¹, Dr. Heike Baldauf-quilliatre¹

1. ICAR Lab

Our contribution investigates players' practices during Kinect video game sessions where players have to synchronize their own body movements with those of an avatar who represents the player in the game. Performing entirely synchronized movements allows the player to earn points.

From a conversation analytic point of view, interaction is considered as an achievement that is co-constructed by all participants. Within the last decade, different studies have detailed particular practices of co-construction in digital interaction, especially concerning the use of different kinds of technological devices such as mobile phones, tablets or voice interfaces as well as video-mediated interactions in different situations (medical interaction, business meetings, or videogames). EMCA research on videogames has almost focused on the players' activities in digital games. It has been investigated how physically co-present players collaborate in the co-construction of digital play (Mondada 2012; Reeves et al. 2017; Baldauf-Quilliatre & Colon de Carvajal 2019). During the last years, researchers have highlighted the importance of non-playing participants who are physically present and who participate in different ways in the interaction and in the gaming (e.g. Tekin & Reeves 2017; Baldauf-Quilliatre & Colon de Carvajal 2021; Olbertz-Siitonen, Piirainen-Marsh & Siitonen 2021).

In our paper we will investigate how all participants collaborate in the ongoing activity. Our analysis is based on a local video game session with Kinect. The participants are playing at Dance Central, a dance videogame. The aim of the game is to swing on the choreography represented on the screen as in the reflection of a mirror. The four participants take turns in dancing, the three non-players are sitting on the sofa, watching the player dancing. In our presentation we present two extracts: one extract in which the player Dominique is totally synchronized with his avatar's movements and a second one showing the player Lucas who struggles to synchronize. We therefore draw on previous work of playing sessions with Kinect by Tekin & Reeves (2017) and Tekin (2021).

Concerning our data, the comparison of the two situations (good vs. bad synchronization) allows to establish an interesting link between digital play as social practice and game design. Indeed, the interactional practices of the three non-players are different depending on whether or not the player manages to synchronize with the avatar's movements. We focus on the resources mobilized by the participants to consider the (non) synchronicity of the player through the features available at the screen and the “seeing” posture of the four participants.

Coherence markers, word-finding difficulties, and their relationships: what can we learn from Alzheimer's disease?

Panel contribution

Dr. Aurélie Pistono¹

1. Ghent University

Language production difficulties occur early in Alzheimer's disease (AD). In particular, word-finding difficulties are one of the hallmarks of Alzheimer's disease. Most authors analyzing connected-speech production in AD interpret the high proportion of disfluencies in this group as a proof of word-finding difficulties (e.g., Kavé and Goral, 2018). In the current study, we focused on other phenomena, namely coherence markers. We also investigated the relationship between coherence markers and cognitive functions (linguistic and non-linguistic). We predicted that discourse variables would be correlated with several linguistic and non-linguistic processes, meaning that discourse-level assessment is a useful tool for revealing impaired communication and cognition. 17 early AD participants and 17 matched healthy controls were recruited. They underwent a language assessment (Bézy et al., 2016) -which included a picture-based narrative- and a neuropsychological assessment. We compared the number of mandatory elements, the proportion of misinterpretations, modalizing discourse, connectors, ambiguous references, and topic shifts produced during the picture-based narrative. We then performed correlations between these variables and lexical performance, memory performance, as well as executive functioning.

Results indicate that AD participants were less informative (i.e., fewer mandatory elements) and produced more modalizing discourse than healthy controls. These variables were correlated with memory and executive function abilities. Additionally, AD participants with lower lexical performance also produced ambiguous references and misinterpretations during their narrative.

Altogether, the current study shows that, in a population characterized by lexical and memory impairment, discourse coherence is also reduced. Nonetheless, the fact that AD participants produced modalizing discourse means that their pragmatic abilities are preserved and used to communicate about their difficulties (Duong et al., 2003). Lastly, lexical impairment probably contributes to patients' coherence failure (i.e., in particular by increasing ambiguous references), which is calling for further research on the links between word-finding difficulties, disfluencies, and coherence markers.

Conversational and intonational characteristics of dialogue between autistic adults

Panel contribution

Dr. Simon Wehrle¹, Prof. Kai Vogeley², Prof. Martine Grice¹

1. IfL-Phonetik, University of Cologne, 2. Department of Psychiatry, University Hospital Cologne

Most research on conversational speech in Autism Spectrum Disorder (ASD) is based on data from structured interactions between autistic children and non-autistic adults. We cannot expect to reliably extrapolate findings a) from structured to more naturalistic settings [1], nor b) from the behaviour of children to that of adults, particularly in neurodiverse populations [2].

Perhaps even more importantly, the vast majority of previous research in the field only reveals what happens when we observe interactions in heterogeneous, disposition-mixed dyads, consisting of one autistic and one non-autistic participant, that is, between interlocutors with different cognitive styles [3]. This does not allow any direct insights into what characterises conversations between autistic interlocutors.

In an effort to close this gap in the literature, we recorded 28 German-speaking adults, half of which had been diagnosed with ASD, engaged in semi-spontaneous dialogue in homogeneous, disposition-matched dyads. We recorded 5 hours of speech, for an average of 20 minutes per dyad. Our analysis focusses on five different aspects of conversation: intonation style, turn-taking, backchannels, filled pauses and silent pauses.

Overall, we found robust tendencies in the ASD as compared to the control group for 1) a more melodic intonation style, 2) very similar turn-taking behaviour, 3) a lower rate and diversity of backchannel productions and 4) a lower rate of filled and silent pauses as well as differences in the former's prosodic realisation (all confirmed using Bayesian modelling).

One overarching conclusion we can draw from this multi-dimensional analysis is that each ASD dyad behaved differently, represented as a unique pattern for each speaker (pair). It is also important to note that patterns were different for each aspect of conversation analysed, and that at least one ASD dyad differed from behaviour typical for the control group, in all dimensions.

Ultimately, the analysis at the dyad-level allows us to arrive at some generalisations at the group level with more confidence. For instance, the clearest between-group difference was found for backchannelling, which has an important function in structuring discourse and might be conceived of as a prototype of other-oriented communicative behaviour. The greatest similarity between groups, on the other hand, was found for turn-timing, which is a more fundamental and domain-general skill.

With these findings, we contribute to the area of research on neurodiverse behaviour in discourse by a) using data from semi-spontaneous conversational interactions between dyads of autistic adults and b) analysing these data using a multi-dimensional analysis focussing on speaker and dyad-specific patterns.

Disfluencies and interruptions in everyday conversations with autistic children

Panel contribution

Mrs. Lisa Vössing¹

1. Bielefeld University

Autism Spectrum Disorder (ASD) is associated with pragmatic language impairments, but the impairments may vary considerably between individuals with ASD (Volden, 2017). Among others, problems in the conversational management e.g. turn-taking, topic management or repairing a conversational breakdown are reported (Paul, Landa, & Simmons, 2014; Volden, 2017). Difficulties in those areas may lead to disfluencies and interruptions in the interactional flow of conversations. Since these phenomena are difficult to assess in structured tests settings, because they most likely occur spontaneously in everyday interactions, a qualitative methodical approach, e.g. ethnomethodological conversation analysis, seems to be appropriate to reconstruct and analyse the interaction in detail. There are already some CA-informed contributions focussing on the autistic children's conversational management skills, focussing on performance in responding to questions and turn-taking in general (Kremer-Sadlik, 2004; Ochs, Kremer-Sadlik, Sirota, & Solomon, 2004; Rendle-Short, 2014).

Subsequently to those contributions, this paper aims to investigate in detail the appearing disfluencies and interruptions and their causes that occur in the interaction with autistic children. The analysis is based on authentic conversational interactions of three autistic children in different settings at home and in therapeutic settings, using a CA-informed approach. Taking into account that autism is a spectrum with various competences concerning the conversational management, the examined autistic children show a heterogeneous profile of competencies and difficulties in the interactions. The similarities and differences are presented and discussed. The goal of the case study is twofold: (1) to learn more about the various causes of disfluencies and interruptions in authentic interactions with autistic children and (2) to investigate whether or in which way these phenomena affect the interaction. The second investigation is especially interesting to the decision of declaring a disfluency and interruption as atypical (autism specific) or normal.

In-the-moment episodes as structuring devices in the conversation of people with dementia

Panel contribution

Dr. Simon Williams¹

1. University of Sussex

The Carolinas Conversations Collection is one of the few corpora of informal talk featuring people living with dementia. A manual survey of the collection suggested that participants with the Alzheimer's Disease (AD) form of the disorder seldom took the first turn in an exchange outside occasional episodes of in-the-moment talk, which can be defined as talk about the participants' immediate environment. Examples include an object, event, or state, or some aspect of the participants themselves. The episodes showed a more equal length of turn between speakers that enabled topic drift to take place, taking the discourse closer to conversation. To examine more closely the contribution of in-the-moment talk to the structuring of conversation in a similar population required a larger collection of examples, and original data was collected in the South of England in July 2022. Twenty-two participants, 11 people diagnosed with dementia and 11 healthy controls, agreed to take part in three 15-20-minute conversation meetings with a researcher, usually in their own home, and the conversations were audio- and video-recorded. An oral survey in the first meeting established possible triggers that the researcher might use to elicit episodes of in-the-moment talk in the following meetings. Examples were a favourite possession such as a book or photograph, or a gadget, device, or piece of equipment. It was found that people with dementia took part in more in-the-moment episodes than did healthy controls and produced more linguistically assertive talk than elsewhere, evidenced by the inclusion of imperatives, first-person pronouns, declarative statements, and meta-comments. Their talk was often accompanied by deictic gestures, e.g. while referring to paintings, 'It's all hand-written and that's from Crawley'; or to a pigeon in the garden, 'It didn't want to go. What's the matter with it?'. By reducing cognitive load, declarative statements accompanied by gesture in these exchanges appeared to offer speakers with dementia a means of structuring the interaction by sustaining more equal pair parts.

Linguistic correlates of cognitive impairment: findings from a corpus of pathological speech produced by elderly Italian subjects with dementia

Panel contribution

*Ms. Elena Martinelli*¹, *Ms. Vita Garrammone*², *Ms. Francesca Mori*², *Ms. Incoronata Nolè*², *Ms. Franca Cameriero*², *Dr. Matilde Martino*², *Dr. Gaetano Di Bello*², *Prof. Gloria Gagliardi*¹

1. University of Bologna, 2. Universo Salute – Opera Don Uva

The presentation will illustrate the preliminary results of a quantitative/qualitative linguistic comparison between the speech of Italian speakers affected by dementia and neurotypical peers. The study aims at profiling the linguistic-communicative features of cognitive impairment in the Italian language.

We enrolled 40 Italian-speaking individuals living in Basilicata (an administrative region in Southern Italy), forming two groups balanced by sex (24 females, 16 males) and age (Pathological Group age = 81 ± 6.9 , range: 63-91; Control Group = 81 ± 6.3 , range: 63-92): 20 healthy subjects and 20 subjects affected by different types of dementia.

We obtained written informed consent for all of them. The research project was approved by the Bioethics Committee of the University of Bologna (n. 0072032/2022).

After the neuropsychological evaluation, we collected a sample of semi-spontaneous speech by administering three elicitation tasks. The resulting corpus was manually transcribed at the orthographic level, segmented into utterances [1], and annotated at the level of the prosodic structure (theoretical framework: L-Act [2]). Then, we automatically performed tokenization, lemmatization, post-tagging, and syntactic parsing. Finally, we extracted the Digital Linguistic Biomarkers (DLBs) – i.e., a rich set (151) of phonetic-acoustic, rhythmic, lexical, syntactic, and readability indices [3] – and we investigated possible differences within the cohort by applying parametric/non-parametric inferential statistics in R [4].

The main findings affecting the pragmatics of pathological speech are:

- *Fluency*: the patients usually produce significantly shorter utterances, consisting of fewer words and full of empty pauses, phonetic fragments, paraphasias, and false starts. Sudden interruptions of the speech flow are also more frequent. In particular, the subjects with vascular dementia produced a higher percentage of disfluencies than individuals with Alzheimer's disease.
- *Discourse construction*: although pronouns and conjunctions percentages in the cohorts are not significantly different, the qualitative analysis of their occurrences enables us to point out pragmatic-discursive deficits. As a matter of fact, the pronominalization strategies and the coordination/subordination between sentences reflect typical errors of referential cohesion (e.g., the patients use pronouns without introducing an antecedent in the text or pointing to a referent in the extra-linguistic context) and local/global coherence (e.g., patients often produce coordinated/subordinated sentences formally correct but tangential to the main topic).

This study supports the trustworthiness of a corpus-based mixed analysis for the identification of atypical speech peculiarities. The quantitative data (i.e., 84/151 DLBs reaching the statistical significance, p-value <0.05) mainly reflect degradation at the micro-linguistic level. Moreover, the integration of qualitative observations helps to understand the mechanisms of interaction management and speech structuring of people suffering from cognitive decline, highlighting the impairments of macro-linguistic skills (e.g., tangentiality, ideational derailment, lack of referential cohesion, repetition/argumentative iteration).

Non-autistic versus autistic children: Why should I say “um” if I’m not talking to anybody?

Panel contribution

*Ms. Cynthia Boo*¹, *Dr. Aaron Shield*², *Dr. Nancy McIntyre*³, *Dr. Ruth Grossman*⁴, *Dr. Peter Mundy*⁵,
*Dr. Letitia Naigles*¹, *Dr. Emily Zane*⁶

1. University of Connecticut, 2. Miami University, 3. University of Central Florida, 4. Emerson College, 5. University of California - Davis, 6. James Madison University

When speakers use “um,” they may be conveying that they are pausing to plan an utterance (Clark & Fox Tree, 2002), and/or intending to take a turn in the exchange (Fischer, 2000). Research finds autistic individuals use “um” less often than non-autistic (NonAu) individuals when they answer questions during diagnostic testing (Gorman et al., 2016), describe how to play a sport (McGregor & Hadden, 2020), and describe pictures (Irvine et al., 2016). These authors argue that differences in “um” frequency are due to autistic individuals’ general pragmatic challenges. However, a recent study reported no difference in “um” usage between NonAu and autistic children during dyadic conversation (Boo et al., 2022). This suggests that differences in “um” use may not occur in all contexts. The current investigation compares “um” use by NonAu and autistic speakers across datasets that utilize different discourse elicitation tasks.

Data came from two sites (A and B): At Site A, 15 NonAu (Mage = 13.4, SD = 2.1) and 18 Autistic (Mage = 13.5, SD = 2.3) children participated in two tasks – first, they completed the Trier Social Stress Test (Kirschbaum et al., 1993), where they had three-uninterrupted minutes to Narrate a story in front of a panel of judges. Then, they conversed with an adult researcher, where they answered questions about their family and hobbies. At Site B, 22 NonAu children (Mage = 12.5, SD = 2.3) and 21 Autistic children (Mage = 11.6, SD = 2.2) also engaged in conversation, but they interacted with virtual avatars that mimicked peers instead of an adult. In all three language samples, “um” tokens were tallied.

“Um” tokens did not differ between NonAu and Autistic children in conversational tasks from Sites A or B, $p > 0.05$. At Site A, NonAu children produced more “um” tokens than Autistic children during the Narrative task, $t(38) = -2.097$, $p = 0.043$. Significant cross-task differences also emerged ($F(5, 110) = 3.886$, $p = 0.003$, $\eta^2 = 0.150$): both groups from Site A produced fewer “um” tokens in the Narrative task than children from both sites who engaged in conversation, $p < 0.05$ (Figure 1). No significant differences between the conversational tasks from Sites A and B emerged.

Findings suggest that “um” use differs depending on the nature of the discourse context (i.e., monologic vs. conversational). Interestingly, “um” use was statistically equivalent regardless of whom participants were speaking to, suggesting that discourse type (dyadic conversation vs. monologic storytelling), and not discourse partner, most affects “um” usage for both Autistic and NonAu speakers. Further, the fact that Autistic participants use “um” significantly more often during conversation suggests that they recognize its usefulness as a turn-taking device. This function of “um” is unnecessary in a context like storytelling, where speakers are asked to talk for a specified amount of time without interruption. Overall, findings reveal pragmatic strengths for autistic speakers, including not only their use of “um” in the first place, but also their ability to vary their frequency of “um” use across contexts.

On the representation of the other discourse in the autobiographical narrative of the speaker suffering from aphasia: atypical characteristics

Panel contribution

Dr. Aleksandra Nowakowska¹

1. Université Montpellier 3, UMR 5267 Praxiling

This research, which is part of discourse analysis, proposes to explore some aspects of represented discourse (Authier-Revuz 2020), in the autobiographical narrative of the aphasic speaker. The research is based on a corpus composed of audio-visual recordings of 37 speakers suffering from fluent or non-fluent aphasia at the chronic stage. The data collection was carried out via the zoom platform, within the framework of the Aphasia and Analysis of Interaction Discourse project, in order to constitute a database in French. These recordings are made according to a collection protocol (Sharaoui, Martinez, Nowakowska 2021) involving several tasks (question-guided interview, image description, reading aloud, storytelling and conversational dyad). Our main interest in this paper will be the study of the semi-directive interview in which the aphasic speaker tells, among other things, the story of the occurrence of the aphasia, its recovery and a significant event in his life. These autobiographical narratives are characterised in particular by a significant presence of represented discourse, the forms and functioning of which present atypical characteristics, for example:

(1) The aphasic speaker (global non-fluent aphasia) tells the story of the stroke. The speech represented in the direct style is used when he reports the moment he is in the hospital after leaving intensive care:

alors je me suis dit hof@i ça va prendre un mois puis je pourrai Rate [: retourner] travailler [=! rire] !

so I thought hof@i it's going to take a month and then I can Rate [: go back] to work [=! laugh]!

The speech represented in direct style can be identified by its formal characteristics: the presence of the introductory verb followed by the fragment which keeps its own deictic and modal system, which corresponds to typical DD marks. On the other hand, what poses a question for the analysis is, on the one hand, the presence in DD of elements related to the expression of emotional attitudes, which constitute the interjection and the laughter, and, on the other hand, the production of the error *Rate* [go back] non corrected by the speaker. How to deal with these elements from the enunciative point of view? Are they elements of represented discourse or of representing discourse? Is the laughter part of the represented discourse? Indeed, sometimes the speaker express, mimes or gestures several times the non-verbal attitudes that accompanied the production of the RD at the moment t_0 of its production, especially when it is his own speech, and sometimes he evaluates it in this way a posteriori, at the moment t_1 when he reports the event during which the represented statement was produced. In the same way, how can we deal with the error from the enunciative point of view in this case?

We will first look at the identification and classification of different forms of represented discourse, and then at their dialogical functioning (Bakhtin 1978 and 1984, Goodwin 2007, Du Bois 2014, Bres 2021). This study will finally lead us to address the expression of emotional attitudes accompanying the represented discourse.

Prosody, gesture and disfluency in teenagers with Autism Spectrum Disorder (ASD)

Panel contribution

*Ms. Cwiosna Roques*¹, *Prof. Christelle Dodane*¹, *Dr. Ludivine Crible*²

1. Université Paul Valéry, Montpellier 3, 2. Ghent University

Autism spectrum disorder (ASD) is a neurodevelopmental condition characterized by a range of impairments in communication and social interaction. The present paper focuses on three dimensions of possible atypical language use in autism: prosody, gesture and disfluencies. Taken separately, prosody, gesture and disfluency have received some attention in the literature on ASD. With regard to prosody, researchers have noted abnormalities in rhythm, accentuation, pitch, intensity and rate of speech. Turning to gesture, ASD can be accompanied by deficits in non-verbal communication behaviors, such as eye contact and body language deficits or deficits in the understanding and use of gestures. Lastly, the production of disfluencies seems to differ in typical and atypical speech.

Against this background, the present study integrates annotations of disfluencies, prosody and gestures in order to identify potential specificities of pragmatic language use in ASD. In particular, individuals with ASD (Silverman et al., 2017) produce the same co-gesture's types than their neurotypical peers, but in a lesser extent and these gestures are more difficult to understand, which has significant implications for their communicative abilities. While prosody, co-speech gesture and disfluencies typically perform pragmatic functions related to speech planning and expressivity, their use, mapping and features remain largely unknown in the study of autism. Addressing this gap is essential since these devices have a significant impact on the linguistic and discursive levels, but also on the transmission of attitudes and affects.

To do so, we annotated prosody, gestures and disfluencies in 5 French-speaking children aged 12-17yo video-recorded during the autism diagnostic observation program (Baghdadli et al., 2020) and 5 peers with typical development, using PRAAT and ELAN. Our sample includes data from a narrative and a conversational task, in order to investigate the range of discourse functions that are expressed by disfluencies. Prosody was annotated for a number of parameters to observe whether deviations frequently reported in ASD do occur in our data. Lastly, manual gestures were classified as representational or non-representational (Kita & Özyürek, 2003), to test whether co-speech gestures differ across speaker groups. Disfluencies were identified using the ANODIS procedure developed for typical and atypical speech (Crible et al. 2022). We will present our main findings and emphasize some examples of ASD compared to neuro-typical peers.

Relationships between speech and gesture in the production of disfluencies in stuttering and non-stuttering adult French speakers

Panel contribution

Prof. Christelle Dodane¹, Dr. Loulou Kosmala², Dr. Ivana Didirková³

1. Laboratoire CLESTHIA (EA 7345) Université Sorbonne Nouvelle, 2. Laboratoire PRISMES EA 4398 / EA 370 GReMLIN, Université Paris Nanterre, 3. Laboratoire TransCrit UR 1569, Université Paris 8 Vincennes - Saint-Denis

Stuttering-like disfluencies (SLD) differ from other disfluencies (OD) in the way articulatory gestures are produced (Didirková et al., 2020). Such motor disturbances are not limited to speech, stuttering can also be accompanied by involuntary and abnormal hand gestures (Riva-Pose et al., 2008). This is not surprising, given that speech and gestures are closely related and form an integrated communication system in language production. Previous research has shown that people who stutter (PWS) are unable to initiate a representational gesture simultaneously with a SLD, resulting in a breaking off, suspension, or a complete interruption of their ongoing manual gestures (Mayberry & Jaques, 2000). From different sensors, the speed of the different gestures was also calculated in cm/sec.

In order to study the relationships between gesture and disfluency, we recorded two speakers, a fluent speaker and a PWS during a cartoon narration task with a platform developed in the previous project. Movements of both hands, face, and tongue were recorded with an electromagnetic articulograph. The SLDs and ODs were then annotated (Crible et al. 2022) and the manual gestures, segmented according to their different phases and classified as representational (deictics, iconics or metaphors) or non-representational, illustrating the structuring of the discourse (Kita & Özyürek, 2003).

Our preliminary results show that the fluent speaker produced 48 OD disfluencies, while the stuttering speaker produced 77 TSDs and 12 ODs. During the ODs, both speakers produced exclusively representational gestures, whereas during the TSDs, the stuttering speaker produced more atypical, non-representational gestures (> 40%). This could be explained in part by the presence of initiating and releasing movements (Riva-Pose et al., 2008). Quantitative analyses show, for both speakers, that manual gestures are faster during fluent speech, but slower during disfluencies, although this deceleration is not as marked for TSDs than for ODs. This difference could be explained by a qualitative difference in gestures observed during ODs and TSDs: the stuttering speaker produces mainly releasing movements, which could possibly make her hand move faster. Our goal is now to extend this procedure to a larger number of speakers, in order to better investigate how articulatory and manual gestures are integrated and coordinated with speech production.

The role of discourse markers, backchannels and pauses on discourse structure in Augmentative and Alternative Communication (AAC)

Panel contribution

***Dr. Iris Hübscher*¹, *Prof. Christiane Hohenstein*¹, *Dr. Martina Spiess*¹, *Prof. Brigitte Gantschnig*¹**

1. Zurich University of Applied Sciences

Discourse markers and backchannels play an important role in connecting parts of as well as contributing to fluency in discourses (e.g. Fraser, 1996). While research on discourse markers on the verbal level in “typical” language use is abundant (e.g. Aijmer & Simon-Vandenberg, 2006; Fischer, 2006), little is still known about the manifestation of discourse markers and backchannels in Augmentative and Alternative Communication (AAC) (see Friginal et al., 2013 for an exception). AAC discourses are “atypical” in that they are characterised by AAC users’ pauses for utterance production and overlaps with interlocutors’ turns using spoken language. To our knowledge, no multimodal approach has been taken so far to analyse the discourse of persons who communicate using AAC. To fill this gap, we address the question of how discourse markers, backchannels and pauses are employed multimodally in AAC.

The data stem from six interviews with persons belonging to AAC groups 3 and 4 (cf. Weid-Goldschmidt, 2013) who communicate through speech-generating devices. Despite representing a close range in terms of AAC users, their communication shows a wide range of diversity and complexity. The interviews were carried out as part of an interdisciplinary project investigating the challenges experienced by AAC users during the transitions after compulsory school, entering higher education, a workplace, or an adult institution (Kollmar et al., 2018). Each interview lasted approximately two hours and was transcribed orthographically first. In each interview, key passages were selected where pragmatic stance-taking or discourse interventions on the part of the AAC users took place. These then underwent a detailed multimodal transcription in EXMARaLDA.

Preliminary analyses of the data show that a wide variety of multimodal features characterize AAC discourse such as body movements, hand and head gestures, facial expressions, gaze, PORTA signs and conventionalized signs, vocalization and speech-generating devices being used alternately and sometimes simultaneously by AAC users to structure their discourse. Taking a close look at the structure of the discourse from a “typical” speaker’s normalized perspective on discourse, lengthened pauses can be perceived as atypical or fragmenting the discourse in AAC communication. For AAC users, characteristic features like pauses are essential for structuring their AAC discourse. Furthermore, with regard to the occurrence of discourse markers and particularly backchannels, it can be noted that there are several commonly used forms displayed to participate in the discourse, such as offering a turn to another person, the use of affirmation and negation signals and connectors which, depending on the circumstances, will be expressed through one or a combination of the above-mentioned multimodal features.

Change of the world: With respect to seysang in Korean

Panel contribution

Prof. Hyun Sook Lee¹

1. Jangan University

The Korean lexeme *seysang* (世上) ‘the world’ is of Chinese origin. A historical survey shows that the first appearance of *seysang* is attested in the 15th century, meaning ‘the world people live in.’ The meaning of the lexeme has gone through a chain of semantic changes involving subjectification. In spite of the intriguing nature of the changes, the lexeme has not drawn much attention to date, and this study intends to fill this gap, on the basis of the data taken from historical and contemporary corpora.

When *seysang* appeared in Korean in the 15th century, it occurred in an argument position as a full-fledged noun, marked with the possessive and locative cases as well as topic markers, and later with the accusative cases in the 16th century. Its semantic function was predominantly to denote ‘the world people live in’, as shown in (1):

(1) 世上엿 길히 비록 해 어즈러우나

seysang-ays kil-hi pilok hay eculewu-na
the world-GEN path-NOM nevertheless very chaotic-CONN

내의 사람도 □□ 잇□나라

nay-uy salom-to stohan kAzi isnAnila

I-Gen living-also also end-NOM exit-DEC

‘Although the way of the world is very chaotic, my life also has an end.’

(1481 *Twusienhay* 10:3)

In the example (1), the word *seysang* as a noun is employed with a genitive marker and modifies the noun *kil* ‘way.’ It denotes ‘the world we live in,’ which is the primary meaning of *seysang*.

The meaning of *seysang* is extended to the following senses: the period of the time from birth to death; the time or the place individuals or groups can be active; the outside society seen out of closed communities such as temples, monasteries, or prisons; the hearts of people (in the world); and the earth contrasted to heaven. The lexeme *seysang* is also used adverbially to mean ‘beyond compare’ as well as to emphatically denote a negative meaning ‘not in the least’. When the Sino Korean *seysang* ‘the world’ is used with the locative particle *-ey*, the literal meaning of the combination denotes ‘in the world.’ In Modern Korean, the combination *seysangey* has developed into a discourse marker (DM).

(2) A: (in a calm voice) ... I was fired!

B: what?!

A: I said I got fired. The manager said to me that I’d better work as a sale representative or canvasser than an office worker. The ones that are needed to run around outside a lot...

B: **seysangey**...

DM

‘Oh my gosh...’

(2000 A Higher Animal)

In the example (2), *seysangey* signals the speaker’s stance, mostly carrying a feeling of unexpectedness. As a DM, *seysangey* is independent of the sentence where it occurs. The noticeable characteristic of DMs is freedom of position, among others. The development of the functions of *seysang* and its relative *seysangey* is an instance of subjectification and intersubjectification. In addition, a distributional analysis of *seysangey* does not support the hypothesis that LP and RP usage is related to subjective and intersubjective, respectively.

Development of the Vietnamese discourse marker ‘thật’/‘thật là’ from the 17th century to the present

Panel contribution

*Dr. Mayumi Adachi*¹

1. *Tokyo University of Foreign Studies*

This study explores the diachronic development of the Vietnamese discourse marker *thật* or *thật là*, which is mainly based on the documents written in the 17th century. Compared with its contemporary usages, *thật* originated from a Sino-Vietnamese lexeme meaning ‘fruit.’ It obtained equivalents in Chinese, Japanese, and Korean as well as a meaning modification to ‘truth, reality, and fact’ (Rhee et al. 2021). Currently, *thật* has various usages as different parts of speech in both spoken and written contexts: (1) an adjective (noun+*thật*) ‘real’ (e.g., *tên thật*, meaning ‘real name’), (2) an adverb (*thật*+adjective) ‘really’ (e.g., *thật ngon*, meaning ‘really tasty’), (3) an utterance-final particle ‘indeed’ (e.g., *nên làm thế thật*, meaning ‘should do so indeed’), and (4) a discourse marker in the utterance-initial position. In usage (4), which is often followed by copula *là*, *thật* expresses the speaker’s attitude toward the situation described in the preceding or following contexts (e.g., *thật là không may*, meaning ‘unfortunately’) rather than objective facts. However, in *Catechismvs in octo dies diuisus* (*Catechisms in eight days*), the first romanized Vietnamese prose written by Alexandre de Rhodes, a French missionary in 1651, *thật* was used in most parts of the prose as (1) an adjective (e.g., *Chùa thật* meaning ‘the true load’) and (4) a discourse marker (e.g., *thật là...*, meaning ‘the truth is.../without a doubt (the demon is in hell)’) to preach “religious truth” to Vietnamese at that time. These findings propose that a discourse marker *thật* or *thật là* experienced (inter)subjectification from obvious facts to the speaker’s affective or evaluative stance in the grammaticalization process thereafter.

From a unit of time on a temporal axis to a discourse marker on a contextual–spatial axis: The case of *shunkan* ‘(at the) moment’

Panel contribution

*Prof. Reijirou Shibasaki*¹, *Ms. Keiko Takahashi*²

1. Meiji University/University of British Columbia, 2. Toyo University

This study investigates the historical development of the Sino-Japanese (SJ, hereafter) lexeme *shunkan* 瞬間 from a clause-internal adverbial to a clause-external discourse marker (DM, hereafter) in Japanese, from the perspective of grammaticalization. SJ lexemes have usually been used in formal registers such as Buddhism, Confucian notions, politics, legislation and administration, not constituting everyday spoken language. Given that studies on DMs have been based on spoken-oriented discourse materials, typically in conversation and historically in drama scripts (e.g., Hansen 1998; Waltireit 2011), we can propose that the written-oriented grammaticalization seen in East Asian languages is different in essence from any spoken-contact-based grammaticalization reported in many preceding studies. The data used for this survey are retrieved from a variety of corpora.

The temporal noun *shunkan*, which was first witnessed in the first half of the nineteenth century, appears to have been adverbial-oriented from the very beginning, accompanied by the adverbializer *-ni* of Japanese origin, i.e., *shunkan-ni* 瞬間に ‘at the moment.’ In the early twentieth century, the demonstrative-prefaced example of *sono shunkan(-ni)* ‘(at) that moment’ was found, presumably to clarify both anaphoric and cataphoric relations in a stretch of discourse. Finally, such morphosyntactic clues became eroded, creating a stand-alone DM, as in (1).

(1) *Kare-wa... hito-no-kage-o mitome-ta.*

he-TOP people-GEN-shade-ACC admit-PST

Shunkan, *inu-no-youni sono-sugata-no-hou-e hasshit-ta.*

moment dog-GEN-like that-figure-GEN-direction-to run-PST

‘He saw a human figure. Instantly, (he) ran up to that figure like a dog.’

(1925 *Hechima no Tsukemono*: Taiyo)

The reason why *shunkan* was adverbial-oriented from the start can be explained as follows. *Shunkan* can be considered to have developed through the influence of the pre-existing *setsuna* 刹那, a Buddhist term that has a strong association with the Sanskrit lexeme *kṣaṇa*, the smallest unit of time in Buddhism, i.e., 10^{-18} . The use of *setsuna*, albeit nominal-oriented, could form part of an adverbial phrase such as *setsuna-no-uchi-ni-oite* [moment-GEN-inside-in-put] ‘in a flash’ (lit. ‘in the smallest amount of time’). Further, due to the emergence of another adverbial expression of nominal origin, *totan(-ni)* 途端に ‘(at the) moment’ in the late nineteenth century, we may be able to hypothesize that these three lexemes could form a word group that enabled such written-oriented lexemes to move in step with each other to become DMs over the twentieth century.

From objective to subjective and to intersubjective functions: The case of the Thai *jing*

Panel contribution

Ms. Kultida Khammee¹

1. University of Phayao

Thai and Chinese belong to different language families, i.e., Sino-Tibetan and Kra-Dai (Tai-Kadai), respectively. Despite the fact that the two languages are not genealogically connected, they share a number of typological features as a result of geographic propinquity and the Chinese cultural-intellectual leadership in the area in historical times. Thai still retains many words borrowed from Middle Chinese (Haarmann 2012[1986]: 165, Suthiwan and Tadmor 2009: 601, Rhee 2021: 435-436, among others). Thai *ching* ‘true/real’ is a borrowing from Middle Chinese *cin* ‘true, real, sincere; (Suthiwan and Tadmor 2009: 613), and a few words and expressions derived from it developed into discourse markers (DMs).

The Thai *ching* as a lexical word denotes ‘true, real, genuine’ (objective meaning), but it also has the adverbial function marking ‘surely, certainly, definitely’, i.e., an intensifier (subjective meaning), a natural development considering its lexical meaning. In the discourse domain the lexeme acquired a number of interactional functions (intersubjective meaning). The ‘truth’-related DMs in Thai include *ching* itself and a number of the DMs derived from *ching* through various morphosyntactic operation, e.g., *tai ching* (< lit. ‘real death’), *ching pa* (< lit. ‘real-Q’), *ching ching* (lit. ‘real-real’), *mai ching* (< ‘not real’). Due to the lack of historical data, the chronology of the development of ‘truth’-DMs cannot be established, but the interaction between the lexical source meaning and the pragmatic inferences from the context is evident. The DMs *ching* ‘really’ and its negative counterpart *mai ching* ‘not really’ are among the common response tokens for agreement (‘yes’) and disagreement (‘no’). The DM *tai ching* (from ‘real death’) carries the function of marking surprise (“Oh dear!”) or sudden remembrance (“Oh, I almost forgot”), which often prefaces an action disrupting the interaction or turns the discourse to a different direction. The DM *ching pa*, which involves a phonologically eroded question marker (thus ‘Really?’), marks disbelief, typically with negative connotation but occasionally positively as well. The reduplicative DM *ching ching* carries the function of prefacing disalignment, thus often challenging the veracity of the previous speaker’s claim or statement. Another notable function of the same DM *ching ching* is to reinstate the crux of the state of affairs, disregarding all peripheral issues, either presented or imagined, thus paraphrasable as “putting aside all other issues.”

A comparative analysis of the DMs in other Asian languages such as Korean and Chinese involving the same etymon reveals many similarities, supposedly due to the lexical source semantics and common cognitive operations, and subtle differences, supposedly due to the minor variation of such cognitive operations.

From temporal adverbials to discourse structuring markers: The development of Chinese *yuanlai* and its Japanese cognate *ganrai*

Panel contribution

Prof. Wenjiang Yang¹

1. *University of Macau*

This presentation demonstrates how Chinese *yuanlai* and Japanese *ganrai* evolved from temporal adverbials to discourse structuring markers (DSM) through investigations of historical corpora in both languages. Japanese *ganrai* is a loanword originating in Chinese *yuanlai*. Both *yuanlai* and *ganrai* consist of a morpheme meaning ‘origin’ (Chinese *yuan* and Japanese *gan*) and a morpheme meaning ‘since’ (Chinese *lai* and Japanese *rai*), and thus literally mean ‘since the beginning’. From their first occurrences in historical documents till today, *yuanlai* and *ganrai* have retained the nominal meaning of ‘beginning’ or ‘previous situation’, but more often than not, they are used as adverbials with the meaning of ‘previously’.

As temporal adverbials, Chinese *yuanlai* and Japanese *ganrai* are often used in contrastive contexts where a situation in the past signaled by *yuanlai* or *ganrai* is compared with the present one. This use paves the way for *yuanlai* and *ganrai* to evolve into DSMs, whose major functions are to guide listeners’ or readers’ attention towards the background or explanatory information for the preceding discourse, and consequently to highlight discourse coherence. Together with the rise of the new functions, their syntactic positions shift from typically occurring clause-medially to predominantly occurring clause-initially.

Notwithstanding the commonalities in their developmental paths, they apparently differ in the following ways. First, Chinese *yuanlai* is frequently used in colloquial style, whereas Japanese *ganrai* bears the sense of formality and is mainly found in written texts. Second, their textual functions have subtle differences. Chinese *yuanlai* exhibits a strong causal relationship between *yuanlai*-prefaced clause and the preceding clause(s), roughly translatable as ‘this is because’ or ‘it turns out that’. Japanese *ganrai* tends to merely provide supplementary information as to the preceding discourse, synonymous with English ‘in fact’ or ‘actually’. Third, relevant with the above properties of colloquiality and causality, Chinese *yuanlai* has acquired an attitudinal function (“mirative” in Tsai and Yang 2022; “counter-expectation trigger” in Zhao and Bai 2022). It is used to indicate that the speaker has just found out the true status of the situation s/he has been curious about, usually with overtones of unexpectedness.

From truth to truly: the case of *shin-ni* ‘truly’ in Japanese

Panel contribution

*Dr. Yuko Higashiizumi*¹, *Prof. Reijirou Shibasaki*²

1. Toyo University, 2. Meiji University/University of British Columbia

This study traces the development of the adverb *shin-ni* ‘truly’, the hybrid form consisting of the Sino-Japanese noun *shin* 真 ‘truth’ and the adverbializer *-ni* of Japanese origin, in the history of Japanese, drawing on various historical and contemporary corpora. It has previously been observed that some words with the meaning “true (‘true’, ‘real’)” have developed into “intensive” in Chinese, English, French, Hungarian, etc. (Kuteva et al. 2019: 443). This paper presents a case study of the word with the Chinese etymon 真/眞 in Japanese to contribute to a discussion of whether or not words that share the same Chinese etymon are grammaticalized into discourse-pragmatic markers similarly across some Asian languages.

The lexeme *shin-ni* is listed as an adverb or a phrasal adverb in contemporary Japanese dictionaries. The word *shin* was found in Buddhist-related documents from the seventh century in Japan, denoting ‘truth, sincerity, non-falsehood’ in the Buddhist sense. It began to be attested as a noun marked by the genitive *-no* or the accusative *-o* in non-Buddhist documents from the thirteenth century onwards. Its adverbial form *shin-ni* began to be used as an evaluative intensive adverb ‘truly’, modifying an adjective or a predicate (e.g., ‘truly sorrowful’, ‘be truly in love’), in colloquial written Japanese from the late eighteenth century. However, the use of *shin-ni* is more or less limited to formal registers in contemporary Japanese. Although infrequent, we can find an example of *shin-ni* that serves to intensify the illocutionary force of the utterance. In other words, it expresses the speaker’s subjective attitude or evaluation toward the speech act being conducted. For example, *shin-ni* in (1) can be seen as intensifying the speech act of apologizing.

(1) *anata-no-o.kokoro-o kujiku-yoo-de shin-ni mooshiwakenai-no-desu-ga,*
you-GEN-RES.heart-ACC discourage-way-COP **truly** sorry-NML-COP.POL-but

... *go.rooshi-no-kanbyoo-o onegai-deki-nai-deshoo-ka?*

RES.old.master-GEN-care-ACC ask-can-not-COP.CONJ-QP

‘I am **truly** sorry to discourage you, but...could you please take care of your old master?’ (BCCWJ: PB29_00269, 23790, 2002)

The extension from the noun *shin* ‘truth’ to the intensive adverb *shin-ni* ‘truly’ in Japanese is in line with the development from “true” to “intensive”. On the other hand, while it is reported that ‘truth’-related words with the same etymon 真/眞 in Chinese, Korean, and Thai have extended from ‘truth’ to ‘truly’ and have further developed a number of interactional functions as discourse-pragmatic markers, *shin-ni* does not carry a clear discourse-pragmatic function. Thus, it appears that the extension of the etymon 真/眞 from ‘truth’ to ‘truly’ is one of the commonalities among these four Asian languages, whereas the interactional functions of each discourse-pragmatic marker may exhibit differences.

Textual-to-epistemicity or else? The case of Chinese *shenzhi* (yu) and Korean *sim-ci-e*

Panel contribution

Prof. Haiping Long¹

1. Sun Yat-sen University

Chinese *shenzhi* (yu) ‘so much as to, even’ and Korean *sim-ci-e* ‘so much as to, even’ may be used between two correlative clauses or in the medial position (i.e., the position between the subject and the predicate) of the second clause.

(1) *Tā pàng duō le, shènzhì yǒude rén/yǒude rén shènzhì dōu shuō tā biàn yàng le.*

‘He has become much bigger. **Even** some people/Some people **even** say that his appearance has changed because of that.’

(2) *Ku-nun ton-to ilh-ko cikep-to ilh-ess-e. Simcie ayin-to/Ayin-to simcie ttena-ss-e.*

he-topic money-also lose-and job-also lose-past-end **even** girlfriend-also/girlfriend-also **even** leave-past-end
He lost money and a job. **Even** his girlfriend/ His girlfriend **even** also left him.’

Liu (2012) sees a *shenzhi* (yu) that appears between two correlative clauses as a discourse structuring marker (shortened as a DSM), and a clause-medial *shenzhi* (yu) as an epistemic adverbial (shortened as an EA). The author argues that the former appeared earlier than the latter in historical Chinese. Similarly, Traugott (2022) also argues that a DSM *after all* that is used between two clauses appeared earlier than an EA *after all* that is used in a clause-medial position in historical English. Diachronic changes of Chinese *shenzhi* (yu) and English *after all* seem to hint a hypothetical pathway leading from a DSM to an EA.

We don’t support this hypothetical pathway because our diachronic investigations of Chinese *shenzhi* (yu), Korean *sim-ci-e*, and English *after all* reveal that these constructions had epistemic meanings when they appeared between two correlative clauses, and retained discourse structuring functions when they appeared in the medial position of a clause. In other words, diachronic changes of these constructions don’t support a hypothetical pathway leading either from a DSM to an EA, or from an EA to a DSM.

From the perspective of discourse grammar, we argue that there is a group of constructions (e.g., manner adverbials, prepositional phrases, clauses) that indicate epistemicity, and at the same time serve to link clauses. These constructions may exhibit features of both a DSM and an EA. They may follow the hypothetical initial-to-medial pathway argued by Long et al. (2022), and move to the medial position of one of the clauses that it links.

The way of truth: The case of the Korean DM *cincca* in comparison with Chinese DMs *zhenshi* and *zhende*

Panel contribution

***Prof. Seongha Rhee*¹, *Ms. Lin Zhang*²**

1. Mahidol University & HUFS, 2. Seoul National University

Despite its recency in development, the Korean discourse marker (DM) *cincca* presents an interesting grammaticalization scenario. It is a hybrid form consisting of the Sino-Korean morpheme *cin* ‘truth’ and the native Korean nominalizer *cca* ‘thing, person’, thus denoting ‘a true thing’. It is a noun phrase in form but from the early days of its appearance, it carried an adjectival function of adding genuineness or excellence in quality to a modified noun (e.g., ‘a true story’, ‘a genuine treasure’) or an adverbial function of adding emphasis to an adjective or a predicate (e.g., ‘truly fortunate’, ‘truly painful’). From the emphatic adverbial function there arose diverse DM functions through the interaction of the source meaning of truthfulness and diverse inferences from the discourse contexts.

Among the primary, and presumably first, function is the emphatic function, paraphrasable as “I am serious,” modifying a proposition. The DM further acquired the emotive function of marking frustration or annoyance (“I am annoyed/frustrated”), often occurring stand-alone often accompanying ellipsis before or after it. Closely related to the function is that of marking challenge (“I am challenging you”), also often occurring in elliptical contexts. Unlike these negative functions, the DM also acquired a neutral or positive function as an interjection marking surprise (“I am surprised”), i.e., the surprise involved may be of negative, neutral, or positive nature. The DM carrying the interjective function also tends to occur in elliptical structures, often involving elongated trailing of the last syllable. The ellipsis strongly suggests that the speaker is emotionally overwhelmed and is unable to complete the utterance. When the ‘truth’ meaning became significantly bleached, the DM acquired the filler function, not with any notable semantic content, only paraphrasable as “I am speechless” or “What can I say?”. Still another function is to mark sudden remembrance (“Oh, I almost forgot” “Oh, that reminds me”), often serving the function of prefacing a statement that was nearly forgotten. All these functions are observable in present-day Korean.

When it is compared with the Chinese DMs involving the same etymon *zhen*, i.e., *zhenshi* and *zhende*, some interesting aspects emerge. The Chinese *zhenshi* ‘really’ denotes truthfulness of a descriptor, either a choice of expression or the content of a statement. As a DM, *zhenshi* or its reinforced form *zhenshide* signals the speaker’s disgust or discontent (“I am unhappy/frustrated”). Similarly, the Chinese *zhende* ‘truth, fact, really’ also functions as a DM, signaling diverse speaker’s attitudes or assessments toward the statement being presented, e.g., surprise, emphasis, preface to disalignment, etc. Unlike the negatively-biased *zhenshi*, *zhende* is used in various value-neutral contexts.

Drawing upon historical and contemporary corpus data, this presentation describes the functions of the Korean and Chinese DMs originating from an identical etymon from a comparative perspective. Their developments and current usages exhibit much commonalities and subtle differences at the same time.

Registers of gender conscious person references in German

Panel contribution

Prof. Helga Kotthoff¹

1. University of Freiburg

For more than 40 years, a debate on gender-related person references has been taking place in the German-speaking world. I am going to discuss four styles of gender conscious person reference as “registers” in the sense of anthropological linguistics (Agha 2003). This concept of registers implies that the producers are located in a socio-symbolic cosmos and can be perceived with cultural evaluations (in production and reception, for example, as conservative, progressive, feminist, queer, Kotthoff 2020). In my paper I shall explore their (socio)linguistic underpinnings within conceptions of language ideology (Woolard 1998) in order to grasp the communication-reflexive charges of this discourse.

The traditional writing practice with a generically intended masculine (type 1), as favoured, for example, by Eisenberg (2017), argues within structural linguistics for a general capacity of the basic masculine gender to refer to all persons. Psycholinguistic and cognitive-psychological experiments repeatedly show with very short texts that women are more likely to be mentally included if the syntactic-semantic structure contains an explicit reference to women in addition to men or using internal majuscules within a morphologically feminine form to refer to both sexes (“FahrerInnen”) (Rothmund/Scheele 2004). Neutral forms are also proposed here which use a participle (“Fahrende“) (type 2). In partial contrast to type 1 and also to some strategies of feminist-inspired language reform (type 2), representatives of a queer view (type 3) argue that reference to men and women (i.g. „Fahrer und Fahrerin“) or using internal majuscules (“FahrerInnen“) strengthen the dichotomy of gender classification instead of creating gender diversity. New signs are integrated at morpheme boundaries, especially the underscore and the asterisk (also called “gender star“) (e.g. „Lehrer_innen, Verkäufer*innen“, recently also a colon at the morpheme boundary „Fahrer:innen“)

According to Hornscheidt (2012) and many guide lines, which are constantly published by universities or cities or firms these graphemes are mainly intended to invite cognitive representations of persons with non-binary gender identities (but there are also many vague justifications in the direction of sexual identity). In addition, in some media (e.g. radio stations, magazines and some daily newspapers) and also in the social sciences, styles of “flexible gendering” (type 4) have emerged, which often work with neutral forms and only selective mentioning of all genders. In my paper I try to discuss the linguistic ideologies which underpin these registers.

Sequential stand-offs in police encounters with the public

Panel contribution

Prof. Geoffrey Raymond¹

1. *University of California Santa Barbara*

Schegloff's (2007) account of sequence organization includes a description of a practice that introduces an unexamined source of potential complexity for the organization of action: In describing sequence initiating actions and the responses they make relevant, Schegloff (2017:16-19) notes that recipients of a first action can produce a "counter" in place of doing an appropriate responding action – that is, they can produce an alternative sequence initiating action that reverses "the direction of the sequence and its flow." While the sequences initiated by such "counters" can be resolved in short order, if both parties persist in pursuing a response to their own action (in lieu of responding to the other's) a "sequential stand-off" entailing a contest over "adjacency" or "nextness" (which play a central role in sequential organization, Schegloff, 2000) can emerge. Using data from police encounters initiated to address "policeable matters" (Mehan, 1989), this paper briefly documents the basic features of sequential stand-offs, the sequential contexts in which they emerge, and the methods participants use to pursue, expand, and resolve them. These observations help to situate a set of methods participants can use to (re)cast conduct produced to pursue one course of action as a form of "resistance" to the other, thereby enabling an alternative set of resources (including physical violence) as methods for resolving the emergent struggle (see Bittner, 1970). The organized methods participants use to pursue and resolve such stand-offs constitute a form of social organization that elaborates previously underspecified features of the organization of action sequencing.

The effects of agency on the construction of identities in political interviews

Panel contribution

***Dr. Luisa Granato Grasso*¹, *Mrs. Maria Moccero*¹**

1. Universidad Nacional de La Plata

Issues of identity and positioning become central in public appearances of politicians when they have access to high-rank positions in government. Identity work in the circumstances demands adjusting to new challenges, and to changes in the communicative behaviour. As Leipold and Winkel (2016:15) hold “actors are forced to creatively adjust to new meanings and take up changing subject positions in different policy making discourses”. Agency is crucial in identity construction, as it produces various effects upon self-and-other presentation in the development of the talk, and manifests itself mainly through the exploitation of diverse discursive and linguistic resources. The purpose of this presentation is to determine how agency is materialized in the speech of the president of Argentina, and what it contributes to the construction of the identities perceived in interviews broadcast on television. Media interviews offer one of the best opportunities for politicians to reveal themselves as worthy of support. A socio-pragmatic approach is used as an overall perspective to analyse meaning, with special attention to the notions of identity and agency. Research on identity construction chiefly draws upon the Positioning Theory principles that consider the dimensions of storyline, identity, discourse acts, and rights and duties (Slocum Bradley 2008). Two types of identities related to the social and to the interactional roles of the interactants are considered: the identity granted by the institution they represent, and the identity co-built as the discourse unfolds (Van Langenhove 2014). For the analysis of agency, this work adopts an author-centered approach as described by Leipold and Winkel (2016). The data emerged from a corpus of seventeen interviews held between December 2019 and May 2022. A qualitative analysis was conducted, and observation, comparison and interpretation techniques helped examine the texts in their contexts of production. Results show a relationship among the functions expressed through the production of discourse acts, the agency exercised by the speaker, and the identities developed. It was possible to determine that self and other exercise of agency refers to past, present and future actions. Two closely related resources are salient in agency and identity building: the employment of referring expressions, particularly first-person pronouns in all their forms, and the use of “ventriloquism” (Cooren, 2010) as the phenomenon through which an agent makes another being speak, be it human or non-human. Through these resources the president strives to position himself as conscious of his rights and duties, and to project the image of a sensitive, determinate, powerful, knowledgeable, and thoughtful head of state.

Transgression and tradition in teenage girls' talk: Positioning self in a changing world

Panel contribution

*Prof. Elena Raymond*¹

1. *University of California Santa Barbara*

An integral element of youth identity that requires further attention within the context of globalization is gender. For young women who live in traditional contexts, in particular, it is expected that globalization processes will affect their lives more drastically than men's. For example, global mass migration becomes intricately implicated in the process of gender identity formation because gender ideologies migrate along with people and are not always in accordance with the local gender discourses of the new social contexts in which they are embedded.

In the patriarchal context of Cyprus, the dominant gender discourse involves the display of a heterosexual gendered self, which is framed within the normative confines of gender performance. Differentiation is based on gender styles, which become symbolic boundaries between different teenage groups. Drawing on a corpus of data of recorded interactions, participant observations, and in-depth interviews, collected during a yearlong ethnographic study at a multiethnic middle school in Cyprus, this paper examines how teenage girls navigate diverse and occasionally contradictory gender ideologies as they encounter and take up the prominent discourse of heterosexuality and particularly, how some of these girls in specific interactional contexts maneuver their positions through a matrix of stigmatization and negative connotations associated with sex and female sexuality. In the social space examined in this study, where the rural meets the urban, the migrant the local, and the religious the secular, gender practices variably construct different kinds of femininities and masculinities and, as a result, students can hardly avoid the appropriation, interrogation, ascription or denunciation of particular gender subjectivities. This paper addresses two main questions: first, how do students negotiate different gender ideologies (and related moralities) that migrate into the local space via global processes, like migration and global media, and second, how are students' understandings of gender expressed through their own gender practices and also through their articulated interpretations of the gender practices of others.

The symbolic representation of femininity and masculinity at Central Junior School is achieved through an array of linguistic and cultural practices. Linguistic practices include positioning, labeling and gossip that become involved in claims of individual and group identity. These identity practices primarily function to mark the fault lines between groups, which for girls also demarcate assumptions about moral distinctions. Morality becomes involved in the process of gender construction as it is integrated into the patriarchal idealized version of womanhood, or alternatively, maidenhood. In this school, when students examine their own or other girls' gender practices, they often make allusions to the ethics of the referenced individual or group. Assessments of girls' morality is based on a continuum of sexual practices, from the most liberal to the most traditional, along which they place different cultural groups (which are often equated with ethnic groups). With the conflation of sexuality with gender, the sexual practices of girls become fundamental in youth's interpretations of gender identity.

Unravelling bureaucratic dilemmas: identity and communicative style in advice seeking

Panel contribution

Prof. Jenny Cook-Gumperz¹

1. University of California Santa Barbara

Ulrich Beck (2002) describes the challenges of living a late-modern life as presenting precarious social options: “we live in an age where the social order of the nation state, class, ethnicity and the traditional family are in decline. The ethic of self-fulfillment and achievement is the most powerful current in modern society. The choosing, deciding, and shaping human being who aspires to be the author of his/ her own life, the creator of an individual identity is the central character of our time.” Freed from traditional constraints social options become subject to institutionalized guidelines (Giddens, 1991). These bureaucratic requirements in turn lead to gatekeeping through written documents and face-to-face encounters, and to the need for new communicative strategies.

For example, in a study of advice giving to new mothers in the UK, Heritage and Sefi (1992) studied some of the interactional pragmatic dilemmas facing health visitors providing support for first time mothers with newborn babies in their own homes. Health visitors must not appear to press expert knowledge on mothers or risk rejection of this advice, and mothers themselves often hedge their own requests for advice so as not to appear incompetent in their new role as mothers. Both participants in the interactional exchange are constantly in danger of undermining the other’s position as advice giver or taker, by reason of their ambiguous relationship as private citizens and representatives of a government sanctioned authority.

The studies discussed in this paper will explore advice giving in a different context, one where participants actively seek help from a public organization. The data come from two different advice centers in the UK Midlands: a local government center specifically for housing advice and a community-sponsored center for advice on all social welfare issues.

The requested advice exchanges in these two settings provide examples of how any understanding of a personal self interacts with our position as an institutionalized individual. In managing challenges of daily life and its regulation we are concerned with who speaks for whom, to whom, and where the authoritative voice rests in any decision-making. The data show different communicative styles in these two public settings that have implications for advice-seeking outcomes. In the first case, negotiating bureaucratic constraints both advice seeker and advice giver develop shared communicative strategies. In the second case, there is need to overcome traditional institutional roles through participants attempts to redefine their communicative strategies in solving their particular bureaucratic dilemmas.

A-typical discourse as creative practice in the interaction of a care home

Panel contribution

Prof. Almut Koester¹

1. WU Wien

The professional context of a care home is not an obvious choice for an exploration of creativity. In fact, research has shown that interactions in elder care institutions are highly routinized (Grainger, 2004; Backhaus 2017) due to the nature and constraints of the work, where carers interact with residents and other co-workers as they do their rounds. The research presented explores the question of whether any creative practices can be identified in a corpus of care home interactions and, if so, how these are manifested in language and discourse.

This paper presents findings from a study of typical and a-typical language and discourse in a corpus of approximately 60,000 words transcribed from over 70 hours of audio-recorded naturally-occurring interactions in a care home in England. I propose that a-typical language and discourse may potentially involve instances of creative practice, where care workers depart from routines in the way they interact with residents or creatively solve problems with co-workers.

Methods used in the study include both corpus linguistics and discourse analysis. While corpus methods are typically employed to identify frequently-occurring language, such methods can also identify infrequent or a-typical items. The corpus linguists Hoey (2005) and Hanks (2013) propose that a-typical or rare words and phrases may also be those that are potentially creative. Corpus methods (word frequency, keywords and concordances) were used to identify rare or a-typical words and phrases as well as instances of (potentially) creative language, such as figures of speech or hyperbole. The items identified through corpus methods were then investigated in their discourse contexts to discover any creative uses.

The analysis showed that while creative uses of language and discourse were rare in the corpus, some of the a-typical items identified did involve creative discourse, where speakers departed from care work routines. Infrequent, a-typical language was sometimes used by care workers in small talk sequences in which they engaged relationally with residents. Such relationally-oriented sequences stand in contrast to the routinized, transactionally-oriented interactions that make up much of the discourse of the care home, and can, therefore, be identified as instances of creative practice. By engaging relationally with residents, care givers reduce the asymmetry and power imbalance that is inherent in the nature of the care relationship and frequently reinforced through language use (Grainger, 2004).

Building a child-centered participation framework as a stepping stone to build trust in a medical encounter

Panel contribution

*Dr. Stéphanie Caët*¹, *Dr. Sara Debulpaep*²

1. Univ. Lille, CNRS, UMR 8163 - STL - Savoirs Textes Langage, F-59000 Lille, France., 2. University Hospital Gent

This presentation offers a first analysis of the 32-minute consultation between a pediatrician, a 5 year-old child and his mother that was presented in the first, introductory presentation.

We focus here on a stepping-stone strategy the paediatrician uses to make the child at ease and build trust: making him her main addressee.

In the context of this interdisciplinary project, three types of information will be shown to reveal the subtle construction of a child-centered participation framework:

- qualitative analyses of the paediatrician's verbal and non verbal behaviour (including the use of terms of address and pronouns, gestures, gaze, body orientation, touch, object manipulation) enable us to reveal how she makes sure to address the child directly, thus turning the mother's status into that of a bystander (Goffman, 1981), in a way that seems unusual to the mother and the child in this context (Tates & Meeuwesen, 2001).
- thanks of the participatory nature of the PANIC² project, we could identify, together with the paediatrician recorded, specific moments when she felt she was being "successful" in making the child more confident. Quantitative analyses based on the systematic coding of the data confirm that participation frameworks unfold differently around those landmarks.
- a comparison of the linguistic properties of the utterances addressed to the child vs. to the mother shows that the paediatrician also involves the child in the conversation by adapting her speech, using features from child-directed speech.

Although the child does not speak more as the encounter unfolds, the modality of his utterances progressively changes, from mostly non verbal to mostly verbal, and from mostly answering questions to asking questions himself.

By involving children in the conversation, not only do paediatricians improve the bond with the child, but they also augment the possibility for the children to recall medical recommendations (Lewis et al., 1991), gain a greater sense of control over their medical care (Sisk et al., 2021) and socialise them into the role of patient (Stivers, 2012).

Doctor-parent-child and facework theory

Panel contribution

Prof. Karin Aronsson¹

1. Stockholm University

In this paper, facework theorizing is discussed in terms of social distance and how distance is regulated in clinical encounters, more specifically pediatric settings. In his pioneer work on facework, Goffman (1967) discussed acts of affiliation, on the one hand, and respect displays, on the other. His theorizing has inspired Brown & Levinson's (1987) model of directness where power relationships are seen as key factors behind polite distance, on the one hand, and affiliative communication, on the other. But social distance is not necessarily a *background factor* behind mitigation. In our empirical work, social distance instead surfaces as a collaborative product of doctor-parent-child interaction. The present analyses draw on three data sets: (i) preschoolers and other young children's verbal improvisations in doctor-play (Aronsson & Thorell, 1999, 2002) revealing an early awareness of adults' collusive moves in triadic encounters. Even very young children, for instance, deployed collaborate we-formats when playing doctors. A couple of clinical data sets involve (ii) doctors' indirectness in communication with asthma/allergy children and parents (Aronsson & Rundström, 1989) as well as (iii) family therapy talk involving potentially collusive parent-therapist alignments (Aronsson & Cederborg, 2012). In the data sets, social distance is partly co-constructed during doctor-parent-child talk. It surfaces as a part of sequences where parents, children and doctors address each other (e.g. through collaborative 'we'-formats) and the ways in which directives are upgraded or downgraded. Moreover, the findings resonate with work on children in cancer clinics where even quite young children communicate fearlessly with doctors and nurses in clinics, if potentially threatening procedures are presented in playful ways (Rindstedt & Aronsson, 2012).

Gaze functions in repair-like interactions between a 10 year-old communicator with anarthria and his mother

Lecture

Mx. Aleksandra Kurlenkova¹

1. New York University

In CA literature, it has been shown that gaze may play a role in repair activities. Among other functions, it may be used to claim independent repair completion, or elicit help during word search both in typical (Goodwin and Goodwin 1986) and atypical interactions (Laakso, Klippi 1999; Laakso 2020).

Research on repair in interactions between speakers with dysarthria/anarthria and their typically speaking partners, however, has concentrated mostly on the *verbal contributions* of both partners aimed at resolving misunderstanding (e.g. Bloch, Barnes 2020, Rutter 2009).

My research aims to bridge the gap in CA literature on repair activities between dysarthric/ anarthric communicators and their familiar conversational partners, specifically pertaining to the different uses of *gaze* in such activities. The video-data I want to present at this panel comes from a collection of around 30 cases of other-initiated self-repair practices in interactions between a 10 year-old boy with anarthria and mobility limitations due to cerebral palsy and his typically speaking mother (in Russian). In this dyad, the boy uses conventional gaze-pointing at the objects in the environment and his mom's body, while his mom uses orally produced candidate understandings to co-construct the boy's utterances.

The use of both gaze and repair is pervasive in this data. Moreover, I argue that in the analysed interactions, repair (or repair-like phenomena, similar to hint-and-guess sequences described in Laakso, Klippi 1999, but based on gaze signs) serves as a major conversational structure underlying most of the boy's interactions with his mother (see also Satchidanand, forthcoming). As the boy's primary communication modality, gaze, in combination with facial mimics and vocalizations, is used to do different things at different stages of repair sequences, such as 1) secure / mobilize reciprocity; 2) produce initiating actions - gaze-signs; 3) monitor mom's understanding, and, in case of multi-unit turns, proceed to each new gaze-turn after registering the receipt of the previous one; 4) confirm or reject mom's candidate understandings.

In my presentation, I want to analyze the different functions of gaze in repair (or repair-like) interactions in this dyad.

Introduction to PANIC2: ‘Pragmatic ANalysis of Interaction between Children and medical Caretakers’

Panel contribution

*Dr. Vikki Janke*¹, *Dr. Sara Debulpaep*², *Prof. Ilse Depraetere*³

1. University of Kent, 2. University Hospital Gent, 3. University of Lille

In this first presentation of the panel, I introduce the PANIC² project, which is an interdisciplinary and cross-linguistic collaboration, initiated by Ilse Depraetere, comprising five researchers from Lille, Ghent and Kent, who, collectively, offer expertise in paediatrics, pragmatics, language acquisition and the analysis of verbal interactions. Our team aims to uncover the most successful communicative strategies used by paediatric nurses and doctors when attempting to build a rapport with their child patients. We do this by (a) examining how communication between paediatricians and child patients unfolds, (b) documenting the communicative exchanges using precise and accessible language, (c) highlighting those aspects that visibly help gain a child’s trust and (d) synthesising these in way that is easy for a clinician on the ground to understand and implement. A crucial point of our study is that successful communication with the child goes way beyond careful vocabulary, and that it is a linguistic approach that can best reveal and bring together those layers of the exchange that are most beneficial. We start by showing a 6-minute video of a 32-minute consultation between a paediatrician (one of our team), a 5-year-old boy and his mother, which takes place at Ghent University Hospital. The child is being prepared for a tricky eye operation for which a strong anaesthetic is not an option, so the onus is on the clinical team to calm him and familiarise him with the strange tools that will surround him in the operating theatre. During this video clip, we will ask you to note any aspects of the exchange that seem integral to the trust being built. We will then revisit these in detail in the subsequent two presentations and invite you to share your perspectives on the encounter and our analyses of them.

Making a child feel at ease during a medical consultation: facework strategies

Panel contribution

***Prof. Ilse Depraetere*¹, *Dr. Sara Debulpaep*², *Ms. Siham Ezzahid*³**

1. University of Lille, UMR 8163 STL, 2. University Hospital Gent, 3. University of Lille

This presentation reflects further on the 32-minute consultation between a pediatrician, child and his mother that was presented in the first, introductory presentation.

Building on the second presentation, which shows how the child-centred approach takes shape, here, we focus on the ways in which the pediatrician establishes rapport by performing facework. First, we spell out in more detail how the pediatrician involves the child in the conversation through the use of particular types of interrogatives. Of immediate note is the extremely high number of interrogatives addressed to the child. It is mainly *yes-no* interrogatives that are used, which facilitate non-verbal responses, the few *wh*-questions relating to safe, that is, non-face-threatening, topics. This technique makes the child gain confidence, and, as he grows more confident, he becomes a more involved interlocutor, which in turn, makes him feel more at ease.

Second, we show how rapport is further built up between child and pediatrician by analyzing the facework performed by the pediatrician. Brown & Levinson's (1987) politeness strategies will serve to demonstrate the overarching strategy implemented by the pediatrician to make the child feel at ease and to divert his attention away from the threat to his negative face, which is huge, given the circumstances (i.e. the unfamiliar setting of a hospital procedural room, the use of a tube to administer medication, the use of a laughing gas mask, the use of a laser). We illustrate that the abundant use of positive politeness strategies and the quasi-absence of negative ones is an effective means of making him feel more comfortable.

Overall, our analysis (in presentations 2 and 3) shows that medics move beyond the avoidance of negative words (like 'pain' or 'hurt') or imagery and the promotion of terms that communicate sensory information in a positive way (see references in the introductory presentation). The strategies implemented are rich and multi-faceted. The linguistic perspective we have employed makes it possible to describe, in a more accurate way, what is occurring in the communicative exchange. Equally importantly, we have shown how successful communicative strategies can be formulated in more general terms.

Cute snacks for empowered Chinese middle class women: How marketing colonizes ideological shifts

Panel contribution

*Prof. Gwen Bouvier*¹, *Ms. Menghan Deng*²

1. Shanghai International Studies University, 2. Shanghai Jiao Tong University

In this paper, we use multimodal critical discourse analysis to analyse food packaging that targets younger, single, middle-class women in China. For a range of reasons these comprise a growing demographic group in China, and they are an attractive niche target group for marketers. It has been observed that there have been significant changes and tensions, particularly for middle-class women in China, in part as internationalisation and commercialisation have brought with them newer forms of individualism and notions of self-fulfilment, often related to neoliberal ideology. These sit alongside traditional Confucian culture, with its sense of family duty in relation to kinship, marriage and motherhood. Advertising of products, we show in this presentation, tend to represent this sense of women as getting-ahead, go-getting, good neoliberal individuals, as has been observed to also be the case in, for example, European societies. But, unlike in other settings, in China such products also tend to foreground cuteness and softness, known as Kawaii culture, explained in part as a form of comfort or retreat from social pressures, demands and contradictions. In this paper, carrying out a close multimodal analysis of food packaging, we explore how these conflicting representations are handled and represented in food marketing targeting these younger middle-class Chinese women.

Gendering craft beer names

Panel contribution

***Mr. Steffen Schaub*¹, *Prof. Marcus Callies*²**

1. University of Greifswald, 2. University of Bremen

Craft beer culture, like other higher-value beverage cultures (wine, whiskey), reflects stereotypes about gender preferences. The profile of a typical craft beer drinker is “that of a young man, with a higher education and a medium-high income” (Baiano 2021). Even though women make up a sizable portion of craft beer consumers and are growingly visible in the industry as producers and experts, craft beer is still a largely male-dominated and -oriented space. Branding and marketing of craft beer, for instance, has been found to draw heavily on sexist imagery (Thurnell-Read 2022). Furthermore, research by Darwin (2017, 2018) and Chapman et al. (2018) has shown that certain beer styles are perceived to be more agreeable to certain genders: bitter or strong beer styles like India Pale Ales or stouts are perceived as ‘masculine beers’, whereas light and fruity beers are associated with femaleness. The male dominance of the craft beer scene in general and the gender-specific stereotypes about beer styles in particular have an impact on how craft beer is described by patrons (Darwin 2017), discussed in online forums and blogs (Darwin 2018) and how craft beer is presented in terms of labeling and packaging (Kappele 2015). Some years ago several major beer producers launched marketing campaigns to target female consumers by introducing so-called ‘female-friendly’ or ‘feminine’ beers that, however, ultimately failed (O’Reilly 2014).

Withers (2017: 237f.) identifies marketing as one of three “elements of cultural construction and maintenance” within the craft beer industry to establish and uphold it as a white male cultural form. Names are a crucial component of the marketing process, with the naming process and branding involving a complex set of factors, including copyright considerations, the target consumership, noticeability on a saturated market, a connection to the brewery and the region, modern cultural references, and, for some, tying in with an international scene. Since previous research has shown that craft beer is gendered across different communicative domains of the industry, it is likely that this gendering also extends to craft beer names.

In this study we want to explore two main questions: Do craft beer naming practices and the accompanying imagery reflect the gendering of craft beer in general and of different craft beer types in particular? Craft beer names are collected from the database of a popular craft beer app called *Untappd*, which serves as a comprehensive catalogue of existing beers world-wide. We approach this topic from two methodological angles: First, we use a list of keywords that may exhibit gendering of craft beer names (e.g. *bitch* as in *Hoppy Bitch IPA* or *male* as in *Alpha Male IPA*) to explore the database for relevant names and imagery on the labels. In our second analysis, we extract the names of the most popular beers from different beer styles, differentiating between beer styles that are perceived as masculine versus feminine. We then analyze how they are named and whether the naming practice hints at gender-specific advertising strategies.

Language, Food, and Sex in Taipivae, New Year's Day, 2020

Panel contribution

Dr. Kathleen Riley¹

1. Rutgers University

Language, food, and sex are probably multivalent and co-constitutive processes in every corner of the human (if not also beyond-human) world. That is, human language is implicated in the indexical construction of sexual identities, activities, and orientations; sex is subliminally and explicitly entangled with the production, exchange, and consumption of food; and food functions as medium, metaphor, and context for linguistic interactions. This paper lays the groundwork for analyzing how language, food, and sex were engaged in the negotiation of meaning during one discursive event that took place on New Year's Day, 2020, in the Marquesas, French Polynesia. In this case, I came to awareness after many years of longitudinal fieldwork on the island of Nuku Hiva of how my now elderly, female-identified friend "Tahia" was adept at enacting a "masculine voice" to create a comfortable setting for her kin (who were serving us crackers and wild beef stomach) given the unexpected intrusion of my recording device in this setting. The other men at the event were reticent to engage in any normal partying-style interactions (despite their gendered meat-grilling labor) until she took hold of the situation and used Marquesan and sexual innuendo to joke about local politics (specifically the upcoming elections). Some of the paralinguistic features (deep pitch, loud volume) and lexical choices ("nasty" sex-related allusions) as well as some of the foodways displayed (bbq, beer, etc.) might seem typical of the gendered dynamics of a family gathering half a globe away (e.g., in New Jersey). However, the specific values and relationships that emerged in this situation require some deconstruction based on an understanding of the colonial imposition of Catholic prudery, French education, and global foodways on the commensal rituals, sexual practices, and discursive formations of *te 'enana 'o te henua* (the people of the land) in the valley of Taipivae (where Melville once spent time). The data to be analyzed in this instance were collected via a range of ethnographic methods, including participant observation, unstructured interviewing, and the audio recording of natural discourse. For the conference, I will present some basic ethnohistorical information about the islands as well as analyses of more general sociocultural and communicative norms and practices derived from years of fieldwork. All this background is needed to make pragmatic sense of several transcribed moments of interaction that transpired during this food-mediated New Year's event. The primary focus will be on identifying and comprehending the gendered indexicality of various multimodal signs (food and language) and their implications for ongoing transformations in the construction of gendered communicative norms and foodways given the *longue durée* of colonization and now globalization in this part of the world.

Linguistic and semiotic perspectives on nutrition as a gendered cultural practice – An introduction

Panel contribution

***Prof. Janina Wildfeuer*¹, *Prof. Theresa Heyd*², *Dr. Sofja Rüdiger*³**

1. University of Groningen, 2. University of Greifswald, 3. University of Bayreuth

Food and drink, and consumption more generally, is deeply linked to cultural practice, and to the negotiation of social status and other aspects of social identities. This connection is entrenched in classical sociological theory (Veblen; Bourdieu), and has been increasingly explored in linguistics in recent years. Thus, linguistic approaches to food practices (Rüdiger and Mühleisen 2020; Tovares and Gordon 2020) have highlighted how social status and categories of belonging are talked into being around practices of food and drink consumption (e.g., Silverstein 2003 on wine talk and status anxiety; Cotter and Valentinsson 2018 on bivalent class indexing in specialty coffee discourse; Mapes 2020 on palatable eliteness; Schneider 2020 on third wave coffee and cosmopolitan discourse).

However, the gendered dimension of food and drink talk has so far received less attention. In cultural and social theory, approaches such as Contois' (2018, 2020, 2021) work on food and masculinity have pointed to these connections: ideologies of gender are cast upon practices of eating and drinking, from gendered product ranges and eating places to gendered assumptions and regimes of un/healthy eating, dieting, and cooking (see also Bouvier and Chen 2021).

In a similar vein, foodie culture and practices have been shown to perpetuate the performance of stereotypical, classed femininities and masculinities, while also allowing an escape from them, particularly for women (Cairns, Johnston and Baumann 2010; but see Brookes and Chalupnik 2022 on masculinity-asserting discourse representations of vegan men). Dichotomous gendered eating practices have also been observed in the context of fitness magazines (Fuller, Briggs and Dillon-Sumner 2012). In addition, cookbooks authored by female chefs emphasize aspects of hegemonic femininity such as care for self and others, while concurrently offering competing discourses of self-fulfillment and independence (Matwick 2017).

In this introductory session, we provide an overview of previous research on gender and food-and-drinks talk. In particular, we focus on pragmatic and discursive, sociolinguistic and multimodal aspects in order to contextualize the “Dude food and chick beer: Linguistic and semiotic perspectives on nutrition as a gendered cultural practice” panel contributions.

On ‘pale hipsters’ and ‘well-educated young women’: A diachronic corpus-assisted analysis of gender stereotypes in German veganism discourse

Panel contribution

*Mr. Markus Majewski*¹

1. University of Hamburg

The increasingly important role of food as an identity-forming practice in affluent western societies is linked to gender. Studies in nutritional science show that 60-80% of vegans in Germany are female (Englert/Siebert 2016:13, Fleischatlas 2021). Sociological and psychological research suggests a close connection between gender and veganism (e.g., Modlinska et al. 2020). Researchers in discourse analysis have examined ‘vegaphobia’ in print media (Cole/Morgan 2011), moral aspects of veganism (Drescher 2020), and the connection of veganism and masculinity on social media (Brookes/Chalupnik 2022). However, linkages between veganism and gender in public discourse, and in particular the role of gender in the discursive construction of stereotypes of vegans and veganism, have not yet been examined.

To address this issue, this paper presents findings from a qualitative case study that is part of a larger ongoing project on the diachronic development of veganism discourse in German print media. Based on a large diachronic corpus with over 9,000 German newspaper articles from 1959-2020, this paper focuses on how veganism as a specific diet choice is linked to gender and how this linkage changed in the last 30+ years.

Based on the larger diachronic corpus a small-scale corpus of articles with a high frequency of the string *vegan** was created by using AntConc’s method of visualizing the ‘density’ of chosen lexemes in plot-graphs (Anthony 2018). It is assumed that media pieces with a high frequency of this keyword are particularly rich sites of veganism discourse. Drawing on the Discourse-Historical Approach (DHA, Reisigl/Wodak 2009) this sample is qualitatively analyzed to identify discursive stereotypes at the level of nomination and predication structures. The analysis focuses on (a) gendered nominations that are linked to vegans (e.g. phrases such as *loud bodybuilder* and *good housewife*, which are grammatically gendered in German), and (b) respective predications that feature gender-stereotyped actions (e.g. *posing with his muscular body* and *baking a pink cake*). To check whether these are singular occurrences or recurring patterns in the discourse, these gendered nominations and predications are used as search terms and queried in the entire corpus.

The findings suggest a small number of constant gender stereotypes in German media discourse, some linked to general discourses on gender and food, others more specific to veganism discourse. At the same time there are also changes in the representation of vegans over time, which go hand in hand with general changes in the discourse, for instance the motivation to opt for a vegan diet.

‘Eat your gender’: critical multimodal perspectives on gendering through food in global health and lifestyle magazines

Panel contribution

*Ms. Iwona Gibas*¹, *Prof. Sylvia Jaworska*¹

1. *University of Reading*

As much as being an organic product and a major source of energy, food is a social, cultural, and inevitably discursive practice through which social identities (“you are what you eat”), including gender, are produced and reproduced. Yet while linguistic and discourse analytical research on gender has attracted substantial scholarly interest across multiple disciplines, less attention has been dedicated to food as a discursive practice of gendering. Even fewer studies exist that address both natural and synthetic (i.e., dietary supplements) forms of food as distinct vehicles for gendering and social inequalities.

This study turns to these hitherto under-researched areas by investigating gendering through natural and synthetic food in a corpus of food advertisements collected from two of the most popular sibling health and lifestyle magazines, i.e., *Women’s Health* and *Men’s Health* published in Britain in 2017-2021. Both magazines have large readerships across the globe, with *Men’s Health* being the world’s largest men’s magazine (60 million readers worldwide in 64 countries) and *Women’s Health* the fastest growing international women’s magazine in the world available in 52 countries.

The primary interest of this study is in exploring the extent to which advertisements of both natural and synthetic food, as a discursive marketing practice, produce and reinforce stereotypical constructions of femininity and masculinity. Considering that food adverts are essentially ‘multimodal ensembles’, this study adopts a critical multimodal discourse analysis to study a corpus of 111 ads collected from issues published in the 2017-2021 time period. It explores the kinds of natural and synthetic food products that target female and male audiences and the discourses and other semiotic resources, for example colour, corporeal representations, gestures, and gaze, frequently exploited in order to sell food to a particular gender audience.

The results show that food adverts disseminated in *Women’s Health* and *Men’s Health* reproduce and reinforce stereotypical gender constructions, rendering particular foodstuffs masculine while linking others almost exclusively to femininity; this is observed for both natural and synthetic food types. This disparity is further reinforced through the use of various semiotic resources that construct the food and its corporeal ‘receiver’ the body in distinctly gendered ways. We conclude the paper with observations that despite some advances in equality and occasional focus on inclusivity and bodily positivity in advertising, the food marketing in health and lifestyle magazines continues to reinforce homogenised and stereotypical ideals around femininity and hegemonic masculinity; it constructs binary gendered personae through both: ‘what you eat’ and ‘how you eat it’.

“Thirsty for More?”: Gender in Food and Beverage Advertising

Panel contribution

Ms. Elisabeth Zimmermann¹, Dr. Anna Islentyeva¹, Ms. Hannah Graf¹

1. Universität Innsbruck

Promotional culture and advertising are considered to be “one of the most populous and pervasive modern discourse types” (Fairclough 2015: 60). Against the backdrop of the complex relationship between language, visuals, marketing strategies, and gender stereotypes, this study aims to investigate the key strategies that are systematically employed in the representation of men and women in modern food and beverage advertising.

The data set used for this study comprises 40 posters that advertise products that fit into two major categories: (alcoholic) beverages and (fast) food. The advertising campaigns in question were launched between 2000 and 2022 and displayed in public (outdoor) spaces. Among the brands advertised are Burger King, Carl’s Jr., Coca-Cola, McDonald’s, KFC, Lay’s, and Pepsi.

In terms of methodology, the discourse analysis and visual analysis are complemented by an analysis of the Corpus of Contemporary American (COCA) that aims to analyse the most frequent verbal patterns identified in the sample of the posters analysed. The corpus analysis thus reflects on and supports the key findings of the study, which show that language and advertising operate in a distinct circular structure and mutually impact one another.

The findings show that contemporary advertising discourse continues to promote traditional gender stereotypes. For instance, prototypical masculinity is frequently associated with the consumption of meat (cf. Klainberger 2020), which is especially evident in fast food advertising. One of the McDonald’s posters analysed in this study advertises a burger made from Irish beef, with a slogan that reads Serious man food. Furthermore, Coca-Cola intentionally links femininity with Diet Coke and thus with diet and dieting in a more general sense, while Coke Zero is promoted as a “healthy” drink for sporty men.

We conclude that unattainable archetypes of femininity and masculinity are still often propagated as the norm in advertising; stakeholders should be called upon to challenge these stereotypes and present us with a new normal.

**Emancipatory
pragmatics: Interactional
modality from the
perspective of Ba-theory
(organized by Scott Saft,
Sachiko Ide, Yoko Fujii)**

A pragmatic study of interactional explanation in Chinese from a Ba perspective

Panel contribution

Dr. Yansheng Mao¹

1. Harbin Engineering University

This paper aims to systemically explore *ba*-theory as a dynamic approach to interactional explanation in Chinese by introducing the concept of interactional modality, while catering to both propositional content and attitudes toward the content and their addressees, from a perspective of Ba theory. In this sense, the paper will take a step further to describe how participants employ various interactional practices, including linguistic forms as well as non-linguistic acts such as gestures, head nods, and laughter, etc, that contribute to the construction and dissolution of boundaries between people through the act of interactional explanation. With data collected from conflict-meditating TV programs in Chinese, the paper is intended to answer the ensuing research questions: first, what types of modalities are employed in the act of interactional explanation? How are these modalities manipulated for the sake of interactional explanation. The tentative answers to the research questions above may help to highlight that modality may be the most important aspect of interaction as it plays such a significant role in creating and negotiating interpersonal relationships in oriental culture where Guanxi (relationship) is valued most.

Accommodation or appraisal: sentence-final-particles in 'Ba' dynamics

Panel contribution

*Dr. Yasuhiro Katagiri*¹

1. Future University Hakodate

Human face-to-face interaction takes place in an interactional 'Ba': a space (basho), both psychological and physical situation/context, that supports, mediates, and orients the development of interaction. The conception of 'Ba' emphasizes the ambivalent nature of 'Ba' between intentional/conscious or articulated/unarticulated. This often hard-to-characterize nature of 'Ba' can be traced back to the cross-linguistic and cross-cultural examination of divergent phenomena in human conversational interactions. The conception of 'Ba' includes, not only explicitly characterizable elements in dialogue context, such as time, place, speaker, hearer of utterances, but also factors such as culturally established behavioral norms which have historically been developed and implicitly enforced, hence indigenous to a specific conversational community, or shared interpretive conventions created spontaneously in a specific instance of conversational interaction.

Japanese have a variety of (sentence-final)-particles, used exclusively in spoken language (or in written texts that describe spoken interactions). They are mostly used in the sentence-final, as well as phrase-final positions. Some of them can be used in utterance-initial positions or as sole utterances, and play such roles as attention-getters, backchannels, or emotional displays. Their interactional functions have been studied in Japanese usage grammars. We propose a 'Ba'-based functional model of sentence-final-particles, through the examination of sentence-final-particles 'ne' and its variants 'yone,' 'kane,' and 'none' in Mr O. conversation corpus and other dialogue data. We stipulate ambivalent functions on conversational 'Ba' of appraisal for the acknowledgment or appreciation of 'Ba,' and of accommodation for the modification of 'Ba.' We argue that 'Ba'-oriented conception is better than speaker-oriented conception for capturing interactional functions of sentence-final-particles.

Analyzing Libyan Arabic interaction and communication from social and cultural perspectives: localization of CA and DA

Panel contribution

Prof. Mayouf Ali Amarif¹

1. Sebha University

This paper investigates the applicability of CA and DA conventions and practices, postulated by Western analysts, to interactional data from a different social and cultural background (e.g. Eastern). Naturally-occurring interactions in both social and institutional contexts in Libya are analyzed in this paper. The analysis shows that the long occupation of turns and the other-initiate/ other-repair strategies practiced by fathers when interacting with sons, which is seen as impoliteness from Western perspectives, are interpreted as high social status and respect of the father. Moreover, the analysis of Mr. O Corpus data (teacher/students conversations) reports exceeding silence by the students. According to Libya culture, such silence can be interpreted as a sign of agreement and respect. In contrast, other cultures may describe silence as a sign disagreement and uncooperativeness. Furthermore, expressing agreement/disagreement seems to be governed by the interactants' social and cultural norms rather than the CA/DA standards of interaction. Other institutional data from Libya (elderly patient/younger physician) shows what can be interpreted by Western analysts as off-target verbosity and talkativeness associated with ageing. The elderly patients call their doctors as "sons" and ask them about their social and familial background. In fact, taking the Libyan social and cultural values into account, the more reasonable interpretation of such practice can be described as an interactional strategy by the elderly patient to change the context from institutional (physician has the power) into social where the elderly patient regains the power from his younger physician. This paper concludes that the analysis and interpretation processes of CA and DA claimed by Western analysts are not importantly appropriate for other interactions and communications from different social and cultural background.

Atmosphere in Japanese and Chinese Conversations: Relevance of Context and Interaction

Panel contribution

Mr. Yusuke Mochizuki¹

1. Ritsumeikan University

In student-student (S-S) conversation (Japanese and Chinese), they do not keep certain distance, they talk in a relaxed and friendly manner. However, in teacher-student (T-S) conversation, they keep certain distance and try to read tense feelings from the beginning of the conversation.

As the conversation goes on, however, students come to talk to the teachers in a relaxed and friendly way. However, in this thesis, the question is asked; why does the T-S conversation become similar to the student-student (S-S) conversation half way through? These phenomena are relevant to contexts and relationships.

This research uses Mister O Corpus, which is a video recording between two people who cooperate to solve the task and make a story by rearranging fifteen cards. In this data, we could observe a conversation as it follows: e.g.)

T 啊, 对吗? 对吗?

Oh, is it correct? Look at the order.

S [走路, 对吗?]

He walked a road, and found a precipice.

T [走路, 对吗, 对=]

He walked a road, and found a precipice, and then

S =跳不过去, 对吗, 对吗, 对吗, 对吗, 对吗, 对吗, 对, 对, {xxxx}。

He couldn't jump over so came up with an idea to pick up a stick and try to jump over with it, but it broke. He was in a hurry, went to pick up another stick again and tried a few times.

T [嗯, 对吗去捡棍子, 对吗, 对吗{xxxx}试了一下, 对吗, 对吗, 对吗, 对吗, 对吗, 对吗然后过来了]

Yes, he came up with an idea, right? He happily went to pick up a stick and tried a few times, but it broke. Then he got angry and went there again and found another thick stick. All right? And he came back here. At the beginning of the conversation, the student has less expression and less utterance, but during the last part, we can observe the cooperativeness between them like repeating sentence as above and even the student's laughter, body language and eye contact.

That is a conversation which is influenced by an age difference and relationships. In addition, there are conversations which are not influenced by an age difference, but a pure relationships. Let us take example from a Japanese TV programs, two women comedians quarrel with each other. This conversation seems to be impolite from viewers, but these two women talk to one another in a relaxed tone. Why do they talk in such a relaxed manner through such a quarrel? This research tries to analyze and observe atmosphere in Japanese and Chinese conversations.

Ba theory and deictic systems

Panel contribution

Prof. Federica Da Milano¹

1. University of Milano-Bicocca

In traditional grammars, terms like ‘proximal/distal’ or ‘near/far’ from the speaker are typically used to define the meaning of demonstratives. However, these definitions are only an approximation of a complex semantic and pragmatic domain. In particular, an important issue concerns the distinction, as found in the literature, between so-called ‘distance-oriented’ and ‘person-oriented’ systems. The question is: is that a real distinction, or are they two instantiations of a more general system? In this paper, we will try to apply *ba* theory to the analysis of demonstrative systems in different languages, showing that this approach can better describe the uses of demonstratives. This dynamic approach will be applied to Japanese demonstratives, on the one side, and to other Western, European languages.

The concept of interactional modality as expressed through *ba*-theory will show that modality may be the most important aspect of interaction in creating and negotiating deictic reference. In particular, the theory of *ba* will further develop the concept of ‘dyad of conversation’, already introduced in the analysis of deictic systems by Jungbluth and Da Milano: the concept goes beyond the traditional distinction between ‘distance-oriented’ and ‘person-oriented’ systems because it is based on a detailed physical analysis of the orientation of speaker and addressee.

Starting from his work on deixis in Yucatec Maya, (1990), Hanks substituted a sociocentric approach to the traditional, Western egocentric approach to deictics; in this paper, we will adopt the new concepts developed by Hanks et al. of primary and secondary *ba*: the primary *ba* is the ontological field of mutual dependence, inarticulated, fluid, whereas secondary *ba* is the level at which, through interactional linguistic modality, distinctions and categorization emerge.

Ba Theory and the Creation of Humor Modality Through Pragmemic Triggers

Panel contribution

Dr. William Beeman¹

1. University of Minnesota

Ba theory, as articulated in the philosophy of Kitaro Nishida and Hiroshi Shimizu can be thought of as cognitive space for developing relationships—both interpersonal and in relationship to shared environments. However, a state of ba does not arise sui generis. It arises in social interaction, and for individuals to enter this state there need to be pragmatic signals—something I have termed “pragmemic triggers” in other publications—to initiate creation and sustaining of a ba state. One of the most universal social rituals in which humans engage is the creation of humor. Humor is one of the fundamental dimensions of modality in linguistic interaction. All humor has a common structure. It involves “double framing” in which a scenario, understanding, or agreed-upon reality is presented that is suddenly revealed to be something else, often by being recontextualized during the humorous presentation. The apparent “frame” of the humorous item is broken to reveal the second (and occasionally a third or fourth) frame to the surprise of the listener. The combination double framing coupled with surprise produces an autonomic reaction—usually spontaneous laughter. Consumers of humor are moved from stage to stage in the humor event through the use of “pragmemic triggers”—signaling mechanisms that keep consumers focused on the framing structures of the humor. For people to participate in this process of humor creation, I posit that they must be in a state of ba with each other; they must share the knowledge and understanding of the frames to which they are exposed. Cultural differences in humor creation arise because of the variety of bases for framing in different social traditions, conditioned by history, shared knowledge and behavioral expectations. For this reason, it is often difficult for persons from one cultural tradition to understand the humor generated by other traditions. When one is in a state of ba with others, it is possible to enter the process of humor creation, and the sharing of humor—being able to engage in spontaneous laughter together—in turn reinforces the strength of the ba relationships. This paper will illustrate this process with examples from Japanese, Chinese, German, Persian, Arabic, and English humor creation.

Deictic expressions, interactional modality, and the *ba*-based cognition in Japanese and Korean

Panel contribution

*Prof. Kaoru Horie*¹, *Mr. Kangwon Lee*²

1. Kansai Gaidai University, 2. Nagoya University

Interactional modality is manifested in a very different manner in languages such as Japanese and Korean despite having much similarity in lexico-grammatical structures. This was demonstrated by the higher sensitivity of Japanese utterance particles to the knowledge and emotive state of the addressee, typically indexed by *ne* in Japanese, as contrasted with their Korean counterparts (see Horie and Narrog 2014). From the perspective of *ba*-theory (Hanks et al. 2019), the degree of inclusion of the addressee into the immediate contingent *ba* may be interpreted to be higher in Japanese than in Korean.

The higher degree of inclusion of the addressee into the immediate contingent *ba* is also manifested in the use of deictic demonstrative pronouns in Japanese as contrasted with its Korean counterparts. Both Japanese and Korean are known to have three deictic demonstrative pronouns, i.e. proximate *ko* (Japanese, J)/*i* (Korean, K), medial *so* (J)/*ku* (K), and distant *a* (J)/*ce* (K). Superficially, these deictic demonstrative pronouns in both languages seem to behave alike.

However, there are cases where they behave differently, as shown in (1)-(2). A word on the context of the utterance is in order. Both the speaker (A) and the addressee (B) are seeing a movie in a movie theater. They are approximately 30 meters away from the movie screen. A is asking B about an actor whose name she cannot recall.

(1) A: (J) {*Kono/Ano*} hito dare dakke?
 this/that person who wonder (who) it was
 ‘(I wonder) who was {this/that} person was.’

(2) A: (K) {*?I/Ce*} salam nwukwu-y-ess-ci?
 this/that person who-COP-PAST-SFP
 ‘(I wonder) who was {?this/that} person was.’

Another context where a similar contrast emerges concerns two people (the speaker (A) and the addressee (B)) working together to make a desk, as shown in (3)-(4). A and B are about two meters away, and A is asking B about the object which she holds in her hand (and which A cannot readily identify).

(3) A: (J) Un? Nani {*kore/sore*}?
 huh what this/that
 ‘Huh? What’s {this/that}?’

(4) A: (K) E? Mwe-ya, {*?ike/kuke*}?
 huh what-COP this/that
 ‘Huh? What’s {?this/that}?’

In both situations, the deictic demonstrative pronouns that straightforwardly index the physical distance between the speaker and the referent are felicitous in both languages.

This is where the similarity ends, however. Speaker A can felicitously use the proximate deictic demonstrative *ko* in Japanese (see (1) and (3)). This option (i.e. the proximate ‘*i*’) is not available in Korean. Why is this latter option possible in Japanese in spite of the apparent mismatch between the ‘objective’ physical distance involved and the use of the proximate demonstrative?

We argue that the speaker’s perception of her interactive space (or ‘*ba*’) can be expanded relatively easily beyond the physical bounds in Japanese especially when she views it being shared by the addressee, which

explains the use of the proximate *ko*. As far as the Korean deictic demonstrative pronouns are concerned, they do not seem to show a similar ‘intersubjectively’ motivated deviance from the norm.

Describing Experiences in ‘Languages of Craft’: Quotations Functioning as Interactional Modality in Japanese Discourse

Panel contribution

Ms. Yuko Nomura¹

1. Juntendo University

Explaining one’s own experiences to others is a commonplace form of interaction. Speakers use various linguistic devices to help listeners understand events that they have not experienced and what they felt during these occurrences. One such method is the use of quotations that describe experience. For example, one can say, *Hajimetenō keikende fuan datta kedo, seikou shitanode, “yokatta,” to omotte, hotto shita* (‘I was anxious because it was my first experience, but after having been successful, I thought, “Oh, good.” And I felt relieved.’).

The purposes of this study are to analyse quotations in interviews wherein Japanese actors talked about their appearances in films and to clarify how such quotations function in interviews. The results showed that statements with *omou* (‘think’) as a quotative verb are frequently uttered, as is evident in the following statements: *Zettaini kono yaku wo kachi tori tai’ tte omotta* (‘“I definitely want to win this role,” I thought.’) and *Sugoku gambaritai’ to omotta* (‘“I really want to work hard,” I thought.’). The analysis employs the idea of *ba*-theory that a state of non-separation is the very beginning of human activity and explains that these quotations are direct transmission of the words in mind that emerge in the moment. Such quotations function as an interactional modality that directly invites the listener into the world of the speaker’s experience and induces the listener to experience it with the speaker.

The characteristics of the quotations observed in this study share similarities with *Waza Gengo* or the ‘Language of Craft’. It is defined as the ‘language that encourages the sharing of bodily-based sensations that cannot be expressed in scientific language’ (Ikuta and Kitamura 2011), and it enables the listener to relive the speaker’s experience. This is the language used in the transmission of traditional Japanese performing arts and has recently been applied in educational settings in Japan. Finally, this study suggests that communicating by quotation has an affinity with traditional Japanese culture and education, thereby it is familiar to Japanese speakers.

Habitual practices of gender presentations in Japanese society: How young and middle-aged generations self-disclose and react on Instagram

Panel contribution

***Prof. Ayako Namba*¹, *Ms. Yuka Nishiyama*¹, *Prof. Masataka Yamaguchi*²**

1. Kwansei Gakuin University, 2. Kobe City University of Foreign Studies

The new media', including the Internet, allow people to shape 'a wide range of non-mainstream identities' (Khosavinik, 2014: 287) resonating with voices of minority-group people; women's voices are no exception. 'Self-presentation' (Goffman, 1959) on Social Networking Sites (SNSs) covertly affects the 'presenters' and 'followers' in constructing gender ideology. Self-disclosure is a key source of a resonant relationship between them while revealing perspectives on gender roles in society. However, much room remains to examine interconnections between self-presentation and self-disclosure in the new media as reflecting gender ideology in society. This paper explores how female fashion models maintaining profiles and updates on SNSs achieve their self-presentations through self-disclosure, how their followers react to them, and how they build 'togetherness' through exchanges which covertly reflect their shared perspectives on gender ideology. In comparing two different generations, the young (20s) and the middle-aged (30s–40s), this paper investigates how each generation undertakes self-disclosure and considers how such a treatment distinctively affects both gender-related presentations and their evaluations, revealing through 'emancipatory pragmatics' the construction of gender ideology in Japanese society, drawing on the notion of 'primary *ba*', defined as "b^{asho} of absolute nothingness" (Hanks et al., 2019: 3).

We selected eight fashion models with Instagram accounts who have contracted with major fashion magazines. The data comprise: 1) updates and profiles including text messages and emoticons with the relevant photos posted by those models; and 2) reactions including texts and emoticons posted by their followers. They were collected between 1 September 2021 and 30 September 2022.

The first type of data were categorised based on the relationship between self-disclosure and social space and compared between generations. Posted updates were classified as 'public self' (public relationships) or 'private self' (personal relationships; Bernland, 1975). Self-disclosure by the younger generation was less likely, given the public nature of their self-presentations than for the middle-aged, whose followers preferred posts on their private lives.

The second type of data concerned the followers' reactions to the posts. Findings indicate that the major types of reactions were complimenting and synchronous reactions, strongly reinforcing 'attraction' (attributed to the presenters) and linked to 'evaluation' (Hayes, 2018). To discover factors of such evaluations, we analysed the followers' reactions in terms of physical attractiveness, similarity, familiarity, and fallibility. The reactions of the young-aged mainly concerned physical attractiveness, while those of the middle-aged involved sharing the dilemmas and struggles in their lives.

We then discuss in greater detail how the relationship between the posted presentations and their reactions exerts a huge impact on gender ideology in society through the notion of 'primary *ba*'—"a way of model[ing] something like contextual embedding" (Hanks et al., 2019: 3). We argue that the reactions shape a habitual practice that constructs gender ideology more broadly in Japanese society, and propose that a single voice can shape the collective voice of the society dynamically yet covertly. Thus, the reactions reflect an invisible practice strongly rooted in everyday communication as a key source of 'primary *ba*'.

Interactional Functions of ‘Deferential’ ‘-supnita’ in Korean Conversation

Panel contribution

Prof. Myung-Hee Kim¹

1. Hanyang University, ERICA

As the hierarchical structure of modern Korean society has flattened, the complex system of honorifics in the Korean language is undergoing rapid changes. For example, ‘-yo’, a so-called informal polite marker, is widely used, and other polite markers are disappearing or picking up other pragmatic functions. In contrast to ‘-yo’, ‘-supnita’, a so-called formal ‘deferential’ marker, is mainly used in formal and uni-directional scenes such as news reports, lectures, and wedding vows. Examining a Korean talk show, Brown (2015) claims that ‘-supnita’ is used as a resource for indexing presentational and performative stances of authority and to mark talk as public or ritualistic.

In line with these findings, this study aims to show how speakers use ‘-supnita’ in conversation to create mock formal or ritualistic scenes and add a comical element to their interactions. There are two main uses of ‘-supnita’ in the data. First, it was frequently used as a formulaic expression such as greeting or thanks. Second, it was used when making a formal announcement, suggestion, or question at an important point such as the end of a conversation. These attempts to make the scene mock-formal are often accompanied by a tone and voice that pretends to be serious, and laughter between the speakers. In this way, the use of ‘-supnita’ completes the conversation and enhances the intimacy between the speakers.

Interactional Modality in Japanese verbal interaction

Panel contribution

Prof. Yoko Fujii¹

1. Japan Women's University

Interactional modality can be defined as “the use of language to express the speaker’s attitudes toward the content and the addressees in interaction.” This presentation illustrates that the Japanese language is rich in interactional modality through which the speaker shows his/her attitude toward the speech content and the addressees in communication.

Fujii (2012, 2014) conducts a comparative analysis of Japanese and English in the interactions involving problem-solving tasks in terms of the interactional linguistic features displayed by participants. The results show that the Japanese speakers interacted with each other by embedding themselves in *ba* (lit. “field”) through language use that induces the partner’s responses, situating themselves as if entraining themselves and resonating with each other. They seek understanding and agreement at every moment and need congruity at every step of the task. Thus, they show interdependent and mind-sharing interaction using rich linguistic devices that display interactional modality such as the frequent use of various question forms, final particles inducing the partner’s responses, sentence co-construction, and repetition. The results of these findings illustrate that Japanese employ various kinds of linguistic practices of interactional modality to show their attitude toward the addressee in communication. This pattern of interaction results in a state of self-other non-separation, where the speaker and the addressee embed themselves in *ba* and resonate with each other, and the boundary between self and other disappears. In this sense, it is a *ba*-oriented type of interaction. In other words, it is more inclined to Primary *ba* (Hanks, et. al, 2019), an interactive context of mutual dependence, impermanence, and non-separation. Thus, it is different from the widely-accepted pragmatic concept of “context” in Western-based pragmatics.

Based on this finding and assumption, this study further demonstrates rich linguistic practices of interactional modality in the Japanese language, focusing on the speaker’s attitudes toward both the content and the addressees in interaction. The Japanese language employs abundant morphemes to express the speaker’s feelings and attitudes toward events that involve, for example, “giving/receiving” verbs implying indebtedness to the addressee, auxiliary verbs implying the speaker’s disappointment or pleasure with regard to unexpected consequences, modal expressions relating to territory of information, and final particles illustrating the speaker’s identity and politeness toward the addressee. Although Japanese does not require obligatory representation of the agent, it has rich linguistic resources to express the agent’s/speaker’s attitude and emotion toward events and the listener to maintain resonance and entrainment in the interaction.

The fun of repeating: How Japanese speakers jointly engage in conversational playfulness

Panel contribution

*Dr. Saeko Machi*¹

1. Rikkyo University

This study examines how Japanese interactants repeat each other's humorous expressions to jointly engage in conversational playfulness, and hence create an interpersonal connection. Repetition of another's utterance, or cross-speaker repetition, is prominent in Japanese conversation, fulfilling various important functions to manage a smooth conversation as well as interactants' harmonious relationships (Machi, 2021). This study focuses on its yet underexplored aspect—the entertaining aspect—to underscore the significance of the device in Japanese conversation.

Previous research on humor has claimed that Japanese humor is different from that of American or British English in terms of the context where humor is produced, its purpose, as well as the rhetoric. According to Takekuro (2006) and Oshima (2013), while English jokes appear in formal business settings or even between strangers as well as close friends, Japanese jokes appear only within close personal and familial relationships. As for the purpose of jokes, it has been reported that English jokes are told as an ice breaker or expression of identity and sense of humor, whereas Japanese jokes and humor are shared among close friends to index and reinforce their solidarity (Oshima, 2013; Zawiszová, 2021). Additionally, what is equally noteworthy is the rhetorical difference between Japanese and English humor. According to Takekuro (2006), in English jokes, speakers creatively and wittily introduce new informational material in the punch line to make them humorous. In Japanese jokes, in contrast, interactants pay close attention to words and phrases used in each other's previous utterances and refer back to them to make a joke or a word play. This rhetorical difference is meaningful as it suggests that cross-speaker repetition might be a key device in understanding Japanese style of humor.

To build on the previous research, this study analyzes cross-speaker repetition in seemingly playful exchanges, utilizing six triadic conversations taken from a Japanese TV talk show. The study demonstrates how Japanese interactants, instead of using ready-made jokes or imaginative jokes that have a different context, jointly engage in playfulness by closely attending to each other's humorous expressions that are rooted in the given *ba* (space) of a conversation and sharing them in the form of repetition. The study shows that cross-speaker repetition performs in five different ways—1) tease, 2) reaction to a tease, 3) savoring echo, 4) developing humor, and 5) enjoyment of repetition. By employing these five types of repetition, interactants interweave their playful utterances and jointly create a lively and amusing atmosphere as well as a sense of connectedness among themselves in an ever-shifting flow of conversation. The study further explores why the device of repetition, which is often associated with boredom in some Western languages, can be entertaining and conducive to interactants' interpersonal connection in Japanese by referring to the concept of *ba* and its related ideas of mutual dependency and non-separation of self and other. The study reinforces how Japanese interactants value the state of oneness or connectedness in the given space of a conversation and pursue it through cross-speaker repetition.

The Usage of Self-reference Terms in Japanese: An Interpretation Based on Ba Theory

Panel contribution

*Dr. Kishiko Ueno*¹

1. Tokyo City University

The Japanese language has a variety of self-reference terms (corresponding to “I”), such as *watashi*, *watakushi*, *boku*, and *ore*, each differing in social indexicality, the choice of which depends on the speaker’s age, gender, topics, and situations where they are used. This study regards the speaker’s choice of self-reference terms as a representation of “interactional modality” and explicates it in terms of *ba* theory.

As the panel proposal indicates, the concept of interactional modality assumes that “speakers employ language to express not only propositional content but also their own attitudes toward the content and their addressees” and, more importantly, emphasizes that “such attitudes are highly ephemeral and constantly in flux as interaction unfolds.” This approach is based on *ba* theory, which assumes “all aspects of contexts starting in a state of non-separation” and thus allows us to explore how taken-for-granted self-other distinctions “emerge from and sometimes dissolve through social interaction.”

The current study analyzes some excerpts of conversation in which shifts in self-reference terms are observed. One of the excerpts to be analyzed comes from a TV program in which Hanyu, the winner of the 2018 Winter Olympics figure skating competition, and Uno, the runner-up, are being interviewed by the presenter. Hanyu intuitively shifts his choice of self-referent terms between *boku* and *ore*. Both terms are used mainly by men, but *ore* sounds more masculine and is often used in casual situations with an equal or junior partner, while *boku* sounds more neutral and can be used even in formal situations with a superior partner. Hanyu’s usage of *boku* and *ore* accords with the ever-changing context of the interview, representing interactional modality—that is, his constantly changing attitudes toward the propositional content, the addressee(s), and the assumed audience behind the camera. Based on *ba* theory, this phenomenon can be further explicated in terms of the articulation of self and, thus, the emergence of self-other distinction, which underlies all language use and social interaction.

Why Emancipatory Pragmatics, Why *ba*-theory, and why interactional modality?

Panel contribution

*Dr. Scott Saft*¹

1. *University of Hawai'i at Hilo*

This presentation explains why the major concepts promoted through this panel, particularly, Emancipatory Pragmatics, *ba*-theory, and interactional modality, are essential to extending our understanding of language usage within the field of Pragmatics. Toward such an explanation, the presentation features a critique, more generally, of the approach to context commonly employed in pragmatic research and, more narrowly, of the conception typically adopted of the individual as an autonomous social actor that is easily distinguishable within a context. It will be argued that such an approach, which derives from Euro-American thought, serves as an impediment to achieving a deeper grasp of how language is used throughout the world's languages.

As an alternative, this presentation offers *ba*-theory as an approach to context that views all aspects of any situation, including people, as beginning in a state of non-separation and nothingness. *Ba*-theory derives from the Japanese concepts of *ba* and *basho* (both usually translated into English as "field" and/or "context") and possesses a "consciously Asian register" that links to both Zen Buddhism and Chinese Buddhism (Hanks et al., 2019). It is particularly this side of *ba*-theory that distinguishes it from Euro-American thought and that encourages a *ba*-theory approach to context to consider interaction, including the individual bodies and identities of the participants, as emergent from states of non-separation, nothingness, and impermanence. *Ba*-theory, it is argued, also requires researchers to extend beyond concepts such as discourse modality, which typically see language as generated from individual speakers, to an interactional modality that examines language and non-verbal behaviors as they emerge from *ba*. A concept such as interactional modality, it is argued, is essential to our understanding of the processes through which language and linguistic categories emerge from social interaction.

To support the claims of this presentation, examples are given from two non-Euro-American languages, Japanese and Hawaiian, to demonstrate that aspects of language, particularly pronouns and possessive forms, can leave speakers in states of non-separation within an unfolding *ba*. Additionally, the argument is made that *ba*-theory and interactional modality have the potential to widen our understanding of the way interaction works in a Euro-American language such as English. Through these examples, this presentation hopes to facilitate a critical discussion of context that will advance the agenda of Emancipatory Pragmatics, namely, to attain a more comprehensive understanding of how language is employed in the diverse set of languages that populate the world.

Conversational repair in child-adult interaction of children speaking L1 or L2

Panel contribution

*Prof. Minna Laakso*¹, *Ms. Minea Tikkanen*¹

1. University of Helsinki

This paper compares repair organization in child-adult interaction involving children who were using Finnish as their first (L1) or second (L2) language. Five of the children were monolingual and five multilingual with immigrant background. Multilingual children had lived in Finland for at least two years, and were attending Finnish speaking day care. All children were videotaped for one hour in dyadic interaction with an adult who was a native speaker of Finnish. The data (10 hours) was studied using ethnomethodological conversation analysis. In the analysis, self- and other-initiated repair phenomena were identified and annotated with ELAN software. Also embodied visual practices during conversational repair sequences were annotated and examined.

Preliminary results of the analyses showed more trouble sources and repair sequences in the interactions of children using L2 compared to children using their L1. Repair sequences were also longer in L2 interactions. In L1 interactions 2/3 of repair sequences were swift self-initiated self-repairs within one turn, whereas in L2 interactions 2/3 of repair sequences took four or more turns. Regarding self-repair, word searching was common by children speaking L2, whereas L1 children most often self-repaired their speech by replacing, abandoning, or adding. Adults made other-initiations of repair more often with children using their L2 than L1. L2 children responded to adults' other-initiations by repeating their prior turn, or accepting the candidate offered by the adult, whereas L1 children also clarified their prior turns in more detail. The linguistic construction of speaking turns was the most common trouble source both in L1 and L2 interactions.

Regarding embodied practices during repair sequences, descriptive hand gestures were much more frequently used by children using their L2 compared to children using L1. Similarly, adults interacting with L2 children used hand gestures and other multimodal resources more often than adults interacting with L1 children. This finding suggests that embodied visual practices may enhance intersubjective understanding in L2 interaction. Typical combinations of embodied and linguistic repair practices in L1 and L2 interactions will be the main focus of the presentation, and their significance for developing language will be discussed.

Embodied and linguistic repair practices in in non-institutional play and language assessment by 5 to 6-yers-old children with developmental language disorder and typical language development

Panel contribution

Dr. Inkeri Salmenlinna¹, Prof. Minna Laakso¹

1. University of Helsinki

This study focuses on self- and other-initiated repair practices in child-adult interaction involving children with Developmental Language Disorder (DLD) and typically developing children aged 5 to 6 years. The data consist of videotaped play interactions (child-parent) and language assessment interactions. All repair sequences in which children used self-initiated self-repair (SIR) or other-initiations of repair (OIR) were identified following the conventions of conversation analysis (based on turn units and sequential structure of the conversation). All repair sequences were annotated following the annotation template developed in the COMPAIR research project (2020-2024). The template included verbal turn units, the length of repair sequences (number of turns and duration), parts of the repair sequence, the types of SIRs and OIRs, gaze, and gestures of face, body and hands. Both quantitative and qualitative analysis were utilized to compare children's SIRs and OIRs in different interactions.

The distribution of SIR and OIR indicates that SIR was more common than OIR both among children with DLD and with typical development. However, children with DLD used more and longer SIR than typically developing children in play interaction. This can be explained by the difficulties that children with DLD have in word finding and speaking. In non-institutional play interactions, all the children used OIRs in a similar way. The problems were solved smoothly: The OIR sequences consisted mainly of a short insertion sequence of two turns. In language assessment children with DLD used more OIRs than in non-institutional play, and the use of embodied means as part of the OIR was more common. There was also a difference in the problems that the children with DLD were dealing with in non-institutional play interaction and in language assessment sessions. These findings indicate that children's use of SIRs and OIRs might partly reflect the problems they face in different interactions.

Using video-based motion tracking to track movement during repair practices in child-adult interaction.

Panel contribution

*Dr. Satu Saalasti*¹, *Dr. Jaakko Kauramäki*¹, *Prof. Minna Laakso*¹

1. University of Helsinki

Problems of mutual understanding in natural conversation may be repaired with embodied (also called multimodal, visual bodily or embodied) practices. Recent research suggests that there are subtle differences in embodied repair practices during self- (SIR) and other initiated repair (OIR). In OIR-sequences the embodied focus is on upper body, head, facial expressions and gaze. In SIR, and in word search in particular, hand gestures are more typical. Interestingly, the embodied practices occur early in the repair sequence, in SIR even pre trouble source. However, some more holistic phenomena may be difficult to examine with human eye, for example inter-personal synchrony of movement or kinematic entrainment. Recently, video-based motion tracking methods have become more common in studying movement in interaction. We aimed to find out how to take advantage of these advancements to complement theoretically informed conversational analytic information. First, we aimed to study if movement of dyads in real-life videos can be quantified with machine learning based algorithm. Furthermore, we explored whether movement in repair sequences differed from movement in other kinds of interactional sequences.

Data were two corpuses of dyadic adult-child interaction. In the first datasets eight parent-child dyads were filmed twice (16 videos) while reading the same book (duration 3–5 min) and in the second dataset 20 videos (10–12 min) of parent-child dyads were playing with a playhouse. The videos were annotated with ELAN software according to a template developed for COMPAIR project, and these annotations were used to identify time points of linguistic repair sequences, both SIR and OIR. Then we estimated the poses of individuals in the videos by running OpenPose pipeline (Cao et al., 2018), which recognizes the poses of humans frame-by-frame. The data obtained by the algorithm was further processed to extract the movements of the child and the parent. This allowed us to investigate the dynamic change of children's and parents' poses, individually and how postural attributes relate to each other. Next, these data were combined with annotations, to explore movement 10 s before repair onset and 10 s after repair offset.

In the presentation we will share our experiences in utilizing machine learning based pose estimation algorithm to quantifying movement related to embodied practices during repair sequences. We also share some recommendations for optimal video recording enabling successful analysis. We found that hand and body movement can be reliably estimated. When we examined how the postural attributes were related to each other, we found that the combined activation of parents and children was somewhat heightened 10 s prior to repair onset. We conclude that using video-based motion tracking presented here may complement findings from human annotated conversational analysis.

An interaction among governmental policies, communities and individuals with developmental difficulties in England

Panel contribution

*Dr. Kyoko Aizaki*¹

1. Japan Society for the Promotion of Science

In many countries, the population of individuals identified with ASD has been growing. However, research has established that adults with ASD, including those with and without accompanying intellectual impairment, are at risk of experiencing high rates of unemployment and social isolation when compared to individuals with other disabilities or those without a disability (Hedley et al. 2016). This had led governments to set out social policies to support this population and their access to education, employment, and society in general. What remains unclear is how such policies are experienced by the individuals and families they are intended to support.

The researcher interviewed four adults with ASD and four parents who have children with ASD in the UK, which has established provisions for individuals with ASD. These covered their personal experiences of having, or being a parent to someone with, ASD, such as [1] diagnostic process, [2] impacts on relationships with their relatives, friends or colleagues, [3] financial situation including employment, and [4] education. The interviews were transcribed and analysed thematically to identify recurring themes, topics and ideas. From this analysis, salient social aspects which impact on individuals with ASD were identified. It explores, for instance, the relationships between this group and local communities and peer groups within other communities.

The findings suggest that the diagnosis system and its costs, both financial and logistical, are borne by individuals with ASD and/or their families. The families of people with ASD may limit opportunities to socialise with other local community members and/or may even be discriminated against by the community. They reported a struggle to find employment, insufficient employment support and, consequently, problems with coping financially. The major consequence of this was that they were prevented from living independently. This created a gap between the aspirations of the policies and their outcomes. However, a further consequence of such experiences was that they motivated the creation of groups and communities among individuals with ASD. Consequently, these individuals with ASD and their parents were positioned as either representatives of, or powerful decision-makers, of informal networks beyond legal provision.

Bodies, languages, and other material conditions on migrant students' interactions in Brazilian High Education

Panel contribution

Prof. Joana Plaza Pinto¹

1. Universidade Federal de Goiás

This paper discusses a theoretical and analytical basis to approach how bodies and languages are involved in the material conditions of interactions. This approach was developed during a longitudinal ethnography on the interconnections of bodies and daily basis metapragmatics among migrant students in Brazilian High Education. The students migrated through a cooperation program between Brazil and Global Southern countries, in which they undertake full undergraduate studies at Brazilian public universities free of charge. Although the majority are non-white women, the profile is diverse in terms of countries of origin, undergraduate courses and known languages. During the collaborative activities registered in the ethnography, the analysis showed the interaction is regulated by heterogeneous parameters, which dispute the meaning and legitimacy of languages and bodies uses and establish material resources' hierarchies of interpretation. This regulation creates conditions to permissions, stimuli, interdictions, or punishments of practices in the migrant students' networks. By analyzing the migrant students' interactions, this paper argues that the material conditions are differently distributed in global populations. Geopolitical and historical dynamics affect bodies, affect the intersubjective and interactional processes of bodies, and together they all affect acts of speech that only exist because of bodies. This means language is triggered, but other material resources may be more important in a given interaction – bodies, objects, spatiality &c. These decisions are not made in a homogeneous way by all the people participating in the interaction, since the control of decisions about what counts as an interpretable resource in a given interaction depends on power structures, interests, previous hierarchies, and differences at play. Following these analytical insights, several categories are brought together from different fields to approach the metonymic relation between languages, bodies, and other material conditions in interaction. A pragmatic basis for language materiality (Scollon & Scollon 2003; Silverstein 1993, 2003) and a feminist approach to bodies constructions (Anzaldúa 1999, Butler 2004, Povinelli 1999, 2011) are the key fields for this critical endeavor, helping to re-thinking the conditions governing the interaction with alternating patterns in the modern/colonial world-system (Wallerstein 2004). These patterns are structured layers: 1) of geopolitical and historical dynamics that work on the body; 2) of intersubjective and interactional processes that make the body work; and 3) of linguistic processes that depend on the body to work.

Emerging intersubjectivity in multicultural interactions: The diversification of interactional resources in second language Spanish

Panel contribution

Mr. Victor Garre Leon¹

1. The University of Texas at Austin

This study investigates the developmental trajectories of second language (L2) learners' interactional resources occurring in interactions with native speakers (NSs) of Spanish. Focusing on the emergence of intersubjectivity between interactants following EMCA (ethnomethodological conversation analysis) and discursive-pragmatics approaches, I analyze language acquisition as it emerges through use in interactions with others (De Bot, Lowie, & Verspoor, 2007). Despite many qualitative studies after the 'social turn' (Block, 2003; Firth & Wagner, 1997) in second language acquisition (SLA), there is a dearth of research on the development of interactional competence from a socially-oriented perspective, and research dealing with longitudinal perspectives on intersubjectivity has only recently started to appear (Lindström, Laury, Peräkylä, & Sorjonen, 2021; Pekarek Doehler & Eskildsen, 2022). By analyzing how meaning in talk-in-interaction is co-constructed and jointly achieved by participants to establish common ground (Clark, 1996), and following the call to study L2 interactional competence from a longitudinal perspective (Pekarek Doehler & Berger, 2018; Pekarek Doehler & Eskildsen, 2022), I submit that research on L2 social interaction should investigate what resources both L2 and native speakers deploy in interaction as they develop a dialogic 'habitus' over time (Bourdieu, 1977). As such, this presentation sheds light on how Spanish L2 learners' interactional competence resources develop to co-construct a so-called 'sphere of intersubjectivity' (Kramsch, 1986) with their interlocutors. Because intersubjectivity must be "achieved, monitored and maintained in the sequential course of interaction" (Sorjonen, Peräkylä, Laury, & Lindström, 2021, p. 19), in this presentation I show how it emerges in multicultural interactions by analyzing L2 learners' resources to employ (i) appropriate speech acts, (ii) turn-taking, (iii) topic management, and (iv) repair strategies in the interaction. The **research questions** guiding the study are the following:

1. How do interlocutors establish and maintain intersubjectivity in multicultural settings over time?
2. How are interactional resources exploited in the process of establishing intersubjectivity in interaction?
How do these resources evolve over time in L2-NS interactions?

The study **design** is longitudinal in nature, comparing six intermediate-level L2 Spanish learners speaking with native speakers. Each dyad completed four semi-elicited conversation tasks (Nguyen, 2017, 2019) collected throughout a semester to account for a stepwise progression of interactional resources over multiple collection times. The qualitative data were analyzed with the software *NVivo* using conversation-analytic tools (Schegloff, 2007; Schegloff et al., 1977).

Results showed L2 learners' functional diversification of interactional and multimodal resources over time, revealing how these speakers gradually deployed interactional strategies to carry out more effective sequences in acts involving requests, humor, listener responses, and postures as they become familiar with their NS interlocutors. Over time, L2 learners expanded their strategies to deploy more extended turns at talk to avoid interactional trouble, showing also how the interlocutor shaped the learners' talk and identity to promote intersubjective understanding during the interactions. These findings have implications providing further understanding of language learning and language use as a situated and co-constructed social practice, where being interactionally competent in another language entails engaging in joint action with others in locally adaptive ways.

Multimodal construction of pretend play interactions in kindergarten children

Panel contribution

*Dr. Valentina Fantasia*¹, *Dr. Arianna Bello*²

1. Lund University, 2. Università Roma 3

Pretend play is usually defined as an activity wherein objects and actions (but also affective expression, at times) are separated from their original meanings. Its developmental appearance is set around the second year of life, when kids show brief pretend gestures and engage in object substitutions (Jackowitz, Watson 1980). Pretense then increases dramatically in duration, frequency and quality when play episodes start becoming more complex, both linguistically and interactionally (Piaget 1945), to reach its peak in preschool years (Smith, Lillard 2012). From a sociocultural perspective, imaginative play is regarded as a fundamentally social and culturally constructed activity (Gaskins 1999, 2013); an activity in which imaginative or make-belief realities are built upon and developed through the shared coordination of meanings (Giffin 1984). Within this perspective, the broadest socio-cultural environment shapes the quality and content of the pretense scenarios, crafting ways and opportunities to participate in it. To date, however, little attention has been devoted to investigating the developmental foundation of pretend play such as early non-verbal pretense activities among toddlers (Fantasia & Nomikou, 2022).

Our study focuses on early social pretend play, aiming at investigating early spontaneous pretend play interactions occurring in two small groups of Italian kindergarten children (aged 20-28 months) during six observation sessions (31 episodes in tot). Along with behavioural descriptions of the most frequent social pretend activities children engaged in (e. g. cooking with toy food and utensils, nursing and caring for babydolls, or play pretend characters by using clothing to dress up), we used multimodal micro-analyses on video-recorded group interactions to uncover children's use of non-verbal resources (gestures, facial expressions, spatial configuration, verbalization) to coordinate play episodes, e.g. in terms of negotiation and repairs.

Our preliminary results showed two distinct aspects in how children engaged in and managed the pretend play episodes: 1) in different degrees, all children in the two groups individually played with pretend toys in functional ways, that is, they used objects in their standard function (e.g., cooking or eating toy vegetables in pans or plates). However, they rarely engaged others on this type of play. At the same time, however, 2) episodes of parallel pretend play, wherein children played with toys on their own but willingly coordinated actions and communications in a shared interactional space, emerged frequently and lasted longer. In particular, we found that children displayed a wide array of multimodal resources to negotiate not only what toys they chose or used, but also the shared spaces (e.g. the toy kitchen, the dressing/costumes area) in sequentially organised, situated ways. For instance, they did so by making relevant or sustaining particular participatory frameworks over others, thus constructing shared play spaces and formats; by re-cycling and building on others' previous moves or behavioural displays; by verbally marking transitions from one activity to one another. These findings seem to support a view of social pretend play as an early social activity constructed through situated and embodied shared meaning-making practices.

Prosodic variations in everyday interaction and how they guide social decision-making

Panel contribution

Dr. Jonathan Caballero¹

1. Independent Researcher

Prosody refers to the set of suprasegmental cues in speech and can provide a plethora of relevant information to guide social interaction in everyday life. The richness of social cues that it conveys makes it a fruitful area of inquiry to understand better how and why we react to these seemingly “hidden” cues, and how they influence the way in which people regulate their social behavior. This work summarizes common types of socially relevant information that prosody conveys in everyday interaction and describes how game theory and experimental games – widely used theoretical and methodological approaches in cognitive science and behavioral economics – can be used to test the effects of prosody on social interaction. Because these methodologies intend to model key characteristics of social interaction, such as the interdependence of outcomes of interacting social agents, they constitute a flexible methodology that can be adapted to simple and complex experimental designs in basic research and applied scenarios. To illustrate it, we summarize the results of studies using this approach to research a) how emotional cues in prosody influence listeners’ behavioral tendencies, b) how accents influence listeners’ social behavior towards the speakers, and c) how individuals with Parkinson’s Disease use social information conveyed by prosody to guide social decision-making. Because it is intended to provide a concrete illustration of how experimental games can be adapted to study a variety of topics, we focus on key considerations for using this methodology to tackle linguistic and pragmatic research questions rather than going in-depth into the minutiae of the examples themselves.

When a proposal is rejected: Distributing deontic rights in emergency care team interactions in Japan and the UK

Panel contribution

Dr. Keiko Tsuchiya¹, Prof. Kyota Nakamura², Prof. Frank Coffey³

1. Yokohama City University, 2. Yokohama City University Medical Centre, 3. Nottingham University Hospitals NHS Trust

Emergency care involves dynamic complexity, where a multidisciplinary team collaborates to conduct medical procedures, making numerous decisions for ascribing joint actions under time pressure. Joint decision making in team interaction is key to successful health care as described with the terms, *team talk* (Sarangi, 2016) and *collective competence* (Lingard, 2012). In such context, the leader's rejection to a colleague's proposal could happen, which could be face-threatening (Brown & Levinson, 1987; Goffman, 1955).

In line with the argument, this panel presentation reports a multimodal analysis on team interactions in emergency care simulation in two different sociocultural contexts, Japan and the UK, capturing the moment when a team leader rejects a member's proposal of future actions. Drawing on the notion of deontic authority (Stevanovic & Peräkylä, 2012), the negotiation of their deonticity and epistemicity in interprofessional (intercultural) communication is cross-culturally investigated.

Four simulation training sessions (two each in both sites) were filmed with video cameras and an eye-tracking device, which was worn by the team leader. In the four data sets, about 50 occurrences of members' proposals were identified, most of which were accepted by the leader, distributing the agency and deontic rights to team members. On few occasions, members' proposals were rejected, most of which accompanied the leader's accounting, displaying his epistemic primacy and deontic reasoning. With providing accounts, the leaders seemed to simultaneously reassure the proposers' legitimacy and responsibility to contribute to joint decision making, which is a shared practice observed in the trauma team interactions in the two distinctive sociocultural contexts. However, a difference in the team dynamics was foregrounded through the practices of the Japanese and the British leaders' rejection; the deontic rights were *given* to a proposer in the former while they were *distributed* by the leader in the latter.

Change and variation in address terms during oral arguments at the U.S. American Supreme Court

Panel contribution

Dr. Elisabeth Reber¹

1. *University of Bonn*

On the official website of the United States Courts, the opening of an oral argument at the U.S. American Supreme Court (SCOTUS) is described as follows: “After the Court is seated, the Chief Justice acknowledges counsel for the petitioner, who already is standing at the podium. The attorney then begins: ‘Mr. Chief Justice, and may it please the Court’” The website continues: “Only the Chief Justice is addressed as Mr. Chief Justice. Others are addressed as ‘Justice Scalia,’ ‘Justice Ginsburg,’ or ‘Your Honor.’” (<https://www.uscourts.gov/about-federal-courts/educational-resources/about-educational-outreach/activity-resources/supreme-1>) This quotation shows that in oral arguments, terms of address should be used in normative ways defined by the institution. In the history of English, nominal terms of address have been generally described as resources to calibrate interpersonal relations, ranging from “nicknames and terms of endearment” to “terms of abuse” and “formal terms of address”, and have been considered as markers of in/formality and im/politeness (Taavitsainen / Jucker 2016). The study of institutional interaction has found that nominal terms of address serve functions depending on the speakers’ institutional roles, e.g., in news interviews (e.g., Clayman 2012, Margutti 2022, Rendle-Short 2007).

This paper offers a diachronic, interactional study of the forms and functions of address terms in SCOTUS oral arguments and examines how these verbal practices of address may have undergone change between 1960-2019. The analysis is grounded in a self-compiled, machine-readable database of audio recordings and corresponding transcripts which allows for a mixed approach involving corpus-linguistic and interactional linguistic methodologies. A first analysis revealed a varied set of nominal address terms for 1) justices: honorifics (“Your Honor”, “Sir”, “Ma’am”), professional title (“Judge”), Mr + professional title (“Mr Chief Justice”), and professional title + surname (e.g., “Justice Ginsburg”), 2) counsels: Mr / Ms + surname (e.g., “Ms Blatt”), and professional title (“Counsel”), and 3) collective reciprocity (“gentlemen”). Based on these observations, we ask: What is the distribution of these nominal address terms? Have they changed in terms of their relative frequency and use since 1960? Specifically, how do the counsels address the Justices? The data suggest that the use of professional titles such as “Mr Chief Justice” shows a higher relative frequency than that of the honorific “Sir” and a greater increase over time. These address terms tend to be used together with minimal response tokens (“Yes / No, Sir”) or in ritualized structures (e.g., “(Thank you) Mr. Chief Justice, and may it please the Court”) in the question-answer sequences during the oral arguments.

Connecting socio-cultural developments and language change: Recent variation in gender-inclusivity in the USA and the UK

Panel contribution

Ms. Hanna Bruns¹

1. *University of Bonn*

Linguistic studies on the topic of gender-fair address and reference indicate that attitudes are becoming more positive (cf. Sarrasin, Gabriel & Gygax 2012) and that gender-inclusive forms are used more frequently over time (e.g., Baranowski 2002). Furthermore, variational studies indicate that AmE is more conservative than BrE in regards to their use (Adami 2009). This development is often discussed in the context of socio-cultural changes: e.g., Baker (2010: 144) connects his results on changes in gendered address to Mair's (2006) idea of democratisation and colloquialisation.

This study aims at making this connection more explicit: in order to find out how the development of gender-fair language use compares across cultures and over time, the frequencies of generic referentials, pronouns, and gendered occupational titles are traced in a corpus study. To further shed light on any trends from the quantitative analysis, the data will also be examined through a qualitative lens. Then, developments in the use of individual forms are contextualised by tracing changes in socio-cultural norms regarding specific groups (e.g. police officers).

The corpora used for the analysis belong to the BROWN family corpora: first, a small, balanced sample-corpus of the BROWN family corpora is examined, and then the full versions of the corpora: BROWN & LOB (1961), FROWN & FLOB (1991), and BE06 & AME06 (2006) as well as the newly created BE2021 (2021). Socio-cultural developments regarding specific groups of people are traced by making use of official statistics and public debates on the topic.

The results indicate that the use of gender-fair language is very much context- and item-constrained and that developments in BrE and AmE previously observed may need to be re-evaluated from this more context-bound perspective. One such instance is the use of gender-inclusive pronouns and occupational titles: while the trajectory of use of inclusive singular *they* has been rising steadily since the 1960s in both cultures – with BrE in the lead, BrE turns out to be much more conservative than AmE when it comes to the use of inclusive occupational titles. What is more, the analysis reveals that individual occupational terms behave very differently even within one culture. The look into socio-cultural developments regarding specific groups may help to determine reasons for the change in use of certain terms and structures.

Democratization effects on nominal address terms – Sir and Guys in 20th and 21st century American English

Panel contribution

***Prof. Svenja Kranich*¹, *Ms. Hanna Bruns*²**

1. Universität Bonn, 2. University of Bonn

Democratization, a tendency gaining ground since the 1960s in many societies, tends to be reflected in linguistic practices that increasingly avoid stressing hierarchical differences (cf. Farrelly & Seoane 2012: 393) and may thus be visible, among other areas, in a decline in formal address (titles and last name) and an increase in more colloquial forms of address (cf. Leech 2014: 293).

The present paper focuses on general changes in the use of generic address and reference terms, such as *sir*, *madam*, *dude*, for singular addressees, and *ladies and gentlemen*, *guys* for a group of addressees using the Corpus of Historical American English (focusing on the 1900s-2010s). The first hypothesis, that formal terms are decreasing and informal terms are increasing, is clearly borne out: comparing 1900-1909 to 2010-2019, *sir* decreases by more than half, while *guys* rises dramatically from 0.55 to 241.36 per a million words.

Our second hypothesis posits that this is due to a loss of acceptable contexts for more formal terms and an increase of contexts where informal terms have become the norm, both occurring as a consequence of democratization. Based on a random sample of *sir* and *guys* from different decades (1900, 1930, 1960, 1990, 2010 – each 200 instances per term, with a total of around 2000 instances), we have classified speaker-addressee relations, based on Buyle (2021), to investigate the type of power and distance relation that exists in speaker-addressee pairings. The qualitative analysis conducted supports the hypothesis of an ever-increasing range of situations in which *guys* is acceptable, showing its trajectory from an informal and highly colloquial address term in the early 20th century to a term acceptable in various neutral contexts in present-day American English. At the same time, we can observe a growing restriction in the range of acceptable contexts for *sir*, the latter moving from very wide-spread in all types of constellations to its restricted niche of +P interactions, especially formal power contexts, such as the military or police.

Hi bestie! Address terms in communication between fashion companies and their customers on Instagram

Panel contribution

*Dr. Minna Nevala*¹, *Dr. Hanna Limatius*²

1. University of Helsinki, 2. University of Vaasa

In social media discussions, people are often categorized on the basis of positive and negative values, beliefs, or practices into disparate sociocultural groups (cf. Moscovici 1984; van Leeuwen 2008). In this paper we will study how Instagram (IG) creates social circumstances for interaction between companies and customers, i.e. the ways in which three fashion brands address their customers in IG comments and captions. We focus on politeness theory, and positive politeness markers such as the use of first names, nicknames and friendship/endeavour terms (cf. Brown & Levinson 1987; Nevala 2010). In addition to claiming common ground, the speaker usually wants to convey that the speaker and hearer are cooperators. In other words, positive politeness involves showing in-group membership, and it is one of the linguistic strategies IG posters commonly use to approach their followers. In general, friendliness and involvement are an important feature of understandings of politeness particularly in the context of Anglo-centered social media (Culpeper, O'Driscoll & Hardaker 2019).

Our data consist of IG posts collected from the official accounts of three international fashion brands that promote their products in English. The dataset includes all IG posts (including feed posts, reels and responses to comments) published by the brands *Princess Polly* (Australia), *Adore Me* (US), and *Cider* (China), between 1 September and 30 November, 2022. Our analysis investigates promotional language across different geographical and cultural contexts. The companies were chosen for the analysis because they utilize social media actively to engage with their customers and have a considerable following on IG (between 790,000 and 3.8m followers). Our preliminary results indicate that when fashion companies directly approach their customers in their IG posts, the majority of the terms used show positive politeness in an attempt to include followers in their in-group. Moreover, the companies participate in drawing the boundaries of this in-group by adopting language that emulates the language use of Instagram users, young adults in particular. The ways in which the companies address potential customers thus create a sense of community with a particular audience (Limatius 2020) – at the same time, however, they risk distancing themselves from customers who do not belong in the same sociocultural group.

Intercultural perceptions of endearments and regional identity in Northern England

Panel contribution

Dr. Nicole Baumgarten¹

1. University of Sheffield

The paper explores user perceptions of the usage and interactional functions of endearment ‘love’ in ‘mono-’ and intercultural communication in the UK. Data were collected through a survey questionnaire on usage and attitude towards ‘love’.

Public stereotypes of endearment ‘love’ associate the term and its use with specific regional (‘northern’), sometimes local (‘Sheffield’), socio-economic (‘working class’) and socio-ethnic (‘white’) identities, as well as with specific communicative stereotypes (‘northern friendliness’). However, there is only very little research to underpin these perceptions.

The bulk of body of research available on address forms and practice is dominated by research on pronominal and inflectional systems, and where nominal forms of address are considered, by a focus on ‘male’ forms such as for example the class of English familiarisers (‘mate’, ‘bro’, ‘dude’). While address terms in general have important functions for human sociality in that they are makers of social relationships and indexes of individuals’ rights and obligations interaction, these male nominal forms of address have been shown to be used to express affiliation with, or a reworking of, larger cultural, ethnic, or national identity constructs and discourses (e.g. ‘dude’ in American English or ‘mate’ in Australian English, Kiesling 2004; Almoradian 2014). These indexicalities can be strategically introduced by speakers in interaction in the pursuit of communicative goals.

Recent corpus-based research on endearment ‘love’ (Baumgarten 2021) suggests that ‘love’ is undergoing a pragmatic shift towards indexing disaffiliative stances and becoming more generally available as a negative evaluative token for non-normative behaviour. This indicates that the indexicalities around ‘love’ are changing and, as a consequence, that the endearment may be understood and used in different ways by different groups of people.

In order to show the extent to which endearment ‘love’ plays a role in creating local or regional identities that are played out in communicative interaction (enregisterment, Agha 2005; Johnstone 2006), this paper specifically addresses

- the current pragmatic scope of ‘love’ as understood by members of a wide range of socially and linguistically different English language user groups in the UK;
- the availability of ‘love’ for linguistic (dialect) and social/geographical stereotyping as well as speakers’ identity work;
- the degree to which ‘love’ is claimed by ‘northern’ users as part of ‘their’ semiotic register.

The informal address term system of Sri Lankan English

Panel contribution

Dr. Tobias Bernaisch¹

1. Justus Liebig University Giessen

The first contact between English and Sri Lanka dates back to the end of the 18th century. During its more than 200-year-long Sri Lankan history, English – after a short initial period of British disregard concerning organised language policymaking until the 1830s – became the official language of Sri Lanka, entering many spheres of everyday communication. Even after Sri Lankan independence in 1948 and subsequent attempts to dislodge English via the Sinhala-only policy, English remained *de facto* an official language and is currently defined as a link language in the Sri Lankan constitution.

Partly rooted in its century-long evolution, Sri Lankan English (SLE) has received notable scholarly attention. Anecdotal descriptions of the structures of SLE (e.g. Gunasekera 2005; Meyler 2007) have been complemented with corpus-based descriptions (e.g. Bernaisch 2015), but their focus has been on SLE lexis, lexicogrammar and/or syntax. As verbal negotiations with other speakers involving requests, expressions of gratitude, regret etc. represent probably the integral part of our day-to-day communication and need to follow particular culture-specific conventions to be successful, the pragmatics of SLE (and postcolonial Englishes more generally) must be considered especially responsive to indigenisation effects. Still, pragmatic research in world Englishes is still largely lacking, although noteworthy and statistically reliable exceptions exist – also for SLE (e.g. Degenhardt 2021; Funke 2022).

Against this background, this study investigates the SLE informal address term system. The spoken part of the Sri Lankan component of the International Corpus of English (ICE-SL; Bernaisch et al. 2019) is the empirical basis to explore informal address terms like *machang*, *men* or *dude* in SLE with multifactorial statistical models considering speaker- (e.g. age or gender) and context-related (private vs. public setting) factors with the aim of answering the following research questions:

- What are the frequencies of the individual informal address terms used in SLE?
- What factors influence the choice of a concrete informal address term in a given communicative context in SLE?
- To what extent can the informal address term system in SLE be considered nativised?

Localised informal address terms such as *men* and *machang* are more dominant in SLE than international forms like *bro* or *dude*, but their frequency of occurrence is particularly sensitive to speaker-related parameters, but only marginally to context. The quantitative insights are complemented with qualitative perspectives on individual informal address terms to profile the nativised facets of the informal address term system of SLE.

Can expressive meaning be negotiated? Insights from a corpus-based study on lexical expressives

Panel contribution

Ms. Mireia Cabanes-Calabuig¹

1. University of Cambridge

Expressive content is defined as a type of meaning that conveys information about the emotions, attitudes or feelings of an agent (e.g., a speaker and/or a referent) (Kaplan, 1999). Consequently, the study of expressives has put a strong focus on the speaker, with the hearer being relegated to a passive role in explorations on the meaning(s) conveyed by lexical expressives (Potts, 2005, 2007; Amaral, 2018; Hess, 2019). However, theories of interactional meaning acknowledge that communication is not just concerned with speakers intending to convey meanings and hearers attempting to infer them. Instead, they propose and show how meanings are co-constructed in interaction between speakers and addressees (Clark, 1996; Sanders, 1987; Arundale, 1999, 2010; Kecskes, 2008, 2010; Elder and Haugh, 2018). These accounts of meaning apparently clash with traditional views on expressive meaning and pose the following question: can expressive meaning be negotiated?

The present study addresses this question using empirical data retrieved from the spoken component of the BNC2014. A database of 1700 occurrences containing lexical expressives was retrieved and compiled. All the occurrences and their contexts were examined with the aim of providing insights into how the expressive meaning of lexical expressives is conveyed in real-life interactions. This examination joined theories of meaning negotiation with my novel typology of expressives (classified as *modifiers*, *ascriptives*, *referentials* and *exclamatives* (Cabanes-Calabuig, 2022) in order to provide a holistic account of the behaviour of lexical expressives in communication. The talk summarises the results observed in the database about whether expressive meaning is actually negotiated/co-constructed, how and under what circumstances, and advocates going beyond meaning theories centred on the speaker(s) attitudes with regards to the study of expressives.

Identifying the core genre-related components of online discourses: Experimental and qualitative corpus analytical methods

Panel contribution

*Ms. Júlia Ballagó*¹

1. Eötvös Loránd University

The issue of genre is getting increasing attention in recent scholarly discourse in the field of internet pragmatics (cf. Gruber 2019; Herring, Stein, and Virtanen eds. 2013). The talk reports on an empirical study that strives to (i) provide experimental and corpus-based evidence for the proactive nature of the functioning of genre knowledge, and (ii) offer a well-grounded methodology for identifying the core genre-related components of discourses. The study rests on the theoretical assumption that genres are discursive schemas and categories that dynamically emerge in discourses. Thus, genres are knowledge types activated during the production and processing of utterances (cf. Busse 2014; Steen 2011). However, we only have evidence for the functioning of this knowledge from the discursive practice.

In this context, the empirical study focuses on the investigation of two specific genres in Hungarian: online food recipes and book reviews. Regarding them, I address two central research questions: (RQ1) What are the core components of the discursive schema of online food recipes and book reviews? (RQ2) How can we retrieve these components from the discursive practice?

The talk answers these questions by presenting a two-pronged empirical study. On the one hand, I conducted an experiment in which two groups of informants (25–25 persons) were asked to produce (i) “the recipe for a good novel” and (ii) “the review of a good recipe”. As a result of contaminating the two genres under study, informants activated the most crucial elements of their genre knowledge, i.e., aspects of construal that make a text a recipe or review. In addition, they did not only activate this knowledge retroactively but in a creative, proactive manner. Experimental data were analysed in MAXQDA software. The qualitative analysis focused on the emerging patterns of linguistic construal along several criteria: structural organization of the experimental texts, speech acts, deictic person-marking, verbal construction types, genre-related signals of metapragmatic awareness, etc. On the other hand, I carried out the systematic analysis of a small-scale research corpus comprising 50 food recipes and 50 book reviews. The “authentic” online food recipes and book reviews were also analysed in MAXQDA software along the same criteria as the experimental texts. Qualitative analyses were supplemented with descriptive statistical data. A final comparison of the two datasets allows us to precisely identify the core components of the discursive schema of food recipes and book reviews. The talk will primarily focus on the presentation of the experiment.

Misinformation flourishes in L2: The Effect of Processing Disfluencies on Epistemic Vigilance

Panel contribution

Prof. Didier Maillat¹

1. University of Fribourg

Relevance-theoretic pragmatics (Sperber & Wilson 1995, Wilson & Sperber 2012) posits a specific cognitive module whose main function consists in assessing and filtering the pieces of information which enter the cognitive environment of the hearer. This set of mechanisms is known as the Epistemic Vigilance filter (Sperber et al. 2010, Mercier & Sperber 2017). This filter evaluates the quality of the information conveyed by an utterance both in terms of its content and of its source. When a given utterance is found to be deficient in one of these two dimensions, the epistemic value of the information communicated by the utterance will be decreased. As a result, the probability that this piece of information will be accepted in the cognitive environment of the hearer is lowered.

Working on the impact of foreign accents on the processing of information, Lev-Ari and Keysar (2010) argued for a ‘processing fluency’ effect, whereby the un/ease with which a given piece of information is processed has a direct negative impact on the evaluation of its source’s credibility. Within the relevance-theoretic framework, it follows from Lev-Ari and Keysar’s claim that ‘processing fluency’ can be seen as affecting epistemic vigilance. Specifically, processing disfluencies would lower the epistemic value of an utterance. However, Lev-Ari and Keysar’s results have been hard to replicate (De Meo et al. 2011, Podlipský et al. 2016, Stocker 2017; see Wetzel et al. 2021 for a discussion) casting some doubt on the effect.

In a follow-up to Lev-Ari and Keysar’s research question, we will present an experimental study in which 60 English native speakers and 60 non-native EFL participants took part in an information evaluation task to assess the impact of processing disfluencies introduced by L2 (EFL in this instance) on epistemic vigilance. While our results do confirm a processing fluency effect on epistemic vigilance, the effect triggered by L2 is the *opposite* of that observed by Lev-Ari and Keysar. The processing disfluencies experienced by our non-native speakers correspond to a significantly improved evaluation of the epistemic value of the information.

We will propose a relevance-theoretic account of the processing disfluency effect and of its influence on epistemic vigilance. Crucially, we will argue that our EFL-based, reversed replication of the processing fluency effect can help us understand some of the contrasting results obtained in foreign-accent-based studies, as well as some of the difficulties encountered when trying to replicate the effect. To conclude, we will discuss the implications of our findings in a social environment in which the consumption of information in L2 is the norm rather than the exception.

Pragmatic and social analyses of the discourse marker *órale* in Mexican Spanish

Panel contribution

*Ms. Elisa Camps Troncoso*¹, *Dr. Lori Czerwionka*²

1. Purdue University/Duolingo, 2. Purdue University

Discourse markers (DMs) are multifunctional linguistic units that guide inferences about discourse organization, interpersonal relationships, and stances (Heine, 2013; Schiffrin, 1987). DMs can also index social meaning (e.g., Arnold et al., 1993; Bolden, 2006; Erman, 2001). Considering the multiple types of meanings, researchers must engage with a variety of methods to gain more complete understanding of how a given DM functions in discourse and society. The current project implements such an approach to examine the pragmatic functions and social meanings of the DM *órale*, a salient DM in Mexican Spanish (Mejía-Gómez, 2008; Mendoza-Denton, 2011; Navarro, 2005), but one that has been seldom examined.

From a pragmatic variationist approach (Barron, 2014), we analyzed the 189 tokens of *órale* in the *Corpus Sociolingüístico de la Ciudad de México* ‘Sociolinguistic Corpus of Mexico City’ (Butragueño & Lastra, 2011–2015). To analyze the pragmatic functions, we conducted an interactive, qualitative, discourse analysis that considered previously mentioned functions of *órale*, turn position, surrounding discourse, and also the positioning work of the DM. For the positioning analysis, social acts (similar to speech acts) and interlocutor positions in the interaction were examined (Davies & Harré, 1990). The pragmatic functions identified were: affirmation (agreement, understanding), exhortation (command, motivation), and resultative (presentational, discourse anaphora) (see examples). The three functions share a proposed core meaning relating to an immediate change, whether that be a change in activity, knowledge, or attention.

Affirmation (agreement)

“*ven, vamos a que le ayudes allá a mi mamá*” “*¡pues órale!*” (CSCM-37)

“come, go help my mom over there” “well *órale!*”

Exhortation (command)

“*órale métete al baño*” (CSCM-103)

“*órale* get in the shower”

Resultative (presentational)

entonces aplicó al Itam, pasó el examen y viene: “¡sí lo pasé!” y no sé qué, bueno, pues órale, ahí va al Itam (CSCM-33)

then he applied to the Itam, he passed the exam and he comes: “yes I passed it!” and I don’t know what, okay, well *órale*, there he goes to the Itam

In addition to analyzing the pragmatic functions, statistical models were examined to understand the use of *órale* by different populations (i.e., gender, education, age). Results indicated that men used *órale* more than women. When predicting the use of the three *órale* functions, education was an important variable, particularly as education relates to the use of *órale* for affirmation and exhortation.

Overall, the results provide a new, economical, and thorough understanding of *órale* as a pragmatic variable and as a resource to construct social identities. The triangulated pragmatic approach provided a valid approach to examining *órale*’s pragmatic functions, making the pragmatic results more reliable. The sociolinguistic results demonstrate the need to consider pragmatic function in sociolinguistic analyses, and they also comment on the relationship between language use and social identity. The discussion will address how mixed-methods allow for new insight into the intertwined pragmatic and social meanings contributed by DMs.

Pragmatic variation in Britain: A corpus-based study of politeness and social variation

Panel contribution

*Ms. Isolde van Dorst*¹, *Dr. Mathew Gillings*¹, *Prof. Jonathan Culpeper*²

British culture is said to be characterised by off-record or negative politeness (e.g., Blum-Kulka, 1987; Stewart, 2005) and norms giving prominence to social distance (e.g., Bargiela-Chiappini & Kádár, 2011). However, this assumes that politeness works in the same way across all speakers and contexts. Work constituting variational pragmatics (e.g. Barron and Schneider 2005) – a field at the interface of pragmatics and sociolinguistics – has shown this to be an over-simplification. A meagre amount of research on politeness variation has looked at usage differences between certain groups across Britain, though often limiting itself to one or two social variables at a time (e.g. Culpeper & Gillings, 2018). This paper explores the wider scope of politeness variation in Britain, using data from the Spoken British National Corpus 2014 (Love et al., 2017), by looking at seven social variables simultaneously: sex, age, region, population density, social class, highest qualification, and setting.

We selected 50 key British formulaic politeness expressions, each allotted to one of three different types of politeness (tentativeness, deference or solidarity), and differing levels of formality (e.g., relatively formal *goodbye* versus relatively informal *bye*). Our selection of expressions was driven by the academic literature and/or non-academic literature (e.g., newspaper articles complaining about politeness); our own knowledge of politeness practices; or extrapolations from other expressions (e.g., *thank you* would lead to a consideration of *thanks*, *ta*, *cheers*). Instances of these 50 expressions were retrieved from a subset based on setting (private; public; institutional) of the Spoken British National Corpus 2014, and then manually screened to remove non-genuine cases of politeness (e.g., sarcasm).

We applied a linear mixed effects model to analyse the effect of each social variable on the use of politeness expressions. Clear differences across politeness types and levels of formality emerged. The most frequent significant difference was the setting of the conversation. There is also an observable difference in politeness usage based on residency density, and between speakers in rural areas versus metropolitan cities specifically. There are likely to be multiple and complex reasons for each finding; we will offer some tentative possibilities.

Pragmatics and mind-reading: an experimental investigation on the derivation of implicatures from the listener's perspective

Panel contribution

Prof. Napoleon Katsos¹, ***Ms. Blanche Gonzales de Linares***², ***Dr. Ekaterina Ostashchenko***³

1. Cambridge University, 2. University of Cambridge, 3. Manchester Metropolitan University

Influential theories of meaning propose that listeners understand a speaker's implicit meaning thanks to mutually assumed norms of conversation that take into account what the speaker has said, as well as contextual factors, including what the speaker knows. Emerging psycholinguistic research shows that listeners derive a particular kind of implicit meaning, quantity implicatures, when their speaker is knowledgeable about the situation but suspend it otherwise. This work does not focus on if and how listeners use the knowledge that is available only to themselves, i.e. the listener's perspective. Here we explore the derivation of ad hoc quantity implicature in situations where the speaker does or does not have full knowledge of the situation, while, in the latter case, the listener have two types of privileged knowledge in her perspective. We report two versions of a study with English-speaking adults which show that listeners are influenced by their own perspective, as well as the speaker's. We discuss the implications of these finding for models of common ground, pragmatic processing and interpretative strategies.

Resonance and Engagement ‘applied’ in Chinese Doctor-Patient interaction: A Western vs Traditional Chinese medicine divide

Panel contribution

***Dr. Vittorio Tantucci*¹, *Dr. Carmen Lepadat*²**

1. Lancaster University, 2. RomaTre University

Resonance in interaction involves speakers re-using (parts of) the utterances of their interlocutors (Du Bois 2014). When resonance is creative, speakers engage with other people’s language to express something new. In this respect, important methodological and applied considerations are in order. Persistent creative resonance is a key indicator of interactional engagement. Conversely, consistent absence of it underpins interactional detachment, which is distinctive of ASD speech (Tantucci & Wang 2002). This study tackles creative resonance in Chinese Doctor-Patient interaction. We created a corpus sourcing 60 conversations, including 1415 utterances from the ChunyuYisheng online medical consultations’ platform and compared the speech of Western medicine doctors (WMD) with Traditional Chinese medicine doctors (TCMD). Doctors’ engagement is central in medical communication, (Jin et al 2022). Palliative care textbooks evoke ‘active listening’, backchanneling and repetitions of patients’ words (Jenkins et al. 2021).

We propose that creative resonance is key for diagnostic assessment, as it is not limited to repetition, but involves engagement as joint creation of knowledge (Tantucci et al. 2022) between specialist and patient. We devised a corpus-based multifactorial model, accounting for medicine type, gender, turns and words’ count, peripheral particles of intersubjectivity, overt acknowledgement of interlocutors’ speech, illocutionary force and creative resonance. A mixed effects linear regression shows that TCMD’s textual engagement with patients is higher than in WMD. Creative resonance in TCMD’s speech correlates with overt relevance acknowledgment and marked intersubjectivity. We also discovered that TCMD’s language is inherently directive, whilst WMD’s speech is more assertive. This suggests that TCM is more distinctively geared towards advice-giving (Yip 2020), while WM favours etiological assessment. TCM involves a holistic approach to the body with its social and natural environment (Lu et al. 2004:1854), with stronger emphasis on harmonious interaction (Spencer-Oatey 2005). This is reflected in the sociopragmatic enactment of TCMD’ behaviour in contrast with WMD.

Speaker trustworthiness: shall confidence match evidence?

Panel contribution

Prof. Diana Mazzarella¹, Ms. Mélinda Pozzi¹

1. University of Neuchâtel

Communication is open to the risk of misinformation. As a result, humans have evolved a suite of cognitive mechanisms that allows them to assess others' trustworthiness and guide partner choice (referred to as 'epistemic vigilance', Sperber et al., 2010). An important component of epistemic vigilance is the ability to track epistemic commitments and evaluate their credibility. Speakers can endorse or distance themselves from the truth of their claims through different linguistic and pragmatic devices, thus modulating their epistemic commitments and managing their reputation as trustworthy informants (Boulat and Maillat, 2017; Mazzarella et al. 2018). Previous literature suggests that confidence expressions (such as epistemic modals) function as commitment signals: confident speakers are more likely to be believed than unconfident speakers, but suffer greater reputational costs than unconfident speakers if their claims turn out to be false (Vulliou et al. 2017). Little is known, though, of the extent to which judgments of speaker trustworthiness are affected not only by the accuracy of the speaker but also by their *evidential basis* (in line with the Gricean sub-maxim of Quality: "Do not say that for which you lack adequate evidence").

The present study investigated the role of 'confidence-evidence calibration' in the assessment of speaker trustworthiness. We tested two hypotheses. First, overconfidence does not backfire when a confident but inaccurate claim is justified (Hypothesis 1). Second, confidence can backfire if a confident and accurate claim is not justified (Hypothesis 2). We conducted two pre-registered online experiments adapted from Tenney et al. (2008), in which participants (Exp 1: $N = 107$; Exp 2: $N = 109$) were presented with two testimonies concerning a car accident, one from a confident witness and the other from an unconfident witness. In Experiment 1, both witnesses were inaccurate but were justified by strong evidence. In Experiment 2, both witnesses were accurate but had weak evidence. Participants judged their credibility and were asked to choose which of the two depositions they believed at different times during the experiment, as information about accuracy and evidence unfolds. We measured participants' credibility judgments (on a scale from 1 to 6) and believability choices (*Which deposition do you believe?*).

Experiment 1 showed that the perceived trustworthiness of a confident speaker who communicates false information is at least partially restored when it turns out that the speaker was justified by strong evidence (thus supporting Hypothesis 1). Experiment 2 showed that a confident speaker who makes an accurate claim but is not supported by enough evidence loses their trustworthiness (thus supporting Hypothesis 2). These two findings suggest that speaker trustworthiness as a source of information depends on how confidence expression is calibrated to the speaker's evidential basis, and that to keep their own reputation, a speaker should first and foremost commit to what they have evidence for. Committing to the truth of a message only when one is justified is a better sign of epistemic responsibility than actually sharing true information, which may be accidentally transmitted by people who are not deeply concerned about truth.

Third-wave im/politeness theory: Swearwords and the company they keep

Panel contribution

Prof. Andreas Jucker¹

1. Universität Zürich

To what extent can swearwords be seen as carrying impolite meanings? Is their use generally – or perhaps even by definition – linked to impoliteness? These are important questions if swearwords are to be used in a corpus-based assessment of im/politeness levels in specific contexts. In a first-wave approach to politeness, linguistic expressions were taken to have relatively fixed politeness values. In a second-wave approach, im/politeness values were taken to be locally and discursively negotiated. A third-wave approach provides a rapprochement between the first and second. It assumes some default values that can be re-negotiated in specific contexts. But how can modifiable default values be used in a corpus-based investigation?

Corpus-based investigations generally rely on (relatively) fixed values in order to provide a basis for large-scale generalisations across entire corpora. They also tend to require time-consuming and laborious manual inspections of the retrieved hits in order to eliminate deviating instances. To solve this problem, Lutzky & Kehoe (2016, 2017) proposed a method of using contextual information in order to automatically sort through lists of swearwords, such as *shit* or *bastard*, and apology expressions, such as *sorry*, *pardon* or *excuse*, respectively.

In this presentation, I introduce a further development of this approach. Lutzky & Kehoe rely on collocates of their search terms, i.e. expressions that regularly occur in close vicinity to the search term. I propose a more global approach – a topic approach – which relies on the keywords that characterise those texts in which a specific search term tends to occur. Keywords are expressions that appear in a specific text with a frequency that is much higher than their frequency in the entire corpus. They are a good indication of the topic structure of the text in which they occur, and they provide not only a useful tool to disambiguate the search terms (as in Lutzky & Kehoe's approach), but they also offer nuanced information on the im/politeness level of the search terms themselves, and they afford an empirical basis for the evaluation of the severity of certain swearwords. As a result, they help to uncover additional swearwords with similar distribution and usage patterns, and they turn swearwords into useful diagnostics in contrastive or diachronic investigations of varying im/politeness levels in specific contexts.

Why do we use the same words when we disagree with each other? An experimental approach to interactive alignment

Panel contribution

*Dr. Nele Pöldvere*¹, *Dr. Victoria Johansson*², *Prof. Carita Paradis*³

1. University of Oslo/Lund University, 2. Lund University/University of Kristianstad, 3. Centre for Languages and Literature, Lund University

Interactive alignment, or the reuse of ideas and constructions from prior speaker turns, is a compelling type of meaning negotiation, dialogue management and stance coordination in everyday face-to-face conversation. Du Bois (2014) argues that engaging in this way with prior speaker contributions is a socially motivated phenomenon that speakers use for various communicative purposes. Garrod and Pickering (2004) consider alignment to be a largely automatic cognitive process that makes conversation smooth and easy. In a previous corpus study (Pöldvere, Johansson & Paradis, 2021), we brought these two approaches together to investigate why and when speakers make use of each other's contributions in conversation, and what the social and cognitive underpinnings of this behaviour might be. The study showed that (i) speakers tend to align with each other when they disagree, and (ii) the disagreements are produced very quickly (with no-gap-no-overlap). Both of these results point to the mitigating function of alignment in disagreement situations.

Using the overhearer paradigm (Bögels & Levinson, 2017), we investigate how participants perceive interactive alignment in disagreement situations in a controlled laboratory setting. This experimental study concerns the social processes underpinning the interpretation of alignment by drawing on insights from Du Bois' notion of dialogic engagement and Garrod's and Pickering's observations of turn transitions. From the perspective of an overhearer of a conversation, does alignment influence the overhearer's judgments of social closeness among speakers in disagreement situations? Are there differences between the different types of alignment? What role does timing play in the overhearer's reactions? In the experiment, the participants listen to pre-recorded conversations between two people who disagree with each other. The stimuli were recorded with two actors who spoke with a British English accent. The manipulations involved the presence or absence of alignment, the extent of the alignment (formal vs. semantic) and the timing of the disagreement (no-gap-no-overlap vs. a gap of one second). The participants in the experiment are native speakers of British English. After listening to the recordings, the participants rate their agreement with two statements on a seven-point Likert scale, designed to elicit their intuitions about social closeness among speakers in the recordings (I feel that these people share similar views, these people seem to be comfortable with each other). Contrary to expectation, though, alignment, and particularly formal alignment, received lower ratings of social closeness in the pilot study than non-alignment. This result was modulated by time whereby alignment expressed after a no-gap-no-overlap was rated higher than non-alignment that was expressed after a gap.

‘You anti-semantic bastard!’ Impoliteness as a linguistic phenomenon.

Panel contribution

***Dr. Marta Andersson*¹, *Dr. Daniel Van Olmen*², *Prof. Jonathan Culpeper*²**

1. Umeå University, 2. Lancaster University

According to the arguments put forward in recent literature, a systematic explanation of the concept of (im)politeness should consider multiple perspectives and approaches (e.g., Haugh and Culpeper 2018). The study of the phenomenon should therefore not so readily dismiss the pragmalinguistic dimension in favour of the sociopragmatic phenomena (e.g., Leech 2014). However, the dominant view in the field of (im)politeness studies is that (im)politeness does not reside in the linguistic form but rather depends on the contextual judgement of the participants involved (e.g., Locher 2006). Contrary to this idea, we present a corpus-driven cross-linguistic perspective on the extent to which linguistic form is a stable component of impoliteness and demonstrate that linguistic structures compatible with the expression of impoliteness not only exist in several languages but also exhibit a high degree of conventionalization. Our focus is on the phrase YOU + NP in English, Polish and Dutch. Our investigation of the TenTen web corpora and samples of 200 instances of the expression indicates that, despite the presence of other uses in all three languages (e.g., positive ‘you beautiful girl!’), genuinely impolite cases (excluding closely related uses in banter or dirty talk) account for 70% of the English and Dutch data and 90% of the Polish data. This phrase, in other words, has a strong bias toward negative addressee evaluation.

This predilection is further corroborated by instances of evaluatively neutral NPs that are coerced into a negative interpretation (e.g., ‘you man!’) and by the frequency with which adjectival modifiers occur to ensure a positive interpretation (e.g., ‘you charming man’). Our findings are thus consistent with both pragmatics research, as theorized in Terkourafi’s (2005) frame approach to politeness, which states that if an expression is frequently used in polite contexts, it becomes conventionalized as such. Since this theory has been extended to account also for impoliteness (Culpeper 2011), we contend that YOU + NP is a (partially) conventionalized structure particularly well-suited to cause offense. As we argue, the reason for this pertains to the pragmatic explicitness of the involved pronoun, which not only increases the impact of the evaluative NP by making a direct reference to the addressee but also creates a sense of distance between the interlocutors.

Collaborative signing in a multiparty interaction: the case of overlap

Panel contribution

*Dr. Alysson Lepeut*¹, *Dr. Emily Shaw*²

1. *Université de Namur*, 2. *Gallaudet University*

In this paper, we discuss the results of a microanalysis of sequences (Bavelas, et al. 2011) during moments when two or more signers are signing at the same time. Overlapping discourse can occur for different reasons; signers may need to clarify misunderstandings, reinforce another’s point, or vehemently disagree. We are interested here in one specific type of simultaneous signing—referred to as *cooperative overlap*—which consists of extended moments of turn-exchanges that move along the unfolding discourse while cohering interlocutors in relation to each other. This aspect of signed interaction has received very little attention by sign linguists (see Coates & Sutton-Spence, 2001 for an exception) but appears to be a crucial component of language in the wild – one part of the “enchronic glue” (Enfield 2009) binding interactions (and interactants) together. Some early work on signed interactions touches on the practice (Wilbur & Petitto, 1983) but little is known about the underpinnings of these seemingly messy interactive moments. We seek here to understand how these extended overlaps are achieved by deaf co-participants on a local basis where the outcome results in a forward movement of the topic at hand.

One four-party interaction of roughly 15min. between deaf, fluent ASL signers was analyzed using techniques from ethnomethodology and conversation analysis (EMCA) to primarily answer the following questions:

1. What embodied practices are used to negotiate overlaps while maintaining interactional synchrony?
2. When extended overlaps occurred, what interactional joint actions do the participants engage in (e.g., the careful monitoring of one another’s actions in progress)?

In addition to specific lexical repetition strategies identified previously in earlier work (Wilbur & Petitto 1983; Baker 1977), it was hypothesized that these closely timed sequences of overlapping signing occur often in multiparty interactions and are successful specifically because they engage multiple articulators coordinated across signers, especially eye gaze. Further, it appears that these practices that are symbolic of the joint coordination of co-constructed discourse are a behavior that signers both willingly engage in and recruit to achieve specific interactive tasks (likely, clarification and assessment sequences that manage the dynamically evolving information state and the relationship between fellow interactants). Results do not only account for how deaf signers achieve cooperative overlaps but also reveal the interactive reasons signers engage in these messy moments of interaction in the first place—beyond those identified in earlier studies (namely, gender expression and topic flow coordination).

Communication without a language model: The pragmatic skills of Balinese homesigners

Panel contribution

Dr. Josefina Safar¹, Dr. Connie de Vos¹

1. Tilburg University

Homesign refers to the communication of deaf individuals who have not been exposed to a conventional sign language and co-create a new communication system with their family members and other frequent interlocutors. Developed in the absence of a language model, homesign systems offer a window to investigate the earliest stages of language emergence. Previous work has focused heavily on the genesis of linguistic structures in homesign and been based mainly on elicited and experimental data. Studies on homesigners' interactional skills, however, remain scarce. Adding homesign interactions to our research agenda is essential for understanding whether human beings really possess an "interaction engine" (Levinson, 2019), i.e., an innate communicative ability that precedes language. If we want to know where pragmatic competence comes from, we need to direct our attention to the interactional mechanisms homesigners use when engaging in signed discourse.

Our study draws from the Balinese Homesign Corpus, which represents the first extensive collection of various types of linguistic data from deaf homesigners. The corpus currently involves 14 deaf individuals with different social and communicative profiles (in terms of age, gender, amount of interaction with other deaf and hearing people). It includes spontaneous conversations between deaf adult homesigners and their regular communication partners as well as conversations between homesigners and a deaf research assistant from outside their village. We adopt a Conversation Analysis approach to investigate if and how pragmatic skills are affected by language deprivation, and in turn to what extent the interaction engine is a precursor to language emergence. Examining 4h45min of conversational data from 8 adult homesigners, we provide evidence that Balinese homesigners indeed possess interactional abilities on a par with speakers and signers of conventional languages, including turn-timing, feedback signals and sequence organisation. The presence of these robust pragmatic skills demonstrates that homesigners can monitor mutual understanding in conversations, foresee and repair communicative trouble. Focusing on Other-Initiated Repair (OIR) – sequences dedicated at pinpointing and repairing breakdowns in conversation – we show that OIR occurs frequently in Balinese homesign, and that it exhibits clear parallels with other spoken and signed languages, regarding the formats of repair initiators and the types of trouble they address. Homesigners incorporate features of visual interactions in their environment, e.g. manual emblems, pointing gestures, facial expressions and eyegaze, as sources of meaning-making in repair sequences. We also find that the amount of shared context with their interaction partner influences the frequency of OIR and the choice of repair strategy: homesigners exploit common ground (e.g., shared cultural/geospatial knowledge) with their interlocutor as a resource to achieve intersubjectivity in conversation. To summarise, our study clearly reveals that homesigners are competent interaction partners, capable of identifying and fixing communicative trouble and accommodating their interlocutors to maintain mutual understanding. It proves that certain aspects of pragmatic competence are so resilient that they emerge even in absence of conventional linguistic input.

Conversational Repair in a Local Family Sign Language from Guatemala

Panel contribution

Dr. Laura Horton¹

1. University of Wisconsin-Madison

Previous research on a diverse array of languages, both spoken and signed, provides crosslinguistic evidence that language users have strategies for resolving “trouble spots” in conversation (Dingemanse, et al., 2015; Manrique, 2016; Schegloff, 1992; Schegloff et al., 1977). In this study, I ask whether the widespread existence of repair strategies in conversation extends to signers of a local family sign language used in a community without a standardized national sign language.

In Nebaj, Guatemala, signers do not know LENSEGUA, the national sign language of Guatemala, but there are several local ecologies in which hearing and deaf signers interact with each other regularly. I asked signers to engage in a dyadic communication game – a director-matcher task – in which one signer described a set of photos of familiar local items (food, clothing, locations, etc.) to another signer in their immediate family or social network. Five signers participated in the study. Two of the signers are deaf – they are a mother and daughter who live together with their hearing relatives, also participants. The daughter, Sara, age 10, was a participant in each of four dyads.

30 trials were coded for each dyad. A trial consisted of the initial description of the photo from the director followed by any clarification questions from the matcher until the matcher selected the correct photo from the array. On average, matchers were very accurate – matchers selected the correct photo with one or two guesses in more than 93% of all trials – suggesting they understood the communicative demands of the task. In the analysis, I ask: (1) how often repairs were initiated for each dyad; (2) what types of repairs were most common; and (3) how often repetition was part of the repair request.

There were variable rates of repairs across the dyads, but they happened quite frequently (range 16-29 repairs across 30 trials). I coded each repair (N=88) for repair type. Repair types included: open repairs, initiated without indicating the source of the misunderstanding; restricted repairs, initiated while specifying the source of the misunderstanding; and implicit repairs, described as a “freeze look” in which the signer does not engage in an expected turn but merely makes eye contact with their interlocutor (Manrique, 2016). There was substantial variation in the distribution of repair strategies across dyads. In two dyads, restricted repairs were the most common strategy. Open repairs were most common in the conversation between Sara and her mother. Sara’s mother often expressed a general sense of confusion about Sara’s utterance, without specifying any particular source of misunderstanding. In terms of repetition as a repair strategy, this was only employed regularly by one signer: Sara’s hearing father. Sara’s father would frequently repeat all or part of her utterance back to her before selecting a photo. These findings suggest that even in a two-generation family sign language, hearing and deaf signers have robust strategies for conversational repair, but there is significant individual variation in the types of repair strategies used across signers.

Head Movements as Backchannels in American Sign Language Conversations

Panel contribution

Mr. Paul Gabriola¹

1. Gallaudet University

When people are engaged in everyday conversation, turns that are exchanged occur almost immediately after each other, or sometimes overlap, typically occurring at a transition-relevance-place (TRP) (Sacks, Schegloff & Jefferson, 1974). In order to achieve this natural turn-taking sequence, those engaged in conversation must plan their next utterance during the preceding turn, before they take the floor. Producing a backchannel at a TRP is an indication from the addressee to the narrator that there is no attempt to take the floor for a turn.

Addressee responses in face-to-face (spoken) discourse are typically short reactive vocal cues, like; oh, yeah, and uh-huh. These responses are called backchannels, and their expression shapes narrative development in interaction (Bavelas et al., 2000). Research conducted on spoken language discourse shows addressees utilize both short vocal utterances and gestures when backchanneling (Bavelas et al., 2000). In ASL conversations, backchannels frequently take the form of both manual signs (e.g., YEAH or UNDERSTAND), and non-manual signals (head movements, eye rolls, eyes widening/narrowing, eyebrow movements, and mouth movements) simultaneously. There are instances where non-manual backchannels are produced solely without a manual accompaniment.

Documenting the form and function of various types of non-manual backchannels in context will help us understand how Deaf people's backchannels operate. This paper specifically reports on the form and function of head movements, as a means of backchanneling from the addressee, in ASL conversations. Analysis of three previously recorded dialogues, on Zoom, between Deaf ASL signers from a current study taking place at Gallaudet University called, "A Motivated Look At Indicating Verbs in ASL" (Hochgesang et al., 2019), is utilized. After examining five minutes of addressee feedback from three selected videos, several different forms of head movements were identified using a coding scheme adapted from the CorpAGEst Annotation Manual (Bolly, 2016). The head movements were analyzed as serving different interactive functions based on the utterance that was produced by the active signer either before the backchannel or following the backchannel.

The primary functions of these head movements appears to indicate to the active signer that the addressee was understanding (or not) the conversation. Some patterns of head movements are expected to be seen during specific moments in conversation. Analysis of the data provides a novel categorization of the different forms of head movements as backchannels, labeled; nods, nod-up, nod-down, shakes, or side tilt. The head movements serve one of the following functions for each instance; tracking function (a strong emotional response), continuer function, affirmative function, or hesitation function (Maynard, 1997 & Puupponen, 2015). The study has unveiled that head movements do not occur in isolation, rather, they are typically produced in conjunction with other non-manual features of the face, and sometimes with manual sign pairing.

The scope of this paper solely looks at how fluent ASL signers use head movements as a backchannel during conversation in a virtual space. The research presented is the preliminary step in a larger planned study which will incorporate analysis of other types of non-manual backchannels that can be produced.

Self-initiated repair in German Sign Language (DGS) – results from the Public DGS Corpus

Panel contribution

*Ms. Elena Mpadanes*¹, *Prof. Okan Kubus*²

1. Humboldt-Universität zu Berlin, 2. Magdeburg-Stendal University of Applied Sciences

Conversational repairs have been investigated across a variety of languages to date. But only a few studies so far have focused on signed discourse, e.g. Manrique (2016), Skedsmo (2020) or Safar and Vos (2022). This work connects to these recent studies and adds to the understanding of functional, visual, and sequential properties of conversational repair as a part of the interactional foundations of human languages. Here, a repair is understood as dealing with problems in *producing, perceiving, and/or understanding* (Manrique, 2016, pp. 1–2). We approached repairs in German Sign Language (DGS) through a descriptive analysis of the published data from the DGS-Korpus project, the Public DGS Corpus (Konrad et al., 2020). It comprises a balanced selection of 50 hours of signed videos presenting signers from various German regions and age groups conversing and narrating about topics culturally relevant to the d/Deaf community. A variety of corpus queries were used to identify self- and other-initiated repair sequences which were then tagged in iLex (Hanke, 2002), coded, categorized by repair type, formats and components.

Besides giving a first-time overview of practices in DGS repair, we also shed light on the visual bodily behavior used for initiating and organizing repair in signed discourse while looking at the structural aspects of DGS repairs. In the presentation we will focus on strategies in DGS self-initiated repairs which are prompted by the signer who produced the trouble source turn (repair types total = 361; self-initiated repairs = 287). A significant variety of self-initiated repair operations could be detected, e.g., searching (n=108), replacing (n=86), inserting (n=66).

DGS self-initiated repairs indicate structural and technical similarities to the ones found in both signed and spoken languages (e.g. Dingemanse et al., 2015). The use of visual bodily behavior like gaze patterns and movements of the head and eyebrows was found to play a pivotal role in the organization of turn allocation following repair initiations.

“Hey, look! This-is-im-por-tant!” Embodied focus during signing and speaking family dinners

Panel contribution

*Dr. Marion Blondel*¹, *Dr. Fanny Catteau*², *Prof. Christelle Dodane*³, *Dr. Karine Martel*⁴, *Prof. Aliyah Morgenstern*⁵

1. CNRS, France, 2. SFL, CNRS-Paris8, 3. Université Sorbonne Nouvelle, 4. INSHEA, 5. Sorbonne Nouvelle University

How do parents and children pragmatically activate the semiotic resources at their disposal to negotiate, bring and maintain information to the foreground during the family dinner?

The family dinner is a privileged occasion to study the orchestration of prosodic/pragmatic resources (Morgenstern et al. 2021), because it contains a multitude of resources which are intertwined (Lombart 2021) with multiple factors expressing inter- and intra-individual variation. We investigate the “DinLang” recordings, which consist in a collection of family dinners in LSF and spoken French, in order to compare the resources activated in similar conditions for signing and speaking families (two diners, each lasting 60 minutes). We are particularly interested in the prosodic (gestural) resources of signers and how this can in turn shed light on the gestural resources used for the same pragmatic function in ‘speakers’. After the realization of an inventory of these prosodic resources (higher pitch, stronger intensity and acceleration of the speech flow at the vocal level, increase of signing speed or holding a sign at the gestural level, etc.), we established their systematic and common characteristics across various situations and articulatory modalities. We pinpointed gestural prosodic markers as described in the SL literature (van der Kooij et al. 2006; Wilbur & Malaia 2018) or associated with vocal focus, as described for spoken languages (Ferré, 2019; Graf, et al. 2002). We identified an intermodal “scansion” pattern that allows signers/speakers to stress the relevance of an utterance. All these observations support the unified and physiognomic approach to language (Cornejo & Musa, 2017): some parts or the whole body can be mobilized to realize a hyper-articulated prosodic pattern and to make the focused piece of information salient. Moreover, taking the gestural dimension of these phenomena in SLs into account allows us to emphasize the multimodality of the resources available to hearing speakers.

Constructing positive image at the first workplace meeting: insights from Chinese workplace reality show interactions

Panel contribution

***Dr. Haidan Wang*¹, *Ms. Shu-Yu Huang*¹**

1. University of Hawaii at Manoa

Image or self-presentation plays an important role in every aspect of social life, particularly in workplaces where how one is viewed affects their working performance and career development. Previous pragmatic and discourse studies have illuminated how images are dynamically constructed in naturally occurring discourses in mass media (e.g., Jin & Chen, 2022) and employment interviews (e.g. Adelswärd, 1988). This study aims to extend the investigation of image work by examining how Chinese speakers discursively create positive images through self-introductions at their first workplace meeting. As interactional studies show, self-introductions are a key locus for self-presentation (Pillet-Shore, 2011). However, possibly due to the difficulty in accessing an organization with newcomers present, research of self-introduction has been limited to ordinary interactions. We overcame the obstacle by resorting to reality shows where the interactions are improvised and the interactive practices are recognizable in real life (Sinkeviciute, 2019).

In the show this study examined, eight interns competed for two job offers at a Chinese law firm. At the first meeting, four supervisors and the interns took turns introducing themselves. Adopting Lim & Bowers' (1991) competent and fellowship face framework, we analyzed how participants constructed themselves and each other as competent and sociable through audience-designed referential terms and self-disclosures.

First, the findings show that, in referential terms, participants elevated the status of addresses (e.g. “the winners of interviews”, “senior partners”) and created camaraderie among interns themselves (e.g. “little fellows”). Second, supervisors constructed an image of competence by disclosing their seniority. However, they also sought to related themselves to the interns and presented themselves as a source of inspiration through delineating their progression from their time as an intern. The interns established their competent selves by highlighting their achievements and personal traits—whether adaptive, stoical, or logical—while demonstrating their understanding of the law sector and evaluating themselves vis-à-vis other interns according to their supervisors' reactions. Moreover, the interns developed sociable selves through offering (e.g. teaching Cantonese) and proposing joint activities (e.g. shopping) based on their disclosure of personal interests and abilities, constructing themselves as amiable colleagues. In conclusion, the analysis shows that participants oriented to both competent face and fellowship face, suggesting that image construction via self-introductions is seldom simply a beautifying work of solo nature, but rather, dynamically established via references and situated interactions to build future working relationships in this round-table format and specific context. We thus argue that both context and local interactions need to be taken into account when investigating image work.

Context-dependent identity work in a workplace observation reality TV show

Panel contribution

*Dr. Weihua Zhu*¹

1. University of Wisconsin-Madison

This study investigates how Chinese people display fluid and multiple identities in different local contexts in a workplace observation reality TV show. A few studies (e.g., Zeng & Ma, 2020; Xue, 2021) have examined Chinese workplace observation reality TV shows. However, they only discussed the innovative design and social value of these new shows. None of them has examined the context-dependent identity work of the participants in these shows. To fill this gap, I examine twenty episodes of 令人心动的Offer ‘The Exciting Offer’, a Chinese workplace observation reality TV show, and employ interactional sociolinguistic methods to analyze the data. Theoretically speaking, identity could be categorized into master identity, interactional identity, and personal identity (Tracy, 2013). It can be constructed, negotiated, and modified in context (e.g., Goffman, 1959; Tracy, 2013; Chen, 2022) and located in language (Bucholtz & Hall, 2010). But do people maintain the same identity at the same workplace? Which one of these—master identity, interactional identity, and personal identity—changes in different local contexts? What linguistic strategies can be deployed to present a certain identity? This research attempts to answer these questions using ‘The Exciting Offer’ as a case study. On ‘The Exciting Offer’, eight interns, after successful interviews, work in groups under the guidance of four supervisors who are attorneys in a top law firm in China. Results demonstrate that the participants, despite at the same workplace, did not retain the same identity. Their interactional identity in particular shifted in accordance with their interactional goal in a specific local context. In other words, their identity modification was constrained by contextual factors including but not limited to interactional goals and status differences. The participants also changed their linguistic strategies when modifying their identities. For instance, during the interviews, they presented their confident, capable, and competitive side through assertive statements. When interacting, as an intern, with an attorney, they appeared to be a respectful, agreeing, and sometimes worried/anxious student using polite expressions, questions, and mitigated requests. But when interacting with other interns, they revealed another identity—a normal person who made metapragmatic commentaries on their supervisors. These findings can promote our understanding of context-dependent identity work from a linguistic/pragmatic perspective.

Heroes in harm's way: Constructing images of healthcare workers in Chinese government microblogs during COVID-19

Panel contribution

Dr. Xueyu Wang¹, Ms. Zheng Zheng¹

1. Nantong University

Chinese front-line healthcare workers (HCWs) have been labeled as “heroes in harm’s way” by the public and the media for their commitment and accountability in the fight against COVID-19. Stories about these heroes have emerged on various social media platforms, offering rich data for studying the images of HCWs constructed in social media discourse. In this study, we looked at how a Chinese government microblogger, under the username @healthchina (“健康中国”), constructed various images of the front-line HCWs in these stories during the outbreak of COVID-19. Specifically, based on 275 stories told and retold by @healthchina during the pandemic, we investigated how the front-line HCWs were named, depicted, and evaluated discursively in these stories. The results show that HCWs in the stories were depicted as loving and caring, competent and confident, and unselfish and dutiful. These images were constructed via the discursive strategies of nomination, predication, argumentation, perspectivation, and intensification. We argue that Chinese government microbloggers constructed HCWs’ images to mobilize affect, gain trust, and reinforce social cohesion in the war against COVID-19.

Multimodal Evaluation and the Promotion of China's National Image

Panel contribution

Dr. Dezheng Feng¹

1. Department of English and Communication, The Hong Kong Polytechnic University, Hong Kong SAR

In this study, I will develop a framework for the systematic analysis of the multimodal construction of China's national image in a promotional film. In my approach, national image is conceptualized as a set of semantic categories (i.e., evaluative attributes), which enables us to understand their multidimensionality and inner complexity. The analysis gives us a nuanced understanding of the multifaceted image China intends to present to the world, which includes economic achievements, sustainable development, social fairness, racial harmony, expanding democracy, cultural prosperity, and so on. Moreover, it shows how the attributes are constructed through the deployment of complex filmic devices, such as the selection of characters and the design of their actions in the mise-en-scene, the selection of events and sceneries, the cinematography (e.g., shot distance), and the editing techniques (e.g., fast cut and match cut). I will also discuss how the promotional film has become a new register of national discourse and an important means for branding China's image in the world. The Field, Tenor, and Mode of the register are explicated, which provides new understandings of China's public diplomacy and nation branding in the postmodern world. It shows how the promotional film balances the dual intentions of constructing an all-round positive image of China for purposes such as attracting investment and tourism on the one hand, and engaging the interest and emotions of the international audience on the other hand. The framework may also allow the formulation of more rigorous analytical methods for related areas of political studies, cultural studies, and international relations studies

The Image Work by Chinese Grass-root Officials in their Initial Interactions with Villagers

Panel contribution

Ms. Hao Liu¹, Prof. Xinren Chen¹

1. Nanjing University

Embracing the view that image is a discursive construct in the latest identity literature, the study aims to address various types of image work by Chinese grass-root officials in their initial interactions with villagers. Getting acquainted with people through initial interactions is part and parcel of one's personal and professional lives (Haugh and Sinkeviciute, 2021), based on which people decide whether and how to pursue getting further acquainted. While there has been some literature on the actual discursive practices through which people get acquainted with whom they are previously unmet, little attention has gone to how they work out and maintain their image through their initial interactions in order for further contacts and interactions in the future, especially in institutional settings. On this account, this study investigates how and why Chinese grass-root officials manage their image when getting acquainted with rural villagers in first encounters, based on an analysis of 26 transcribed recordings of naturally-occurring initial interactions. It is found that the officials not only acquisitively construct positive images (e.g. deferential, amiable) by volunteered self-discourses but protectively deconstruct the negative images (e.g., inexperienced, utilitarian) emerging from the negative assessments in the villagers' response to their self-disclosures. These tendencies in the officials' image management practices in these initial interactions are argued to be underpinned by their long-term transactional needs with the villagers. Moreover, they may reflect the efforts of Chinese officials to build a service-oriented grass-root government, as well as the complex interplay between power and seniority deeply rooted in the wider socio-cultural environment. This study might also shed some light on what a lens of image work can bring to our understanding of initial interactions in institutional settings.

The pragmatics of Chinese as interlanguage: A study of compliment responses by British L2 Chinese learners

Panel contribution

*Dr. Yun He*¹, *Dr. Chengyu Zhuang*²

1. Cardiff University, 2. Oxbridge AcaVice

This study reports our preliminary findings of an ongoing project, aimed to provide insights into teaching and learning Chinese as a foreign language and contribute to compliment response scholarship by opening up new avenues for research.

Compliment response is presumably the most studied speech act behaviour in Chinese applied linguistics and pragmatics. Nevertheless, while overwhelming attention is given to native speakers, little work has been done thus far to characterize the way it is used by L2 Chinese learners. This study, therefore, redresses this gap by investigating compliment responses in Chinese as an interlanguage in UK HE institutions.

Two datasets were analysed. The main set is a corpus of compliment responses collected by administering modified DCT questionnaires designed by Chen (1993) and Chen & Yang (2010). The participants are second, third and fourth/final academic year native British English-speaking L2 learners on the Chinese programme at two Russel Group universities. The second set, qualitative in nature, consists of participants' comments or evaluative judgements of compliment responses and metapragmatic knowledge about the behaviour provided by fifteen randomly selected learners through semi-structured interviews (cf., Kasper & Zhang 1995, Spencer-Oatey *et al* 2000, He 2012).

Based on the taxonomy of compliment responses in Holmes (1988), Chen and Yang (2010), He (2012), the corpus was coded into different 'politeness strategies', roughly corresponding to different semantic formulae or syntactic realizations of compliment responses. Findings from our quantitative and qualitative analyses were compared with previous major studies of compliment responses in Chinese and British English as native language. They were discussed within the general framework of identity proposed by Zhuang and He (2020), with reference to the notions of image (Chen 2022) and face (Goffman 1959). Supported by the interview data, we argue that the compliment responses are characteristic of L2 Chinese users. The divergence and convergence are in effect L2 learner identity work, a product of their negotiation of individual ('agency') and cultural identity ('structure') conflict. The presentation concludes with a discussion of how this study makes contributions to compliment response as a topic of research in applied linguistics and pragmatics.

“*Bushi wo V(P)+ ni*”: Managing the speaker’s image in interaction

Panel contribution

*Ms. Xiaohong Liu*¹

1. *Nanjing University*

The metapragmatic negation expression *bushi* + (S) + V + (NP) has extensively examined in the literature. However, research has almost exclusively focused on negatively oriented verbs in the construction *bushi* + (S) + V + (NP) while neglecting positive ones, most probably because the first outnumber the latter. The present paper is an attempt to redress the balance in favor of positively oriented verbs, i.e. “*bushi wo V(P)+ ni*”, which may have its unique function. Based on the data from the existing corpora and TV series, i.e. an etic perspective, supplemented by a questionnaire, i.e. an emic perspective, it is claimed that the speakers may resort to “*bushi wo V(P)+ ni*” when they are aware of a potential or actual threat to their own or expected image. To be more specific, Chinese speakers may deploy “*bushi wo V(P)+ ni*” to manage their image by emphasizing the facticity of what they said. Speakers’ image is thus negotiable and contestable. The study on the role of “*bushi wo V(P)+ ni*” in managing the speaker’s image is able to provide some insights into how the metapragmatic expression serves as a rapport-oriented mitigating device in Chinese interpersonal interaction as proposed in the existing literature, as well as broadening the study on image work by including the meta-level approach.

“Wo zhege ren...” (“I am a person who ...”): Self-image foregrounding as a disclaiming device in Chinese televised interviews

Panel contribution

Dr. Yingzhe Jin¹, Prof. Xinren Chen¹

1. Nanjing University

People present themselves in one way or another in communication. They explicitly or implicitly claim themselves to be a person of a particular kind, the process of which is referred to as ‘self-presentation’ (Goffman, 1959). Studies (e.g., Kim and Dindia, 2011; Yang and Brown, 2016) have shown that self-presentation includes 5 dimensions: breadth, depth, positivity, authenticity and intentionality. The first four dimensions are all concerned with content, while the last dimension concerns whether the interlocutors disclose information intentionally or consciously (Yang and Brown, 2016: 403-404). With the ‘discursive turn’ of many sociological notions, research on the discursive phenomena of identity construction and image construction in verbal communication has proved fruitful. To date, while previous researchers (e.g., Guo and Ren, 2020) focused on how language users construct their own image in implicit ways, they have rarely touched upon how speakers make an explicit presentation or claiming of self in interaction, which is termed as ‘self-image foregrounding’ in this study. By the term we refer to the deliberate discursive effort of “providing explicit [...] information” (Chen, 2022: 119) of one’s image. With Chinese televised interviewing data collected from MLC (Media Language Corpus), this study explores the types and roles of self-image foregrounding adopted by the interviewees. Results demonstrate that self image foregrounding, as a discursive practice, is a disclaiming device in interaction. It manifests interlocutors’ metapragmatic awareness of addressing interpersonal concerns through avoidance of unexpected risks and retypifications. Both positive and negative self images would be foregrounded in televised interviews. Positive self image foregrounding could mitigate potential risks by highlighting positive attributes of self, while negative self image foregrounding performs disclaiming function by revealing weakness and seeking a reasonable justification for self.

Expectations of and influences on politeness – Lay perspectives in the context of human-human and human-robot interaction

Panel contribution

*Ms. Eleonore Lumer*¹, *Dr. Hendrik Buschmeier*²

1. Bielefeld University, 2. University of Bielefeld

Investigating lay people's conceptualisation of politeness is relevant for understanding the general cultural perception and interpretation of the phenomenon and will allow for a comparison of folk notions of politeness with scientific theories and models. We collected expectations of and influences on politeness in semi-structured interviews with seventeen native speakers of German. As our research has a focus on human-robot-interaction, we compared (within subject) participants' expectations for human politeness with their expectations for robot politeness. We analysed the interview data using Thematic Analysis (Braun & Clarke, 2006) and retrieved participants' conceptual ideas for politeness and their expectations. We also examined which words they used to describe ideas aiming at finding differences in terminology used regarding human or robot politeness.

Overall, participants described politeness to be a result of cultural and social aspects, using expressions such as "norms" and "societal rules", or, more generally, "being friendly". Alongside these socio-cultural components, they often mentioned the inclusion and consideration of the interactional partner. Here they often spoke of "respect" and not "hurting someone's feelings". Participants also expected politeness to be situationally adaptive and personally motivated, also considering the mood of interlocutors.

These descriptions are in line with different theoretical concepts of politeness. The consideration of an interlocutor's feelings and the idea of showing respect can be attributed to the face concept (Goffman, 1955). The notion of politeness as being governed by cultural rules, in contrast, is in line with discernment theories of politeness (Ide, 1989; Gretenkort & Tylén, 2021).

When comparing what participants described regarding general and human politeness in contrast to politeness in human-robot-interaction, we observed that many expressions used for the former were not used for the latter, for example those that described politeness as "attentiveness", "considerate", or "accommodating". Other concepts were mentioned for both types of interactional partners, for example the consideration of culturally learned concepts such as honorifics, or saying "thank you". However, while participants talked about "norms" in the context of human interaction, they mostly mentioned "rules", "learned", or "programmed" politeness in the context of human-robot-interaction.

Besides contributing to politeness research, our study also provides insight into human-robot-interaction design. Here, our analysis indicates that the goal of developing robots that are highly anthropomorphic might not be desirable, at least given the current state of technological development.

Folk concepts of politeness, respect and successful communication in Namibian English

Panel contribution

Prof. Anne Schröder¹, Dr. Pawel Sickinger¹

1. Bielefeld University

The analysis of politeness phenomena in communicative interaction has frequently been undertaken from the perspective of an overarching theory of politeness such as face theory (Brown and Levinson 1987) or the theory of relational work proposed by Locher and Watts (2005). This approach runs the risk of superimposing theoretical constructs onto phenomena that might not be fully compatible with the mode of analysis employed, which is especially problematic in the context of research work in cultural contexts not shared by the researchers themselves.

For this reason, we instead take a bottom-up, data-driven approach in our current project on the pragmatics of Namibian English (PraProNE) regarding politeness and related concepts, following principles laid down in Constructivist Grounded Theory (Charmaz 2006, cf. Charmaz and Thornberg 2020). In 15 interviews with staff and students at the University of Namibia in 2022, we have prompted our participants to talk about different aspects of communication in the context of Namibia's multilingual, multicultural ecology. This includes concepts of polite and impolite conversation, pragmatic norms and expectations, respect and appropriate behaviour as well as the recognition and management of intercultural differences. In a distinct series of 30 interviews conducted in 2023, we have asked participants to comment on and elaborate their own pragmatic performance in a DCT questionnaire they had previously filled out. Their reflections on their own pragmatic choices are illuminating regarding, among other things, the perceived need for politeness, indirectness, deference etc. in specific communicative scenarios, giving us a way to validate our use of Brown and Levinson's micro-social parameters in the design of the questionnaire.

Via examples from these two data sets, we will discuss the conceptualizations of linguistic politeness we find in this group of speakers of Namibian English and situate it within well-known theoretical frameworks in politeness research. We will furthermore describe and evaluate our methodological approach to this issue and demonstrate how it informs our ongoing research on speech act performance in Namibian English.

Talking about national and regional boundaries: The public discourse on communicative differences in German

Panel contribution

Ms. Ronja Eggenschwiler¹

1. University of Zurich

This presentation is set in the context of the trilateral project “Variational Pragmatics of German: Comparing Communicative Patterns”, whose overarching goal is to investigate how pragmatic variation in German is distributed geographically and how common assumptions about communicative patterns compare to data on actual language use. My talk will examine such assumptions in more detail, i.e. it will approach the question how speech (inter)actions are perceived and presented from a lay-linguistic point of view (e.g. ‘German directness’ versus ‘Swiss politeness’).

Crucially, I will focus both on statements pertaining to communicative differences *between* the national borders of Germany, Austria, and German-speaking Switzerland as well as on those pertaining to divergent patterns *within* these countries. While the literature often emphasizes the existence of such differences (cf. e.g. Auer & Hausendorf on East and West Germany), evidence from empirical analyses is lacking. The primary aim of this presentation, however, is not to clarify how this may be approached methodologically; but rather to illustrate what types of lay-linguistic statements are found in Swiss, Austrian and German newspapers, blogposts and popular guidebooks (e.g. Lord 2011; Reihl 2013; Steinfest 2017). To render these materials useful for linguistic analysis, a corpus is currently being compiled that covers comments on putative differences in a wide range of pragmatic phenomena including, for instance, a tendency of German speakers in Switzerland to switch from the more formal address pronoun *Sie* to more familiar *du* much sooner (“Sölle mir nöd Duzis mache?”) than speakers living in Germany or Austria. The talk, which will present some preliminary findings from a pilot study, is organized as follows: First, an overview of the project will be given, then a selection of statements will be analyzed to identify and discuss some of the recurring topics found in public discussions on pragmatic variation in German. Finally, I will pursue the question whether lay-linguistic comments in the public discourse are predominantly characterized by generalizations along national lines or whether they also address more fine-grained patterns of regional variation.

What the meta-illocutionary lexicon can tell us about speech act taxonomies

Panel contribution

Mr. Dominik Schoppa¹

1. University of Augsburg

The meta-illocutionary lexicon (e.g., *request, congratulated, begging, apologetic(ally)*) is a subset of the lexicon which anchors second-order pragmatic notions (i.e., illocutions) in first-order (i.e., ordinary) language (cf. Schneider 2017: 225). When used in interaction, the meta-illocutionary lexicon entails explicit meta-communication (cf. Hübler 2011: 108–116) by definition, and therefore intersects with (some of) Verschueren's (2021) *metalinguistic activity types*: quoted and reported speech, self-reflexive speech, and talk about linguistic forms and utterances (cf. 2021: 120–125). Building on Verschueren's (2021) classification, a model is developed according to which meta-illocutionary items can realize three fundamental functions with respect to the illocutions they denote in context: A DESCRIPTIVE function, where the speaker presents a mapping between an the relevant illocution and an external utterance as congruous, a PERFORMATIVE function, where talk about an illocution conflates with the performance of this illocution (under the presupposition of felicity), and an EVALUATIVE function, where the speaker explicates (in)congruencies in the mapping between an illocution and its felicity conditions. The research question this study aims to answer is how these communicative functions are distributed quantitatively with regard to directive illocutions (i.e., requesting, commanding, begging) and expressive illocutions (i.e., thanking, apologizing, congratulating). Moreover, this study will consider British English, Hong Kong English, and Kenyan English data, and is thus situated at the interface of metapragmatics and World Englishes. A total of 5400 meta-illocutionary items were extracted from the GloWbE corpus and coded for their communicative function(s) in context, and the results were compared across (a) the two speech act classes (i.e., directives and expressives), (b) individual illocutions within each class, and (c) the selected varieties of English. The main findings include that talk about all directive illocutions is dominated by the DESCRIPTIVE function, whereas talk about expressive illocutions is much more diverse. In addition, cross-varietal differences are minimal overall. These and other results are discussed against the background of second-order speech act classifications and taxonomies. It is argued, among other things, that the second-order feature of expressives as being a conceptually more diverse category (due to its variable sincerity condition) is reflected in the first-order feature that expressives are talked about much more diversely by ordinary language users, irrespective of the variety of English.

“This apology doesn’t seem sincere at all”: a cross-cultural analysis of online (meta)discourses around Will Smith’s apology

Panel contribution

*Ms. Eugenia Diegoli*¹

1. *University of Bologna*

This study looks at Will Smith’s apology for slapping Chris Rock and how it has been metadiscursively constructed in Japanese and (American) English online communication. In particular, I am interested in comparing users’ first-order conceptualisations about what makes an (in/effective) apology and how Will Smith’s apology and his supposed violation of social and moral norms are interpreted by the two audiences.

Will Smith’s apology was initially posted on his social media on 29 July 2022 and then reported on YouTube by the ABC7 channel. First, the apology was transcribed and the uses and functions of meta-illocutionary expressions (MIEs; e.g., Schneider 2022) and apology strategies (Blum-Kulka et al. 1989) employed therein were coded. Using a Python script, I then downloaded two sets of comments: the comments (in English) to the YouTube video aforementioned and the comments (in Japanese) of a second YouTube video, which is addressed to a Japanese audience and reports, translates and briefly discusses the apology. Finally, I uploaded each data set (collectively amounting to 310,998 tokens) onto AntConc (Anthony 2022) and, using MIEs (i.e., *apolog** for English; *shazai* ‘apology’/*ayama** ‘apologise’ for Japanese) as nodes, I analysed their collocates and the extended concordance lines they occur in. The questions addressed are: (1) Which functions do MIEs serve in the data? (2) How do the two communities metadiscursively discuss, evaluate and eventually challenge the apology? (3) What are the moral orders such metadiscourses appeal to?

The results indicate that the MIEs are used in the comments with two main functions: to report that an apology was performed and to challenge/problematised the apology. However, important differences were also observed. The close reading of 50 concordance lines for each dataset suggests that Will Smith’s apology is often negatively judged by the English audience. This negative evaluation, however, seems to be less prominent in the Japanese comments. A closer look at the collocates also revealed that *apolog** typically co-occurs with *sincere*, usually to challenge the sincerity of the act (e.g., *This apology doesn’t seem sincere at all*). Conversely, *shazai/ayama** is commonly associated with (*o*-)*tagai (ni)* ‘reciprocal(ly)’ to suggest that a reciprocal apology from Chris Rock would be appropriate (e.g., *Uiru dake o semezu ni o-tagai ni shazai shite hoshii* ‘without blaming only Will, I wish they both [lit. reciprocally] apologised’). Culture-specific moral orders seem to play a role in the negotiation of what is (in)appropriate/(im)polite: while in the English-speaking community sincerity is the single most important factor when evaluating the apology, Japanese speakers prioritise reciprocity. Importantly, however, considerable intra-cultural variation amongst members of each group was also observed.

The analysis opens a window on first-order conceptualisations of apologies, revealing an extended negotiation over the pragmatic meanings of MIEs and what an apology is (or *should* be). Such negotiation is motivated by cultural perceptions of (im)politeness but also by individual preferences. The findings have also methodological implications for the ways in which corpus and pragmatic approaches can be merged.

“Well, there’s an understatement, yes”: Meta-rhetorical uses of understatement

Panel contribution

Prof. Claudia Claridge¹

1. University of Augsburg

While instances similar to “to say I am not happy is an understatement” have been called explicit uses (e.g. explicit irony or hyperbole by Barbe 1995 and Claridge 2011, respectively), they are here called ‘meta-rhetorical’, as they are in fact metapragmatic expressions and similar to meta-illocutions (e.g. Schneider 2021).

This study investigates meta-rhetorical understatement (all N, V, ADJ forms) in modern British (BNC) and American corpora (COCA, SOAP). The choice of these corpora is due to the fact that some interesting distributions can be followed up with them. Ethnic terms collocating prominently with understatement are *English* and *British* (pointing to the well-known national stereotype, e.g. Fox 2004), but meta-rhetorical use is more common in American than in British English. A variational perspective is thus of interest. Regarding register, meta-rhetorical *understatement* is not found in informal conversation (BNC), but only in context-governed and public speech (BNC, COCA) as well as more commonly in writing. Interestingly, it is rather frequent in the ‘spoken’ soap operas, which points to specific dramatic functions.

In contrast to meta-illocutions like *apologize* the nominal form predominates here, with verbal forms fairly rare and adjectival forms usually found in a non-relevant sense as in *understated elegance*. Adapting Schneider’s (2021: 15) functions for meta-illocutions, the performative one does not exist with meta-rhetoricals (**I (do) understate*), and (very rare) pure reporting as in (1) seems to usually merge with the commenting function, as (2) not only reports previous understatement, but mainly evaluates it.

(1) “I’ve heard that a few times already,” Eric understated. (COCA FIC)

(2) Robert Leyton told me you were attractive but he understated. (BNC FRS)

In commenting we find the presence of a (presumed) understatement (underlined in (2-3), also *not happy* above), which is either licenced as literally appropriate (3) or called too weak (2), in both cases leading to an overall more emphatic statement (cf. Claridge 2011 for similar explicit hyperbole cases). It is of interest whether the speaker comments on their own (3) or on others’ usage (2) and which of the two is more common.

(3) It’s no understatement to say the entire flower industry depends on that number. (COCA MAG)

(4) Understating it a bit, aren’t we? (SOAP, OLTL)

(5) Amber: I know you don’t like me very much. - Aggie: Understatement of the century. (SOAP, BB)

The problematizing function is mostly found in interactive uses like (4-5), with one speaker criticizing another speaker’s utterance. The challenge is made stronger by modifications like ‘of the LONG PERIOD’ (cf. (5)) or rather common premodifying adjectives, e.g. *gross, huge, massive, vast, major*. Interrogative cases like (4) are uncommon, even in the problematizing function, as most instances are found in declaratives, e.g. (3), or as phrasal chunks as in (5).

Co-speech gestures in interpreting sign to speech

Panel contribution

***Dr. Liona Paulus*¹, *Dr. Jana Hosemann*¹**

1. University of Cologne

Interpretation settings between a sign language and a spoken language are very specific communicative contexts that target mutual understanding across language modalities (Stone 2012, Turner et al. 2016). Coming from a “machine”-like interpretation model in the 1980ies, in which interpreters were supposed to produce speech without co-speech gestures and only little facial expressions, the interpretation style has changed in the last decades. Nowadays, sign language interpreters are allowed to use co-speech gestures while interpreting into the spoken language. We hypothesize that the use of co-speech gestures advances the overall communication situation between a deaf and a hearing person.

In our current study, we pilot the hypotheses that an interpreting context, in which the interpreter *does* use co-speech gestures during speech, promotes a clearer communication between the deaf and the hearing person, compared to an interpreting context, in which the interpreter *does not* use co-speech gestures during speech. We address the following questions: Do deaf participants benefit from seeing co-speech gestures during interpreting from sign language to spoken language? In what way does the sign language interpreter as well as the hearing participant also benefit from their use of co-speech gestures?

We collect video recordings of interpretation settings (German Sign Language (DGS) and German) with deaf and hearing participants and interpreters. We analyze the co-speech gestures used by the interpreter into lexical gestures (emblematic, pointing and illustrative gestures), as well as communicative control gestures (recurrent, regulators and beat gestures) (Matsumoto & Hwang 2013, Pfau 2011, Ekman & Friesen 1969, Müller 2004, Ladewig 2014). Lexical gestures will then be compared to DGS signs in a post analysis, and a questionnaire with the participants asks about the communicative benefit for deaf and hearing participant in an interpretation context with frequent use of co-speech gestures.

Exploring the semiotic complexity of interpreter-mediated discourse: Insights from a multimodal analysis of information provision strategies in medical consultations

Panel contribution

***Dr. Inez Beukeleers*¹, *Dr. Laura Theys*¹, *Prof. Heidi Salaets*¹, *Dr. Demi Krystallidou*², *Prof. Peter Pype*³, *Mr. Geert Brône*¹**

1. KU Leuven, 2. University of Surrey, 3. University of Ghent

One key factor in the achievement of successful patient-centered communication and shared decision making in medical consultations considers information provision, i.e., strategies used by healthcare providers and patients to convey information about symptoms, diagnosis and treatment plan (De Haes & Bensing, 2009). When reviewing the literature, it appears that healthcare providers use cognitive aid strategies when providing medical information. They repeat or rephrase information, provide simplifications and/or make use of drawings and pictures in order to provide clear and viable information (Menichetti et al., 2021). However, existing studies have mainly studied this phenomenon in experimental set-ups, rather than in authentic medical consultations. Moreover, it has also not yet been studied in authentic interpreter-mediated medical consultations. Finally, existing studies do not consider the role of gesture in face-to-face interaction.

The current study therefore provides a first systematic account of multimodal information provision strategies used in 5 authentic interpreter-mediated medical consultations. We adopt a semiotic point of view in which language is signaled through the methods of describing, indicating and depicting (Clark, 1996; Shaw, to appear). In doing so, we will investigate the semiotic complexity of informative utterances produced by the primary participant and identify possible shifts in the interpretation process. We thus investigate whether/how interpreters relay the healthcare providers' and patients' visible bodily behavior used to describe, indicate and depict the medical problem or treatment.

Preliminary results show that the primary participants use a variety of semiotic strategies to exchange medical information. Healthcare providers, for instance, do not only use descriptive strategies like repetitions or reformulations, but also use iconic and indexical gestures to indicate and depict information about the patients' medical condition. Moreover, patients do not only describe their symptoms, but they also use pointing gestures and eye gaze to indicate the exact location of their pain. Finally, we found substantial shifts in the interpreter's rendition of the participants' utterances. Repetitions or reformulations are often not relayed and interpreters often do not see and integrate the participants' pointing and iconic gestures in their interpretation. These findings point out that interpreters would benefit from an enhanced knowledge about healthcare communication.

Functions of gestures during disfluencies in simultaneous interpreting of speech

Panel contribution

*Prof. Alan Cienki*¹

1. *Vrije Universiteit Amsterdam*

Simultaneous interpreting is known to be an extreme language task, involving a high cognitive load (Seeber 2011, 2013). Gesture has long been claimed to play a role in facilitating lexical retrieval (Krauss et al. 2000) and speech production (de Ruiter 2000). Different functions of gestures have been studied in this regard, including those of representation/depiction, pragmatic uses, and self-adapting (self-touching) functions.

There are reasons to hypothesize that each of these gesture functions might play a role as interpreters try to resolve moments of disfluency. Representational: because gestures depicting elements of the concepts from the source text might facilitate lexical retrieval in the target language. Pragmatic: specifically, cyclic gestures are known to play a prominent role during word retrieval (Ladewig 2011). Self-adapters: because these movements may help with maintaining mental focus and controlling stress (Ekman & Friesen 1969).

This exploratory study aimed to see which gesture functions were employed most frequently, and in what ways, during moments of interpreting disfluency. Fifty native speakers of Russian (L1) were involved, ranging from less (student-level) to more experienced interpreters. Interpreting was done both to and from an L2 with each participant, with English and German as the L2s, depending on the interpreter's expertise. Each time, the participant heard a ten-minute audio clip from a popular science lecture about biodiversity and the extinction of species; the videos were purposely not shown to prevent potential influence from gestures by the original lecturers. We counted as disfluencies in speech moments involving truncations, restarts, mumbling, use of filler words, dragging out of words, and long (for the given speaker) pauses.

The results show that the most frequent uses of gestures with disfluencies involved pragmatic functions and self-adapters. The pragmatic gestures, however, were not primarily cyclic ones, but rather presentation gestures (palm-up open hands [Müller 2004] and variants of them [Cienki 2021]) and gestures marking emphasis (beats). Self-adapters were those of a sustained nature (e.g. rubbing the fingers of one hand with the other). Gesture use sometimes alternated between these two, with pragmatic gestures 'popping out' (with brief outward movements) during otherwise sustained self-adapter movements. Representational gestures were used far less during disfluencies. These results did not vary significantly according to the level of experience of the interpreters, the direction of interpreting, or the source or target language of the interpreting. However, individual differences between interpreters were great, considering the variance in their reliance on the use of particular gesture functions (Galvão 2020) (their 'idiogest' [Brannigan 2011]).

The two predominant functions of gestures seen here highlight the role of interpreters as 'presenters' to an audience (with outwardly-oriented pragmatic presentation gestures) while simultaneously negotiating the heavy cognitive load that is part of their work (with inwardly-oriented sustained self-adapters). The implicitly interactive nature of their discourse (even if interpreting only for imagined listeners) reflects not only the inherently dialogic nature of talk (à la Bakhtin) but also the blending of viewpoints (Cienki & Iriskhanova 2020) that interpreters engage in—essentially embodying the speaker of the source text.

Gestural alignment in spoken simultaneous interpreting: A mixed-method approach

Panel contribution

*Dr. Inés Olza*¹

1. *University of Navarra*

Background, objectives and research questions

This paper aims to offer empirical evidence on the role and multimodal display of cognitive alignment in spoken simultaneous interpreting. Until now, the body of research on alignment in interaction (see Rasenberg, Özyürek & Dingemanse 2020) has focused mainly (1) on verbal forms of aligned behavior, with still limited attention paid to the multimodal channelings of alignment in gestures and prosody (Kimbara 2006; Olza 2022a); and (2) on regular genre of interpersonal dialogue, with scarce attention to other forms of collaborative linguistic activity where the speaker's behavior crucially relies on another individual's communicative action.

In parallel, the architecture of cognitive abilities that intervene in simultaneous interpreting is still to be fully described, and the place of gesture in the interpreters' practice has been neglected until very recently, with contributions that have advanced in qualitative analyses of data drawn both from (quasi)naturalistic and experimental settings (Zagar Galvão 2009, 2020; Iriskhanova 2020).

Against this general background, and relying on a previous pilot study (Olza 2022b), this paper presents a case-study that addresses the following research questions:

Do simultaneous interpreters (spoken-to-spoken discourse) gesturally align with the interpreted speaker? If so, which types of gestures tend to prompt a higher degree of alignment by the interpreters, and why?

What does all this tell us about the cognitive processes involved in spoken simultaneous interpretation?

Data and methodology

A 30-minute training session for novice legal interpreters at the European Court of Justice (Interpretation Directorate) was recorded. This consisted of a live interpreting exercise carried out in a real courtroom, where the speaker stood in the main of orator's position (central front) and the trainees occupied individual booths in both sides of the room. The speaker delivered a speech in Spanish on non-legal issues related to the history of technology. Two interpreters were recorded: interpreter 1, from Spanish into spoken English; and interpreter 2, from Spanish into spoken French.

A mixed-method approach is used to analyze the data. Four 2-minute excerpts of the recording are randomly selected to carry out the analysis. First, a qualitative analysis of the excerpts serves to identify the presence and type of gestures (beat, deictic, iconic, metaphoric, pragmatic) performed by both the speaker (baseline) and the interpreters, along with the correspondent speech sequences uttered by all of them.

Second, statistical analyses are run to define the degree of convergence between the speaker's and the interpreters' gestural behavior, also looking at the type of gesture originally carried out by the speaker.

Expected results

The quantitative analysis of the interpreters' behavior will provide a general picture of the degree of gestural alignment they exhibit towards the speaker. Moreover, the integration of gesture types in the analysis will determine the kind of body movements that are more likely to prompt alignment by the interpreters, thus feeding the general theory of alignment with new data and helping to describe how it is modulated in interpreting practices.

Gesture and cognitive load in simultaneous and consecutive interpreting: A pilot study

Panel contribution

Dr. Yuetao Ren¹, Prof. Jianhua Wang¹

1. Renmin University of China

Simultaneous interpreting (SI) and consecutive interpreting (CI), both frequently used in conference settings, are mostly carried out under high cognitive pressure (Gile, 1995; Lv & Liang, 2019). Studies on language and gesture show that speech and gesture form an integrated system during language comprehension and production (McNeill, 1992; Kelly *et al.*, 2008). Gesture plays a facilitative role in language production by lightening the cognitive load, especially when working memory is taxed (Goldin-Meadow *et al.*, 2001; Ping & Goldin-Meadow, 2010; Gillespie *et al.*, 2014; Lewis *et al.*, 2015), and studies on conference interpreting find that interpreters do gesture in both SI (Martín de León & Fernández Santana, 2021; Stachowiak-Szymczak, 2019; Zagar Galvão, 2015) and CI mode (Stachowiak-Szymczak, 2019). However, gestures in interpreting, especially their relationship with the underlying cognitive process, remain understudied.

This study aims at exploring the relationship between gesture and cognitive load in conference interpreting. To this end, we set up a remote interpreting setting via the Tencent Meeting app, a Chinese equivalent of ZOOM, for data collection. Fourteen student interpreters participated in three kinds of speech production tasks, namely: a monologic spontaneous speech (free talk), four interpreting tasks (both SI and CI in video and audio conditions, order counterbalanced) and a dialogic spontaneous speech (interview). A cued retrospective session, using interpreting task videos as stimuli, was conducted afterward, in which participants made spoken commentaries on their interpreting process.

Our first hypothesis is that there will be differences in gestural behavior between these three kinds of speech production tasks as well as the four interpreting conditions as a result of differences in cognitive load. Our second hypothesis is that gestural behavior will be different between SI and CI, due to different interpreting strategies. Cognitive load is measured using disfluencies as problem indicators.

Both gestures and disfluencies were analyzed using ELAN software. Gestures were annotated according to their main functions: referential and pragmatic (Martín de León & Fernández Santana, 2021). For disfluencies, the following sub-types were included for annotation: silent pauses longer than 0.5s, filled pauses, filler words, truncation, restarts, repetitions and prolonged sounds (Bóna & Bakti, 2020; Cienki & Iriskhanova, 2020; Han & An, 2020).

Preliminary results show that the frequency and amplitude of gestures are significantly greater in the dialog task. Most gestures are adjacent to disfluencies, which provide evidence for gestures' facilitative role in cognition and language production. It is argued that there exists a functional difference in the gestures used in fluent and disfluent speech. That is, gestures accompanying (quasi-)fluent speech serve to propel spatio-motoric and abstract thinking and those that go with disfluent speech, however, facilitate lexical retrieval and short-term memory. In this way, gestures lighten the cognitive load in the interpreting process and "lend a hand" to interpreters in achieving fluency.

How does physical separation affect the interpreter's use of gestures in distance interpreting?

Panel contribution

Dr. Jelena Vranjes¹

1. Ghent University

Although research has shown that speakers' use of manual gestures is strongly linked with speech in many ways (McNeill 1992), gestures have received little attention in dialogue interpreting research. Previous studies on spoken interpreting have investigated, for instance, the function of body-oriented gestures in healthcare interpreting (Gerwing & Li 2019) and interactive gestures that serve the purpose of pointing out the 'principal' of the talk (Vranjes & Brône 2021). Yet there is much more to be learned about the use and function of gestures in the process of dialogue interpreting.

This paper will investigate gestures in a technology-mediated form of interpreting, namely video remote interpreting (VRI). VRI refers to the use of a video link to connect the interpreter, who is at a distant location, with the primary participants, who are together at one site. Especially since the beginning of the Covid-19 pandemic, the importance of video remote interpreting for providing interpreting services has drastically increased and is likely to continue growing in the future. Although video technology enables "co-presence at a distance" (Hutchby 2000), research has indicated that embodied resources do not function in the same way as in face-to-face settings (e.g. Heath & Luff 1991).

Drawing on insights from gestures studies and Interpreting Studies, the study addresses the following question: How does physical separation affect the interpreter's use of gestures in distance interpreting? The study is based on data drawn from experiments that aimed at comparing onsite interpreting and VRI in terms of interaction management. The study will focus on the interpreters' pragmatic or interactive gestures (Bavelas et al. 1992, Kendon 2004) during the exchange and the constraints placed on the use of those gestures in VRI. The paper will show how dialogue interpreters' use of gestures relates to the complexity of the interactional setting and how adopting a multimodal approach to the analysis of VRI yields novel insights into the intricacies of technology-mediated forms of interpreting.

Making gestures inside and outside the booth — A comparative study

Panel contribution

***Dr. Celia Martín de León*¹, *Dr. Elena Galvão*²**

1. Universidad de Las Palmas de Gran Canaria, 2. Universidade do Porto

Although co-speech gestures show great variability across individuals, context and communicative situation may also influence their production. Simultaneous interpreting is a very cognitively demanding activity as well as a complex form of cross-linguistically mediated communication. All of this can influence the production of interpreters' co-speech gestures. Given the idiosyncratic nature of gestures, comparing the gestures of the same interpreter while interpreting and in face-to-face communication may shed some light on the specific characteristics of gestures in simultaneous interpreting. This exploratory study focuses on the gestures of five professional conference interpreters working from their L2 (English) into their L1 (Portuguese in four cases, Italian in one case), and aims to compare the co-speech gestures of each interpreter in the two settings.

Previous research not only shows that speakers gesture at a higher rate when addressing a visible interlocutor, but also that gestures made in face-to-face interaction are significantly larger than those made when the interlocutor is not seen or does not exist [1]. Furthermore, Cienki and Iriskhanova [2] found some similarities across the gestures of simultaneous interpreters, such as the prevalence of adaptors and beats as opposed to representational gestures. Taking all this into account, our initial hypotheses are as follows:

- (1) The rate of gestures will be higher in face-to-face communication than during interpreting.
- (2) Gestures will be larger in face-to-face communication than during interpreting.
- (3) The rate of adaptors will be higher during interpreting than in face-to-face communication.

To test our hypotheses, we analysed data collected in two situations: an interview with the researcher and a simultaneous interpreting task. We based our analysis on the concept of “interpreters' gestural style” developed by Zagar Galvão [3] to describe the individual gestural profile of interpreters, and focused on two of the dimensions proposed to characterise it plus an additional one:

- (1) Gesture rate (number of gestures per minute).
- (2) Classification of the amplitude of the gestures (small, medium, large) according to their location and trajectory in the gesture space [4].
- (3) Adaptor rate (number of adaptors per minute).

The preliminary results on the gesture rate of four interpreters in the simultaneous interpreting task show moderate differences across subjects (from a minimum of 22.72; to a maximum of 31.12 gestures per minute).

Reformulation structures in French Belgian Sign Language (LSFB) > French interpreting: A pilot study

Panel contribution

*Dr. Sílvia Gabarró-López*¹

1. *Universitat Pompeu Fabra*

Reformulation structures (RS) are defined as two segments of discourse (X and Y) in which X says something and Y says it in a different way in order to narrow, expand, adjust, specify, clarify, define, correct or modify different aspects of X [1]. RS are the foundations of interpreting, and they can be found at different levels of this linguistic activity [2]. By analysing RS used in French > Polish interpreting, Woroch [2] differentiated between interlinguistic RS (i.e. the information of the source language is reformulated into the target language) and intralinguistic RS (i.e., RS only occur within the target text). In signed-to-spoken and spoken-to-signed language interpreting, RS remain almost unresearched to date [3].

This paper aims to describe intralinguistic and interlinguistic RS in French Belgian Sign Language (LSFB)-to-French interpreting. The form of RS, their semiotic composition and distribution across LSFB source and French target discourses is studied adopting a multimodal approach without any a priori distinction between ‘linguistic’ and ‘non-linguistic’ articulators. In other words, the starting point is that signers and interpreters use various semiotic repertoires including description (i.e., conventional structures of a language such as lexical items, morphology and syntax), depiction (i.e., iconicity of sounds, intonation, gestures and body movements) and indication (i.e., pointing with the hand or with the gaze) [4].

Two language datasets are annotated and analysed using ELAN: dialogues of two LSFB signers [5] for the source data (totalling 10 minutes) and their interpretation into French by two experienced bimodal interpreters [6] as the target data (totalling 20 minutes). Preliminary results show that both interpreters produce interlinguistic and intralinguistic RS in French target productions, but to a lesser extent than in source LSFB productions. Interpreters do not seem to be influenced in their gesturing by the signs produced in the LSFB source dialogues and seem to control their amount of gesturing by placing their hands on their lap. Nevertheless, they combine the semiotic repertoires mentioned above while reformulating. Interpreters also engage their voice (not only to interpret the messages given by the signers but also to imitate how signers express them) as well as their hands (e.g., producing palm-up gestures), body (e.g., moving their heads and their shoulders) and face (e.g., depicting the signers’ attitudes or feelings using facial expressions).

Self- and other-oriented gestures in consecutive dialogue interpreting: impact on the cognitive load and performance appraisal in interpreter-mediated interactions

Panel contribution

Dr. Monika Chwalczuk¹, Dr. Robert Balas¹

1. Institute of Psychology, Polish Academy of Sciences

To date, the multimodal approaches applied to interpreting studies focused mainly on two stages of the Interpreting Communicative Event¹: processing of the source message² and production of the target speech^{3,4} both examined in simultaneous mode. To contribute to the as yet understudied research avenue that analyses consecutive dialogue interpreting through the lens of multimodal corpora^{5,6,7}, we propose to examine gesture *production, perception* and the underlying *cognitive processes* in interpreter-mediated interactions in spoken languages (English, French, Spanish, Polish).

Previous research shows that simultaneous and consecutive interpreters produce co-speech gestures encompassing spontaneous productions and visible actions induced by gestural alignment with the speaker^{6,8}. To what extent are these bodily semiotic resources recruited to unburden the interpreter? Does their presence additionally benefit the receivers of the target message? The paper's contribution to the panel is twofold: examining the interpreter's gesture (re)production along with its correlations with physiological indicators of the cognitive load and analyzing if target speech production is evaluated differently when delivered with or without gestures. Onsite experiments involving 30 graduate students of interpreting consist of mock public service interactions meant to recreate medical, police, and administrative settings. Three types of data are collected, spanning: 1) video recordings annotated in ELAN – to account for gesture production; 2) physiological measures, i.e., EEG and HRV – to investigate underlying cerebral and heart rate activity; 3) self- and peer-reports – to verify if the presence of gestures has an impact on the performance appraisal.

The paper presents findings from the first part of an ongoing research project. Combining an embodied cognition framework with sociolinguistic measures, we hope to contribute to the limited body of literature that sheds light on how a multimodal approach can improve performance in consecutive dialogue interpreting – a foundation of communication access services indispensable to vulnerable populations.

Simultaneous interpreters' gestures as a window on conceptual alignment

Panel contribution

*Dr. Terry Janzen*¹, *Dr. Barbara Shaffer*², *Dr. Lorraine Leeson*³

1. University of Manitoba, 2. University of New Mexico, 3. Trinity College Dublin

Taking our cue from Sweetser's (to appear) claim that the body in space is fundamental to embodied cognition, we examine the meaning of interpreters' gestures when interpreting from spoken English to another spoken language. Simulation of the speaker's narrative sequences is evident in interpreters' gesturing, and the main question we ask is whether the gestures show evidence of conceptual alignment or non-alignment with the source speaker's viewpoint portrayal of scenes and events.

In the present qualitative study, we report on data from a larger study where fourteen interpreters participated, interpreting two spoken English texts into the other language in their language pair: French, Spanish, Navajo, Ukrainian, American Sign Language, or Irish Sign Language. All interpreters had at least five years of professional interpreting experience. Each interpreter first watched a video of two spoken English texts and then were video recorded interpreting them into their target language. This was followed by a video recorded Think Aloud Protocol (TAP) (Russell and Winston 2014) where they discussed how they made lexical and grammatical choices in the target language, and whether their visualizations of the source text aided in how they understood the text and subsequently made these target language choices. Both source text speakers gestured throughout their texts, and all interpreters gestured frequently as they interpreted. In this study we focus on the spoken to spoken language data.

In analyzing the resulting interpretations, supported by the TAP results, we find evidence of the interpreters' simulation (Barsalou et al. 2008; Kok and Cienki 2017) of the speakers' narrative sequences, based on their gestures, especially when viewed within the context of viewpoint gesture space. This reflects a multi-level cognitive blend, where the interpreter's own past (subjective) experiences blend with their assessment of the speaker's viewpoint, rather than the interpreter fully assuming the speaker's viewpoint. Critically, interpreters' alignments and misalignments with the speaker's intended message, observed when comparing the speakers' and interpreters' co-speech gestures, reveal degrees of both gestural (often spatial) alignment and conceptual alignment. Here we examine elements of the interpreters' conceptualization blends, and propose a typology of gestural and conceptualization alignment/non-alignment in the interpreters' target texts.

The embodiment of renditions in signed-to-spoken language interpreting: Recontextualizing constructed dialogue

Panel contribution

*Mrs. Vibeke Bø*¹

1. OsloMet

The complex and interactional character of interpreting is now well established by interpreting scholars (e.g., Wadensjö, 1998a; Roy, 2000; Hale, 2004; Mason, 2006; Llewellyn-Jones and Lee, 2014; Kluuskeri, 2019; Gallai, 2017; Blakemore and Gallai, 2014; Farinde et al., 2020). However, the nature of this complexity remains unclear, specifically the research on the multimodal pragmatic processes in interpreted discourse is scarce. This paper seeks to explore some of these processes by aligning new insights on the embodiment and multimodality of language from linguistic research and gesture studies with interpreting studies. Moreover, the study seeks to fill a gap of knowledge about interpreters' visual bodily signals when rendering from a signed to a spoken language.

Interpreting from a signed to a spoken language entails situating utterances that used to belong to a visual language ecology into a language ecology with both visual and auditive resources, or a unified speech gesture-system (Holler, 2022). This paper qualitatively explores how two interpreters recontextualize the depictive resource of constructed dialogue. Drawing on Goodwin's (2000) notion of *contextual configuration*, with the tools of multimodal conversation analysis (Davitti and Pasquandrea, 2017; Deppermann and Streeck, 2018), I demonstrate and discuss the observations of embodied pragmatic processes, including gestural resources, deployed to properly recontextualize constructed dialogue in its new ecological surroundings. The empirical material consists of two informal interpreter-mediated lunch conversations. Each conversation is approximately one hour. The data set analyzed for this paper consists of four extracts, two examples from each conversation. These extracts are annotated in ELAN (Crasborn and Sloetjes, 2008). As this study represents open data, the analyzed video extracts will be included as part of the presentation.

The in-depth multimodal analysis of interpreters' renditions provides a glance into the characteristics of the important pragmatic choices made in simultaneous interpreting. This explorative study thus contributes to the acknowledgement of pragmatic competence as an essential part of interpreters' competence (Gallai, 2017), and argues the extended reflections on naturally occurring data are important contributions to the field of interpreting.

Construction of shared affect in a Japanese research interview: changes in participation framework

Panel contribution

*Dr. Haruko Cook*¹

1. *Univerty of Hawaii at Manoa*

In studies of sociolinguistics and pragmatics, it is assumed that distinctive types of talk are produced in formal and informal contexts (cf. Irvine 1979). Typically, institutional talks including interviews are considered as a type of formal context. This study explores how informal context is created in a multi-party research interview in Japanese.

In Japanese, which is rich in honorifics, formality and informality are linked to the addressee honorific, *desu/masu* form and the non-honorific counterpart, the plain form, respectively. So far, scholars have extensively investigated how the plain form is occasionally used in what is considered as the *desu/masu*-form dominant formal context (cf. Jones and Ono 2008). It was found that in institutional talks, official activities are normally conducted in the *desu/masu* form while activities not of an official nature such as small talk within institutional talk are often conducted in the plain form (e.g., Cook 1996; Geyer 2008, 2013). In interviews, the interviewer momentarily shifts to the plain form without an affect key in a summary/evaluation turn for the purpose of extending the interviewee's response (Cook 2002, 2008; Ikuta 2008; Nazikian 2007). The *desu/masu* and plain forms, however, are not the only resources for constructing formality and informality in social context. This paper investigates how a shift of participation framework in a multi-party interview (Goffman 1981) contributes to a shift to an informal context within the formal context of an interview. Goffman (1981) observes two types of participation framework that may occur in multi-party talk. One is that the speaker treats all the official participants as a group of addressed recipients. The other is that the speaker selects one participant as the addressed recipient, creating a distinction between the addressed and unaddressed recipients in the speech context. The paper asks the following questions: i) How do the interview participants change participation framework in a multi-party interview?; ii) What co-occurring linguistic and non-linguistic features are deployed to mark a change in participation framework?; iii) What effects does a change in participation framework have on the interview?

The data come from a research interview in Japanese, in which the interviewer interviews three Japanese women concerning differences in workplace culture between Japan and Hawaii.

The qualitative analysis of the data shows that Goffman's first type of participation framework in a multi-party talk contributes to the interviewees' display of heightened emotions. The interviewer treats the interviewees as a group of addressed recipients when she asks a question. This move creates a footing shift within an interview. The interviewees, who are collectively treated as the addressed recipients, respond to the interviewer's question by engaging in an informal talk among themselves by using the plain form, repetition, laughter, among others. This paper demonstrates that this is an effective way to produce vivid descriptions and display strong emotions in the interview. It contributes to the study of participation roles, an important issue, in the study of pragmatics (cf. Levinson 1988; Verschueren 1999).

Formality and Intimacy in Japanese Variety Shows

Panel contribution

Prof. Naomi Geyer¹

1. University of Wisconsin-Madison

In Japanese, the use and non-use of addressee honorifics constitute stylistic variations. While their use and non-use are traditionally considered to indicate formality and intimacy respectively, recent studies claim that honorific usage is related to speakers' linguistic identity, ideology, and self-presentation.

In the fields of pragmatics and linguistic anthropology, researchers who take the indexical approach to pragmatic phenomena have called for a re-examination of honorifics usages, viewing the relationship between language and social categories as mediated by language ideology (Johnstone, 2013; Okamoto & Shibamoto-Smith, 2016). With such a view, researchers demonstrate that honorifics index multiple social meanings, and the use and non-use of honorifics cannot simply be linked to the distinction between formal and informal contexts. As the panel organizers stated in their proposal, the simple 'formal' vs. 'informal' dichotomy is "a static ideological construct."

The formal and informal contexts are especially intertwined in media discourse where multiple layers of relationships between interlocutors and audiences coexist. The discourse participants' language use including their multimodal enactments constructs and is constructed by the interlocutors' and audience's varying footings and participation framework (Goffman 1981). For instance, in case of Japanese variety shows, participants talk in front of audience who are in the studio with the participants, and the program is televised for a larger audience who watches the show. In such a case, the program itself might be considered public and somewhat formal, but it may include instances of informality and enactment of closeness. Moreover, sometimes the dynamics between regular participants and a guest can create different layers of formalities.

Using qualitative discourse analysis, this study examines the participants' use and non-use of honorifics along with other linguistic and multimodal elements in 5 variety shows. It also examines 18 online discussion board entries which discuss the participants' language use in these programs. Showing the range of language use, footings, and participation framework displayed in these programs and ensuing metapragmatic discourse, this study aims to reexamine the notion of "formality" as something discursively constructed and displayed in on-going interaction.

Invoking rapport and feelings of usualness: Effects of quotidian reframing in a formal context

Panel contribution

*Prof. Yoshiko Matsumoto*¹

1. Stanford University

While engaging in interactions that normally call for some degree of formality in linguistic choice and demeanor, some speakers depart from such general expectations and use linguistic (and non-linguistic) expressions that are more closely associated with informal or intimate interactions. Such departures may be more noticeable in Japanese than in some other languages, as formality can be morphologically specified in Japanese, notably in predicate forms. For example, the verb *ikimasu* 'go' is a formal counterpart to the informal *iku* 'go', while both forms convey the same propositional content.

This paper argues that such departures from expectations in formal contexts do not occur randomly but are aligned with reframing or change in footing (Goffman 1981) of what is being talked about in the interaction. Importantly, the general nature and the content of the interaction are not altered by such contextually unexpected choices of expression. However, the speaker takes the perspective of the familiar and quotidian (Matsumoto 2011) as the footing for the conversational topic. The resulting quotidian framing is accompanied with contextualization cues (Gumperz 1982), i.e. linguistic and non-linguistic means consonant with familiar and informal situations. Adopting a quotidian footing reduces the formality of the interaction by invoking rapport among the participants (the speaker, the ratified listener and audience) and putting them at ease as if they were engaging in conversations about regular matters of daily life.

Instances from three different interactionally formal settings are examined: (1) a retelling of a doctor's instructions to a first-time acquaintance, (2) a TV talk show and (3) Twitter postings by a political party. While each interaction targets different listeners/audience through different media, all employ quotidian framing, forging intimacy expected in familiar and ordinary contexts. In (1), a discussion between a speaker with a severe cardiac condition and a doctor about an emergency was reframed as if it were a daily chat between two old friends. It was accompanied by familiar forms and laughter, suggesting regained emotional normality. In (2), the talk-show host, describing a videotaped scene in which the guest, a recovering cancer patient, walked into an operation room, overlaid a scene of a leisurely daily stroll with mimetics, casual linguistic forms and light laughter. This reframing also achieved an emotional balance and a light atmosphere. Twitter posts by a political party office in (3) were made during an election campaign. Amid official political messages issued in formal language, online postings about political gatherings were framed as quotidian matters and included emoji and friendly expressions that conveyed rapport (real or imagined) between the party and the supporters. These instances, which align with familiar linguistic styles, demonstrate the value of quotidian reframing – segments that change the footing of participants in a formal context to that of conversations on quotidian matters to invoke rapport among the participants of the interaction along with feelings of being normal and usual.

Making connections: Reported speech, repetition, and eccentric metaphor in research interview discourse

Panel contribution

Dr. Satoko Suzuki¹

1. Macalester College

Conventionally, a research interview would be considered a formal occasion. Because the goal of research interviews is to find answers to academic questions, the atmosphere tends to be subdued and not particularly conducive to heightened emotion. Moreover, if an interview is conducted in Japanese, the interlocutors are expected to use the honorific language, which is usually associated with formality.

However, in many research interview contexts, researchers strive to engage with participants emotionally in order to solicit compelling stories, and they sometimes succeed in making emotional connections with their participants. I experienced this when conducting interviews on the topics of identity and belonging with female professors from Japan. We spoke in Japanese, and, because the interviewees and I knew each other only professionally, we used polite/honorific language. Yet they generously opened their hearts and told me some things about their inner selves.

I observed some recurrent linguistic elements in such moments of connection, including (1) reported speech and thought, (2) repetition, and (3) eccentric metaphors, as shown below in English translation:

- One time I was in a small committee meeting and somebody said, “**Are you following?**” I thought, “**What?**” When he said, “**Are you understanding?**” I thought, “**Are you kidding?**” [...] So that person who belittled me was an old white professor, who probably thought that whites are the best of all races. So, I am this small Asian woman being quiet, so he wondered if I understood what was going on at the meeting.
- In general, people have an easier time expressing opinions when they get older. Their own **voice** comes out. I felt that way as I got older. [...] At my age, everybody, including high powered individuals, has become the same to me. Even if somebody is the President of the United States, things like that do not matter. [laughs]. And I gradually came to have my own **voice**. I told you I was introverted, right? As I got older, I was able to bring out my **voice**.
- [Talking about teaching Japanese language] Yeah, so I feel like **I am selling my body** [laughs heartily], so I am sad, you know? [Researcher: You feel like you are selling your body? What do you mean by that?] Well, I would not go as far as saying I am a prostitute, but I am using what I already have as a business tool, you know?

These examples referring to painful experiences or inner thoughts demonstrate that the researcher was able to make connections with the participants. Linguistically, the examples illustrate how speakers’ styling practices construct contexts. Example (1) shows the use of reported speech and thought. Example (2) illustrates how the repetition of the word “voice” emphasizes the speaker’s message. Finally, example (3) includes the use of an unusual metaphor. This study will explore how the interviewees used these linguistic elements to make stories come alive, to engage the other speaker more fully, and to elicit laughter and curiosity and thus bring the speakers closer together.

Sounding like a skateboarder at the Tokyo Olympics: Vernacular honorific speech style and innovative speaker identity construction in Japanese

Panel contribution

*Ms. Sara King*¹

1. University of Hawaii at Manoa

The research presented in this paper investigated a sports commentator's use of a vernacular honorific speech style at the Tokyo 2020 Summer Olympics skateboarding event. Many studies have examined speakers' style shifting between the addressee honorific *desu/masu* and the non-honorific plain style (Cook 2002, 2018; Geyer 2008; Okamoto 2011, Enyo 2015), but few have investigated style shifting with relatively new vernacular honorific speech style marked by *su* (cf. Nakamura 2021). The above studies on style shifting look at the ways in which *desu/masu* style functioned as an index of the speakers' on-stage self (Cook 1996, 1998, 2008) while the non-honorific plain style indexed one's innate persona or the spontaneous expression of self (Cook 1996). This paper will show how the use of *su* style along with honorific *desu/masu* style worked to create a third space for the presentation of an on-stage, innate persona and locally situated identity during the broadcast of the skateboarding event at the 2020 Olympics.

A previous metapragmatic analysis of online discourse regarding *su* style found that, when discussing the use *su* style in formal settings such as the workplace, commenters used a variety of derogatory terms to assess speakers who use *su* (Nakamura 2021). While these findings suggest some speakers are skeptical of the appropriateness of *su* style in formal settings, the focal speaker of the present study who appeared as one of two sportscasters in the broadcast of the Olympic sporting event, drew positive attention to himself as a result of his frequent use of *su* style. Drawing on Ferguson's (1983) work on SAT (sports announcer talk) and the roles of sports announcers and sports commentators, this study examines how the skateboarder sportscaster's shifting speech styles (*desu/masu* and *su*) worked to index shifts in the role he was engaged in at the moment during the broadcast.

The analysis found that the skateboarder sportscaster frequently used *desu/masu* style when engaged in sports announcer activities such as providing statistics or other background information about the skaters and skateboarding techniques or giving play-by-plays. In contrast to this, when he provided his affective assessments of the skateboarding performances or he engaged in talk related to skateboarders' lifestyle, the skateboarder sportscaster utilized the vernacular *su* style and his speech style indexed his role as a sports commentator. While the speaker's roles of announcer and commentator are both relevant to his professional capacity as a sportscaster and therefore would prompt the performance of the on-stage self (Cook 1996), the distinct usage the vernacular *su* style worked to index the speaker's unique position as a sportscaster who is also a skateboarder. In this way, the unique setting of the skateboarding event at the Olympics made it so that the honorific style shifting could constitute the relevant the contextual identity of skateboarder sports commentator.

Style-shifting between Standard and Kansai Japanese at a business manners training camp

Panel contribution

*Dr. Junko Saito*¹

1. Temple University, Japan Campus

This study explores Japanese style-shifting among *desu/masu* (honorific) forms in Standard Japanese (SJ), plain (non-honorific) forms in SJ, and Kansai dialect forms by an instructor at a Japanese business manners training camp.

Speech styles in Japanese have drawn extensive attention in the fields of sociolinguistics and pragmatics. While several of these studies have investigated speech style-shifting in workplace discourse, they tend to focus on SJ *desu/masu* and plain forms (e.g., Cook, 2011), although a handful have focused on the use of regional dialects (e.g., Barke, 2018). Building on this prior research, this paper addresses the following research questions: How does a male instructor at a Japanese business manners training camp use speech styles? And what stances does he display through his style-shifting during the training sessions? Utilizing Kiesling's (2009) notion of stance, the study describes how the instructor takes epistemic and interpersonal stances through his style shifts to construct his relationship with the trainees. Such strategic stance-taking ultimately helps the instructor accomplish his teaching objectives.

The data are approximately 27 hours of video-recordings from one company's four-day-three-night business training camp. The participants are one male instructor and 22 of the company's new employees. Attention is given to style-shifting by the instructor with particular focus on his use of SJ plain forms, including masculine linguistic features, and of the Kansai dialect, both in juxtaposition to SJ *desu/masu* forms. The analysis demonstrates that while the instructor is likely to use the SJ *desu/masu* and plain forms in lectures during the training sessions, he tends to switch almost entirely to the Kansai dialect for non-lecture situations during the training sessions. In the lectures, the instructor's mixed use of SJ *desu/masu* and plain forms indexes epistemic and interpersonal stances of casualness, authority, and knowledge, constructing a greater social distance from the trainees; in non-lecture contexts, his use of the Kansai dialect indexes interpersonal stances of humor, solidarity, and friendliness, creating less social distance between him and the trainees. The study explores how the introduction of the regional dialect vis-à-vis the standard language (the *desu/masu* and the plain forms in this case) restructures the indexical fields of the standard language by deactivating some indexical values based on mainstream ideologies and activating a different set of indexical values.

This study suggests the importance of paying attention to regional dialects in relation to the standard language for our further understanding of the complexities of style-shifting in Japanese and other languages.

Vernacularizing the Japanese TV live sport broadcast: A frame analysis of a youth vernacular in the Tokyo Olympic skateboard telecast

Panel contribution

Dr. Momoko Nakamura¹

1. Kanto Gakuin University

This paper examines how a commentator uses a youth vernacular during the Tokyo 2020 Olympics TV live broadcast of the skateboarding event and demonstrates that the conformity with a normative interactional frame increases the acceptability of the vernacularization of the formal interaction of Japanese sport broadcasts. While many studies recognized the conversationalization (Fairclough 1995), vernacularization (Couland 2014), and personalization (Thornborrow & Montgomery 2010) of mediatized language, it has not been extensively explored how a vernacular can be used in formal, institutional interaction of Japanese live sport broadcasts and what effect the vernacular usage makes on the viewers' assessment of the broadcasts. Compared to plentiful studies on the style shift between the addressee honorific *desu/masu* and the non-honorific plain styles (Cook 2002, 2018; Geyer 2008; Okamoto 2011), no study has included the vernacular *ssu* style. Locating the interaction between the announcer and the commentator within three major interactional sequences of the normative frame of Japanese live sport broadcasts, the paper intends to reveal their systematically distinctive usages of the three styles.

The Japanese live sport broadcasts constitute highly structured interactions between an announcer and a commentator(s), who play the distinctive interactional roles (Miyake 1997; Tatara 2015). The announcer-commentator interaction is required to follow the normative interactional frame (Goffman 1981; Okada 2002), and the deviation from the normative frame may evoke complaints from the viewers (Miyake 2004; Okamoto 1999). During the live broadcast of the skateboarding event at the Tokyo Olympics, despite the commentator amply utilizing the vernacular, many viewers praised him.

The paper examines the ways the announcer (A) and the commentator (C) use the *desu/masu*, plain, and vernacular *ssu* forms within the following three major interactional sequences that previous studies demonstrated to constitute the normative frame of the Japanese TV live sport broadcasts:

- (1) I-(Initiation; A's question) R-(Response; C's professional information) F-(A's Follow-up) E-(C's evaluation);
- (2) RC-(C's response cries) D-(C's description) E-(C's evaluation); and
- (3) LD (Live Description: A and C give play-by-play of the action in turn).

The analysis found that A and C collaborate to maintain the normative frame by following the speaking rights pre-allocated by the sequences and by distinguishing the different elements of the sequences by distinctively utilizing the *desu/masu* form for giving professional information, the naked plain form for descriptions, and the vernacular *ssu* form for evaluation.

The commentator's usage of the *desu/masu* and plain forms in giving professional information and descriptions respectively are congruent with the social meanings of these forms: enacting on-stage talk in the *desu/masu* style and foregrounding the content in the naked plain form (Cook 2018). In contrast, his use of the vernacular in delivering evaluation works to add the meanings of personal excitement and private feelings to the broadcast. The differentiated usage of the vernacular serves to personalize the context of the broadcast while preserving the normative frame of live sport broadcasts. The findings imply that the success of the vernacularization of mediatized language, especially in the highly formal interaction, depends on the conformity with the normative interactional frame.

‘Hey! What are you doing now!’: Negotiating closeness and workplace relationships on Japanese TikTok

Panel contribution

Dr. Gavin Furukawa¹

1. Sophia University

In typical discussions about Japan and Japanese culture, phrases like *status-oriented* or *hierarchical* are often used to describe the ways in which company relationships influence interaction in the office. Such messages abound in classrooms where new employees who have just passed through the dreaded *shūkatsu* (‘job hunting’) process in their last years of university struggle to learn the rules of their new workplaces as well as in popular and often highly conservative books on manners. Such traditional hierarchies and their associated ways of speaking are common tropes also used in manga, television programs, and movies. At the same time, our understanding of these hierarchies and their associated linguistic forms goes far beyond the rigid prescriptivist rules of the manners classroom and textbook. This presentation examines how the traditional workplace relationship of *jōshi* and *buka* (‘boss’ and ‘subordinate’) is navigated through social media in the form of short video segments. In particular, this research project analyzes how the relationship of co-workers is negotiated with specific work situations where subordinates must interact with superiors through the complex use of contextualization cues drawing on participants’ understandings of framing, entextualization, style shifting and the use of editing features in social media including sound and screen text.

Using the social media platform TikTok, which allows companies, groups, and individuals to create short video clips typically ranging from fifteen seconds to three minutes in length, I have assembled a collection of over 200 videos using a hashtag aimed at interactions between supervisors and subordinates. After detailed analysis it became clear that these examples often did not follow what is typically prescribed in terms of language use between higher and lower positioned individuals. While there was occasional evidence of shifting between the addressee honorific and the plain form, the suprasegmental features of the interaction and the use of pragmalinguistic features such as imperatives and interjections did a large share of the work. Furthermore, the specific uses of impoliteness, which I suggest that through entextualization have become conventionalized, and the frame-bounded range of consequentiality for the interactants shows how the contexts of workplace relationships, the social media platform, and the semiotic interpretations added through the editing process serve to create a specific way of communicating with both other participants in the videos and with the wider viewing audience. This presentation thus shows how the subtle negotiation between solidarity and formality contributes to art, mediatized society, and our perceptions of prescriptivist social rules that are often perpetuated within the conservative discourse of Japan.

Demystifying Dementia: A Corpus Linguistic Study of the Construction of Alzheimer's in Film

Panel contribution

Dr. Monica Cantero-Exojo¹

1. Drew University

The question I plan to explore in this presentation is: how do films alter our understanding of dementia? In particular, this analysis focuses on the discourses of the illness as depicted in recent films. Using corpus linguistics to analyze data from filmic narratives centered on characters facing a terminal diagnosis, these films depict the family mechanisms and biomedical implications of an illness discourse in which dementia is encoded within family parameters and framed in contextual metaphors of love, anticipatory mourning and suicide, and, making sense of events in a tangled memory.

The data obtained from using corpus linguistics software (Bednarek 2021; Bednarek 2018) is analyzed applying the framework of Conceptual Metaphor Theory (CMT) (Lakoff and Johnson, 1980) and conceptual metaphors in filmic discourse (Fahlenbrach, 2016; Eggerstson & Forceville 2009; Forceville 2006; Coëgnarts and Kravanja, 2012; Carroll 1990). This analysis addresses the following research questions, with a focus on language use and visual representation:

- How frequent are mentions of Alzheimer's, dementia, forgetful, etc. in the films?
- How are people with Alzheimer's depicted (multimodal representation -visual and narrative) ?
- How are people with Alzheimer's referred to?

The filmic discourse of Alzheimer's and its images are ultimately indicative of a society that prefers to deal with the patient living with dementia in the microcosm of the home/nursing home, and that may or may not choose to commit suicide as the ultimate alternative to their situation. Thus, beneath the films' fictional plots, there is a societal and medical correlative: a society that may or may not accept suicide as an ending to dementia's detrimental consequences, and the strong desire among filmmakers and artists to portray the struggle of cognitive brain decline within a discourse that is centered in the patient.

Emblems as Rhemes: Authenticity, Innocence, and Otherness in a Lahu Film

Panel contribution

*Dr. Judith Pine*¹

1. *Western Washington University*

In this paper I explore the use of variations of traditional costume as semiotic emblem in Lahu language films made in Southeast Asia, using as my examples the deployment of costumes at particular points in the Lahu language film “Akawve” (2013). The use of variations on traditional costume in Lahu language media is a common occurrence, playing an important role in indexing Lahu identity alongside other elements of Lahu material culture. In the film “Akawve”, however, and in other Lahu-language digital media, Lahu traditional costume moves beyond an indexical sign. I argue that the use of distinctive costumes in this film engage a complex bundle of rhematized indexical signs – an emblem.

The group Lahu, creators of Lahu language media circulated throughout the Greater Mekong subregion and, via YouTube, across the globe, is notoriously internally diverse.

Walker, foremost ethnographer of the Lahu, describes them as “a collectivity of human beings who, despite their lack of common social, political or economic institutions, share a feeling of ‘Lahu-ness” (2003: 52-3). The diversity within the category “Lahu” includes considerable difference in traditional clothing. The film “Akawve”, intended as a cautionary tale about human trafficking in the region, includes several distinct recognizable traditional costumes and variations on those costumes, yet these differences are not used to make internal distinctions. Rather, the variety appears to be incorporated into a single category which might be called “Lahu dress”. The film, a cautionary anti-human trafficking tale with both English and Thai subtitles, includes visual elements which would occur as icons for wide audience which would include non-Lahu readers and perhaps non-Lahu speakers as well as several “breaking the 4th wall” moments when the audience is addressed and encouraged to fight trafficking, a message clearly intended for Lahu from all sub-groups throughout the Greater Mekong subregion.

The use of costume in the film does not simply index Lahu identity and Lahu history however. I argue that variations on traditional costume are deployed throughout the film to index distance from the urban, innocence, ignorance, authenticity, and Other-ness. Entextualized in the film, costume becomes an emblem incorporating these disparate elements into a complexly immediate whole. Rhematization of the indexical (Irvine and Gal 2000; Gal 2005) takes place, drawing upon complex habitual indexical relationships to create a sense of the natural, the inevitable rather than contingent, indicating a shared semiotic ideology which spans national borders and religious and sub-ethnic difference. Analysis of this process provides insights into being complexly Lahu in a 21st century world.

Experiencing Water and Swimming: Figurative Meaning and World Creation in Cinema

Panel contribution

Dr. Eduardo Urios-Aparisi¹

1. University of Connecticut

In this presentation, I discuss how film style constituents provide viewers with affordances to access additional meanings while creating worlds that are apparently naturalistic. Films create environments viewers can interact by accessing their own previous experiences and knowledges. Studies from philosophy, semiotics and neuroscience applied to cinema show how affects, empathy or the activation of mirror neurons participate in the viewing experience (see Sobchack 1992 and 2004, Gallese and Guerra 2019, Richmond, Müller & Kappelhoff 2018).

I analyze swimming in public swimming pool scenes in three films that connect water and memory: Kieślowski (1994); Subirana (2008) and Markovich (2011). Coëgnarts (2020) proposes a methodology that limits film metaphor to those metaphors motivated by image schematic structures identified in the framing of a film but sidesteps other important constituents of cinematic discourse.

I show that important constituents such as the *mise-en-scène* create an environment that allows viewers to experience the film world as an external projection of emotions among other meanings. Those meanings emerge via multimodal repetition and variation. In particular, swimming pool scenes are clusters of meanings of bodies in which bodies, swimming styles and movements, and symbolic meanings of water interact. While viewers can focus on any of those items at a time, as a whole the water environments allow viewers' body and mind connect to the film and also access emotions such as danger, fear or peace and happiness (cf. Nichols 2014).

Telecinematic culture and memetic recycling in pandemic times: Spanning the fictional - non-fictional divide

Panel contribution

Prof. Jan Chovanec¹

1. Masaryk University

The presentation explores the interface between fictional and non-fictional discourses in humorous memes, as a distinct genre of modern digital communication. It concentrates on how aspects of the non-fictional world, represented by visual and textual references to telecinematic art, are recontextualized by online users and meme creators to comment – in humorous ways – on the current situation, i.e. their everyday lived and non-fictional experience. The focus is on how individuals draw on their shared socio-cultural background and apply such intertextual knowledge in the virtual digital space, thus linking the fictional and the non-fictional worlds. The analysis is based on a set of humorous data, such as memes and digitally circulated short video clips, which were collected from various social media in the Czech Republic and internationally (cf. the database of covid-related humour; Kuipers 2021) at the time of the covid pandemic in 2020-21. The material deals exclusively with intertextual references to classic and popular films, aiming to identify how cinematic art is employed in humorous creations. The analysis describes two kinds of inter-semiotic relations: between the verbal and the visual components, and between the original movies and the current situation indexed by the modern memes and video clips.

The findings indicate that memes, clips and other instances of humour based on telecinematic art manifest a specific kind of intertextuality, where the prior humorous texts (comedies and humorous scenes from films) are ‘echoed’ (Hale 2018), i.e. the earlier texts are ‘revisited’ and the original humour is sustained or reactivated in the new creation that need not, by itself and without the recipients’ access to the shared cultural knowledge, appear as humorous or at all meaningful. One way of looking at this intertextuality is to see it as humorous recycling (humorous texts being turned into subsequent humorous texts) and intertextual play that, at the era of the digital media, involves frequent mash-ups and hybridity (Yus 2019), and creativity of forms (Vásquez 2019), while often having a critical stance (Tsakona and Chovanec 2020: 4) and providing a social commentary. In addition, the study identifies a highly culture-specific aspect of shared humorous repertoire, namely verbal quotes from films which are instantly recognizable by members of a particular cultural or linguistic community. Such cinematic one-liners, as snippets of fictional discourses, appear to have a much more ‘local’ character than visual elements that are more universal and ‘global’.

The Pragmatics of Horror: Vertical Despair, Waste, and Wealth Inequality in *The Platform* (2019)

Panel contribution

Dr. Ruth Yuste-Alonso¹

1. *Hendrix College*

Once a niche genre for the few, horror has become today a globally celebrated expressive mode by the public and a generative critical framework for scholars to examine primal configurations of social dynamics. From the haunting legacy of slavery in *Get Out* (Peele 2017), the traumatic monstrosity of motherhood in *The Babadook* (Kent 2014), or the abjection of the ageing female body in *The Visit* (Shyamalan 2015), horror offers a compelling visual imaginary to conjure our inner fears and collective woes, to summon difference and the uncanny on the silver screen. Drawing on works on multimodal metaphor and discourse (Forceville & Urios-Aparisi 2009; Kress and Van Leeuwen 2001) and the pragmatics of fiction (Locher & Jucker 2021), this paper examines visual representations of isolation, waste, and class inequality in the Spanish horror thriller movie *The Platform* (2019). In particular, I argue that the dystopian scenario portrayed in *The Platform* not only provides an escapist source of entertainment in the early stages of the global pandemic, but also serves as a valuable fictional text to reflect on society's *status quo* and spark stimulating political conversations across geographical boundaries to rethink social power structures amidst an atypical event such a global pandemic complicated by epistemic uncertainty. Released on Netflix at the start of the Covid-19 global pandemic, *The Platform* (2019) [*El hoyo* by its Spanish title] became a major commercial success, its premise resonating with viewers worldwide confined at home under lockdown orders and competing over material resources on their occasional shopping incursions. In his debut film, Basque-Spanish director Galder Gaztelu-Urrutia concocts a dystopia set inside the Vertical Self-Management Center, informally known as The Pit, a colossal, concrete tower-style structure where 'residents' are forced to compete—and even murder—for limited food supplies, delivered through a descending platform, to survive within a merciless distribution system. While civility and self-management are expected, social conflict is inevitable, as individuals at the top take more than they require, leaving for those at the bottom the leftovers smeared in bodily waste, a vicious cycle exacerbated with each month's floor relocation and the haunting memories of scarcity and human consumption. Through its vertical, stratified design and hollow interior, The Pit materializes the horrors of class inequalities and injustice, exposing the fraudulent logic behind late capitalism that trumps the social contract, class mobility and class solidarity, leading individuals to predate and cannibalize one another for survival. Yet it is thanks to the horror conventions and the epistemic uncertainty surrounding characters' fate that the film's radical pragmatic communicative potential resides, for it is in the unknown where other forms of resistance and political change can emerge in an atypical scenario.

Um David e muitos Golias: hyperbolization of fiction in Portuguese sports news

Panel contribution

Dr. MariaClotilde Almeida¹

1. University of Lisbon - Portugal

Sequencing the investigation on the blending of football media with fiction, which proved that films titles, biblical texts, historical episodes, or myths are involved in the metaphorical conceptualizations in sports media (Almeida, 2006, 2016; Almeida & Sousa 2010; Almeida et al. 2013, Almeida & Sousa 2015; Almeida 2022-in print), this paper builds on the hyperbole as a rhetoric tool (Nustrand & Duffy 2003), in the conceptualization of headlines from the sports newspaper *A Bola*. More concretely, it focuses on the hyperbolically bible-inspired representation “Um David e muitos Golias”, headline of the cover of *A Bola* in 15.9.2022, from a multimodal socio-cognitive perspective (van Dijk 2010). Hence, it aims at uncovering the hyperbolization technique through the usage of nouns in the plural in reference to the Juventus football team in the written mode, as in “muitos Golias” (transl. “many Golias”), contrasting with the pictorial representation of groups or pairs of Portuguese players in the visual mode, clearly linked to the headline “Um David (entre muitos) contra Golias” (transl. “One David (among many others) against Golias”), with the communicative purpose of emphasizing Benfica’s glorious defeat over the powerful Juventus football team. Moreover, it highlights the hyperbolized storyline in the inner pages of this edition of *A Bola* is relevantly sustained by a web of metaphorical representations. This is the case of “A velha senhora sem pernas” (lit. transl. “the old lady without legs”), the metonymically-metaphorically representation of an unfit team, *versus* the metaphorically represented “swift-moving eagle” (Benfica’s club symbol), as in the complete headline “Velha Senhora sem pernas para o baile desta águia” (transl. The weak old lady *versus* the dancing eagle).

Strategic uses of alternative modalities in Traditional Chinese
Medicine consultations**

Panel contribution

Dr. Anne Schluter¹

1. Department of English and Communication, The Hong Kong Polytechnic University, Hong Kong SAR

Medical diagnosis typically draws on a mix of verbal and non-verbal clues, constituting an essential aspect of patient-practitioner communication. Given the emphasis on the whole body in Traditional Chinese Medicine (TCM), this setting provides a rich site to deepen the field's understanding of embodied forms of communication. Consisting of 1.) smelling the patient's odor and listening to the patient's voice, 2.) feeling the strength of the pulse and palpating selected body parts, 3.) speaking i.e. asking questions, and 4.) inspecting physical features such as the skin and nails, the four core tenets of observation practices of TCM directly align with recent calls to consider the entirety of human senses to understand human communication more fully (Pennycook, 2017). The on-going use of masks since the start of the pandemic, coupled with periods of TCM clinic closures in Hong Kong during case surges, has compromised TCM practitioners' capacity to tap into some essential communicative resources. The resulting limited access to patients' embodied forms of communication raises questions about practitioners' strategies for attaining clear pictures of their patients' symptoms during the atypical circumstances of the pandemic.

As part of a larger study that analyzes observation and interview data from a Hong Kong TCM clinic to identify the linguistic and extra-linguistic details of patient-practitioner alignment, this paper addresses the approaches employed by one of the practitioners and ten of her patients to discuss their health concerns during telehealth and in-person consultations. This focus has generated a corpus of key communicative resources, including gestures, haptics, micro and discursive-level linguistic strategies, and humor. As a means of circumventing the constraints imposed by mask wearing at face-to-face consultations and bad connections during telehealth consultations, the practitioner exploits social media tools by requiring all patients to send her photographs of their tongues via WhatsApp prior to consultation. Special attention to these tongue photos in addition to the pitch and intensity of patients' voices suggests that, with the restricted access to patients' embodied communication during the atypical circumstances of the pandemic, a heightened role for “alternative modalities” (Kress 2009) has emerged.

Communicating Uncertainty about COVID-19 to the Public: Variations of Speaker Identity and COVID-19 Development

Panel contribution

*Dr. Yi An*¹, *Dr. Mian Jia*²

1. Beijing University of Posts and Telecommunications, 2. The University of Texas at Austin

Effectively communicating COVID-19 information to the public depends on strategic presentation of the health message (Harrington, 2020; Jia & Zhao, in press). In China, such communication often happens when public health experts or government officials are interviewed on national television programs such as *News 1+1*. Although many scholars have explored the communication of uncertainty during the pandemic (see Ratcliff et al., 2022 for a recent review), few studies have developed typologies of communicated uncertainty in COVID-19 contexts. Developing a typology would help researchers to better understand how health communicators use language to address different communicative purposes and at different stages of the pandemic. Specifically, scientists and government officials tend to discuss different kinds of uncertainties in that the former have expertise in the scientific nature of COVID-19 whereas the latter attend more to the policies and regulations related to the pandemic. Moreover, speakers are also likely to communicate uncertainty differently as new variants emerged and new vaccines developed. The present study, therefore, proposes two research questions. First, how do interviewees in Chinese national TV programs communicate uncertainties to the public? Second, if and how do these uncertainty strategies differ by speaker identity (i.e., health scientists vs. government officials) and COVID-19 development (e.g., inception, new variant, new vaccine). The data consists of 90 transcribed interviews from *News 1+1*, which is a popular Chinese TV news program. These interviews span from January 2020 to June 2022. Strategies for communicating uncertainty were identified, illustrated, and calculated based on a corpus analysis of the data. Preliminary results include eight linguistic strategies: Using subjectivisers (e.g., 我想; I think), Reducing reliability, Reducing precision, Acknowledging inadequate knowledge, Indicating low predictability, Referring to complexity of the situation, Making provisional statements, and Using hypothetical conditionals. Comparative analysis shows that health scientists expressed uncertainty significantly more frequently and employed more uncertainty strategies than government officials. These differences can be explained by the different topics they addressed in the interviews which could be ascribed to speaker identities and their work in responding to COVID-19. This study also reveals differences in both the frequency and realization of uncertainty across stages of the coronavirus pandemic. Our findings contribute to the research on uncertainty communication by developing a linguistic typology that can be used to analyze the strategic use of language across different contexts. In practice, the eight uncertainty strategies identified in our study would offer pragmatic suggestions for health and government spokespersons to communicate their message more effectively.

Topic:

This study examined typical interactions between practitioners and people with epilepsy (PWE), to understand how they discuss the risks of epilepsy in a manner that might empower people to change their behaviours.

Background:

This National Institute of Health funded UK study ran for 2 years. Data is currently being analysed to be written up. The study was based on the WHO international recommendations that there needs to be greater discussion with people with epilepsy (PWE) about risks to their health to reduce what is considered preventable mortality. Mortality rates for PWE are up to 10 times higher than the normal population, including in young, otherwise healthy people. Yet communication about epilepsy mortality and SUDEP (Sudden Unexpected Death in Epilepsy) risks is known to vary historically and geographically in frequency and quality. How to hold these discussions has not yet been widely researched.

Aim:

To understand how risk is typically introduced by epilepsy experts in clinical encounters with people recently diagnosed with epilepsy.

Method:

Data were: Clinical discussions between practitioners and PWE (n=24), clinician Reflections (n=25), and interviews with PWE or supporters also attending (n=25). Interactions were analysed using Conversation Analysis (CA) to identify the practices used to introduce risk. Patient interviews and clinician reflections guided the analytic foci. After initial CA, analysis included Joint-Analysis where researchers, PWE, clinicians, and patient representatives analysed extracts together.

Findings:

We identified a question-answer pattern that was used to introduce risk to patients, where PWE were asked 'what do you know', 'what do you understand' or 'what have you been told', about risk. The responses were either that people asked what was meant by risk or listed some risks; often focusing on household safety eg: bathing or driving. Clinicians then give risk advice, such as don't stand too close to the edge of a platform. This was the 'typical' practice. Practitioners emphasized the sensitivity of the question design, to ensure that they were able to provide advice relevant to the PWE's knowledge. However, discussion with PWE suggested that these questions were like an 'exam question'. We evidence with our data how this question appeared 'atypical' to PWE.

Discussion and Conclusion:

We discuss how, although the practice of introducing risk through asking about it is typical institutionally in these forms of interactions, it may appear atypical to PWE's expectations of clinician-patient interactions, and for empowering conversations. The use of these questions may signify the uncertainty discussed in the literature that clinicians hold in discussing mortality risks with patients.

We argue that attention to the CA detail and the complex levels of meaning generated by both practitioner and the PWE are important considerations to design what might be useful forms of interaction. We discuss how we addressed the methodological challenges of mixing interviews with CA, and including non CA specialists in analysis. We raise questions about the next steps for this research.

Identity and Meaning Making in Persons with Dysarthria from an Acquired Brain Injury. Arguments for More Inclusive Theoretical and Methodological Frameworks

Panel contribution

*Prof. Melissa Moyer*¹

1. *Universitat Autònoma de Barcelona*

Identity in sociocultural linguistics relies heavily on language for understanding ways individuals construct multiple subjectivities, but for persons with dysarthria and a limited ability to use language, this notion requires a wider understanding of how meaning can be communicated. The World Health Organization's report on disability (2011) notes that approximately fifteen per cent of the world population has a speech impairment such as dysarthria, hence the need to gain an improved understanding of the ways they communicate, construct and contest identities that get imposed on them.

Data from an ethnographic study carried out in the city of Barcelona between 2017-2019 by the Voiceitt[i] team led by Moyer (2017) over a period of eighteen months with seven persons with an acquired brain injury, their families, and caretakers serve to illustrate the theoretical and methodological limitations of the notion of identity. The examples presented illustrate multiple modalities for expressing meaning that are used to gain agency and represent identity both on an interpersonal and a societal scale.

Four considerations about identity in persons with ABI are presented and which seek to contribute to developing a more inclusive conceptual and methodological framework. First, is the need to better understand the experience and complex process of identity change ensuing a neurological impairment; second, is the multiple modalities of exercising agency and communicating about identity without language; third, is the embodiment of identity and its implication with language, and the final consideration examines imposed identity and forms of resistance.

[i] The Voiceitt team worked with the Israeli company Voiceitt in the project for developing technology for voice recognition and production of persons with unintelligible speech. The members of the team include Melissa Moyer, Gema Rubio, Ignasi Clemente, and Marta Gimeno. Funding for the project was obtained through the European Commission, Horizon 2020 H2020-SMEInst-2016-2017 (H2020-SMEINST-2-2016-2017), Proposal: 779105 — *Talkitt Social Inclusion and the Impact of Voiceitt on Identity and Talk in Persons with Acquired Brain Injury*.

Occupational Hazards and Challenged Bodies: Physiotherapists Interacting with Covid-19 Patients during Respiratory Failure Treatment.

Panel contribution

Prof. Stef Slembrouck¹

1. Linguistics, Ghent University

The Covid-19 pandemic brought to the forefront various ways in which the interactional dynamics of communication was being challenged in situations permeated by actual sickness and lives-at-risk. Not only was it the case that prevention measures such as wearing mouth masks fundamentally interfered with taken-for-granted modalities of spoken interaction (e.g., facial expression remaining partly invisible). The conditions of lockdown and the risks attached to physical nearness also resulted in a widespread shift from *in presence* face-to-face to *online* video-mediated interaction across many domains of social activity. Mapping the impact of such a shift inevitably begs the question of particular affordances and constraints which are “dictated” by available technologies, their limitations, and their impact on interactional behaviour and meaning making (e.g., in video-mediated interaction, “eye contact” is in a fork between the eye’s receptive attention to what’s on the screen, while its gaze dimension depends on a relative position towards the PC’s camera). At the same time, the practices which we observed soon resulted in relatively conventionalized participation formats which were motivated by specific considerations though not necessarily dictated by the technology as such (e.g., many slipped into the habit of switching off camera and microphone while at the receiving end of an online seminar; congratulatory speech acts were typically done via popup icons or comments in the chat; meetings started and ended on time but involved less socializing).

In my paper, I’m concentrating on the interactional conditions and compensatory practices which mask and face-shield wearing physiotherapists resorted to when interacting in hospital wards with Covid-19 patients who were suffering from respiratory failure. I will examine both the condition of (i) “non-invasive ventilation” (in which case the sound is muffled) and (ii) and that of “intubation” (in the latter case, patients can no longer use their vocal cords). I will particularly concentrate on the availability and purposeful use of alternative communicative strategies and modalities (e.g., letterboards, touch, lip-reading, forms of signing), while raising the question of how particular areas of meaning making were affected and/or relatively prioritised (e.g., treatment efficiency, the patient’s physical comfort, affect and emotional well-being, etc.). The data for this paper consists of fieldwork observations and interviews with patients and practitioners. It was not possible to access recorded interactions.

Remediation of narratives in podcasts on mental health and eating disorders

Lecture

Dr. Małgorzata Sokół¹

1. University of Szczecin

This paper addresses the challenges of talking about health in digital media by focusing on storytelling practices in healthcare and well-being podcasts. Being convenient both to produce and experience, and linked with social media, podcasts have gained popularity as an asynchronous medium to share information with diverse audiences (Rime et al 2022). Podcasts are also viewed as a hybrid cultural form between old and new media (Bonini 2022). In the context of healthcare and well-being, podcasting has been recognized as an effective medium to propagate health-related information to the general public, and to bridge the gap between evidence-based research and students or practitioners (Willis 2020).

This paper takes a narrative-pragmatic approach to explore how narratives, which are central to medical practice, have evolved to accomplish the communicative tasks of the podcasts users: healthcare professionals who aim to educate their audience and engage in experience sharing, and laypeople interested in the given topic and aiming to get informed. The discussion will be based on the study of the corpus of 40 episodes from 6 podcasting channels on the topics of mental health, diet and eating disorders run in Polish by healthcare professionals of such specializations as dieticians, nutritional psychologists and psychiatrists.

The qualitative analysis of the transcribed research data reveals the structural complexity of the narratives and their multiple functions related to knowledge exchange, self-expression and commercial objectives in three podcasting formats: the monologue, interview and co-hosted conversation. The three formats differ in how the healthcare professionals remediate narratives and interdiscursively mix them with other basic text types such as argumentation, exposition and instruction (Werlich 1976). The narratives also merge with self-disclosure, technical and colloquial expression, social and self-promotional discourses. The healthcare professionals exploit the affordances of the medium to educate and potentially empower their lay audience outside the 'traditional' forms of specialist-patient communication. For example, through self-disclosure and personal narratives, the podcasts become sites of experience sharing. Patient empowerment may thus be accomplished through the transformation of the professionals' private experience into public discourse that the listeners can find relevant. Podcasting may also be beneficial to other healthcare professionals as it can be used to expand their evidence-based practice in a flexible and accessible way.

Discourses of infertility on Instagram: constructing knowledge and (shared) identities through online narratives

Panel contribution

Ms. Sofie van der Meij¹, Dr. Jana Declercq¹

1. University of Groningen

This paper study the discourses of Instagram communities of involuntarily childless women undergoing fertility treatment. One in ten people remain involuntarily childless throughout their lifetime, and more are involuntarily childless at some point in their life. While personal circumstances such as relational situations can play a role, for a significant group of these people, there is a medical issue that can be addressed with medical treatment. In this paper, we focus on those that identify as women in the group undergoing medical treatment, and examine their discursive identity and narrative work as members of this online health community. We do so because online contexts, and Instagram specifically, are known to be a context for sharing knowledge as well as peer support, and building communities around a particular health issue. Infertility is an interesting case as it used to be a primarily social issue that has become increasingly medicalized, as treatment options became available in the past fifty years.

We analysed wall posts and users' biographies, using the small stories framework as outlined by Bamberg (2006) and Bamberg and Georgakopoulou (2008). In this framework, narratives not just include fully-fledged full tellings, but also 'tellings of ongoing, future and hypothetical events, and shared known events' and 'allusions to (previous) tellings, deferrals of tellings, and refusals to tell' (Bamberg and Georgakopoulou 2008: 381). This framework is productive for our approach as narratives are mainly investigated from a more functional approach, in terms of the social actions they perform in everyday interactions. They are seen as both reflecting and constructing both individual and collective identities, and thus as instrumental in community building.

Our analysis uncovered that users constructed narratives, and within those, identities, to make sense of their infertility experience. They discuss both the purely medical and the personal experience. By using specific technical medical language, they construct themselves as well as their audience as medically literate and knowledgeable in the domain of fertility medicine, and as members of the in-group of those undergoing fertility treatments. However, they also share experiential knowledge, both in the medical domain as well as on the social dimensions and identity challenges in daily life. They also structure their posts as interactional, by using hashtags, referring to followers/readers as community members or as being supportive, and asking questions that can be answered in the comments. In conclusion, not only a patient-like identity and medical narrative is constructed by sharing medical knowledge. The users also extensively (re)tell the lived experience of undergoing fertility treatment, with a complex intertwining of an identity of an involuntarily childless person with the identity of a future parent.

Fellow sufferers have mutual sympathy: Comforting discourse among Chinese cancer patients in online health community

Panel contribution

*Ms. Yue Zhao*¹

1. Harbin Engineering University

As a speech act of emotional support by the comforters in response to the negative events (e.g., cancer, etc.) or emotions (e.g., pain, sadness, etc.) experienced by the comfortee (Applegate, 1980; Burleson, 1994, 2008), comforting becomes a key issue in the field of health communication (MacGeorge & Zhou, 2021). Most of the previous studies focused on comforts from family, friends, and healthcare providers (e.g., Arora et al., 2007), dropping a hint that the comfort from peer patients of the same disease as insiders have been given scant attention. In other words, how are such comforts constructed linguistically and emotionally still remains uncovered. Especially, in cultures where there is a strong popular belief that the patients are reluctant to disclose their problems and suffering like in Chinese, peer disclosure and comforting shelter parents from ‘emotional overinvolvement’, relieving them from intensive pressure and anxiety (Hong et al., 2012).

In these regards, to meet patient-centered care and get more references for health communication from the perspective of oriental patients, this paper is intended to address a neglected aspect of health communication by portraying the forms and the distribution of comforting strategies based on the comforting turns among cancer patients in Chinese online health community. Additionally, taking an interactional perspective, this study aims to demonstrate the discursive interaction among patients, especially peer patients’ responses to recipients’ worries in the Chinese context. The findings suggest that the comforting strategies among Chinese cancer patients can be categorized into three strategies, followed by six emotion-and information-centered sub-strategies, among which Chinese cancer patients prefer moderate patient-centered (MPAC) comforting to low patient-centered (LPAC) and high patient-centered (HPAC) ones in online anonymous context. We believe that the above findings would enrich and extend the line of research on health communication from a patient-to-patient perspective while highlighting the insights into doctor-patient communication in the oriental context.

Hierarchies of Knowledge in Responses to Messages of Newbies in Online Health Support Groups

Panel contribution

***Prof. Barbara De Cock*¹, *Prof. Carolina Figueras Bates*²**

1. UC Louvain, 2. Universitat de Barcelona

Experiential knowledge, understood as the epistemic competence that comes from the lived experience, represents, together with emotional assistance, one of the defining features of peer online health support forums. The nature of this knowledge, and its potential to improve the outcomes of traditional treatments (Mazanderani, Locoock, & Powell 2012), has been the focus of investigation in recent years in the areas of social science and mental health (e.g., Blume 2017; Noorani et al. 2019). The growing interest for experiential knowledge stems from the increasing importance of the role of patients' experiences as the grounds for decision-making in the medical arena.

According to Herrero et al. (2021), discussion threads in online health forums represent a form of interactive communication within a group of individuals who share a similar lived experience. In relation to the nature of the information traded off in those discussion threads, several studies have concluded that online support groups for mental health conditions (depression, schizophrenia, eating disorders) present a high number of emotional posts. Instead, online support forums for individuals suffering from diabetes largely focused on providing informational aid to recognize and understand the symptoms, with a focus on managing the condition, rather than curing it (Deetjen & Powell 2016).

Within this framework, in the present study we focus our attention on the first message of new members and its responses in two different Spanish online forums: a support group for diabetes and a support group for eating disorders. These first messages are particularly important since they are often posted by recently diagnosed persons or individuals who are still awaiting diagnosis and who have a lot of questions. The specific aims of the present study are the following: a) to pinpoint the concrete kinds of knowledge displayed in the responses to the first post; b) to examine how the role of expertise and knowledge is linguistically construed in those responses; c) to determine whether hierarchies of epistemic and emotional knowledge can be identified and established in both forums; d) if so, what are the linguistic resources mobilized by groups members to assert and claim their knowledge.

How Multimodal Affordances of Platforms Shape the Epistemic Engine of Health Communities Online: A Case Study

Panel contribution

Dr. Heike Ortner¹

1. University of Innsbruck

Health communities that form online develop conventions of how to share knowledge. Additionally, the question of who is deemed “knowledgable” in terms of epistemic status (Heritage 2012) may become a subject of negotiation. This is, however, not only a result of the Interactive history shared or of acquired of the participants’ acquired privileges (‘seniority’, ‘authority’). It is also entrenched by the ‘affordances’ of the online platforms, i.e. the options they offer for interaction (Bateman, Wildfeuer & Hiippala 2017:90). This talk takes a closer look at the preconditions of sharing knowledge and negotiating accountability for shared knowledge. It combines two rather distinct concepts of multimodality that intertwine in online health communities: multimodal affordances (e.g., options of commenting on a posting) and multimodal interaction analysis of online discourse. This will be examined by discussing the example of a German health community that is dedicated to the chronic disease Multiple Sclerosis (MS): The “Deutsche Multiple Sklerose Gesellschaft Bundesverband e.V.” (roughly translated ‘German Incorporated Federal Association for Multiple Sclerosis’) provides a rather professionalized network of information. This includes profiles on current Social Media platforms such as YouTube, Twitter, Instagram, Facebook, and a discussion forum. All of these profiles allow for mediated, primarily written multimodal interaction. The main hypothesis is that the platforms differ with regard to: 1) their multimodal affordances, 2) the types of knowledge shared, and 3) the negotiation of the epistemic status and epistemic stance of the social actors who share their knowledge of MS.

The research questions are as follows: 1) Is there a difference in the types of knowledge that are shared on the different platforms? 2) Who shares what kind of knowledge? 3) What are the multimodal affordances and constraints of the platforms (both technical and social) and how do they influence the sharing of knowledge? 4) Can hierarchies of knowledge and knowledgeability be reconstructed with a linguistic look at the discourse? 5) How do the actors support of each other’s shared knowledge, and how does this relate to the platforms’ affordances?

Both a quantitative and qualitative approach are applied: First, a systematic review of the types of shared knowledge and its ‘carriers’ of one year’s postings on Twitter, Facebook, YouTube, and Instagram will provide a broad overview. Second, there will be a detailed look at the hierarchies of knowledge on these platforms and the discussion forums, following the discourse about one common topic of expertise.

Knowledge formation and patient expertise in Polish health communities on Facebook

Panel contribution

***Dr. Anna Tereszkiwicz*¹, *Dr. Magdalena Szczyrbak*²**

1. Jagiellonian University in Krakow, 2. Jagiellonian University in Krakow, University of Pardubice

The paper discusses the processes of knowledge formation and membership categorisation in a Polish online health community gathered around the problem of endometriosis. It explores the ways in which the participants' experiences and perspectives are constructed, focusing in particular on the main themes and strategies used to communicate the unfulfilled needs and frustrations which prompt information gathering and support seeking. The study builds on existing understandings of *epistemic community* (Haas 1992; Miller and Fox 2001), health knowledge sharing (Bellander and Landqvist 2018) and recontextualization (Sarangi 1998), and it sheds light on how Polish Facebook users communicate their own experiences (experiential knowledge) and how they establish intertextual links with external sources (professional knowledge). Using data from an open-access Facebook support group for endometriosis sufferers, the analysis examines the factual, social and temporal dimensions of knowledge formation (Kimmerle et al. 2012), subsuming, accordingly, forms of knowledge, expectations and treatments; types of users (help-seekers and helpers); and the time frames of illnesses and therapies. At the same time, it reveals which linguistic strategies are relevant to information seeking, advice giving, evaluation and consolation in a setting in which role differentiation is blurred and hierarchies of expertise are flattened. The study provides insights into how health knowledge is shared, recontextualized and transformed into expertise within online health communities, in addition to showing the strategies that members of such communities pursue in order to gain psychological support, seek self-management advice, and show empathy. It also highlights a gap between the patients' expectations and the level of medical care they receive, thus raising awareness of their unmet health needs and explaining how these are articulated in an open-access support group.

Sharing and reshaping specialized knowledge in online health communities: A quali-quantitative analysis

Panel contribution

Dr. Sarah Bigi¹, Dr. Vittorio Ganfi², Dr. Sibilla Parlato¹, Prof. Valentina Piunno³, Dr. Maria Grazia Rossi⁴

1. Università Cattolica del Sacro Cuore, 2. Università Roma 3, 3. Università degli Studi di Bergamo, 4. Universidade Nova de Lisboa

In recent years, the debate on shared decision-making (SDM) in clinical contexts has been revived, especially after repeated acknowledgment of frequent suboptimal realizations of SDM (Epstein - Gramling, 2013; Kaldjian, 2017; Duffin - Sarangi, 2018). Recent studies have rediscussed the definition of SDM and its implementation (Gerwing - Gulbrandsen, 2019; Dingwall - Pilnick, 2020; van der Horst et al. 2022; Politi & Neuman 2022). In this paper, we tackle the issue from the point of view of the conceptual and practical steps that make up a SDM process. Referring to the description of the deliberation model proposed by Walton et al (2014), we consider the information sharing phase highly relevant for appropriate SDM. More specifically, with regard to increasingly frequent cases of seemingly ‘unreasonable’ decisions by citizens about health-related behaviors (e.g., vaccines), we aim to explore the co-creation of information in online communities. We choose to analyze online communities as paradigmatic of how knowledge is shared and often reshaped in debates among participants who do not necessarily have specific *expertise* about the topics at issue, but may have *experience* about them.

We analyze and compare two corpora that collect online interactions pertaining to different clinical fields; linguistic data are annotated and processed through Sketch Engine software (Kilgarriff et al. 2004). We focus in particular on the expression of doubt and uncertainty through linguistic elements such as opinion verbs, uncertainty adverbs and question markers. We perform a qualitative and quantitative analysis, expecting to be able to account for some of the dialogical mechanisms that lead to the creation of ‘chunks’ of knowledge which may then be used as the grounds for decisions.

Children's linguistic abilities at 5-6 years of age can be predicted by expressive pragmatic skills at 3-4 years of age

Panel contribution

1. Universitat Oberta de Catalunya, 2. Universitat Pompeu Fabra, 3. ICREA-Universitat Pompeu Fabra

Children with Developmental Language Disorder (DLD) are rarely diagnosed before age 5-6 (Bishop et al., 2017) because (a) earlier predictable signs are hard to identify, and (b) most standardized tests can only be used from these ages onwards. One of the clearest signs of DLD is the children's impaired structural language at the morphosyntactic and semantic levels (Van der Lely, 2005). We know that children's structural linguistic abilities at a certain age are related to pragmatic skills at that same age, and that this relation holds in typically developing (TD) children as well as children with DLD (Matthews et al., 2018). Because little is known about the direction of this association and its longitudinal nature, in the present study we investigate (a) whether children's expressive pragmatic skills and structural linguistic abilities are longitudinally related, and (2) whether expressive pragmatics at age 3-4 can predict structural language at age 5-6.

A total of 73 Catalan/Spanish-speaking TD children were first assessed at ages 3-4 for their expressive pragmatic skills using the Audiovisual Pragmatic Test (APT, Pronina et al., 2019). The APT contains 35 items accompanied by illustrations that represent different contexts that might plausibly occur in a child's everyday life and that tap into (a) basic expressive acts, (b) complex expressive acts, (c) unbiased requests, (d) biased requests, (e) unbiased assertions, and (f) biased assertions. Children were presented with these situations as a discourse prompt and they were asked a spoken reaction, which were then evaluated for pragmatic appropriateness (0: pragmatically inappropriate; 1: expressing target meaning but lacking social adjustment; 2: highly pragmatically appropriate). Additionally, their vocabulary and syntactic skills were also assessed at age 3-4 through the ELI expressive vocabulary subtest (Saborit Mallol & Julián Marzá, 2006) and a test for expressive syntactic abilities based on CASL-2 (Carrow-Woolfolk, 2017). The same children were then assessed for their linguistic abilities at ages 5-6 using the CELF Preschool 2 (Wiig et al., 2004), as well as for non-verbal intelligence quotient (K-BIT; Kaufman & Kaufman, 2000).

A full multiple linear regression model was run with all predictors (age at Time 2, Vocabulary, Syntax and Pragmatics at Time 1; age and K-BIT at Time 2) and for each CELF language score. Then a stepwise model selection was used to select the best predictors of each language score. Results showed that Pragmatics at Time 1 was a significant predictor of Core Language ($t=2.913$, $p<.01$), Expressive Language ($t=2.355$, $p<.05$), Language Content ($t=2.813$, $p<.01$), and Language Structure ($t=2.511$, $p<.05$) at Time 2. We thus found that children with better expressive pragmatic skills at a young age have better expressive and structural linguistic abilities two years later. These results show that individual linguistic abilities are longitudinally related to, and can be predicted by, earlier expressive pragmatic skills, and thus suggest that early pragmatic skills could be a reliable early sign of language impairment in children.

Disfluency Use as a Window to Pragmatic Language Competence in Bilingual Children with and without Autistic Spectrum Disorders (ASD)

Panel contribution

Mrs. Marianna Beradze¹

1. Bar-Ilan University

Background: Speech disfluencies - such as filled pauses, repetitions, self-corrections, silent pauses, and prolongations - can serve pragmatic purposes, such as signaling upcoming delays, holding the floor, emphasizing an idea, marking boundaries, or signaling upcoming delays to the listener. There is a tendency for individuals with neurodevelopmental disorders, especially autism spectrum disorders (ASD), to have pragmatic language difficulties (Reindal et al., 2021), therefore studying disfluency use in individuals with ASD is of both theoretical and applied importance. Recent studies showed that monolingual children with ASD produce fewer filled pauses than their non-autistic peers (Hallin et al., 2016; Parish-Morris et al., 2017). Although bilingualism has been reported to be beneficial with regard to pragmatic abilities, little research has been conducted on disfluencies in bilingual autistic and non-autistic children.

Aims: This current study aimed to investigate how bilingual autistic children (BI-ASD) and their non-autistic peers (BI-TLD) use disfluencies within Lake et al.'s (2011) pragmatic-based division to listener-oriented versus speaker-oriented disfluencies in both languages spoken by the children: Heritage (HL-Russian) and Societal (SL-Hebrew). The second aim was to determine whether children's usage of disfluencies differed across their two languages.

Methods: Participants included bilingual Russian-Hebrew speaking autistic children (BI-ASD, n=21) and their bilingual non-autistic peers (BI-TLD, n=30) aged 5-9 years. Picture-based narratives from the LITMUS-MAIN battery (Gagarina et al., 2012), told in both languages by participants, were transcribed and coded for eleven disfluency types using CHAT conventions in the CLAN program (MacWhinney, 2000). Between-group (BI-ASD vs. BI-TLD) and within-group (HL-Russian vs. SL-Hebrew) comparisons of eleven disfluency types were conducted.

Results: A comparison of disfluency use in both languages demonstrated that HL-Russian posed additional processing costs for both groups, which resulted in higher rates of disfluencies and errors in HL-Russian than in SL-Hebrew. This study confirmed fewer listener-oriented filled pauses production by autistic children, as previously reported for English-speaking monolingual autistic children, but only in HL-Russian. No significant differences in disfluency types were observed between the two groups in SL-Hebrew. Cross-language comparisons of disfluency types demonstrated consistent patterns in the BI-ASD group, but varied patterns in the BI-TLD group, which probably utilized them depending on each language's constraints and pragmatic benefits.

Discussion and Conclusions: A higher total disfluency rate produced by both groups in weaker HL-Russian confirms the negative relationship between disfluencies and proficiency level. Following previous findings for monolingual autistic children, filled pauses may function as markers to differentiate BI-ASD and BI-TLD, yet only when the linguistic and cognitive load is high. Comparisons of disfluency types across the two languages showed consistent patterns in both languages in the BI-ASD group, while children in the BI-TLD group varied their disfluencies in accordance with the language-specific constraints of each language, probably reflecting a higher degree of pragmatic ability to adapt to a listener's language.

Clinical implications: The use of listener-oriented filled pauses may further benefit speaking ability by helping bilingual and monolingual autistic children to hold their conversational turns and to improve their pragmatic skills.

How does the Degree of Intimacy Affect the Expressions of Suggesting Ideas?: A Comparative Analysis in Japanese/American Task-based Interaction

Panel contribution

*Mrs. Lisa Shinke*¹

1. *Japan Women's University*

This study investigates the relationship between the degree of intimacy and the choice of verbal expressions for suggestions in task-based interaction. Suggestion is the speech act in which the speaker put forward his/her idea for the hearer. However, at the same time, it holds the possibility of offending the listener by imposing the speaker's idea, categorized as one of the face-threatening acts in Brown & Levinson's politeness theory. This indicates how the speaker perceives the listener has a certain influence on the usage of verbal expressions for suggestions. The degree of intimacy, which can be one of the significant factors for the speaker's perception of the listener, has not come up in the study of suggestions. Especially, its influence in task-based interaction, which highly requires participants to build cooperation, has not been studied.

To clarify this relationship, the results shown in Shinke (2020, 2022), analyzing interactions of two Japanese/American English speakers of different ages and positions, teacher and student, were compared with those shown in Fujii (2016), analyzing student-student interactions. Both studies used the data of Tasks from the same source called Mister O Corpus, the corpus data which are collected to be able to compare six different languages in terms of language, culture, and social practice. In Tasks, a pair of participants were given 15 pictures and asked to arrange them to make a coherent story. The scene suggesting ideas for the storyline with verbal expressions was only extracted and analyzed based on the categorizations mentioned in Fujii's study ((1) declarative statements, (2) declarative statements with mitigating expressions, (3) declarative questions, and (4) question forms). The following three features could be seen through analysis:

1. In both teacher-student and student-student interactions, a higher total percentage of question forms including declarative forms ((3) declarative questions and (4) question forms) could be seen for Japanese, while a higher total percentage of non-question forms for American-English.
2. In Japanese teacher-student interactions, teachers had a higher total percentage of question forms including declarative forms (74.6%) than students in both teacher-student (44.4%) and student-student interactions (49.2%).
3. In American-English teacher-student interactions, students had a higher percentage of (2) declarative statements with mitigating expressions (47.6%) than teachers (23.2%) and students in student-student interactions (26.4%).

These features indicate that the degree of intimacy does not affect in terms of the general tendency of Japanese and American-English speakers' usage of verbal expressions, as mentioned in 1. However, when comparing the results within the same language data, we can see its influence on participants' building cooperation in teacher-student task-based interactions. By teachers using question forms, which induce the partner's response, more frequently, Japanese teacher-student pairs build a relationship with teachers as idea-building facilitators and students as idea originators. On the contrary, American-English students' frequent usage of declarative sentences with mitigating expressions rather than declarative sentences themselves implies their intention of making concessions toward teachers. This can also signify a different relationship from the Japanese one: teachers as idea originators and students as idea-building facilitators.

Inferential skills in children with Developmental Language Disorder: insights from a narrative comprehension task

Panel contribution

*Dr. Elena Pagliarini*¹, *Ms. Caterina Scilla*²

1. *Universitat Autònoma de Barcelona*, 2. *Azienda AULSS 2 Marca Trevigiana*

Different developmental trajectories across type of inferences have been shown in previous studies: presuppositions are readily derived from the age of 3 years (Berger & Höhle 2012); relation and quality implicatures are derived from the age of 4 years and quantity and manner implicatures start to be derived during school years (Okanda et al. 2015). Limited evidence is present on children with Developmental Language Disorder (DLD): they face difficulties with the maxim of quantity, as well as with the logical meaning of quantifiers (Katsos et al. 2011); however, to date, their acquisition of presupposition has not been investigated.

Our project aimed at comparing the acquisition of different types of inferences (presuppositions, manner and quantity implicatures) in children with typical development (TD) and at comparing the development of their inferential skills to that of DLD children. We expected TD children to derive presuppositions earlier than manner and quantity implicatures, and DLD children not to perform as well as TD children.

Eight children with language delay (mean age: 4;10; age range 4;4-5;2) tested during their first clinical assessment (which confirmed a diagnosis of DLD) were compared to eight age-matched TD children (mean age: 4;11; age range 4;5-5;5). In order to define their linguistic and cognitive abilities, we administered a series of tests assessing phonology, phonetics, receptive and expressive vocabulary, morphosyntactic comprehension, narrative comprehension, content expression and cognitive level. Inferential skills were investigated by adding 6 new questions to the narrative comprehension test *TOR 3-8* [4]: 2 tested presuppositions, 2 quantity implicatures, 2 manner implicatures.

For all linguistic levels, DLD children showed a poorer performance compared to TD peers. As for inferential skills, TD children derived presuppositions 78% of the time, quantity implicatures 50% of the time and manner implicatures 41% of the time. Children with DLD derived presupposition 50% of the time, quantity implicatures 41% of the time and manner implicatures 25% of the time. In line with previous findings, our results showed that TD preschoolers were able to derive inferences based on presupposition, whereas they still had difficulties with quantity and manner implicatures. Furthermore, our innovative results provide evidence that DLD children encounter difficulties in deriving various types inferences.

Investigating the effect of discourse structure in the derivation of implicature in autism

Panel contribution

*Dr. Elena Castroviejo*¹, *Ms. Isabel Martín-González*¹, *Prof. Agustín Vicente*²

1. University of the Basque Country, 2. Ikerbasque Foundation for Science/University of the Basque Country

Difficulties with social communication are pervasive throughout the autism spectrum. In a series of papers, Wilson & Bishop (2019, 2021, 2022) develop a 7-task battery of tests to investigate whether core language skills and pragmatic abilities can be teased apart and, thus, they can be said to be the result of different cognitive underpinnings. In their 2020 paper, Wilson & Bishop (WB) report a study that compares the outcome of neurotypical (NT) and autistic adults. Focusing on their Implicature Comprehension Test, featuring particularized conversational implicature, they observe that autistic individuals are twice as likely to choose a “non-normative” interpretation of an implied meaning, and five times as likely to select an “I don’t know answer” when asked about the presence of an implicated meaning.

Inspired by WB’s Implicature Comprehension Test, the goal of the present research was to find out whether we could replicate their results, and check whether the different behavior in the autistic population might really be due to the non-generation of an implicature, or rather the result of a local processing of discourse, an idea suggested by WB. To achieve these goals, we slightly modified WB’s design to allow for the comparison between two conditions: one that informs about the generation of an implicature (IMPLICATURE), and one that informs us about the local/global interpretation of discourse (CONTEXT).

Our study was a forced-choice task where participants had to decide the best possible continuation of a conversation given three answer types (A, B, C). Importantly, a type A answer revealed the generation of the implicature or the observation of global context depending on the condition. The design consisted of 16 items in the IMPLICATURE condition, 16 items in the CONTEXT (no-implicature) condition (32 critical items in total), and 16 fillers. Participants in our study were NT adults (N = 19) and verbal adults with an autism diagnostic (N = 19), all of them Spanish speaking.

The data we collected show that the autistic group is less prone to choose type A answers than the NT group (63% vs. 92%). We fitted a mixed effects model with a binary dependent variable (A vs. non-A answer), **condition** (IMPLICATURE, CONTEXT) and **group** (autistic, NT) as predictors, and **item** and **participant** as random effects. We found a main effect of **group**, with choosing an A answer being more likely in the NT group than in the autistic group ($\beta = 2.25$, $SE = 0.27$, $Z(1216) = 8.27$, $p < 0.0001$), but no effect of **condition** ($\beta = 0.22$, $SE = 0.43$, $Z(1216) = 0.52$, $p = 0.6$).

Our evidence, coupled up with WB’s results, do indicate difficulties in the derivation of implicatures in the autistic population, and our data seem to point to local processing as being responsible for it.

Metaphor comprehension in developmental dyslexia: an eye-tracking study.

Panel contribution

***Ms. Rita Cersosimo*¹, *Prof. Paul Engelhardt*², *Prof. Filippo Domaneschi*¹**

1. University of Genoa, 2. University of East Anglia

The ability to understand metaphors has often been investigated in neurodevelopmental disorders, but studies devoted to dyslexic adults are few and present inconsistent results: in Cappelli et al. (2018) and Griffith (2007) dyslexic participants show difficulties in metaphor comprehension tasks, while in Kasirer and Mashal (2017) the dyslexic group does not differ from controls. New models of dyslexia emphasize the need for a multifactorial approach, suggesting that each individual has a distinct cognitive and linguistic profile. However, while maintaining an individual difference approach, some common traits can be identified. On the one hand, dyslexic adults tend to show weaknesses in decoding and executive functions; on the other, their vocabulary seems comparable to that of non-dyslexic people, and their creative abilities appear to be particularly strong. These are all features that may play a role in metaphor comprehension, enhancing or inhibiting the process. The proposed contribution aims to present a research study that sought to investigate how dyslexic university students process novel metaphors. 39 undergraduate students with developmental dyslexia (F=31) and 41 typically-developing controls (F=32) matched on age, education, and vocabulary, were administered a series of standardized tests to assess cognitive abilities (RAN, working memory, vocabulary, theory of mind). An online metaphor comprehension task based on the Visual World Paradigm was then carried out with eye-tracking. Metaphors and corresponding literal sentences were aurally presented in isolation, and participants were asked to select the picture that best corresponded to what they heard. Findings indicated that dyslexic students are as accurate as controls in interpreting metaphors, but need significantly more time to process metaphorical meanings (i.e., have a longer reaction time). Other than being a strong pedagogical device, metaphor is also present – according to recent studies – in 18.8% of academic texts: shedding light to strengths and weaknesses of dyslexic students in this area can be useful to inform both easy-to-read guidelines and teaching practices.

Retrieving implied meanings in a native vs a foreign language – inferencing skills among young adults

Panel contribution

*Prof. Emanuela Sanfelici*¹, *Dr. Elena Pagliarini*¹, *Prof. Sara Gesuato*¹

1. University of Padua

The ability to understand a text involves decoding its overt content, and retrieving what it conveys implicitly, e.g., through presuppositions and entailments. The sender assumes the addressee can recover implied meanings because of their expertise as communication participants and shared background knowledge. While children, elders or people with atypical development may encounter difficulties “reading between the lines”, adults with typical development usually face no such challenges [1,2]. Yet, studies have reported that even the latter population have difficulties dealing with phenomena at the interface between syntax and discourse as well as semantics and pragmatics in their non-native language [3,4,5].

This study investigates how often and how easily L1-Italian young adults with typical development engage in inferential reading in their native language (NL, Italian) vs. a foreign language (FL, English).

We designed an online questionnaire which included: a reading passage; 19 multiple-choice comprehension questions focused on the retrieval of presuppositions, entailments, and the recognition of unstated content; 19 items for rating the difficulty of the comprehension questions on a 4-point scale. Adopting a between-participants design, it was administered online to volunteer B2-level EFL university students in an Italian (49) and an English version (49).

The overall accuracy in retrieving information was fairly high (68% of the answers): 1272 responses were correct, while 590 were not. More correct responses were found in the English version (N=658) than in the Italian one (N=614). Participants accurately retrieved entailments in 84% of the items: 161/196 correct responses in the Italian version and 170/196 in the English version. Retrieval of presuppositions was successful in 65% of the items: 344/539 correct answers in Italian and 355/539 in English. Finally, unstated content was accurately recognized in 62% of the items: 109/196 correct responses in Italian and 133/196 in English. The comprehension questions were mainly rated as either somewhat easy or very easy. Yet, participants’ ratings did not uniformly correlate with their accuracy in the comprehension questions. In most erroneous answers, participants judged the respective questions to be somewhat or very easy.

The findings show that the retrieval of implied meanings was not hampered in the FL, which was apparently more challenging in the NL, and that the perceived difficulty of the questions was not always matched by comprehension accuracy. The participants’ somewhat unexpected better performance in the FL might be attributed to greater concentration efforts put into decoding the FL text.

Sentence processing at the syntax-pragmatics interface: Interindividual variation and ASD-related psychological traits

Panel contribution

*Dr. Anna Czypionka*¹

1. University of Konstanz

The processing of pragmatics has been studied extensively for autistic and nonautistic speakers. Research outcomes are mixed, with studies finding both evidence for differences (e.g., Deliens et al. 2018) and similarities (e.g. Kissine et al. 2015) between both groups. A few studies go beyond a binary distinction of autistic/nonautistic speakers, investigating the predictive power of fine-grained psychological assessment measures (Autism Quotient (AQ) (sub)scores, Baron-Cohen et al. 2001) for language processing. These tools allow independently assessing different autism-associated traits that vary considerably across the general population. AQ-scores have been linked to the processing of some types of implicatures (van Tiel et al. 2018). At the syntax-pragmatics interface, a single study suggests a link between the AQ ‘communication skills’-subscore and participants’ propensity to experience linguistic illusions (for NPI licensing, see below); speakers with more autism-like traits were shown to perform better at spotting ungrammaticalities than ‘less autistic’ speakers (Xiang et al. 2013).

The current contribution presents research on the processing of the syntax-pragmatics interface in German from > 80 speakers with and without autism diagnosis. Stimuli include two interface phenomena: (A) illusory licensing of negative polarity items (NPIs) and (B) pragmatic licensing of question-sensitive discourse particles (QDiPs). Both involve complex licensing at the syntax-pragmatics interface. (A) reflects a processing error stemming from an overapplication of pragmatics (Parker & Phillips 2016); (B) represents legitimate pragmatic licensing ‘rescueing’ the interpretation of syntactically non-ideal structures (Czypionka et al. 2021). We present acceptance rates from speeded acceptability ratings, linking the findings to participants’ (sub)scores for AQ and Systemizing/Empathizing Quotients (SQ-R/EQ; Weelwright et al. 2006).

Participants with high ‘attention to detail’ AQ-subscores and high SQ-scores perform significantly better at spotting violations for both interface phenomena than those with low scores. In addition, these participants are particularly likely to ‘appreciate’ syntactic well-formedness in QDiP licensing, their acceptability rates resolving subtle differences in processing quality between syntactic and pragmatic QDiP licensing. This suggests an increased sensitivity to syntactic well-formedness, both in the rejection of ill-formed structures and in a preference for syntactic over pragmatic QDiP licensing, without actual difficulties in pragmatic licensing.

In line with earlier findings, high AQ ‘communication’-subscores are descriptively linked to a reduced likelihood for NPI illusions, i.e., errors resulting from an overapplication of pragmatics. There is no evidence for a link to difficulties with legitimate pragmatic QDiP licensing.

Taken together, the findings suggest that for the two interface phenomena at hand, autism-related measures are linked not to difficulties in pragmatic licensing, but rather to interindividual differences in the relative reliance on pragmatic and structural cues. This variation is not visible in a categorical distinction between autistic and non-autistic speakers, but across the full range of high and low amounts of autism-related traits in individual speakers. Our results showcase the high degree of variability in interface processing in the general population.

What inferences do people actually make on encountering informationally-redundant utterances? An individual differences study

Panel contribution

*Ms. Margarita Ryzhova*¹, *Ms. Alexandra Mayn*¹, *Prof. Vera Demberg*¹

1. Saarland University

In previous research, it was shown that upon hearing an utterance mentioning a highly predictable activity in a given context, subjects tend to rate the probability that this activity usually occurs lower than if it was not explicitly mentioned. For example, if the utterance mentions the actor paying the cashier in the context of going grocery shopping, subjects tend to infer that the actor does not usually pay the cashier [1].

Previous work assumed that subjects make sense of informationally redundant (IR) utterances by computing *atypicality inferences*, that is, by coming up with an alternative informative explanation of why the utterance was said (beyond stating the obvious fact of paying the cashier in the example above). Thus, the addition of the redundant mention of the typical everyday behavior results in the interpretation that it is actually *atypical* for the referent, for example, because they are a shoplifter and therefore do not usually pay.

In the following study, we show this experimentally by asking subjects to explain their judgments about the activity typicality. Additionally, we investigate whether individual variability in the rate of deriving atypicality inferences is modulated by cognitive or personality traits. We hypothesize that pragmatic responding might be modulated by working memory capacity (RSpan), linguistic experience (ART), socio-pragmatic traits (AQ), and general reasoning ability and reflexivity (non-verbal IQ and Cognitive Reflection).

Each subject participated in two experimental sessions. Each session contained 10 stories about everyday situations (such as going shopping), based on materials from [1]. In each session, in the 3 target items, the story contained an IR utterance (paying the cashier), while there was no utterance in the 3 control items. Each story was accompanied by 2 questions: 1) a slider question ranging from 0 to 100 about how typical this activity was for the actor; 2) an open-answer question to explain the provided typicality rating. In addition, subjects saw 4 fillers with no IR manipulation. Since the critical items involved highly typical activities, filler questions were about atypical activities (e.g., adding avocado to pasta sauce). At the end of the second experimental session, subjects completed 5 cognitive and personality tests. Data from 193 subjects were used in the analysis.

For the analysis, participants' responses to the second question were annotated as either containing an atypicality inference or not. We confirm the assumption made in previous work that when confronted with an IR utterance, subjects tend to infer that the described behavior is *atypical* for the actor, and additionally come up with rich explanations for such behavior.

We also find that, just like for other pragmatic phenomena, people differ in whether they derive atypicality inferences: there are subjects who are consistently literal, consistently pragmatic, and those who are inconsistent in their explanations. Finally, we show that the degree of pragmatic responding is predicted by participants' reasoning ability and reflexivity, and discuss how it might be linked to pragmatic inferencing.

Analysis of Dynamic Structure in Multimodal Information in Manzai: Forming and Unforming the Patterns

One typical category of Japanese comedy is “*manzai*”, written as 漫才 in Japanese. It originated from traditional performance art. A *manzai* has a set pattern: A pair, one called “*boke*” and the other “*tsukkomi*”, engage in conversations and gradually unleash a comic story.

Although some research has focused on the linguistic and non-linguistic aspects of *manzai* patterns and also on their audience, they all looked at single factors of *manzai*, e.g., the language, timing, or the audience. Their characteristics have been analyzed independently, without paying attention to the time-series changes that occur with the *manzai* talk. Considering that *manzai* talks progress through interactions between the performing duo, and also between the performers and the audience, it is necessary to analyze how they share with each other the rhythm and/or timing that both sides feel comfortable with. This study, therefore, aims to clarify how the different time and space are characterized through the performer-audience interactions. It looks at the time-series changes in multimodal information, including both linguistic and non-linguistic features. In this way, this study will show the “*kata*” (like the style, pattern, and form) of the *manzai*, viewing them through multimodal interactions between the on-stage performers and their audience. How about defining this word “*kata*” if you want to add it?

The study analyzed the video images of the 15 finalist pairs in the 2001-2019 M-1 Grand Prix, the most prestigious *manzai* contest. We used video-recordings of the 15 *manzai* pairs and extracted these factors: The switching pause (time lapse between the end of the last speech and the beginning of the next speech) between different topics/themes, the intensity of the audience’s reaction (how much they laughed), and the number of orientation changes (of the face/body) of the performers. Using this data, we extracted representative values at 30-second intervals. We then used them as indices to show time-series changes.

As the result of above analysis, by defining the constant rhythm that the performers’ faces and bodies made and by defining the speed of the rhythmic patterns of the performers’ talks and the audience’s laughter, it was clear that there was a multi-layer dynamic structure of rhythms that characterize the *manzai* style. Our study especially showed the secondary curve depicting the relationship between the switching pause and the intensity of laughter. It showed that when forming a dynamic structure, the audio/sound information from both the *manzai* performers and the audience were organically integrated.

This study visualized how *manzai* has transformed into new styles, by repeating pattern forming and unforming, even though the older form *mansai*, written as 万歳 in Japanese, originated from traditional performing art. As more widely-varied *manzai* forms and styles are sure to develop in the future, the researchers expect that this study, showing the existence of a “dynamic structure built together by the performers and audience”, will contribute to the future research into *manzai* and other intangible culture.

How are knowledge, skills and emotions handed down to apprentices in pottery class where the master is a person with aphasia?

Panel contribution

***Prof. Hiro Yuki Nisisawa*¹, *Prof. Rui Sakaida*²**

1. Tokiwa University, 2. Future University Hakodate

Similar to other cases of “GEIDOO”, in other words, accomplishments, performing arts or traditional crafts, discussed in this panel, knowledge and skills are transmitted in the activities in the pottery class. In addition to this, some emotions are also transmitted, such as pleasure, enjoyment, and inspiration etc. At the pottery class discussed in this presentation, the teacher is a person with aphasia. Using videotaped data, the activities of this class are analysed and described from the perspectives of ethnomethodology and conversation analysis, as well as multimodality and multisensoriality. As a result, the following findings are made. A double asymmetry exists here between master and apprentices. In addition to the asymmetry of knowledge and skills that exists between the teacher and the students, which is also found in other GEIDOO, there is an asymmetry of communicative repertoires. This asymmetry gives rise to several interesting features. For example, the students formulate their questions in the way that is easier for the teacher to understand or answer. Alternatively, the students adopt the strategy of repeating what the teacher says, complementing both the form and the content, to obtain confirmation. The above forms of interaction between the teachers as a person with aphasia and students as able-bodied persons confirm what Charles Goodwin discovered. In addition, the teacher often focuses his teaching not only on words, but rather on demonstrations with his hands. The title of this presentation, “handed down”, also has this nuance. In this case, the teacher makes extensive use of onomatopoeia. Our presentation will also examine how imitation and simulation, the topic of the panel, are achieved in the interaction between the teacher and the students in this activity. Moreover, we want to consider, as far as possible, how some kind of emotion, such as the kind of pleasure, enjoyment and inspiration etc. mentioned at the beginning of this paper, is understood, is handed down and reproduced intersubjectively.

Imitation and simulation in Jiu-jitsu practice: Participants' orientation toward the organization of the class

Panel contribution

Dr. Yasuharu Den¹

1. Chiba University

This study investigates how a Jiu-jitsu class in Japan is organized such that the teacher and students are oriented to the overall structure of the class in which *imitation* and *simulation* of physical skills play important roles. I discuss how these two aspects of physical-skill practice enable the students to not only acquire correct bodily movements but also understand their implications when performed in real-life situations. These points are illustrated through a multimodal analysis of video-recordings of my Jiu-jitsu class.

Instruction on and learning of physical skills have been garnering increased attention, and numerous studies have been conducted based on the video recordings of lessons and classes in various settings (Keevallik, 2013, 2014, 2018, 2020). Japanese martial arts have become one of the emerging topics in this line of research (Råman and Haddington, 2018; Råman, 2019). In our previous IPrA panels (2019, 2021), I described how the teacher in a Jiu-jitsu class skillfully uses his words and bodily movements to give the students an explanation and demonstration of physical skills while simultaneously providing his partner hints on how to move for a collaborative demonstration. Furthermore, I explained how the teacher segments a complex bodily action into smaller installments, thereby enabling him to interactively (re)organize the instructing process by checking the students' achievement after every installment.

In contrast to my previous studies which primarily focused on the teacher's conduct, the current study examines the other components of the class, in which the students actively practice their skills, that is, the repeated practice of demonstrated bodily actions and sparring between the students. The class comprises the technique session and sparring (free-form fighting with another student). In the technique session, the students repeatedly practice the bodily actions demonstrated by the teacher, where the *imitation* of the teacher's skills is the students' primary goal. The teacher's orientation to this goal is manifested as positive evaluation ("You are OK."), dependence on experience ("You may do slowly if unused to this technique."), correction ("You must not place your right arm on the opponent's back."), and interruption followed by individual coaching for a specific student. Meanwhile, practicing the demonstrated actions in the technique session is considered as a *simulation* of real fighting, which is experienced in the sparring between the students. In sparring, they are expected to attempt to use any technique that they have learned in the technique sessions. The teacher demonstrates his orientation to this expectation by making the students aware of the situation in which they can utilize the tactics that they have learned ("You can try what you learned today/the other day."). Additionally, when the teacher is the opponent, he guides the students in a situation similar to the one they have experienced in the technique session.

In this manner, the organization of the class inherently involves the imitation and simulation of physical skills, and this format of instructing/learning serves as an effective way of transmitting physical skills in the Japanese context.

Instructing and Learning Kata in Unison: A Multimodal Analysis of a Taïdo Lesson.

Panel contribution

*Dr. Ikuyo Morimoto*¹

1. Kwansai Gakuin University

This study investigates what the imitation of practical skills achieves in instructing/learning interaction in a *Budo* lesson. In recent years, a growing body of literature has examined the multimodal practices used in organizing instructing and/or learning activities. Using the methodology of Conversation Analysis, the present study aims to contribute to this research trend by exploring an instructing and leaning activity in which *Budo* students practice *kata* in response to commands from a master.

Data for this study come from two hours of a video-recorded lesson of a type of *Budo* called *Taïdo*. *Taïdo* is a type of Japanese mixed martial art, which originated from various kinds of martial arts, such as judo, karate, and boxing. The lessons are normally structured following several steps. First, the master demonstrates in front of all students the correct movements of *kata*, which are ‘forms’ of specific patterns of movement. Second, the students each imitate the movement on their own. And third, the master gives a command and all the students imitate the movement in unison following this. This study focuses on the third step and analyzes the embodied ways in which either the master or the students synchronize their movements.

The analysis demonstrates the following three points. First, both the master and the students are all oriented to synchronizing their movements of practicing the *kata* in the third step. Second, the multimodal practices used to organize the transition to the third step are recognizably ritual. The students’ response “*sei*” and their arm movements are symbolic acts in *Taïdo*. These practices show that the students are oriented to the last step as being more real and official than the previous steps. Third, while the transition is initiated by the master, it is achieved in a collaborative way. For example, the master’s announcements are usually prolonged, such as “*ikima:::s*” and “*kamaete:::*,” which provides the students with time to perform the movement before the prolonged sound ends, and enables them to start the next action in unison. Răman (2018) found that teachers’ management of the transition in judo and Brazilian jiu-jitsu lessons is largely dependent on the students and their embodied conduct. His observation also aligns with the findings of this study.

This analysis suggests that the multimodal practices employed for organizing the transition to the last step, as well as for synchronizing movements, exhibit the following orientation of the participants: the rituality and formality of *kata* in *Taïdo* and the membership of the community of practice of *Taïdo*. Practicing *kata* in a synchronized way suggests that *kata* are treated as being learned and transmitted in a disciplined way that has been established over the years. It also suggests that *kata* are regarded as being learned by all participants together, which nurtures the membership of the community of practice of *Taïdo* and the spirit of their community.

Multimodal Analysis of Kata-based Training in a Child-oriented Karate Lesson: How to Achieve an Adequate Imitation of an Expert's Practice

Panel contribution

*Dr. Seiji Nashio*¹

1. Hiroshima University

This study focuses on *kata*-based training, a methodology used in Japanese martial arts to transmit explicit and implicit essences for the acquisition of practical skills from experts to novices based on their synchronized bodily practices. This study demonstrates, through a multimodal analysis of an activity in a child-oriented *karate* lesson, how instructors operate and support the training while novices' practices are still developing into adequate imitations of experts.

Karate is a modern form of Japanese martial arts, and its *kata* is a methodological tool that consists of stylized sequential patterns of bodily motions containing experts' inner sense and intelligence. In this training, trainees recurrently practice these patterns while imitating an (existent or imaginary) expert's practice. Through the training, they obtain key qualities of motions, such as speed, force, and dynamics, along with the inner sense and intelligence that can be accessed only by bodily practice, and they refine their motions to practical karate skills. Finally, their practices reach the adequate imitations of experts, and thereafter, they can train and learn all by themselves. This means that they have become independent practitioners of *karate*. In contrast, novice trainees who have not achieved an adequate imitation are required to start learning basic motions, procedures, and knowledge about *kata* and need deliberate instructions. This study specifically focuses on these instructions for novice trainees.

The data analyzed in this study were videotaped segments of *karate* training in which a *shihan*, the head of instructors, teaches various motions and *kata* to children 15 years of age or younger, with the help of two other instructors and two adult assistants (adult trainees). All participants speak Japanese. *Shihan*'s instructions are mostly provided through words and bodily demonstrations. Meanwhile, the *shihan* uses the bodily component to visually demonstrate problematic points in the trainee's bodily motions (cf. Keevallik 2010). Otherwise, the *shihan* demonstrates bodily interaction by pairing with and directing another instructor or trainee and addressing his instructions to the trainee in question (cf. Den 2016). The most important issue is that the *shihan*'s instructions are somewhat analytical by dividing the sequences of *kata* into elements irrespective of its essential feature. According to Ohniwa (2021), *kata* is for non-analytical comprehension and communication and loses its value when decomposed into relationships between elements. In this presentation, I specifically analyze *Shihan*'s multimodal instructions for leading and correcting novice trainees' practices and discuss the significance of the above inconsistency in the instructions and how the instructions efficiently refine the trainees' imitations to adequate ones.

“Shu, Ha, Ri (Obey, Break, Separate)”: Logical Types in Tea Ceremony Learning

Panel contribution

*Dr. Daiji Kimura*¹

1. independent

At the last IPrA, I gave a presentation titled “Well-modulated Bodily Movements in the Japanese Tea Ceremony (*Sado*)”. In it, I asked, “If the tea ceremony procedure is strictly prescribed, how do we find it interesting and satisfying?” Through video analysis, I found that although the basic rules are set, there are modulations that express a sense of tension or the host’s character. By acquiring these modulations, the host moves from a state of “being bound by *kata* 型 (procedure)” to “playing with *kata*”.

In this presentation, I clarify further the learning stages of the tea ceremony, using the theoretical framework of Bateson’s logical type theory. The materials analyzed are videos of learning scenes, interviews with learners, and literature on the tea ceremony.

Bateson outlines a ladder of learning, i.e., zero learning, learning I, learning II, learning III, etc. Zero learning is the state in which the responses to certain stimuli are constant, like a vending machine. In learning I, the response to the same stimulus changes as the stimulus is repeated. In the tea ceremony, the change from “not knowing how to prepare tea” to “being able to prepare tea according to the procedure” corresponds to learning I. In terms of the theme of this session, this stage corresponds to “imitation”. Learning II is “a change in the process of progression of learning I” or “learning the way of learning I itself”. Modulating one’s manners to create a sense of tension applies to learning II, and corresponds to “simulation”. In the presentation, I will analyze these stages using video scenes and interviews.

However, the classical literature on the tea ceremony states that the practice does not end at learning II. There is a very famous phrase “*Shu, Ha, Ri*”. “*Shu* 守” means “protect” or “obey” the rules. This corresponds to learning I. “*Ha* 破” means “break” or “detach”, which means do not obey the rules completely, but deviate. This corresponds to learning II.

The problem is “*Ri* 離”. This word has the connotation “separate” or “transcendent”, meaning that we should throw away what we gained in learning I and II. This stage corresponds to learning III. It is difficult to imagine this stage. Indeed, Bateson writes: “Learning III is likely to be difficult and rare, even in human beings”; “Zen Buddhists, Occidental mystics, and some psychiatrists assert that these matters are totally beyond the reach of language”. Thus, learning III might correspond to enlightenment in Zen Buddhism. The tea ceremony has its origins in Zen, and the goal of learning in the tea ceremony is to reach a state of complete abandonment of the acquired form. However, not all tea ceremony students can reach such a state. I will consider whether there is another way to reach learning III.

**Impoliteness in Chinese
social media (organized
by Yongping Ran)**

A corpus-based examination of Chinese impoliteness metalanguage on Weibo

Panel contribution

*Prof. Na Yang*¹

1. Zhejiang Gongshang University

This study investigates how Chinese speakers use impoliteness metalanguage to position themselves on *Weibo*. By employing the Modern Chinese Dictionary and the NLPPIR(9,160,074 words) as a reference, I chose to focus on four words meaning impoliteness: *bùlǐmào* (impolite), *méilǐmào* (uncivilized), *màofàn* (offend), and *cūlǚ* (rude). To achieve the research purpose, I conducted a corpus analysis based on a sub-corpora of BCC comprised of data from *Weibo* reviews. With the help of corpus analytic tools, I examined the core meanings of the four items and compared their functions in the context. The results show that: (1) the Chinese speakers employ *cūlǚ* (rude) most frequently while least frequently using *màofàn* (offend) to evaluate others' impoliteness; (2) the speakers relate *méilǐmào* (uncivilized) more often to a context of describing one's individual quality, whereas they tend to refer to *bùlǐmào* (impolite) in talking about the affective quality of interaction; and in addition, (3) the Chinese speakers like combining the item *cūlǚ* (rude) with the verb-phrase *shāng gǎnqíng* (affection-threatening), which helps to extend their argument for justifying a comment on impoliteness. The study aims to contribute to (im)politeness research by examining the metalanguage used in Chinese.

A Study of the Moral Order Construction of Collective Reprimand in Online Comments Aiming at Parent-Child Conflict

Panel contribution

Dr. Qian Chen¹

1. Northwest Normal University

In online social media, aiming at parent-child conflictive incidents, netizens express their opinion and position through comments, among which, collective reprimand is a typical impolite behavior. Adopting the method of “computer mediated discourse analysis”, this study sets in parent-child conflict incidents and examines the collective reprimand in online comments from the perspective of moral order construction. It is found that collective reprimand is an impolite discourse practice making evaluation based on moral order, which mainly constructs the moral order of showing filial piety and respect, being diligent and frugal, and holding gratitude in return in social interactions by way of criticism, questioning and emotional venting. The study further reveals the intrinsic connection between impolite speech acts and moral order in cyber public space, and sheds light on the socio-pragmatic study of public discourse.

Exploring the moral conflicts: Online public denunciations against children's noise making on train

Panel contribution

*Dr. Rong Lei*¹

1. Center for Linguistics & Applied Linguistics, Guangdong University of Foreign Studies

This sociopragmatic research aims to elucidate the interface between immorality, incivility, and impoliteness (Horgan 2019, 2020; Garcés-Conejos Blitvich & Kádár 2021; Haugh, Kádár & Márquez Reiter 2022) by examining how denunciations of public incivility (i.e., child passengers' noise making on trains) occur in Chinese online communities, how the incivility is discursively positioned as publicly denounceable through framing the conduct as morally transgressive. Drawing on publicly available comments posted by social media users sent in response to a video featuring child passengers' noise making on the Chinese High-speed railway, the findings indicate that social media users' moral orientations lead to moral conflicts and impoliteness. The social media users, who held the moral norm that people ought to be quiet in public places, align with the video poster's critical stance and display moral indignations by accusing, blaming, complaining, criticizing (Haugh & Sinkeviciute 2018; Márquez Reiter & Haugh 2019; Drew 1998; Pillet-Shore 2016; Jay 2018). These moral indignations, however, result in other social media users' feelings of offense on the part of themselves and on the part of the offended party (i.e., the noisy child passengers). Other social media users held the moral norms that the adult should follow the Confucian “宽容”(tolerance), and take a counter-offensive position, resulting in the conflicts and the escalation of conflicts between these two groups of social media users. These offer a window into conflicting behavioral expectations when people are faced with child wrong-doers. This paper aims to contribute to the research on morality in sociopragmatics, which remains largely embryonic (Haugh, Kádár & Márquez Reiter 2022). It also attempts to shed new light on the interconnections between immorality, incivility, and impoliteness by targeting morality and language use in Chinese social media.

Investigating Chinese Online Impoliteness and Topic Sensitivity During COVID-19

Panel contribution

Ms. Yuxin Jiang¹, Prof. Qun Zheng¹

1. University of Chinese Academy of Sciences

Increasing impolite behaviors have been ubiquitous on the Internet in the wake of the COVID-19 pandemic outbreaks. After the first infected case was reported in China, cyberspace has garnered increasing hate-infused online debates across the globe. However, the research on Chinese online impoliteness, especially during the time of the pandemic, is still limited. It is widely agreed that impoliteness is both culture- and context-dependent. The less discussed cultures such as Chinese and the extent of topic sensitivity on the use of online impoliteness thus are worth exploring. Hence this study aims to unveil a) the emerging trends of impoliteness on the Chinese Internet, and b) the pragmatic choices of impoliteness in sensitive (i.e. politics-related) and non-sensitive (i.e. service-related) topics. Drawing on Culpeper's (2011) impoliteness model, we analyzed lexical patterns and impoliteness strategies in two self-compiled corpora containing 15,227 online comments on 8 politics-related and 8 service-related top-rated videos from Bilibili, a popular Chinese video-sharing platform. We found that in general Chinese online users prefer implicit impoliteness to explicit impoliteness. Regarding topic sensitivity, non-sensitive topics beget more explicit impoliteness than sensitive topics do. Non-sensitive topics were often accompanied by pointed criticism and implicated impoliteness while sensitive topics were frequently followed by sarcastic comments. These findings indicate that though an implicit strategy of impoliteness seems fit in Chinese culture, we can still observe an impulsive and anxious online crowd in a pandemic era expressing their concerns and holding an online carnival.

Membership categorization in taking offence in Chinese WeChat group talk

Panel contribution

Dr. Shuangping Gong¹, Prof. Chaowei Pang¹, Dr. Rong Xiao¹

1. National University of Defense Technology

Taking offence refers to a social action initiated by the recipient in which he or she interprets the actions or conduct of the prior speaker (or some other person or group of persons) as offensive (Haugh 2015). Compared with giving offence, the investigation of the interactional dynamics of taking offence is much more limited.

Membership categorization is pervasive in taking offence in online conversation. However, little attention has been paid to how offensive context invokes language users' choices in membership categorization and how these choices influence the development of taking offence in online multi-party conversation. This study explores membership categorization in taking offence in Chinese WeChat group conversation. The data were collected from the conversation in a property owners' WeChat group from 2020 to 2022, during which the residential community went through several controversial issues such as the reselection of the Owners' Committee and the installation of elevators. The participants in the property owners' WeChat group include ordinary property owners, members of the Owners' Committee who are the elected representatives of the property owners, and several staff members from the property management company.

Detailed analysis of the data revealed four types of membership categorization strategies in taking offence in online multi-party conversation, namely membership denigrating, membership negating, membership challenging and membership foregrounding. Due to the multi-layer of participation framework and the diachronicity of WeChat group talk, offensive or impolite acts may trigger negative emotional responses (e.g. a feeling of anger, annoyance or displeasure) from one or more recipients in the WeChat group, and may result in taking offence in an increasingly aggressive manner, which can be observed from the participants' choices of membership categorization strategies. However, a shared membership in a community such as "neighbors" may be foregrounded to mitigate conflicts triggered by offensive acts since in Chinese culture "good neighbors are much more helpful than far away relatives" and neighbors are supposed to maintain harmony with each other. The results of the study indicate that membership categorization in impolite context in Chinese WeChat group talk is a social action which could be employed by offence recipients to manage interpersonal relationship among community members.

Ostensible offence in Chinese live-streaming commerce interactions

Panel contribution

Dr. Ping Liu¹, Ms. Linlin Yang¹

1. Guangdong University of Foreign Studies

The notion of “offence” lies at the core of current models of impoliteness (Haugh, 2015). It is suggested that previous work on causing offence (Culpeper, 2011) and mock impoliteness (Leech, 1983; Culpeper, 2011; Haugh and Bousfield, 2012) can be complemented by an analysis of ostensible offence in digital business communication. Ostensible offence is defined as an offensive pragmatic act consisting of impolite forms, whose effects or perlocutionary effects can be cancelled, neutralised or legitimized by the context; this means the offence remains on the surface and the speaker with no intention to cause personal as well as public offence (following Leech, 1983; Culpeper, 2011, 2022; Haugh and Bousfield, 2012). It is proposed that ostensible offence can be both productive and rapport enhancing in particular contexts, which means the speakers causing offence are sanctioned or legitimized for these impolite acts in order to achieve desired interactional goals. This position is illustrated by drawing from analyses of the interactions between streamers on Chinese live-streaming commerce platforms. Based on a self-built corpus comprising 100 h of transcribed texts from live-streaming on top Chinese social media platforms Taobao Live and Tiktok, three research questions are addressed: (1) How do streamers cause ostensible offence in live-streaming commerce interactions? (2) How do the targets take the offence? (3) What functions is ostensible offence intended to accomplish in live-streaming commerce interactions? This research aims to contribute to our understanding of impoliteness, collective intentionality, and relational work in digital business interactions.

Personality Traits and Mediation Discourse in the Rapport-challenge Contexts: An Interpersonal Pragmatic Perspective

Panel contribution

Prof. Ling Zhou¹, Mr. Jiewen Wu¹

1. Northeast Normal University

This paper aims to explore the moderating effect of different personality traits on conflict discourse from the perspective of interpersonal pragmatics by examining the data from a modern TV mediation program. The findings show that personality traits greatly influence the effect of mediation. Specifically, the mediated parties are characterized by dominant personality and mild personality, while the mediator represents rational personality. The dominant personality inhibits interpersonal bonds by aggravating conflicts, which impedes a successful mediation; the mild personality establishes closer interpersonal connections and eases conflicts, thereby playing a positive role in the mediation of conflict talk; and the rational personality promotes the mediation by the way of negotiating interpersonal relations, thus acting as a driving force in conflict resolution. Furthermore, the results suggest that the mediator's personality traits facilitate the transition of the mediated parties' personalities to rational personalities, gradually improving the interpersonal relationship, which in turn contributes to their personality state adjustments through different language use.

The Metapragmatics of Impoliteness and Offence on Chinese Social Networking Sites

Panel contribution

*Dr. Xu Huang*¹

1. Center for Linguistics & Applied Linguistics, Guangdong University of Foreign Studies

Offence-taking, is generally perceived as an outgrowth of impolite, improper or immoral behaviors. Prior studies have pointed out that offence lies at the heart of impoliteness evaluations, yet their interrelationship is far more complicated than what it seemed at first sight. Given the scarce scholarly attention it has received to date, this study reports an examination of the metapragmatic use of OFFENCE and IMPOLITENESS in Mandarin Chinese by drawing on two datasets of microblogs from Weibo, in an attempt to disentangle their interconnection. After manually coding all the valid data, we tease out different metapragmatic uses of offence and impoliteness respectively, and analyze the frequency and percentage of each usage. It is found that whereas offence is more closely related to morality issues such as disrespect, indecency and immorality, impoliteness is predominantly connected with less serious, more innocuous formality issues such as disregard (in terms of messages received and read), unfollowing and message-bombing. Also, the metapragmatic impoliteness evaluation (e.g. *It will be impolite if ***continues*) is increasingly seen to convey humorous and jocular implications rather than offensive or even aggressive evaluations that prevail in the existing impoliteness literature. Therefore, this study will add to our understanding of the nuanced differences between offence and impoliteness in Chinese culture from a metapragmatic perspective.

Troubles talk, sanctioned offence and participation order in online group chat

Panel contribution

Dr. Lili Gong¹

1. Guangdong University of Foreign Studies

Troubles talk is a social practice involving multiple interpersonal concerns, such as dissatisfaction, face, offence, emotion, im/politeness, or rapport management, etc. Previous studies on troubles talk took it for granted that it is hearer's responsibility for providing appropriate response to teller's negativity. Consequently, failure to attend teller's comforting need is considered inappropriate, inducing negative feelings and evaluations, such as being offended, unsatisfactory or disappointment, etc. This study expands the literature by examining troubles talk in Chinese online group chat, where participants with similar problems or difficulties are gathered for a conjoint purpose of mutual support, i.e. pregnant & novice moms group of Chinese for sharing problems and asking for help. Two research questions are focused: (1) What are the discursive patterns of troubles talk in online group chat? (2) How are failures to attend trouble teller's concerns interpreted? Besides the analysis based on threads of talk collected in group chat, a semi-structured questionnaire survey is conducted based on the prominent responsive patterns from group members to troubles teller according to the first question. Pilot study shows that troubles talk in online group chat unfolds diverse discursive patterns apart from face-to-face interaction, given the participation order featured by mass and anonymity of online group chat. The new order calls for further considerations on sanctioned offence triggered by failures to meet teller's comforting needs. The study has implications for theorizing offence regarding its perceptions in Chinese social media.

“We are extremely worried about him”: Emotion-based deontic claim in online pediatric medical consultation

Panel contribution

Ms. Minwen Wei¹, Prof. Yongping Ran¹

1. Center for Linguistics & Applied Linguistics, Guangdong University of Foreign Studies

A division has been made between expressions of emotion and expressions of deontic right. However, the delimitation is not clear-cut in actual interaction, which is an aspect that has received scarce attention. Besides, although previous studies suggest that patients' expressions of their sufferings in medical consultation can be more than an action of pursuing affiliation, but an action of soliciting doctors' diagnosis or treatment, little research has examined that how a third party's expressions of their own emotion can serve as a prompt for a more satisfying recommendation in medical consultation. Drawing on a dataset of Chinese online pediatric consultation and a discursive approach, this study addresses this gap by exploring how a caregiver's expressions of anxiety and worry about the child patient's condition can be a proximal deontic claim to prompt the doctor to propose a more adequate or convincing treatment plan. This study finds that caregiver's emotion-based deontic claim of the kind signals caregiver's dissatisfaction with doctor's previous treatment recommendation. There are two practices of emotion-based deontic claim. Caregivers either express their worry without an explicit deontic prompt or adds an explicit prompt right after they display their emotional stance. In either situation doctors respond with a renewed treatment recommendation. These findings have important implications for understanding the interrelation between emotion and deontics and show that expressions of emotions should be carefully recognized in online medical consultation according to sequential context.

Key words: emotion, deontics, online medical consultation

“We are on the air.” Rationalised coercive impoliteness in complaint handling via helpline

Panel contribution

*Prof. Yongping Ran*¹, *Ms. Jiabei Hu*¹

1. Center for Linguistics & Applied Linguistics, Guangdong University of Foreign Studies

Threatening, whether explicit or implicit, is one of the impoliteness strategies by which the speaker exercises the power to attack the addressee's face and restrict his freedom of action. It can pursue not only transactional goals but social goals (Culpeper, 2011), especially in the institutional and public contexts where impoliteness is not the only issue of interpersonal pragmatics but also sociopragmatics. However, such impoliteness is not necessarily associated with specific linguistic forms but is driven and shaped by the context. Thus, whether an utterance is impolite and has a coercive function needs to be examined in discursive practices.

This study draws on the data from the Chinese helpline in which the host publicly deals with complaints from migrant workers (i.e., employees) to help them claim their unpaid wages from construction companies or governments (i.e., the management). It focuses on the way how the context-dependent statement, “we are on the air”, functions as a coercive impoliteness strategy (i.e., threatening) by which the host exercises power in interaction and power behind the interaction. Results show that when the complainee (potentially) withdraws from the interaction (e.g., ringing off, withholding information, or avoiding making a promise, etc.), the host employs threatening to restrict their instant freedom of action, successfully pushing the management party to answer questions, provide specific information and make promises (e.g., when and how to pay salaries) in the live broadcast. After reaching an agreement about paying, the threat is utilized to pose a potential face-threat on the complainee in case they fail to pay fully and timely as they promised publicly, and thus performs as pro-active supervision in the real life.

We argue that hosts' threatening, as a coercive impoliteness strategy, is a rational attempt to seek a realignment of interests between the complainants and complainees via attacking the complainee's face and restricting their freedom of action. Meanwhile, the complainee recognizes its coercive power and is pushed to join in problem solving. In so doing, it contributes to processing complaints dealing in real-time interaction, supervising the fulfilment of social obligations of the management in real life, and thus protecting the social rights of employees.

“You are talking nonsense!”: Metapragmatic comments in Chinese academic blog conflictual interactions

Panel contribution

*Ms. Hui Jiang*¹

1. Liaoning Normal University

Engagement in overt conflict is a feature of academic blog interactions (Luzon, 2011), which is likely to cause impoliteness or offence. It is suggested that the expression of conflict in academic blog is not only genre-related (Hyland, 2000), but is also influenced by medium factors and social factors (e.g., the social norms of the community) (Kleinke, 2008). During conflictual interaction, participants use various linguistic or non-linguistic strategies to perform face-threatening acts, among which metapragmatic comments confirm the salience of impoliteness. A metapragmatic comment is an opinion or evaluation about the self or other's language use, assessments of the implications, functions and indexicality of utterances (Culpeper 2011: 74; Bublitz and Hübler 2007), explicitly showing the participant's reflexive awareness to demonstrate one's own orientation to a group and the social norms (Culpeper, 2010).

The purpose of this study is to examine the use of metapragmatic comments in Chinese academic blog conflictual interactions, and to analyze how the participants use different types of metapragmatic comments to maintain or challenge the social norms, construct situated identity and negotiate the interpersonal relationship in the online academic community. The data for the study is taken from a self-built corpus comprising comments in 100 posts from Chinese scienceblog.com. The corpus of blog comments is analyzed to get data on the following aspects: 1) the conflictual exchanges in each post; 2) the forms of metapragmatic comments used in conflictual interactions. The bottom-up analysis of the data relies on previous research on metapragmatic comments and impoliteness (Kádár and Haugh 2013; Haugh 2018 ;Verschueren 2000; Culpeper, 2011). Three research questions are addressed: 1) What types of metapragmatic comments are adopted by the participants? 2) What are metapragmatic comments directed at in the blog comments? 3) What are the functions of metapragmatic comments? This study contributes to our understanding of impoliteness in online academic discourse from metapragmatic perspective, to shed light on the function of metapragmatic comments in managing interpersonal relations and social norms in academic blog conflictual interactions.

Decomposing a multi-unit question: how interviewers and respondents overcome institutional constraints

Panel contribution

*Dr. Maria Erofeeva*¹, *Ms. Vasilina Radkova*²

1. *Ulster University*, 2. *Independent Researcher*

In this paper we examine the interaction between a professional interviewer and a respondent in the institutional setting of standardized telephone interviews on a medical topic. We focus on the use of a multi-unit question (MUQ) as a locus of interactional struggles over the accomplishment of institutional goals. The format of a MUQ and its positioning in a questionnaire force both participants to perform sequentially misplaced actions such as seeking information which was already given. We analyze practices through which participants account for these sequential incongruities.

We consider telephone interviews as *talk-in-interaction* in a certain institutional context where participants orient simultaneously to the interaction order and the 'rules' of standardized interviews (Schaeffer, 1991), especially the obligation of interviewers to deliver all questions by strictly following questionnaire formulations. Respondents, at the same time, usually treat an interview situation similarly to ordinary conversation (Houtkoop-Steenstra, 2000), which forces an interviewer to balance their professional obligations and the demands of interactional order. The tensions created by the questionnaire are particularly profound when we look at the use of MUQs.

Interaction scholars connect the structure of MUQ turns with the interactional consequences and contributions which they allow to make (Linell, Hofvendahl & Lindholm, 2003), for example, inserting opinions in a 'neutral' question with a 'statement+question' turn structure (Clayman & Heritage, 2002), or particularizing the form of an answer with a narrowing cascade of questions (Adelswärd, 1988). In our case, the MUQ is designed to receive information in a form concordant with the questionnaire options. Using the theoretical and methodological framework of conversation analysis we examine the collection of 100 interview extracts. Our data shows that, contrary to the cited studies, the use of MUQs in the setting of standardized interviews requires further interactional work to formulate it, which impedes the progressivity of conversation.

Our analysis shows that, in the case of the 'distributed authorship' of a question turn where interviewer actions are constrained by institutional requirements, the multi-unit structure is rather a restriction than a resource for interactants. MUQs systematically produce sequential incongruities in the stream of talk. For instance, interviewers ask them in places presupposed by the questionnaire despite having already received relevant responses previously. Respondents, on the other hand, produce relevant answers before the interviewer's turn containing a MUQ is completed. We examine two types of practices participants use to overcome these difficulties: 1) decomposing the question at the outset, which thus threatens the normative framework of a standardized interview, but helps maintain the conversational turn-taking order; 2) jointly constructing a relevant answer through the insertion of additional narrowing questions.

Our talk opens up a discussion about what is the 'right' thing to do for differently positioned parties of institutional interaction.

Everybody gets a wow: miscues on Jeopardy meet the contestant segment

Panel contribution

Prof. Gonen Dori-hacohen¹

1. University of Amherst

In the U.S. TV game show “Jeopardy,” a segment called “meet the contestant” happens after the first commercial break. In this segment, “Ordinariness” is created in the dialogue between the host and the contestants by the latter sharing a story or an experience. This segment has a stable overall structural organization (Robinson, 2012), which starts with the host’s first turn, where he introduces the contestant, their place of residence, and occupation. Then, in the same turn, the host invites the guest to tell a story in a structure resembling Sacks’ (1974) discussion of telling a joke. This invitation can have the form of a question or an open invitation. Following the invitation, the contestant tells their story after a discourse marker or answering the question. Following the story, the host assesses the story or the experience. This assessment takes a moderate form of “interesting” or “this is great.” This paper analyzed one segment when the assessment was different. The form of it was over the top, “wow.” Moreover, the placement of the evaluation was wrong. The guest host used the assessment too early in the contestant’s story. These misplaced assessments led to various “problems” in telling the story and in the interactions with the contestants. Thus, this paper explains how an incongruity between the assessment and its placement can lead to overlapping problems in telling the story and exposes the mechanics of this segment, which usually runs smoothly.

Incongruent intersubjectivity: Clarification requests and Corrections in Speech Language Therapy interactions with Children

Panel contribution

Dr. Bracha Nir¹

1. *University of Haifa*

Speech and Language Therapy (SLT) is, by definition, an institutional interaction. Like other forms of institutional talk (Heritage, 2005), it differs from mundane face-to-face conversation. Institutional talk is characterized as having one member of a profession, an SLT therapist, talk with a non-member of that profession, typically a client, to achieve specific goals via specific practices. These practices are usually limited when compared to ordinary conversations (Atkinson & Heritage, 1984).

Following Ferguson and Armstrong's (2004) call to pay attention to the discourse that characterizes these sessions, we explore ways in which SLT practitioners use – and misuse – communicative and linguistic resources to achieve intersubjectivity when working with language-impaired children. We specifically examine the clarification requests (CRs) that signal a true lack of understanding by the interactant. This is a unique locus of breakdown in the intersubjective space (Schegloff, 1992; Wilkinson, 1999) as part of the repair system in general and other initiations of repair in particular (Schegloff, 2000).

Our main question is: how do practitioners use the CR “displaying lack of understanding and eliciting an explanation” (Corsaro, 1977) within the SLT practitioner-child interaction? We rely on a corpus of 12 such interactions (six therapists working with eight children in Hebrew) that includes more than 9000 utterances, and analyze the 115 CRs that were produced by the therapists in various instances. Importantly, our study involves interaction between one competent speaker and one speaker whose competence – especially in terms of the mechanics of speaking – is in question.

Our analyses show that the therapists and the children made an effort to repair communication breaks by fulfilling the clarification requests presented to them. However, the SLT in fact used clarification requests to initiate correction sequences. During these sequences, the children's talk is comprehensible and clearly understood by the SLT. This incongruent use of the clarification request to initiate correction led one child to overcorrection, taking a ‘sincere’ clarification request to be a correction initiator.

We conclude that using mundane practices to achieve institutional goals may be detrimental to the children's communicative abilities. We address the importance of combining complementary perspectives on discourse in understanding the interactional work done in SLT interactions, specifically by relying on CA insights on repair together with current models for the analysis of intersubjectivity and alignment.

Incongruity in institutional complaint reciprocity

Panel contribution

*Dr. Bethan Benwell*¹, *Dr. Maria Erofeeva*², *Dr. Catrin Rhys*²

1. Stirling University, 2. Ulster University

Complaints calls to the NHS follow a structural organisation oriented to the accomplishment of institutional actions and processes (Stitt 2021) in which participants normatively orient to their roles as complainant and complaint handler. Central to these calls are complaint narratives in which callers recount the healthcare experience that led to their complaint. From the perspective of the institutional order, these narratives provide the informational content of the complaint and the call handler's role is to produce an appropriate written record of the "facts" of the complaint. Viewed from the moment-by-moment perspective of the interaction order, the complaint narratives are typically affect-laden stories that encompass inter alia, negative assessments, statements of "hurt and blame" (Pino 2022), expressions of distress, and claims to a "reasonable complainant" identity (Benwell & McCreddie, 2017). At the sequential level, these actions make relevant some form of affiliative uptake (Benwell & Rhys 2017) but our data shows that this is often sequentially displaced by call handler actions oriented to the institutional task of information gathering, resulting in institutional incongruity.

Our paper focuses on two actions oriented to information gathering that, when mis-timed, lead to incongruity: information seeking questions and the action of typing. For example, in Extract 1, the caller expresses distress about their deteriorating health condition. In the interaction order, this makes empathic uptake locally relevant, but the call handler orients to the requirements of the institutional order with an information check about the timeline of the complaint which, in turn, leads to misalignment:

Extract 1

1. C: no it's be- it's (.) just [over the course of the twelve years
2. CH: no no [I understand
3. C: [it's just getting worse and worse and [worse
4. CH: [so that's that was that
5. was maybe mid-May you were saying?
6. (0.5)
7. CH: so then you had to attend a few weeks ago as well you were saying
8. was that maybe two weeks ago?
9. (0.9)
10. C: yeah

Extract 2 shows a sequence of turns where extended typing displaces affiliative uptake:

Extract 2

1. C: why on earth would I make myself sick .hhh I am ~terrified of that
2. hospital~
3. (2.0)((typing))
4. C: I'm absolutely ~ petrified of it~
5. (0.5)((typing))
6. C: .hhh it's got to the stage now I'm terrified to go anywhere near them
7. (1.2)((typing))
8. CH: okay I'm sorry to hear that .hhh if you bear with me wee second I
9. know this is hard to go through but (.) it is important to go

10. through these experiences cause I need to explain exactly what's
11. happened to you to the senior staff to get it investigated?

Our analysis documents the sequential outworking of this institutional incongruity, revealing patterns in the relationship between types of information related activity, the emerging incongruity and the subsequent impact on the interaction but also showing ways that participants sometimes orient to the accountability of the incongruity (shown in Extract 2).

“I will actually respond.” Balancing interactional and institutional demands in Dutch election debates.

Panel contribution

Dr. Menno Reijven¹

1. *University of Amsterdam*

One aim during election debates is to grant the candidates for political office equal amounts of time. For a moderator, this requirement becomes a challenge to manage once there are more than two debaters, as happened during the 2021 Dutch general elections. I study the practices of the participants and the moderator to manage access to the debate floor. I show that when two politicians are debating each other, the moderator may struggle to accomplish a fair debate as they do not engage with *interactional* demands.

Consider an interaction between the moderator, Geert Wilders and Farid Azarkan. Azarkan has just finished his turn which accused Wilders of continuously spurring hate towards Muslims so he can attract voters. He claims that he is in politics to fight that discourse, which he labeled as being a “racist ideology.” Up to that point, the interaction has mostly been between Wilders and Azarkan. Here, the moderator attempts to involve Lillianne Ploumen, the leader of the Labor Party, in the debate. What can be observed is a clash between the institutional need to equally divide the time and the interactional need to respond to an accusation. Consequently, Wilders and the moderator engage in overlapping talk. The moderator first directly addresses Ploumen, while Wilders also starts by suggesting an alternative course of action (“but maybe could I”). The moderator shows that she is not willing to grant this to Wilders, and consequently Wilders uses an imperative (“listen”) and stresses a conversational right which should grant him the conversational floor: after being accused, one is allowed to respond to this (“I am being called a racist and fascist”). Simultaneously, the moderator still tries to get Ploumen involved, but weakens her move (moving to Ploumen’s turn is done “quickly” and the turn itself will be done “briefly” and Wilders will receive a turn “via” her). Wilders then stops requesting the conversational floor but rather demands it (“I will actually respond”), which is not following standard procedure, and therefore he defends his move (“because I won’t just allow myself being called fascist”). The moderator acknowledges Wilders’ position (“I understand”), and grants him a response “soon”. The moderator completely loses control over this interaction once Azarkan reiterates his point, that Wilders’ being a fascist is something “we need to dare to mention”. Then, Wilders is able to get the floor, as he switches from addressing the moderator to addressing Azarkan directly.

What we can observe here is that the moderator was unable to successfully manage the interaction as they did not acknowledge the need politicians have to respond an accusation. They did the right thing institutionally, of insisting on equity, but not at the right moment of the interaction.

“(Inter)linguaging: an integrative approach to language in its communicative habitat”

Panel contribution

***Dr. Charlotte Danino*¹, *Prof. Aliyah Morgenstern*¹, *Dr. Christophe Parisse*², *Dr. Marion Blondel*³, *Dr. Stéphanie Caët*⁴, *Dr. Camille Debras*⁵, *Prof. Diane Bedoin*⁶**

1. Sorbonne Nouvelle University, 2. INSERM-CNRS-Paris Nanterre Université, 3. CNRS, France, 4. Univ. Lille, CNRS, UMR 8163 - STL - Savoirs Textes Langage, F-59000 Lille, France., 5. Paris Nanterre University, 6. University of Rouen

The paper presents the integration of Conversation Analysis (CA) with usage-based cognitive approaches (Tomasello 2003) in the DinLang project (Morgenstern 2021). We study family dinners as a communicative habitat in which children are socialized simultaneously in languaging and dining as co-activities (Haddington et al. 2014) in French signing and speaking families. Our central claim is that languag(ing) is always one activity performed along with others - in this case dining - which recruits the same body parts to perform both activities. The resulting audiovisual corpus captures cultural, social and linguistic dimensions. This triple characterization (in line with interactional linguistics, Couper-Kuhlen & Selting 2018) necessitates methodological (Parisse et al. 2022) and theoretical integration.

CA provides a rich and tested methodology to produce fine-grained descriptions of the organization of multi-party interaction in both their social regulation and temporal development. Anthropological approaches (Ochs & Schieffelin 1984, Duranti et al. 2012, Riley & Paugh 2019, detailed in Kremer-Sadlik & Morgenstern 2022) provide “cultural breadth” (Couper-Kuhlen & Selting 2001). The “technical” linguistic analysis (ibid.) in DinLang focuses on multimodality (body as tool) and kinesiology (body as substrate, after Boutet 2018), less represented in integrative studies.

McIlvenny & Raudaskoski (1996) considered that “ultimately, conversation analysis and linguistics - the investigations of action and structure - are mutually relevant if they are studied in the primary context of real knowledgeable participants in situated, routine human activity”. Family dinners provide such a framework to contribute to the description and analysis of the multimodal, multimedial co-construction of meaning using all available semiotic resources (Cienki 2012, Morgenstern et al. 2021, Morgenstern 2022).

The underlying notion of dialogue is the common epistemological denominator (Linell 2017, Goffman 1974, Clark 1996, Pickering & Garrod 2004, with Schegloff’s response): language is viewed as intersubjective cooperation and as a multi-semiotic system (Goodwin 2018). However it does not explain how children learn how to talk and eat at the same time. We argue that the question can be addressed with the broader notion of (inter)linguaging (Linell 2009) and the three concepts it presupposes.

1) Participants are involved in languaging as an activity regulated by social norms and constrained by cognitive processes. The notion of activity mediates the often-stated contradiction between language-as-social-action in CA, and language-as-mental-product in cognitive approaches (Etelämäki & Visapää 2014, Danino 2014).

2) Languaging only exists in a situation, involving participants, frames, objects, timeframes, ongoing activities, participation frames and previous shared experiences. Integrative frameworks must develop a more ecological and symmetrical theory of language and discourse (e.g. Paveau 2009).

3) Languaging occurs in and over time. The centrality of sequentiality in CA meets the importance of flow in multimodal communication (Boutet 2018, Morgenstern et al. 2021). CA adds a temporal component to the structural modeling of multimodal linguistic meaning making, thus enriching the toolbox of linguistic analyses viewing language as a complex adaptive system (e.g. Steels 2000, Raimondi 2014) from which temporality can no longer be excluded (e.g. Col 2017).

Co-speech pointing as a multimodal practice in grammar and interaction

Panel contribution

Dr. Kurt Feyaerts¹

1. KU Leuven

This contribution is situated at the crossroads of interactional and cognitive linguistics, from where it focuses on pointing gestures as a crucial resource, enhancing both an interactionally situated as well as a cognitively grounded interpretation of a usage event. Methodologically and theoretically speaking, our case of pointing gestures aims to demonstrate the mutual benefit of adopting a combined cognitive and interactional perspective on the multimodal analysis of both grammatical/conceptual and situated interactional phenomena. The empirical basis for this qualitative study is a corpus of two plenary debates in the Flemish Parliament.

It is generally accepted that pointing gestures cannot be categorized as mere reference markers (Kita 2003). Studies have shown that they are used with many formal variations as well as in multimodal co-occurrences (Bavelas & Chovil 2000; Fricke 2007) or that they are dynamically adapted in function of different socio-material circumstances and interactional recipients (Mondada 2014; Ishino 2009). We will demonstrate how a pointing gesture plays a decisive role in the multimodal realization of a ditransitive construction (example_1), an argument structure underlying an attributive participle (*shared* in 2), and in the realization of a metonymic structure as constitutive part of an expression's situated meaning (as in (3) [note: underlining marks co-occurrence with pointing gestures])

- ... a lot of questions have been asked here...
- ... because I think that is a shared concern...
- ... resources that go back to Flanders...

In (1) the speaker points at himself in the semantic role of beneficiary, thus indicating that all questions have been asked to *him*. In doing so, the gesture impacts the syntactic organization of the argument structure as it realizes a multimodal ditransitive construction (Deppermann 2020). In (2) the speaker points at herself and the previous speaker thus profiling two referents of the argument structure of the underlying verb 'share', which factors into a cognitively motivated, multimodal construal of this utterance. In (3), self-pointing exemplifies the speaker as a community member thus realizing a simultaneous cross-modal blend of both source (member) and target (community) of this metonymy. It appears that integrating the situational setting of the pointing gestures into the metonymic analysis challenges the long-standing view on the alignment of metonymic relations in terms of "interactive discourse indices [leading] the interpreting mind to an intended target meaning" (Mittelberg & Waugh 2014: 1755).

Crucially, examples like these demonstrate the need to integrate both aspects of cognitive construal and situated interaction as interdependent constitutive dimensions of an accurate multimodal analysis of the process of meaning making.

Combining Conversation Analytic knowledge and computational linguistics: A case study of pre-sequential elements in online interactions

Panel contribution

Dr. Antti Kanner¹, Dr. Anna Vatanen¹

1. University of Helsinki

Unlike in several fields of linguistics, in Conversation Analysis (CA) computational methodologies have been relatively rarely used. However, Walsh (2013) has argued that corpus linguistics and CA are, despite their ontological differences, not mutually incompatible and has shown this by utilising corpus linguistic methods in several studies in classroom interaction. Other previous studies approaching computational methodologies from a CA perspective include Haugh & Musgrave (2018) who present a combinatorial procedure for identifying examples of an interactional practice across relatively large tracts of data. From the perspective of computational linguistics and HCI, structures of interaction have attracted more attention, as developing talking machines has been a steady interest (see, e.g., Compagno et al. 2018). We wish to contribute to these lines of inquiry by exploring ways of exploiting CA knowledge in building quantitative approaches to analysing patterns in large corpora of online interactions (for more traditional ways of applying CA to the analysis of online interactions, see Meredith 2019). In this way, we seek to continue the discussion initiated by Robinson (2007).

In our presentation, we present our on-going case study that uses different kinds of online interaction conducted in Finnish - such as Twitter and Facebook conversations - as data. Given that online interactions often comprise various types of tellings and assertions of personal opinions and evaluations, and given that the tellings themselves can be very varied in form, we have chosen to focus on a sequence that in spoken interaction typically precedes such tellings to reserve the floor: the pre-(announcement) sequence. Our study aims at automatically identifying types of pre-sequences such as pre-announcements (e.g., Sorjonen 2002, Terasaki 2004) and story prefaces (e.g., Sacks 1974) in the data. In a preliminary phase, based on data from spoken interaction in Finnish, these segments will be identified by their prototypical response sequences (such as the particle *no*; Sorjonen 2002). The identified pre-sequences will be annotated with a wide range of linguistic features, including morphological, syntactic and lexical features.

In previous studies, address terms alongside personal pronoun references to participants, mental verbs and nouns with broad meanings (such as *problem*, *news*) have been recognized as central features of turns that initiate pre-sequences. Statistical analysis based on multinomial regression enables seeing how these and possibly other features interact to form pre-sequences. Sensitivity to the context of interaction can be maintained by adding variables related to contextual features. While this procedure will in itself produce interesting observations about the variety of types and contexts of “pre-sequences”, it can also be further applied in predicting how likely a given segment is a pre-sequence. This in turn will help to automatically search for new occurrences in the data, not necessarily followed by a canonical response. This will allow further analyses, both qualitative and quantitative, on these segments and their following interaction across different datasets with a combinatorial procedure such as the one proposed by Haugh & Musgrave (2018).

Comparing the Finnish verbs “pystyä” and “osata”

Panel contribution

*Mr. Yida Cai*¹

1. *University of Helsinki*

This paper examines two dynamic modal verbs “pystyä” (‘be capable of’, ‘be able to’, ‘be effective’, ‘can’) and “osata” (‘can’, ‘be able to’, ‘know how to’) in Finnish as interactional resources in everyday conversations. These verbs belong to the modal verb type called verbs of possibility and sufficiency (VPS). In grammatically negative context, the verbs express why something was or will not be done due to the insufficiency of certain resources (Flint 1980:1). This study has been inspired by Flint (1980: 135) who has pointed out that the semantic properties of VPS make these verbs suitable for different functions in social interaction.

Verbs investigated in this study are chosen based on their semantic features: “pystyä” and “osata” both belong to the semantic ability-dimension (Flint 1980: 59, 81-83, 86-88). I will analyze how verbs belonging to the same semantic dimension differ from each other regarding their interactional tasks. I will discuss the interactional tasks these verbs fulfill in the possibly larger turns they occur in and the sequential environments of the turn. The data are conversations collected from the ArkiSyn Database of Finnish Conversational Discourse (University of Turku).

I will examine the sequential environments of these two verbs and the tasks they fulfill in daily conversation. I will combine CA and semantic perspectives in the analyses. I will demonstrate how semantic features, especially the lexical specificity of these verbs, can explain their use in certain interactional environments for completing interactional tasks. Therefore, in addition to investigating the interactional tasks of these two verbs, this paper aims at demonstrating the advantages of integrating conversation analytic and semantic approaches. The focus will be on the negative 1st person singular forms (“en pysty”: I am not able to; “en osaa”: I don’t know how to). I will show, for instance, the following: i) “En pysty” in negative context generally needs a specific explanation to clarify which ability is insufficient. In contrast, “en osaa” does not usually require a clarification. ii) The clarification can be done in various ways: a) the speaker clarifies it by him/herself., b) the recipient clarifies it, c) clarification is done in an embodied way. iii) Each way of clarifying has various tasks in interaction. For example, when a clarification is done by the speaker, the clarification and “en pysty” work together as a self-defence. iv) “En osaa” is used as a resource for downgrading the epistemic stance. The speaker can either still sustain or abandon his/her epistemic authority depending on the sequential environment. All these interactional phenomena and tasks can be explained by discussing the semantic features of these two verbs: the ability expressed by “osata” is more specific than the ability expressed by “pystyä”, because the ability expressed by “osata” refers generally to a certain knowledge, which can be viewed as an ability that “pystyä” expresses.

Egophoricity in talk-in-interaction in Wutun: Integrating Conversation Analysis with linguistic field methods

Panel contribution

*Dr. Erika Sandman*¹

1. University of Helsinki

In my presentation, I will discuss integrating Conversation Analysis with linguistic field methods in studying egophoricity in Wutun. Wutun is a little-documented mixed language with Northwest Mandarin lexicon and Amdo Tibetan grammar spoken by ca. 4000 people in Qinghai Province, P.R. China. Wutun verbal egophoric marking system includes the ego marker *-yek* and the sensory-inferential marker *-li*. According to the traditional definition, egophoricity encodes involvement/lack of involvement in the described event (San Roque et al. 2018: 2). At first, it seems that this analysis is valid for Wutun and the ego marker *-yek* is used in first person statements and second person questions, while the sensory-inferential marker *-li* is used elsewhere:

1) a. *ngu huan xhe-di-yek*

1sg food drink-prog-ego

'I am eating.' (personal involvement)

b. *ni ma-ge nian-di-yek*

2sg what-ref read-prog-ego

'What are you reading?' (addressee's personal involvement)

c. *ni huan xhe-di-li*

2sg food drink-prog-sen.inf

'You are eating.' (as I see/infer)

However, examples like 1) are mostly attested in elicitation (data collection directed by the researcher, such as questionnaires) and in monologues. A study by Sandman & Grzech (2022) reveals that in talk-in-interaction, Wutun egophoricity is conditioned by the interpersonal context of the interaction. Therefore, any marker can be used with any person in statements and in questions and the speaker does not need to be personally involved in the event to use the ego marker.

On line 03 in example 2), the speaker DH uses the ego marker in a warning to position himself as knowledgeable and to seek vigorous alignment with his directive on line 01:

2) 01 DH: *quandi quan-she-ma rai-rai-de ze-she*
 clothes put on-res.ao-coord warm~warm-nmlz do-res.ao
 'Put some clothes (on the child) so it will be warm.'

02 ZJ: *ya*

inter

ok

03 DH: *nanqhan lai-gu-yek*

flu come-compl-ego

'Otherwise she will get a flu.'

The data discussed in Sandman & Grzech (2022) comes from a 10h corpus of Wutun, collected in 2010, 2013, and 2018 during 9 months of fieldwork. The data was analyzed by using methods from Conversation Analysis and the results were compared with elicited examples. The results show that in conversation the Wutun speakers use egophoricity to signal their epistemic rights and responsibilities with respect to other speech-act participants. It can be concluded that while traditional field methods like elicitation are necessary in working on the morphology and syntax of a little-documented language, studying subtle grammatical categories like egophoricity requires a method that allows in-depth and systematic analysis of the principles that shape the

interactional context. Integrating methods from CA with more traditional linguistic field methods can yield to better understanding of the grammar of little-documented languages.

Epistemic summons as an intersubjective resource of expressing knowledge in online interaction

Panel contribution

Ms. Laura Lehmuskoski¹, Dr. Anna Vatanen¹

1. University of Helsinki

Different facets of how epistemicity - e.g., participants' epistemic statuses and stances - play a role in social interaction have attracted a lot of scholarly interest especially in the field of Conversation Analysis (CA) (e.g., Stivers, Mondada & Steensig 2011; Heritage 2012). In our study, we wish to contribute to and renew the lines of the previous research by providing new perspectives to epistemics-related actions in online conversations through effectively combining CA with different linguistic approaches: interactional linguistics, research on digital conversations, and the analytical framework of cognitive grammar.

In our talk, we present a study of epistemic summonses in different social media platforms (e.g., Twitter, Facebook). We will focus on the phenomenon of presenting oneself as knowledgeable as an intersubjective resource of interaction in an asymmetric online discussion. The aim of the on-going study is to distinguish and demonstrate the actions and sequences where the expression of knowledge marked as certain over a topic is attached to, and how the platform-specific affordances and algorithms affect the ways of presenting knowledge and pursuits of committing others to an epistemically certain point of view.

An epistemic summons (a phenomenon identified by Lehmuskoski 2021) is an intersubjective means by which the interlocutor can create a knowing and epistemically certain point of view in the discussion, to which the interlocutor seeks to engage others who participate in the online conversation. The epistemic summons is based on the interlocutor's effort to offer his/her own viewpoint as the right and certain one, and to create an impression of mutually shared knowledge. In Finnish, as the previous study (Lehmuskoski 2021) shows, the epistemic summons can be formed with various structures, e.g. the -hAn clitic tone particle, rhetorical questions, and shifting the vantage point of the conceptualizer construed in the comments (Langacker 2008; on combining Cognitive Grammar and CA, see Etelämäki et al. 2009).

The aim of the current study is to extend linguistic analysis of epistemicity to the polyphonic discourses of social media and to study how the realizations of epistemic summons are affected by the technical possibilities and limitations of online discussion platforms, such as varying degrees of anonymity and publicity, or, e.g., the limited number of characters afforded in a post (e.g., on Twitter). On a more general level, our study also seeks to contribute to methodological discussions on the benefits and challenges in the effort of combining different linguistic methods.

Integrating conversation analytic methods with the investigation of phonetic variation

Panel contribution

Prof. Pia Bergmann¹

1. Friedrich Schiller University Jena

Within the recent past, phonetics and phonology have seen a strong increase in interest in phonetic variation of spontaneous speech. Couched in theoretical frameworks such as usage-based linguistics or Laboratory Phonology, though, the relevance of conversational structure on phonetic detail is often neglected (cf. Bergmann 2018; Ernestus & Warner 2011; Ernestus & Smith 2018). In conversation analysis, on the other hand, it has been shown since the 1980ies that phonetic variation is sensitive to interactional influences such as turn-taking, sequence structure or preference structure (cf. Local, Wells & Sebba 1985; Plug 2010).

Unlike studies from a usage-based or related background, however, conversational analytic studies often rest on too low a number of instances to carry out statistical testing, which is a standard method in usage-based approaches resting on corpus studies. Clearly, there is a tension between the need for a thorough qualitative analysis informed by conversation analysis and Interactional Linguistics on the one hand and the desire to prove statistical significance on the other. Even when leaving aside deeper theoretical concerns against the analysis of large data sets with ensuing statistical testing, many challenges come up when investigating phonetic variation in larger data sets from a conversation analytic background. First of all, both the analysis of conversational structure and phonetic variation are very time consuming. The need for many instances thus presents one with practical research problems. Secondly, spontaneous, interactional data is often very heterogeneous while at the same time phonetic variation is highly vulnerable to just these varying dimensions such as regional variation, speaker specific variation, prosodic structure, speech rate and more. Consequently, even more data is needed in order to get a handle on the large amount of variation.

The paper aims to invite to a discussion of the strengths and shortcomings of an integrative approach where insights from conversation analysis and Interactional Linguistics can contribute to the usage-based modelling of phonetic variation. It will do so by presenting the quantitative results of an investigation of the prosody and phonetics of discourse markers in contemporary German (cf. Bergmann *subm.*) and discussing these against the background of local contingencies of talk in interaction.

Interjections and response tokens - Integrating functional linguistics with sequential analysis

Panel contribution

Dr. Søren Sørensen¹

1. Aarhus University

Interjections, response tokens and other one-word-constructions (Couper-Kuhlen & Selting 2018) are well-studied within Conversation Analysis, and important work has been done on the topic (e.g. Stivers 2022). They occur very frequently in conversations and perform a variety of actions. For instance, *mm* is both used to confirm, assess and as a receipt and continuer. Such systems may be part of the grammar of a language (Steensig & Sørensen 2019; Enfield et al. 2019).

My talk investigates such phenomena within functional linguistics and explores how to understand interactional functions (such as action and stance) in relation other concepts of function (e.g. the terminology for units of certain layers). The talk presents two descriptions: the formulation of response tokens as a word class (or part-of-speech), based on the approach in Functional Discourse Grammar as laid out by Hengeveld (1992), with the incorporation of sequential position and action, and an account of the propositional value of response tokens and related phenomena, and how the layered structure of the clause can be used.

The presentation is primarily based on conversation analytic collections of response tokens in Danish everyday interactions, focusing on *ja* ‘yes’, *nej* ‘no’, *nå* (approx. ‘oh’), *okay* and *mm* in freestanding uses, but will also incorporate resources and perspectives from other languages based on existing literature.

I argue that functional concepts allow for more precise descriptions and handling of forms in a way that can more readily relate to “theoretical” linguistics. Specifically for response tokens, the notion of freestandedness (i.e. being able to *function* as one-word-constructions) can handle how functions are divided among forms, while the layered structure of the clause can model the compositional semantics of the individual elements of a turn and the turn as a whole - and through sequences, in capturing how one-word-constructions both import and modify meaning from previous turns.

The descriptions form the basis of a discussion on the different functional concepts and how they can be used to develop interactional descriptions. The discussion fits into ongoing research on action and sequential aspects in grammar, and how to work with the relation between forms and functions, which are important factors for cross-linguistic comparison (Rijkhoff 2016), while suggesting possible compromises needed to connect interactional and “non-interactional” linguistics in terms of terminology and method.

Multimodal Contextualization of Connectors on Stage

Panel contribution

Dr. Beatrix Schönherr¹

1. Universität Innsbruck, Institut für Germanistik

Theatre performances are not natural talk-in-interaction. But can they nevertheless be subject to a research project in interactional linguistics? And what could be the profit both for Interactional Linguistics and Theatre Studies? This talk tries to answer these questions.

A special issue in the interplay of syntax and prosody is prosodic integration vs. disintegration of connectors in relationship to the connected units. Connectors can either be integrated into an intonation unit that comprises both conjuncts or form part of the intonation group of the following syntactic unit. In special cases, they can also be prosodically autonomous (stand-alone connectors) or part of the preceding intonation group with a prosodic break after the connector. However, upon closer inspection, the prosodic boundaries before and/or after the connector are unclear in many cases (cf. Barth-Weingarten 2016). Auer (1997) argues that the connector is usually integrated into the intonation unit of the following conjunct but comprises a phonological phrase of its own within the unit. The published research has not yet comprehensively described and explained these phenomena (cf. Pasch et al. 2003, Fiehler et al. 2004).

Using the Interactional Linguistics approach and including theatre semiotic research results (cf. Fischer-Lichte 1994), several cases of stand-alone connectors, in particular, German *aber* (*but*), will be analyzed concerning the question of how the prosodic shape and co-occurring facial expression, gestures, body posture, and gaze modify the meaning and function of the connector. Several types of contextualization patterns will be distinguished.

The data stem from scenes from classical German plays. These theatre performances are considered a special kind of natural data. Constituting an elaborate communicative genre of their own, they “resemble” natural conversations superficially and use the same resources to some extent. From a cognitive point of view, since the act of memorizing and reciting language differs starkly from spontaneous utterance, the multimodal analysis of scenes on stage can provide new insights not only into theatrical means of expression but also into the relationships between speech, prosody, and gesture in general.

Socio-pragmatic and conversational-analytic perspectives of code-switching between the Northern and Central Thai dialects in online media

Panel contribution

*Mr. Isara Pittayasiri*¹

1. Mahidol University

In bi- or multilingual language communities, code-switching is considered as one of the means of contextualization cue in an interactional conversation (Gumperz 1982), while pragmatics relates to the social and cultural perspectives of the language use depending on the contexts (Verschueren 1999). Both code-switching and its underlying pragmatics can be analysed through conversation analysis (CA) based on empirically contextualized conversation patterns in which code-switching represents socio-pragmatic functions of interlocutors' language use in speech communities.

The current research studies pragmatic functions when interlocutors use code-switching in an utterance and examines how interactional conversations with code-switching can contribute to representation of social identities among interlocutors. In theory, two applied sociolinguistic approaches and pragmatic frameworks support this interlanguage phenomenon. The former is both of micro- and macro-levels of socio-pragmatic code-switching proposed by Tseng and Cashman (2015), focusing on various contexts of interpersonal conversations in micro-level and how interlocutors' conversational behaviour in macro-level can show their unique social identities when they use code-switching with the others. The latter is pragmatic frameworks which code-switching identifies indirect and figurative meanings of the contexts, reciprocal or contrastive utterances between the sender and the addressee in a communicative speech, and a difference between two languages of grammatical structures and lexical terms.

At the methodological level, the data is accumulated from "Nuea Kwa", an online variety programme launched on YouTube counting from the first episode in January 2022 onwards. In the referred programme, moderators and guests use code-switching of Northern and Central Thai dialects. Conversation Analysis (CA) is employed as the medium of data analysis.

The result of this current research suggests that code-switching occurring in the examined online variety programme can illustrate an array of pragmatic functions related to fundamental concepts of pragmatics, such as speech acts, and stance and evaluation. For instance, Code-switching from the Central to Northern Thai dialect yields a marked language use observed in a symmetrical relation among the interlocutors. Additionally, the code-switching has a pragmatic function as contextualization cue as well as performs representation of social identities and values in the macro-level of sociolinguistic studies.

Structural and communicative aspects of intentional silence as a conversational strategy

Panel contribution

*Dr. Thanasin Chutintaranond*¹, *Dr. Chingduang Yurayong*²

1. Chulalongkorn University, 2. University of Helsinki & Mahidol University

Silence is understood as meaningful absence of speech in turn-taking (Levinson & Torreira 2015), considered in Berlo's (1960) communication model as a responding Message in a communicative Channel between Speaker and Receiver. Structurally, silence can operate similarly to conventional discourse markers in conveying speech-act and epistemic functions (Bruneau 1973; Jensen 1973; Johannesen 1974; Ephratt 2008). Communicatively, silence can reveal the interlocutors' background and character, as it is not simply a "talk" without words but concerns the entire universe of language behaviour of the interlocutors (Hall 1990).

This study combines the frameworks of conversation analysis and communication science with a cross-cutting analysis method in linguistic typology to describe "intentional silence" (Kurzon 1998, 2007; Berger 2004) and determine interrelations between its structural and communicative elements. The primary data comprises audit conversations among multiple interlocutors who are politicians and public officers, retrieved from Thai audio-visual news reports such as WorkpointTODAY and Thairath Online. As fundamentals, we adopt Pomerantz and Heritage's (2013) idea of silence as a dispreferred conversational strategy for a response which does not align with the action suggested in the prior turn. In the Austinian (1962) and Gricean (1989) spirits, we also maintain that silence lacks a locutionary force (what-is-said) and argue that the aforementioned structural characteristics allow various illocutionary acts (what-is-implicated) to be performed through silence constructively. We pay a particular attention to how intentional silence as a turn-taking device creates asymmetry in the "territory of information" (Kamio 1997) between S(peaker) and R(eceiver) in the "engagement system" (Evans et al. 2018a, 2018b).

Applying typological parameters of knowledge distribution (Landaburu 1979; Grzech 2022), the data analysis identifies cross-cutting relations between conversational, communicative, and engagement elements in the asymmetry-favouring nature of intentional silence. Engagement-wise, when the prior turn is "interrogative" (S asks about χ which R knows) or "evidentiality" (S and R do not know χ), the next-turn silence may orient the epistemic authority away from the prior-turn Receiver(s): [S-R+/S-R-] \rightarrow [S+R-], translated into the Receiver's ignorance of the prior-turn message. In contrary, when the prior turn is "assertion" (S knows and tells χ to R) or "uninformative" (S and R know χ), the next-turn silence may abduct the epistemic authority from the prior-turn Speaker: [S+R-/S+R+] \rightarrow [S-R+], translated into the Receiver's avoidance or self-defence against the prior-turn message.

Communication-wise, epistemic asymmetry emerging from intentional silence in both scenarios is used as a confrontation technique, particularly for conflict resolution. In our example, a police officer as Receiver intentionally remains silent while a politician as Speaker keeps yelling at him. Such a constructive use of intentional silence by considering epistemic asymmetry manipulated in the conflict situation is consciously employed by the prior-turn Receiver to prevent himself/herself from reacting by carelessly saying unintended things in an inappropriate style and to minimise a risk due to the prior-turn Speaker's possible misinterpretation of implicatures and presuppositions in the message. This corresponds to a principle for conflict resolution that the more one opens his/her mouth, the more one feeds the fire and overwhelm the interlocutors (Mellul 2019).

The Danish Proximal Modal Particles as Codification of Disagreement Moves

Panel contribution

Mr. Lennart Westergaard¹

1. Lund University

According to Hansen & Heltoft (2011: 1054-1058), the Danish proximal modal particles *nu* ('now') and *da* ('then') 1. express a polyphonic structure (cp. Nølke et al. 2004) where the point of view of the speaker is opposed to the point of view of someone else, and 2. they mark the point of view of the speaker as identifiable (*da*) or unidentifiable (*nu*) (cp. *mutual manifestness*). The following examples are adapted from Hansen & Heltoft (2011: 1056). The text in brackets is the contribution of the two modal particles:

(1) A: Hvad har du brugt pengene på?

B: Det skal jeg **da/nu** ikke svare på.

'A: How did you spend the money?

B: I don't have to answer that question

(*da*: as opposed to what you think and as you should know)

(*nu*: as opposed to what you think but I don't expect you to know)

In my presentation, I will propose a modification of this analysis combining CA analyses of arguing exchanges (e.g. Muntigl & Turnbull 1998: 227) and the Functional Discourse Grammar notion *move* (Hengeveld & Mackenzie 2008: 50). The move is a content layer above illocutions in the scope hierarchy of the clause and I regard of it as content pertaining to the sequential function of the utterance. I will argue that in addition to specifying whether the proposition is mutually manifest or not, the proximal modal particles specify that the utterance is to count as a reactive move in a disagreement or conflict sequence.

This claim will be substantiated with the following three arguments:

1. Subordination of clauses with proximal modal particles presupposes the possibility of an illocutionary reading of the subordinate clause which is expected if the proximal modal particles specify a content layer which scopes over illocutions.
2. The polyphonic structure which is proposed in the literature is not constant under different illocutions as noted in Westergaard (2021: 182). A fact which is explainable if the polyphonic structure is derived based on pragmatic mechanisms and the specification of the utterance as a disagreeing move.
3. The polyphony theoretical account is forced to propose a different semantic analysis of the proximal particles when these are used in imperative clauses (they narrow down the illocutionary potential of the imperative according to Durst-Andersen 1995; Hansen & Heltoft 2011: 1070-1072). In my analysis, the proximal modal particles in imperatives and indicatives can be given a unified account.

“Combining CA with corpus linguistics tools: methodological considerations and first results”

Panel contribution

*Ms. Melissa Juliet*¹

1. *University of Neuchâtel*

25 years after Firth and Wagner’s (1997) call for research that takes more into account the socio-interactive aspect of second language acquisition (SLA), conversation analytic research in the field (CA-SLA) is booming. Yet, assessing the development of second language (L2) speakers’ competence is still a challenge. In this paper, I aim to show how the combination of conversation analysis (CA) with the quantitative tools of corpus linguistics can offer novel opportunities for tracking the development of L2 speakers’ interactional competence.

Much research has been concerned with how L2 speakers develop methods to perform specific social actions in interaction (Hellermann, 2008; Pekarek Doehler & Berger, 2018). More recently, a few studies have focused on the precise linguistic resources mobilized by L2 speakers to perform these social actions (Ishida 2009, Kim 2009, Eskildsen 2009, contributions in Pekarek Doehler & Eskildsen 2022). The latter line of research, however, remains scarce in the field. In my project, I explore the development of L2 linguistic resources for accomplishing coordinating social interaction, i.e. how L2 speakers develop an ‘L2 grammar for interaction’ (Pekarek Doehler 2018) as an integral part of their interactional competence, that is, how they mobilize grammar to perform social actions.

To track this development, I combine the fundamentally qualitative procedures of CA with quantitative methods based on the use of a corpus linguistic software, AntConc (Anthony 2004, 2022). This software enables to determine which words are most recurrent in a given corpus (absolute frequency), which word combinations are the most recurrent (lexical bundles or N-grams), and which collocations are recurrent, i.e. which word most often precede or follow a given word or expression. In this presentation, I discuss how such quantitative results can be used either as a starting point or as a complement to sequential and multimodal analysis.

The data consist of a longitudinal corpus of video recordings of interactions among L2 French speakers participating in a conversation circle. The participants are adult university students in French-speaking Switzerland who participated in the conversation circle between 6 and 18 months. Two types of transcriptions were done of these data: a transcription that follows CA standards, and a ‘verbatim’ transcription that works with the AntConc software. For the purpose of longitudinal analysis, the corpus was divided into time-slots that correspond to university semesters. I trace the emergence and development of multi-word expressions over the semesters, using quantitative tools (frequency of use, lexical bundles, collocations) and quantitative CA to determine the functional uses of these expressions in their context of production.

In this presentation, I first discuss the methodological procedures and challenges related to combining the two approaches; I then present the results obtained with regard to the multi-word expression *en fait* (‘in fact’). My analyses show that the increase in frequency of the use of this expression over the semesters is related to the emergence of its functional use as a discourse marker serving interaction-organizational purposes. This testifies to the development of L2 grammatical resources for social interaction.

(Ex)changing perspectives on speech and language pathologists' scaffolding practices: when getting the right meaning becomes more central than getting the right words

Panel contribution

*Dr. Lucie Macchi*¹, *Dr. Stéphanie Caët*¹, *Dr. Cédric Patin*¹, *Mrs. Laure Descamps*², *Dr. Christine Da Silva-Genest*³, *Ms. Ingrid Gibaru*⁴, *Mrs. Klerwi Le Bris*⁵

1. Univ. Lille, CNRS, UMR 8163 - STL - Savoirs Textes Langage, F-59000 Lille, France., 2. Etablissement Public de Santé Mentale de l'agglomération lilloise (EPSM-AL), 3. Université de Lorraine & EA 3450 Devah, 4. Centre hospitalier de Lens, 5. Institut de Réhabilitation de la Parole et de l'Audition de Ronchin

Speech and language pathologists (SLPs) actively seek ways to improve their practice, by relying on the pillars of Evidence-Based Practice to develop their interventions (Roddam & Skeat, 2010), assessing the effectiveness of their methods (Ebbels, 2017), or undertaking supervision (Howes, 2022). One area of their practice SLPs may want to improve, which is not easy to capture and think about, concerns the quality of their interactions with their patients. Especially with children, SLPs may want to pay specific attention to their scaffolding strategies, as scaffolding is theoretically (in a socio-interactionist approach of language development, Bruner, 1983) and clinically (as the development of dynamic assessment suggests, Hasson & Joffe, 2007) valuable.

In this presentation, we first describe a methodology co-designed by SLPs and linguists to enable the analysis of SLP-child interactions, combining self-recordings of several therapy sessions with the same child, qualitative group analyses of the interactions run by the SLPs and the linguists, and questionnaires completed by the SLP on her scaffolding strategies before and after the group analyses. We then illustrate the case of an experimented SLP whose aim was to reflect on and improve her scaffolding practices, in order to get a 4 year-old child with pragmatic, phonological, lexical and syntactic difficulties to become more informative in particular when formulating requests.

Building on qualitative and quantitative analyses of the data (3 video-recordings of 47 min on average, made over a two-months period), we show how the collective analysis of the interactions 1) sharpened the SLP's representations of the child's linguistic and pragmatic abilities, 2) enabled her to identify scaffolding strategies that she perceived as being more successful, 3) lead her to implement more of those strategies in the following sessions. We show how her perspective and her scaffolding practices shifted from getting the child being more informative (by asking information questions in particular) to getting the dyad being more efficient (by asking clarification questions).

One of the first places where SLPs can facilitate and enhance social interactions is the therapy session. It is a place where children can experiment successful interactions (with one interlocutor, in child-centered interactions, with little time pressure - a situation which is quite rare in other daily life settings). It is a place where SLPs can gather information to reflect on situations and language practices that enable the child to contribute to the exchange and the dyad to achieve pragmatic improvement, in their office and possibly in other contexts.

Aphasia and the impact of the embodied aspect of service encounter for successful understanding

Panel contribution

Prof. Carole Anglade¹, Prof. Claire Croteau¹, Prof. Guylaine Le Dorze¹

1. Université de Montréal

Background : Aphasia is a difficulty in speaking, understanding, reading or writing as a result of neurological damage. The quality of life of people living with aphasia (PLWA) is not related to the severity of aphasia (Franzén-Dahlin et al., 2010), but to their participation - that is, how well a person functions in society (Davidson et al., 2008). PLWA find it difficult to communicate in their daily interactions, including with people unfamiliar within their community such as clerks, waiters, etc. (Bernath, 2005). Analyses of interactions with non-familiar people in activities of daily life could provide knowledge about how to integrate these situations in rehabilitation and facilitate ongoing PLWA participation post-rehabilitation.

Objective : To examine how PLWA make their requests understood in service encounters despite aphasia.

Methods : Six people living with moderate or severe aphasia were video-recorded in situations of service encounters, e.g. pharmacies, restaurants, and others. Their interactions and specifically their requests were analyzed using multimodal conversation analysis.

Results : The aphasic participants used non-verbal communication in the physical environment to support their verbal requests, by pointing or gazing toward the product they wanted to purchase. The clerks also used the context of interaction to guess what the request was, using their knowledge of what usually happens at that moment in the interaction, and intersubjectivity was achieved. This study highlighted how PLWA – even severe aphasia - can make the subject of their request understood during service encounters by supporting their non-verbal communication in the context and physical environment of the interaction.

Conclusion : These results are consistent with what we know about service encounters, which happen in public places where the actors of interactions construct meaning from the contextual and sequential ties in the situation in an embodied understanding (Mondada, 2011)

Clinically relevant communication behavior analysis in interaction: Development and practical application in school setting

Panel contribution

Mrs. Paméla McMahon Morin¹, Prof. Stefano Rezzonico¹, Mrs. Laurence Brassard¹, Prof. Claire Croteau¹

1. Université de Montréal

In school, the teacher has a special status in the interaction as being the representative of authority. He/she can therefore speak without being challenged in the right to take many speaking turns. He/she also has the right to allocate – or interrupt – the speaking turn of children (Seedhouse, 1996). This makes that, for many children, particularly those with communication disorder, an explicit support from the teacher will be required to fully participate in class activities, especially in activities held with the entire group, like storybook reading. The teacher has to be aware of his/her role in interaction in order to fully support the children's participation. Doing so, the teacher can effectively scaffold children's responses to promote their language development.

This research aimed 1) to develop a measure of language scaffolding strategies offered by kindergarten teachers to children in their group during book reading sessions and 2) to measure the effect of a professional development program using interactive storybook reading on the teachers' use of scaffolding strategies with children in their group, and particularly to children with an identified language disorder.

The interactive storybook reading intervention was delivered in class by a school-based speech-language pathologist, three times per week over the course of 7 weeks. Participants were 11 teachers and the children in their class. Parents of six children with diverse disorders affecting communication (for example: developmental language disorder, stuttering, Down syndrome) accepted to transmit the last language evaluation for the purpose of the study. Teachers were filmed during book reading session before, after and 3 months after the in-class intervention.

The presentation will first address aim 1 which is the development of our video-based analysis method. Rooted in the approach developed by Croteau et al. (2018), which falls within an ethnomethodological paradigm, a qualitative analysis was first realised on sequences between two children with language and communication disorder and a school-based SLP during whole-group interactive storybook reading sessions. This analysis allowed us to identify main patterns of supportive behaviors. Second, based on those patterns, bottom-up categories of communicative behaviors from the SLP and the children were developed to describe the scaffolding strategies sequences. An inter-rater reliability was performed. Then, the presentation will expose results for aim 2, to show how those categories were applied to interactions between kindergarten teachers and the children of their class during storybook reading activities. Some categories were refined and further developed to suit the content of the professional development program. Another inter-rater reliability was performed.

The developed analysis method revealed diverse patterns of scaffolding sequences, differing regarding the length of those sequences. Results suggested changes in scaffolding strategies used by teacher in interaction with the children of their class following, and 3-month after the professional development program. Those changes seem to impact the children's participation during the book reading, among them, those with a communication disorder. This method allowed us to measure how scaffolding sequences unfolds in teacher-children interactions in a meaningful and clinically relevant way.

Comparing timing of other-initiation of repair: a multimodal approach

Panel contribution

Ms. Kati Pajo¹, Prof. Minna Laakso¹

1. University of Helsinki

Background: When recipients of talk solve various troubles during a conversation, they utilize other-initiation of repair (OIR), such as questions “what, where, you mean x”. These utterances are typically produced with delayed timing. Multimodal, bodily features are also typically included. To date however, there have been few studies investigating the multimodal timing of OIR of individuals with hearing impairment and comparing them to normally hearing individuals.

Method and aims: The current study examined with ELAN-software and conversation analysis video-recordings of 14 dyads with normal hearing and with mild to severe degree of hearing impairment. The research focused on verbal OIR sequences (N=167) but adopted a multimodal approach. The research questions were presented as follows: (1) In relation to the trouble source turn, what is the timing of OIRs?; (2) What visual bodily resources the recipient utilizes during OIR sequences?; (3) Does timing of OIRs and their visual bodily style of production differ between participants with normal hearing and different degrees of hearing impairment?

Results: The results show that gaps preceding OIRs displayed variation and mean values for participants with normal hearing were ≈ 700 ms and with hearing impairment ≈ 500 ms. However, all participants took longer time to initiate restricted OIRs than open OIRs. Especially, ≈ 200 ms mean gap for open OIRs with participants with severe hearing impairment indicated very fast turn-taking, occurring even in overlap with the trouble source turn. In terms of visual bodily actions, the results showed some fundamental differences. Participants with severe hearing impairment held their gaze at the speaker more intensively than other participants. Other visual bodily actions, such as, upper body lean forward, or changes in facial expressions, were found in all participant groups. However, their frequency, timing, and quality displayed variation. Visual bodily actions were mostly utilized by participants with severe hearing impairment. In comparison to other participants in the data, severely deteriorated hearing increased the need to indicate trouble already while the speaker was talking and more overt visual bodily actions were utilized. If we consider repair as a primary and vital action in conversation, it is important to consider the differences in participants’ abilities to follow the ongoing conversation and their use of various multimodal resources to take part when due.

Engaging children with autism in interactions with AAC: professionals' strategies in an inclusive classroom

Panel contribution

*Ms. Roxane Perrin Hennebelle*¹

1. Laboratoire CLESTHIA (EA 7345) Université Sorbonne Nouvelle

This study aims to explore interactions between minimally-verbal children with autism and professionals, and more specifically the strategies professionals develop to involve children in verbal and nonverbal interaction exchanges.

The socio-interactionist perspective (Bruner, 1983; Veneziano, 2005; Vygotsky, 1934) we adopt is helpful to understand the communicative specificities of children with autism, especially minimally-verbal children. Children with autism are atypical interactional partners, because their unexpected moves or lack of reactions may discourage their partners. Nevertheless the quality of interactions improves when the adult is acquainted with these specificities, and knows how to provide support and encourage them (Plumet, 2014, 2020). Thus, to provide a richer and more adapted context to children, professionals need to adjust their speech and language to children's specificities.

In this study, professionals' strategies were analysed through the lenses of scaffolding. We focused on one activity, the snack time, during which the children used the alternative and augmentative tool PECS (Picture Exchange Communication System) (Frost & Bondy, 1994). These data are part of a larger corpus recorded in a special-needs class. The four children of the study were aged between 4;05 and 5;08 at the beginning of the recordings.

The adults' and children's interactional moves were analysed according to four axes: a) their communicative mode; b) their function; c) the presence of gestures; d) the children's initiations and reactions. We focused on the children's engagement during the activity, and then followed the de Weck & Salazar Orvig's (2019) coding grid to analyse the task and linguistic scaffolding strategies used by the professionals, and their impact on children's reactions.

Results show that professionals mainly relied on multimodality rather than only verbal utterances. Moreover, their gestures and actions, which differed from ordinary moves in conversation, were mainly devoted to directing the children's attention or physically guiding their moves. The professionals' verbal utterances tended to direct children's attention, regulate their behaviour, or encourage them to verbalize. The use of PECS entailed multimodality, with specific gestures and actions such as pointing or exchanging pictures. Requests were mostly multimodally co-constructed, with the nonverbal modality produced by the children, who pointed to the pictures, and the verbal modality by the adults, who verbalized the request.

The adults' verbal utterances were mainly repetitions and verbalizations of the children's moves. These contributions are typical of interactions with children with communication difficulties, including communication with the PECS.

The scaffolding strategies used by the professionals adjusted to the children's profiles and their engagement state. When the children failed to maintain engagement, the professionals scaffolded joint attention throughout instructions and physical guidance. Language was scaffolded mostly through verbalizations, speech elicitation and questions. They mostly asked yes/no or alternative questions with deictic gestures which facilitated the children's answers.

Discussion will address the aim of these preferential strategies. For instance, the professionals used snack time as a pretext to train the children to make requests. Their practices differ from those with typically developing children, as we will discuss by comparing our results with previous studies in childcare (Degotardi et al., 2016).

Parents with aphasia – How focusing on their everyday family interaction may inform interventions

Panel contribution

Ms. Helene Killmer¹

1. University of Oslo

Raising a child happens through interaction. Parents with aphasia describe change in interaction with their children, loss of parental authority and need for support to engage with their children. Thus, in the younger stroke population, interventions requires a focus on demands of the whole family, including children. However, we are lacking insights into how parents with aphasia and children engage in real time interaction. Parental requests, such as ‘go to bed’, and ‘sit still’, are common and have been described in typical parent-child interaction. Aphasia may impede involvement in interaction and thus potentially also the possibilities to make requests to children. The aim of the study is threefold:

- (1) To analyze the conversational practices used by parents with aphasia to make requests.
- (2) To examine how severity of aphasia influences requesting.
- (3) To consider what consequences the formulation of requests have for deontic authority (the right to direct another person’s future action) of parents with aphasia.

Using conversation analysis (CA), I carried out a collection-based study of 46 request sequences in 10 hours of video recordings involving three parents with aphasia (two with mild and one with severe aphasia) during everyday interactions with their children (e.g. mealtimes, games).

The results show that when initiating requests, stopping a child’s action may be easier to achieve than getting a child to do something, as it requires less specification of the action. The severity of aphasia may limit the fine-tuning of deontic authority. Whereas the two parents with mild aphasia cautiously calibrate authority, such fine-tuning is not present when the parent with severe aphasia involves in requesting. He uses intrusive physical practices, gestures, increased volume and repetition.

The analysis offers insight into practices that may allow or hinder these parents with aphasia to perform requests and thus to engage in parenting. The findings suggest that individuals with aphasia may benefit from focusing on activities such as requesting in interventions. Further CA research on parental interactions in aphasia would be desirable to develop training aimed at overcoming challenges such as those described in the present study.

Spoken and written persuasive discourse in deaf and hard-of-hearing adolescents

Panel contribution

***Ms. Maude Gagnon*¹, *Prof. Claire Croteau*², *Prof. Louise Duchesne*¹**

1. Université du Québec à Trois-Rivières, 2. Université de Montréal

Persuasive discourse is a difficult task requiring many language abilities, logical thinking, and perspective-taking (Heilmann, 2020). Good argumentation skills are essential in many contexts, including school, work, and social relationships (Nippold, 2005). However, very few studies have examined the persuasive skills of high school students, particularly in deaf and hard-of-hearing (DHH) students. Although many studies have examined language acquisition in DHH young children, we have much less knowledge of the language skills of adolescents. This study aims to determine whether the spoken and written persuasive discourse abilities of DHH adolescents are comparable to those of hearing peers. We hypothesized that DHH adolescents would obtain significantly lower scores than their hearing counterparts in all measures of persuasive discourse (lexical diversity, complex syntax, and macrostructure) in the spoken and written language samples. We collected spoken and written persuasive samples from DHH adolescents aged between 12 and 17 years and from age-matched controls with typical hearing. In each student's persuasive discourse, we assessed: 1) the use of complex vocabulary, as measured by the number of different words, 2) the use of complex syntax, as measured by clausal density and mean length of T-units, and 3) the macrostructure of the discourse, as measured by a persuasive scoring scheme (Heilmann, 2020). Results from a subsample of students will be presented. Findings from this study will help confirm that using functional language tasks is a valid way to identify the language challenges of DHH students. Moreover, learning more about the language strengths and challenges of DHH adolescents will enable clinicians to better assist those students both in clinical and school settings.

The Multiple Assessment of Connected Speech (MACS): an attempt to balance ecological validity and standardization in the assessment of communication disorders

Panel contribution

Prof. Anna Zumbansen¹

1. University of Ottawa

Assessment of communication disorders in clinical Speech-Language Pathology (SLP) and research requires some standardization in data collection and analysis in order to reliably compare an individual's performance to that of a reference population and to document change over time. Traditional evaluation tests in SLP primarily include isolated language tasks (e.g., naming objects, repeating isolated words or sentences), which help diagnose a communication disorder by identifying one or more impaired components of language skills. These tasks are easy to standardize but lack ecological validity. Conversely, a sample of spontaneous conversational speech is probably the ideal linguistic material in terms of ecological validity, but difficult, if not impossible, to standardize.

Eliciting monologic discourse with a standardized stimulus (e.g., asking to tell what is happening in a picture representing a scene from daily life) has emerged as a good compromise and has been used in major diagnostic test batteries for acquired language disorders since the 1970s. Several analysis protocols have been used and research efforts have been renewed in the field with the improvement of automated analysis possibilities. However, there is still a lack and need for psychometric data for the use of discourse analysis in SLP. Crucially, inter-rater reliability must be ensured in analysis protocols.

As a result of these considerations, I have led a team of SLP students and researchers in the development of the Multiple Assessment of Connected Speech (MACS), a picture description test that attempts to balance ecological validity and standardization in the assessment of communication disorders. The MACS includes 15 comparable pictures of scenes from daily life. It is the first discourse test constructed with parallel versions, which allow a participant to be tested multiple times to measure changes while minimizing learning bias. Since its first version applied to post-stroke aphasia in 2011, the analysis protocol of the MACS has been refined by adapting Computerized Language Analysis (CLAN) software that automatically computes dozens of linguistic measures based on the discourse transcriptions and coding. A detailed manual with practical exercises was created to train future users of the method in French (including Canadian French).

The inter-rater reliability of the analysis protocol is tested by having new users re-transcribe discourse samples of 30 participants, based solely on the manual instructions. Preliminary results with a speech-language pathologist show excellent to perfect reliability according to recent guidelines (ICC = .97-1.0) on speech measures such as number of words, utterances, and duration, which underlie most of the other computed variables.

The manual will be used for further psychometric studies of the MACS and can also be used to analyze different types of monologic discourse samples (e.g., narratives). It has been shared with other research laboratories working on discourse analysis in Canada and is available on request (azumbans@uottawa.ca).

multimodal analytical
studies (organized by
Esther González
Martínez, Evelyne
Berger)**

Displaying limited availability for an upcoming recruitment in nurses' interactions with hospital co-workers

Panel contribution

Dr. Angeliki Balantani¹, Prof. Esther González Martínez¹

1. University of Fribourg

This multimodal conversation-analytic study explores recruitments in nurses' interactions with co-workers in hospital corridors. Despite the growing interest in the examination of recruitments in recent years (Kendrick & Drew, 2016; González Martínez & Drew, 2021), little work has been undertaken to study preliminary activities to recruitments. In our project, we have identified four types of preliminary activities that lead to recruitment, that is locating a co-worker by means of a summons, securing their attention, securing their availability and providing them with backgrounding information on the issue at hand. The present study focuses on one such preliminary activity, namely securing availability for recruitment (Kidwell, 2013; Keisanen & Rauniomaa, 2012; Kendrick, 2021). Already when responding to a summons, participants display readiness to get involved in interaction and/or in a new practical activity that will divert the requestee from his or her current involvement or add to it. However, there are instances where participants display limited availability for interaction and reluctance to abandon their current practical activity and get involved in a new one (Schegloff, 2007). The study focuses on such instances where participants visibly mark their resistance to an upcoming recruitment, i.e., by "visible deflation" (Clift, 2014) and/or implicit complaints.

The data for the current study consists of video recordings in an outpatient clinic of an acute-care hospital in the French-speaking part of Switzerland. The recordings took place in the clinic's corridors and liminal spaces over the course of seven consecutive days, twelve hours per day resulting in 331 hours of video data that were then synchronized into multi cam files. For the present study, a collection of 67 instances of recruitments has been selected. By investigating the sequences prior to the utterance of the initial recruitment turn, we further identified 12 instances where participants display limited availability and potential resistance to engage in a new activity. The study will show that resistance to an upcoming recruitment is projectable from the preliminary activities before it has actually been produced. We will concentrate on linguistic and bodily resources available to participants to convey resistance to comply with an upcoming recruitment. The study aims to contribute to our understanding of how nurses move from unfocused to a focused interaction in the distributed work space of a hospital clinic and how talk begins in face-to-face, mobile interaction in a work environment characterized by a pseudo continuing state of incipient talk. More specifically, it could form the basis for a contribution on how recruitment emerges in this specific environment, in which the participants are in and out engaged in common courses of action and how they display (un)availability to do so.

From the transmission of clinical information during nursing handovers to the sharing of knowledge. Keywords: handover, nurse, multimodal interaction, knowing, learning

Panel contribution

*Mr. Louis Maritaud*¹, *Ms. Isabel Colon de Carvajal*², *Ms. Justine Lascar*¹, *Mr. Benoit Chalancon*³

1. CNRS, ICAR, 2. ICAR Lab, 3. Centre Hospitalier Le Vinatier, Lyon

The transmission of information concerning a patient at the hospital is governed on the one hand by the computerized patient's file, and on the other hand by the nurses' and multiprofessional's handovers. As a real challenge for the quality of healthcare, these oral and written transmissions are a specific concern of healthcare institutions. Psychiatry, marked by orality (Barett, 1997), differs from the world of somatic care by this specificity. Nursing practice primarily uses relational care and uses a thought activity in the service of collective intelligence (Merkling, 2007). The CIPSY study (PSYchiatric Nurses Interaction Skills) conducted in collaboration between the Vinatier Hospital and the ICAR laboratory has the main objective of determining the language repertoire of the two production formats (oral and written) during nurses' handovers and written transmissions, using qualitative and quantitative analyses.

We conduct an interactional and multimodal analysis of oral nurses' handovers in psychiatric institutions, which has emerged as a possible place to "know" and "learn" among health professionals. Although the main objective of a nurses' handover is to transmit and share the up-to-date information on the different patients present in the unit, we have been able to identify exchanges during which participants can "complement professional knowledge" or "help the partner see more clearly" (Grosjean & Lacoste, 1999: 112).

Our analysis is based on four excerpts. The study includes multi-view audiovisual recordings of the three handovers on five consecutive Mondays of the same psychiatric unit. The choice was only on Mondays because, for an adult psychiatry service and as the first day of the week, these are particularly rich handovers, since they are abundant of clinical events that happened during the weekend. This original audiovisual corpus, with a total duration of 14 hours 30 minutes, depicts 38 health professionals, and concerns 40 patients put on the agenda of these meetings.

We question the pre-established organization of nurses' handovers in a psychiatric unit and to identify moments that modify the planned interactional sequence of a meeting to bring a more didactic aspect to the current conversation. Indeed, the handovers follow a similar process. A particular nurse designates herself or is designated to list the clinical updated information of each patient, according to an order established by the room numbers. We also use the concept of "super speaker" to define this central role in the succession. Other participants can write down on a handover sheet what is said by the nurse in charge of the meeting. However, in our excerpts, the didactic dimension is more present in the discourse of professionals and temporarily suspends the expected progression of the current transmission.

From a multimodal point of view, the results of the analyses show that these more didactic moments are detectable by specific postures. In the "knowing" sequences, the note taking on their sheet by caregivers is a central activity and can modify the progression of transmissions, while in the didactic phases of "learning", the gazes are oriented more to the speaker who transmits knowledge and skills, stopping the writing activity.

Getting to know patients: opening sequences of a simulation in psychiatric nursing education

Panel contribution

***Dr. Evelyne Berger*¹, *Prof. Alexandra Nguyen*¹, *Prof. Jérôme Favrod*¹**

1. La Source School of Nursing, HES-SO University of Applied Sciences and Arts Western Switzerland

Simulation is a widespread method for training health care professionals in both vocational and continuing education. It is meant to provide participants with an opportunity to practice technical and communicative skills within a realistic reproduction of a clinical setting yet controlled environment (Jaffrelot & Pelaccia 2016). In this paper we aim at a better understanding of the interactional practices participants routinely deploy during the simulation as they go about doing the assigned task in the field of psychiatric nursing education.

In our data the simulation is meant for students to practice facilitation skills of a psychoeducation program (PEPS – enhancing positive emotions for people with schizophrenia, see Favrod et al. 2019) for which they have been trained beforehand. In this context, the simulation is rather a practical exercise involving advanced nursing students with *expert patients* (i.e. people having an actual mental illness diagnosis and putting their personal experience at the service of teaching and research). The corpus consists of 8 videorecorded group sessions lasting 20-minutes each and taking place in a nursing school in French-speaking Switzerland.

We will focus on the opening sequence of the simulation in which participants greet each other and introduce themselves to one another in a go-around fashion led by the students before moving into the actual task at hand. Across all 8 groups, the introduction sequence unfolds according to a similar pattern: the students initiate the sequence by first self-introducing and then solicit patients to self-introduce as well. It appears that the opening sequence is quite a crucial moment of the simulation: it allows participants to mutually engage in face-to-face interaction (see Pillet-Shore 2018, Robinson 1998) and to create familiarity among them (see Svennevig 2014) while also organizing a shared orientation towards the business to be done (see Hellermann 2007).

Drawing on multimodal conversation analysis, we provide a detailed description of the interactional practices students and patients deploy as the introduction sequence unfolds. We will focus on the way students' invite patients to self-introduce and how patients respond to that invitation. We show how the specific linguistic and multimodal formatting of the students' *invitation turn* shapes patients' responses namely in the amount of self-disclosure they volunteer about their identity, medical condition and life experiences. In fact, some of these sequences become rich occasions for personal sharing and creation of a positive group dynamics .

More generally, our interest lies in understanding how nursing students' practices foster increased patient participation and relational work. In conclusion, we argue that the simulation opening sequence is a locus for professional development insofar as it offers students the possibility to engage in rapport-building with patients which is key to further therapeutic work (Scarvaglieri 2020).

Narratives and agency in the arts-based activities for Persons living With Dementia

Panel contribution

Prof. Ilkka Arminen¹, Ms. Anna Heino¹

1. University of Helsinki

We explore storytelling in the arts-based activities for Persons living With Dementia (PIWD). Our wider interest in the agency of Persons living With Dementia is also well served by the analysis of storytelling practices of art group activities for PIWD. Narratives are an elaborate form of social activity that demands both social and linguistics skills that require social and cognitive competence, and therefore are also used in the diagnostics of conditions, such as various types of dementia. More importantly, storytelling can be empowering and allow the tellers a channel for rewarding self-expression. Our perspective is to use video-recorded data of arts-based group activities to explore how PIWD are using narratives in group activities. The aim is to analyze affordances and limitations of arts-based activities in allowing PIWD to engage in story telling as a way to articulate and maintain their agency. We use multimodal conversation analysis to explore interactional practices, in particular, various kinds of story telling in the arts-based groups. Our data comes from a particular type of arts-based activity in Finland, TATAMURI®, which is a group art activity based on clinical work and expressive art therapy methods. Our aim is to contribute to the emerging field of studies on atypical interaction; we address ways to in which arts-based activities can invoke agency for PIWD. We explore the articulation of various degrees of agency in storytelling practices in group activities. In all, we aim to gain insight on, whether arts-based activities in the TATAMURI® group invoke and support the agency of PIWD, and if so, in what ways?

Nursing staff looking for objects with hospital co-workers

Panel contribution

***Prof. Esther González Martínez*¹, *Prof. Barbara A. Fox*²**

1. Department of social sciences, University of Fribourg, 2. University of Colorado, Boulder

Hospital nursing personnel spend a considerable part of their time dealing with objects: tools, products, medical equipment and records (Strauss et al., 1985; Michel et al., 2021). They are responsible for the provision of items to be used by the nursing staff themselves, as well as their coworkers and patients, at the appropriate time and place and under the right clinical circumstances. This implies controlling the stocks, placing orders, organizing the delivered items and moving them from place to place as needed. The hospital environment abounds in rules and procedures as well as human and material constraints governing where objects should be kept, used and disposed of (Volland et al., 2017). Nevertheless, hospital departments are also distributed workspaces, staffed with many different professionals, new and old recruits, all engaged in interdependent activities that require them to move around constantly, taking objects with them. This sets the scene for recurrent searches for objects whose whereabouts are not known to the staff or cannot be found in the expected places at the expected times (Tucker, Spear, 2006).

The paper focuses on nursing staff looking for objects that they try to locate in cupboards and rooms or across hospital departments, recruiting co-workers in the process. It is based on conversation and multimodal analysis of data collected in acute-care hospitals in the French-speaking part of Switzerland. This data is composed on the one hand of audio-recorded telephone calls between Surgery nurses and other members of the hospital personnel and on the other, of video-recorded interactions between co-workers in the corridors of an out-patient clinic.

In the paper, we will first present the importance of studying how objects feature in work practices (Day, Wagner, 2019) and, in particular, how nursing staff look for objects in a hospital setting. We will then concentrate on a specific interactional sequence in which a nursing staff member asks a coworker where an object is. In a few cases, the question is dealt with as a request for information. The recipient either provides the item's location or produces a knowledge disclaimer and/or redirects the question to someone else. More frequently, the question is dealt with as also conveying a request for practical action: to provide the object or assistance in finding it. We examine these sequences as perspicuous interactional moments for delving into the analytical issues of what functions as a recruitment method (Kendrick, Drew, 2016) and as preliminary activities for recruitment, such as (so-called) pre-requests (Fox, 2015). The analysis also provides insight into how participants index who is responsible, or not, for the location and provision of the object in question, for finding it or assisting someone in finding it (Horlacher, 2019). The paper thus addresses complex issues of division of labor, teamwork solidarity and material entitlement, played out in-and-through social interaction, that are conspicuous in the hospital setting and also transcend it.

Use of the “burden of care” levels in discharge planning activities: An occasioned semantics analysis of healthcare interactions

Panel contribution

Dr. Hiroaki Izumi¹

1. Kyoto University of Foreign Studies

In the Japanese healthcare system, elderly persons who need long-term care must obtain a certification that specifies the amount of care services they can receive. This certification has a seven-level scale that consists of two major categories: *yooshien* (“support required”) and *yookaigo* (“care needed”). *Yooshien* comprises support required levels 1 and 2, whereas *yookaigo* consists of care levels 1 to 5, where the burden of care increases with the level. Using occasioned semantics (Bilmes 2015), this study investigates how Japanese rehabilitation team members utilize the seven-level scale in team interactions during discharge planning for stroke or orthopedic patients. Focusing on three major activities including (1) assigning patient priority, (2) evaluating discharge plan proposals, and (3) matching patient criteria with institutional requirements, the analysis systematically examines how the participants accomplish these activities by creating contrastive and scalar relations in the course of their actions (Bilmes 2021; Deppermann 2005; Izumi 2017, 2019; Hauser 2022). The data consist of 65 video-recorded meetings of the rehabilitation team in a Japanese hospital and ethnographic information regarding the long-term care certification and patients’ case histories. The analysis shows that the participants deploy various scales, including burden of care levels, amount of service, and time and financial scales, in discharge planning activities. These scales are not used in isolation but are sequentially combined to create and modify the meaning structures, thereby allowing the participants to make sense of whether the patients are eligible for admission to the facility or whether the discharge plan proposals are adequate. Moreover, when there is a disagreement among the participants in assigning priority to patients or when a proposed discharge plan seems problematic, the participants list patients’ functional status as the grounds to determine whether to classify the patients as *yooshien* or *yookaigo* so as to arrive at a mutual agreement. This study contributes to the empirical study of meaning in talk-in-interaction and healthcare discourse by showing how the analysis of “sequential regrading” (Bilmes 2019) in combination with ethnographic information (Deppermann 2011; Hauser 2011) helps explicate the complex interactional scaling and contrasts that emerge in ongoing interprofessional decision-making practices.

Autoethnographic reflections on video mediated interactions in higher education

Panel contribution

Mr. Bjoern Stoevesand¹

1. Bielefeld University

When the COVID19-pandemic hit us back in 2020, nearly everyone had to deal with specific challenges both privately and professionally. People active in learning and educational environments, at schools and universities faced issues regarding the mastering of organization of socially distanced formats. This necessarily led to adaptations to and changes of common concepts and practices of teaching and learning. Facing these challenges in our day-to-day teaching at Bielefeld University, we quickly noticed a fundamental crisis of established forms and practices in institutional talk and work and with that a feeling of reduced professionalism. We dealt with changing participation frameworks (Goffman, 1981; Goodwin 2007) between teachers and learners, unusual configurations and quantities of interaction and new forms of mutual perception and social interpretation in video conferencing tools. All of these demanded spontaneous adaptations from both teachers and learners simultaneously, which led to overwhelming and irritating situations on both sides. Reflecting on those experiences, our lab at Bielefeld University decided to do a small autoethnography (Ellis et al. 2011) of our teaching experiences in this unfamiliar situation, to take a step back and get an analytic view of the situation (see also AEDil, 2020). Seven of us took ethnographic notes during our teaching sessions, held via Zoom, and collected these protocols as “tales of the field” (van Maanen, 2011), in order to build a corpus of data and make a collaborative analysis possible.

The present work aims to give some insights in the results of our linguistically and conversation-analytically inspired work with the autoethnographic texts, about video-mediated interactions in higher education. With special reference to Goffmans (1956, 1981) remarks on (multimodal-) interaction and mutual perception, I want to provide an inquiring view on our affective reactions and notions of discomfort from the first semester of the pandemic. In a reflective and even therapeutical manner I further want to embrace autoethnography and conversation analysis as a prolific instrument to deal with professional (and individual) challenges concerning interactional processes.

Critical feedback between language teachers in international video conferencing

Panel contribution

Prof. Sabine Hoffmann¹

1. University of Palermo

Video conferencing as part of teacher training is only slowly becoming established; and, as Benitt and Schmidt already pointed out a few years ago (2016: 260), it has hardly been researched empirically. Despite the increasing use of videoconferencing due to the pandemic, there is still a lack of studies that determine how the participants in a teacher training course actually interact in video conferences (Hoffmann and Kasper 2021). This is the same issue we have when we look for empirical studies on collegial feedback (Funk 2016: 28) that reconstruct the processes of interaction in presence as well as in digital spaces, in order to understand how (foreign language) teachers deal with feedback – which can be positive as a kind of affirmation, or negative in the sense of criticism – in discourse and negotiate it (Viebrock 2022: 210/211).

The talk proposed deals with collegial feedback as an interactional process in video conferences as part of international training for teachers of German as a foreign language. The focus is on showing how the teachers provide feedback on the topics to be discussed and how this feedback is received. Particular attention will be drawn to negative or critical feedback and the reaction to it (Hoffmann, in print), especially when it is negated by the addressed colleagues.

The data used for this comes from the Erasmus+ project LEELU (teaching competence development for extensive reading lessons, www.leelu.eu), international teacher-training designed and implemented in a blended learning format. The program was aimed at eighteen DaF teachers from three different countries, who discussed several sequences recorded in their lessons during eight international video conferences. Selected sequences from these digital meetings were subjected to multimodal analysis, which is based on conversation analysis and is used specifically in research into video-based professional communication. The transcripts were carried out according to GAT 2 (Selting et al. 2009); for other multimodal practices, Mondada (2019) was used. The aim of the study is to reveal interaction patterns that characterize the behavior of teachers in the context of digital teacher-training in order to promote an international and intercultural professional feedback culture.

How visual access to ongoing digital text production shapes co-orientation in video-mediated Mandarin tutorials

Panel contribution

Mr. Hsin-Tzu Jen¹, Dr. Gabriele Kasper¹

1. University of Hawaii at Manoa

Multimodal conversation analysis of video-mediated interaction seeks to reveal how participants navigate the affordances and constraints of screen-based encounters in orientation to the activity at hand (Mlynář et al., 2018). A growing body of literature identifies participants' methods for managing the "fractured ecologies" (Luff et al., 2003) of video-mediated spaces, such as extended pointing as a practice of next speaker selection (Hjulstad, 2016), collaborative referencing of shared objects through translocal gestures (Luff et al., 2016), or verbalizing nonvocal action and adjusting visuals (Femø Nielsen, 2019). CA research of digitally mediated interaction in educational settings (González-Lloret, 2015; Jakonen et al., 2022) has shown how students and teachers observably attend to the specific design features of the platform (Balaman & Pekarek Doehler, 2022; Rusk & Ståhl, 2022) or device (Hellermann & Thorne, 2022; Ro, 2021) as a practical matter of jointly accomplishing the activity.

Building on these lines of research, our study examines how participants in video-mediated dyadic tutorials in Mandarin Chinese use PowerPoint (PPT) slides as inscribed objects to accomplish the instructional agenda. Specifically, we focus on how the changing visibility of the tutor's ongoing typing of Chinese text on the PPT slide shapes the tutee's recipient practices. Unlike digital text production in an alphabetic script, Chinese characters are generated through three steps. (1) The user types the syllable in alphabetic script; (2) the device generates matching characters; (3) the user selects the contextually fitting character. Tutors and tutees are literate in the procedure of digital text production.

Data for this study come from a corpus of 64 hours of video-mediated dyadic tutorials in Mandarin Chinese (128 sessions). The participants are four tutors from an M.A. program of Teaching Chinese as a Second Language in China and 17 tutees from an advanced Chinese language course at a public U.S. university. The tutors are tasked with helping the tutees prepare assignments such as essays, oral reports, and discussion questions for the students' co-local classes. Throughout the tutorials, the tutors routinely type on the PPT slides for such actions as outlining, summarizing, and correcting.

Preliminary analysis reveals two sequential trajectories. (1) When the tutor's typing-in-progress is visible on the screen, the tutee displays reciprocity through vocal continuers and nodding. In this way the tutee observably orients to the tutor's sentence production from typing out the phonological combination in alphabetic script, to selecting the corresponding characters, to completing the whole sentence. In this event the tutor moves on to the next action as soon as the student claims understanding of the completed typed sentence. (2) When the typing-in-progress is not visible on the screen, the tutee temporarily gazes at the screen without any vocal or visual recipient activity and only resumes displays of reciprocity when the completed sentence becomes visible on the PPT slide. In this event the tutor will review or comment on the produced sentence before proceeding to the next activity. The contrasting sequential trajectories exhibit "the procedural consequentiality of mediation" (Arminen et al., 2016) in the video-mediated Chinese language tutorials.

Maybe I can share my screen - The role of screen sharing on Spanish online interactions within a Virtual Exchange Project

Panel contribution

*Ms. Naiara Martínez Niño*¹, *Prof. Marta García*¹

1. Georg-August-Universität Göttingen

Virtual Exchange (VE) initiatives in higher education have seen an extraordinary increase in recent years, partly due to the Covid pandemic that made any other kind of exchange almost impossible. While the language of communication in the VE is, in the great majority of cases, obviously English, and therefore the research has been conducted almost only with English as the target language (Balaman, 2016; van der Zwaard and Bannink, 2014), there is an appalling lack of studies on how VEs are conducted in other languages.

In this paper, we report some preliminary results of a Spanish as a lingua franca VE project that took place in autumn of 2021 between 6 European universities, all of them members of the ENLIGHT Network. During the project, over 30 participants, students of Spanish from different fields such as, e.g., translation studies and teacher education, met in small groups for three Zoom sessions of approximately 45 minutes each. The VE had a voluntary character – it was not part of any lecture or university course for any of the participants – and its goal was to discuss – in Spanish – the topics of Sustainability and Social Justice, two of the pillars of the ENLIGHT Mission. The interactions in the small groups, therefore, had the character of conversations-for-learning (Kasper and Kim, 2015) and there was no specific task or assignment to complete. The VE coordinator sent several documents to the participants before each session (newspaper articles and videos) so that they could prepare themselves, and suggested some possible talking points, but did not actively participate in the meetings. The participants, thus, had to manage and negotiate all the interactional tasks themselves; nobody officially had the role of teacher or leader.

The focus of this paper is the groups' interactional self-management. We will be taking a look at how the leading roles are managed, distributed and assumed, and which resources the participants draw on in order to steer the conversation. Specifically, we will analyze the common strategy of sharing the screen on zoom: How, by whom and when it is initiated. By comparing groups where screen sharing was used to ones in which it was not, we also provide some insights into the effects of this particular practice on the interactions.

Multimodal interaction analysis of task-oriented student group work in higher education: observations and reflections on studying online interaction

Panel contribution

*Ms. Silke Tork*¹

1. European University Institute, Florence

This paper presents and discusses observations emerging from the study of two differently situated data cohorts (video-mediated and in person) of task oriented student group work in Higher Education. Through the comparison of these two settings particular phenomena of online interaction and requirements for its analysis have been observed. The applied multimodal approach takes into account the variety of resources used to construct meaning, create intersubjectivity, build up knowledge and relations in task-oriented student group work online and in presence.

The PhD project from which this paper originates is a corpus-based study of multilingualism in Higher Education for which the first data cohort was recorded within a seminar that took place in presence at the PH Karlsruhe while the second cohort was collected during the pandemic within an online-workshop (using the video conferencing platform Zoom) at the European University Institute Florence. The data have been transcribed on the basis of the *Conventions for transcribing multimodality* by Mondada (Mondada 2019).

This paper traces the process from data collection to analysis, reflecting on basic principles and concepts of conversation analysis and multimodal interaction analysis such as interaction order, face-to-face interaction, interaction space, spatiality and the body (Goffman 1963 and 1983; Deppermann/Streeck 2018; Mondada 2005 and 2016; Imo/Lanwer 2019; Due/Licoppe 2020). Through a series of examples specific issues resulting from the situatedness online or in person are highlighted, e. g. the reciprocal visibility in the interaction space, backchannel signals, inter- and intrapersonal embodied actions, gazes as well as technical issues.

Through comparisons of phenomena like verbal overlaps or embodied backchannel signals and the detailed description of selected sequences the analysis aims to point out foci for further research on task-oriented student group work in video-mediated settings in Higher Education.

Online Second Language Interactional Competence (L2 IC) in International Student Video Conferencing

Panel contribution

Mr. Nils Drixler¹

1. University of Education Ludwigsburg

This presentation will demonstrate L2 interactional resources in video team meetings within a Virtual Exchange (VE) project between German and Israeli students of English as a Foreign Language (EFL). The data shown is based on an ongoing doctoral study that utilizes multimodal conversation analysis of synchronous L2 online discourse.

The VE project *Extended Telecollaboration Practice* (www.telecollaboration.eu) comprises seven semesters of telecollaboration between undergraduate EFL teacher students at the University of Education Ludwigsburg, Germany and Kibbutzim College of Education Tel Aviv, Israel. It links research on teacher training at university level (Waldman, Harel & Schwab, 2019) with an on-going micro-analytic study focusing on online Second Language Interactional Competence (online L2 IC) during video conferencing (Drixler).

In the course of our telecollaboration, students from both countries cooperate in joint online projects whereby group sizes are usually four to six students. Recorded video team meetings are being held between the Israeli and German students. Along selected transcripts and video sequences I will show how intercultural student teams yield interactional practices such as turn-taking, sequence organization, repair and common ground practices in a virtual setting. To assess students' interactional performances in online video team meetings, not only participants' utterances but also multimodal resources such as mimical expression, gesture and gaze movement will be regarded.

My panel contribution will (1) delineate the new and emerging field of online L2 IC, (2) illustrate specific interactional resources that play a role in online video team meetings from a multimodal conversation analytic perspective.

Orientations to locality and local meanings of food in a virtual exchange project

Panel contribution

*Dr. Margarethe Olbertz-Siitonen*¹, *Dr. Malgorzata Lahti*¹

1. University of Jyväskylä

This study explores online interactions of a group of intercultural communication students at two European universities collaborating in a virtual exchange project (e.g., Dooly, 2017) focusing on the pre-assigned topic of food. Popular discourses on both student exchange and culinary practices are predominantly essentialist, drawing on the understanding that culture exists outside interaction and that – consequently – learning about others' cultures increases intercultural competence. Here, we are interested in how the participants jointly construct their identities with relation to the two themes as they mutually orient to their different physical locations (“here” and “there”) and negotiate local meanings of food and groceries.

Our analysis concentrates on three video-based meetings of a five-member student group. Three group members were taking a critical intercultural communication course in a university in the Netherlands, while the remaining two were enrolled in a similar course in a university in Finland. The data was collected before the COVID19-pandemic, in the spring of 2019, using automated recording. We treat the online meetings among students who hardly know one another as situated in the public sphere where the participants put on front stage performances of desirable identities (Goffman, 1959). We further draw on discursive psychology and conversation analysis to explore identities as common sense and publicly available resources for building accounts of the social world across distances.

The participants produce both essentialist and non-essentialist identities to make sense of their relationships with one another, and their relation to their offline localities, skillfully reconciling the two ways of explaining the social world. A better understanding of these observably unproblematic blendings of mundane and sophisticated accounts of interculturality in the ‘public sphere’ of virtual exchange sessions can prove useful for the development of novel intercultural communication competence trainings, especially in terms of so called “simplicity” (Dervin 2016, p. 81).

Task repetition and variance in online teachers' instruction-giving: a multimodal (inter)action analysis

Panel contribution

*Dr. Ciara Wigham*¹, *Dr. Hatice Müge Satar Coen*²

1. Laboratoire ACTé, Université Clermont-Ferrand, 2. Newcastle University

Described as a semio-pedagogical activity, synchronous online language learning requires socio-affective, pedagogical, semiotic, and technological competencies, including the ability to provide “clear and concise instructions” (Guichon, 2009: 169). Procedural instructions for language tasks are important for several reasons. First, successful task completion “is often predicated on the effectiveness of [the] instructions” (Watson Todd, Chaiyasuk, & Tantisawetrat, 2008: 26). Second, language learning happens in meaning-focused interaction (Nunan, 2004) and instructions offer opportunities for authentic communication (Watson Todd, Chaiyasuk, & Tantisawetrat, 2008). Third, instruction-giving is part of task-based teaching competencies (Raith & Hegelheimer, 2010). In face-to-face contexts, studies have largely drawn on Conversation Analysis to investigate different components of instructions (Markee, 2015), their interactive nature (Somuncu & Sert, in press), and teachers' verbalisations of written instructions (Ha & Wanphet, 2016). Our understanding, however, of teachers' use of semiotic resources within the complex multimodal affordances of videoconferencing is limited. Indeed, from a multimodal perspective, earlier studies have analysed online teachers' semio-pedagogical competence (Develotte, Vincent & Guichon, 2010), the way in which a single resource is employed (e.g. gaze, gestures, Wigham, 2017) or largely explored the social or interactive aspects of language learning (Cappellini & Azaoui, 2017, Satar, 2016). The few studies that have examined task instruction-giving from a multimodal perspective have largely been limited to trainee teachers (Codreanu & Combe-Celik, 2012; Cappellini & Combe, 2017; Satar & Wigham, 2017). In this paper, we will present a multimodal (inter)action analysis (Norris, 2019) of screen-recorded lessons to understand variance in an experienced online teacher's instruction-giving (inter)actions as a result of task repetition. We explore whether higher- and lower-level actions (HLAs and LLAs) in task instructions-as-process differ when the same teacher repeats the same task with two different dyads of University-age learners of B1-B2 CEFR level (Council of Europe, 2001). Lessons were conducted via the videoconferencing platform Skype and adopted TBLT approach to engage learners in authentic language use during a meaningful task and elicit linguistic output (Ellis, 2000). Our analysis for this paper explores a convergent task (information-gap). Our analysis demonstrates that task instructions appear to be more efficient during a second iteration: fewer higher-level actions are employed and, overall, instructions are shorter in length. In terms of lower-level actions, our findings indicate that the teacher uses the same gestures or gesture types across iterations. We will conclude with a discussion of (1) how semiotic misalignment may fragment or distort the shared interactional space and (2) how modal density misalignment can lead to different foregrounding of actions for the teacher and the learners.

To teach or not to teach: Communication strategies in video-mediated online interaction

Panel contribution

Ms. Caroline Collet¹

1. Saarland University

The paper investigates in how far authentic examples from video-mediated online interaction can be used to improve language proficiency, in particular pragmatic competence.

Language proficiency is the ultimate goal for every language learner – no matter at which age (CEFR 2001). In this paper, the focus lies on communicative competence and communication strategies following descriptors from the new volume of the Common European Framework of Reference (CEFR 2020). The aim of this paper is to provide authentic examples using excerpts from video-mediated interaction which will help learners to improve pragmatic competence and provide communication strategies.

The data which will be used are video-mediated conversations from the CASE project, in fact from the two sub-corpora ViMELF, (Diemer et al 2017), the corpus of video-mediated English as a Lingua Franca conversations, and TaCoCASE (Collet forthcoming), the Transatlantic component of the CASE project. Both corpora consist of conversations between international University students which were held via Skype. The conversations had been collected under the same conditions and the participants were provided with topic prompts about their everyday life.

Following a corpus-based discourse analytical approach, the paper examines what kind of communication strategies the speakers use when for example explaining a new concept or mediating a concrete situation. As far as pragmatic competence in particular is concerned, discourse markers play an important role (see e.g. Schiffrin 1987; Fraser 1999; Bolden 2006). We will take a look at what kind of discourse markers are used and what functions they fulfill. Following research conducted by Redeker (2006), House (2013), Buysse (2012), discourse markers fulfill different functions in non-native or ELF conversations. Therefore, the differences in use between native and non-native speakers will also be explored in greater detail.

The paper provides concrete and authentic examples using excerpts from video-mediated corpora and thus presents a new way of teaching and developing language proficiency.

Epistemics and deontics in the story world: (In)congruent status-stance relations in direct reported speech in stories of interactionally troublesome exchanges

Panel contribution

***Prof. Dorien Van De Mieroop*¹, *Dr. Melisa Stevanovic*², *Dr. Minna Leinonen*², *Mr. Henri Nevalainen*²**

1. KU Leuven, 2. Tampere University

Research on epistemics (Heritage, 2012) and deontics (Stevanovic & Peräkylä, 2012) has shown that through careful interactional analysis, researchers can tease out the relation between the different positions participants hold on epistemic and deontic gradients (viz., their status) and how they actually talk these positions into being (viz., their stance). The status and stance can be aligned, resulting in a congruent relation, or they may be incongruent, as people can invoke stances that imply more or less knowledge or authority than their statuses would suggest. Especially the latter case is prone to result in interactionally troublesome exchanges (ITEs).

The problematic nature of these exchanges often makes them tellable and so they may become the topic of post-hoc storytelling. Moreover, given that the problem source around which the story revolves is situated in a troublesome interaction, it is frequently through direct reported speech that the point of the story is being made. Importantly, while this term may suggest a 'direct' rendering of previously uttered formulations, research has instead highlighted that these reported utterances are adjusted and constructed – hence the alternative term 'constructed dialogue' (Tannen, 1989) – to fit the purposes and format of their new interactional context. Especially in stories, direct reported speech is often used to position story-characters vis-à-vis one another (Deppermann, 2013), seemingly objectively 'showing' – rather than 'telling' (Buttny, 1997) – the story recipients what kind of people the narrator interacted with. Moreover, when direct reported speech takes the form of lengthy sequences of reported exchanges, narrators may convey character-sketches of pro-/antagonists through the sequentiality they construct (Van De Mieroop & Clifton, 2013).

Building on this previous work, we argue in this presentation that (in)congruence in the epistemic and deontic status-stance relations constructed in direct reported speech utterances may function as a way to 'show' the story recipients the breach in social relations that ITEs cause. Drawing on a large and multilingual corpus of mundane conversations and research interviews, and using conversation analysis as a method, we analyze the establishment of (in)congruent status-stance relations in direct reported speech in stories of ITEs. We pay particular attention to how these relate to the surrounding storytelling context – for example through additional character sketches or metacomments – and to the moral and identity work of the narrator.

Interviewees' interpretative and naming practices as troublesome tools for tellability in sharing negative experiences

Panel contribution

Dr. Minna Leinonen¹

1. Tampere University

Sharing negative experiences in qualitative research interview interaction is a sensitive business that is shaped by the situational context and the overall task and research interests that researchers have explicated to the prospective interviewees beforehand. Earlier research has shed light on complaining as a delicate activity that may challenge one's sense of self unless one is able to present oneself as a reasonable person rather than as overly sensitive or a whiner.

The research presented here is based on the analysis of interviews conducted with people working in the Evangelical Lutheran Church of Finland on their experiences on interactionally troublesome exchanges at work. The dataset consists of interviews with people from different hierarchical positions and professional backgrounds who also vary in terms of their age and gender, to name just a few social divisions that surface in the accounts of their experiences. Interviewees were invited through different channels, using intra-organizational communication platforms, social media and personal networks. In the interview invitation people were encouraged to talk about both everyday challenges in workplace interactions and possibly more severe situations, including bullying, discrimination and gender-based/ sexual harassment.

By using the tools of conversation analysis and narrative analysis, we explore the interpretative and naming practices of the interviewees. These practices serve to highlight the organizational context and how and as what the described negative experience should be understood. We ask, firstly, how the interpretative and naming practices relate to the tellability of the accounts; secondly, how they contribute to the agency and competence of the narrator and, thirdly, how risks to tellability are managed in these practices.

Although ongoing research indicates that in some contexts naming negative behaviour as discrimination, bullying or something in the same vein is avoided, interview contexts openly framed as handling issues of equality seem to offer a possibility to increase the tellability of an incident by categorizing the experience. Naming practices may require careful management, though, to make use of the discursive power of naming morally questionable behaviour and to avoid miscategorizations that increase interviewees' accountability in the interview situation. Interviewees' interpretative and naming practices are important in understanding how inequalities can be addressed and discerned in interview interaction and what risks they entail to their user.

Public spaces as sites of interactionally troublesome exchanges for immigrants residing in Finland

Panel contribution

Ms. Annika Valtonen¹

1. Tampere University

Social interaction between immigrants and native people of their new country can become troublesome in a variety of ways, ranging from discrimination and well-meaning daily interactions to troubles in the service system. These interactionally troublesome exchanges (ITEs) may cause stress, discomfort and feelings of otherness for long periods of time after the initial interaction. Being able to account for these situations is integral in overcoming their negative effects on the personal level, as well as seeking social change. However, accounting for these experiences in a tellable way may prove difficult due to multiple reasons. For example, difficulties may arise from moral dilemmas relating to avoidance of being seen as someone who complains, differing cultural understandings or lack of a shared language with other characters in the ITE account.

In this study, a dataset of semi-structured interviews with 20 first-generation immigrants from various backgrounds recruited through Finnish multicultural organizations is analyzed, using Bamberg's positioning analysis. This study explores how immigrants make sense of the ITEs they experience with strangers in public places in Finland, to answer the research questions: *1) How do immigrants make their accounts of ITEs in public spaces with strangers tellable? And 2) How do immigrants position themselves as moral actors in relation to the offender in the story and the recipient of the account?*

In accounting for these ITEs occurring in public spaces, immigrants are faced with various dilemmas. The experiences may be hard to verbalize, when a big part of the ITE – the contents of what is said – is not understandable to the teller of the story. In the dataset, several problematic patterns of telling were identified, which reflect these dilemmas. First, the participants resorted to describing murky feelings of impoliteness or embarrassment, especially when they could not understand the verbal content of the potential insult. Second, they used reported speech of one's own interpretation of what was said in the situation in order to make the account tellable, which may undermine the credibility of the account. Third, they described troubling experiences of non-action by others, which makes it difficult to point out the exact violation that was committed.

When making sense of the experienced ITEs, the interviewees often denounced discrimination as a possible explanation for the ITE. Instead, explanations of differing cultures, drunkenness or the offending person's personality characteristics were offered.

Findings are discussed to shed light on the ITEs that immigrants regularly experience in their everyday lives, and the dilemmas relating to accounting for these experiences. Deeper understanding of the ITEs and the dilemmas relating to accounting for them is key to fostering healing and supportive interaction through social support and affiliation.

Reporting the thoughts of the antagonist: A delicate practice in the accounts of interactionally troublesome exchanges

Panel contribution

***Mr. Henri Nevalainen*¹, *Prof. Elizabeth Couper-Kuhlen*², *Dr. Melisa Stevanovic*¹**

1. Tampere University, 2. University of Helsinki

People's accounts of their past interactional experiences often take the form of stories, which in turn commonly involve "reported speech". The dramatization of the events in the story enhances the impression of tellability, vividness, and authenticity of the story. When the story is about an interactionally troublesome exchange involving the speaker as the protagonist and an absent third-party as the antagonist, reported speech may serve as a culmination of the criticism towards the third-party conduct. When the complainable matter is precisely what that person has said, reported speech enacts the complainable matter instead of merely describing it. Reported speech may be part of accounts about one-time interactional events, but also about general tendencies in the unfolding of interaction with certain antagonists.

In addition to reported speech, accounts of interactionally troublesome exchanges are sometimes embellished by the teller reporting the *thoughts* of the antagonist. While reported thoughts may also be assumed to add to the dramatic effect and tellability of the story, the practice—we argue—may also draw negative attention to the teller's own moral and psychological disposition. This is due to the simple fact that people's private thoughts are technically inaccessible to other people—and the more specific the details provided by the teller are on the thoughts of the antagonist, the higher the risk is that the teller will be held accountable for the accuracy of the thoughts reported.

In this paper, we investigate accounts of interactionally troublesome exchanges in which the teller reports the thoughts of the antagonist as an essential part of the criticism being made of the antagonist's conduct. Drawing on Finnish and English conversations in a broad range of data sets in everyday and institutional settings (e.g., performance appraisal, workplace meetings, research interviews), and on conversation analysis as a method, we investigate the immediate sequential consequences of this practice in terms of the recipients' responses, in this way also seeking to understand the preconditions and consequences of using reported thought as a storytelling practice in different interactional contexts. More specifically, we describe three sequential patterns associated with reports of the antagonist's thoughts: the recipient (1) refraining from taking any stance toward the report (*no affective or epistemic stance-taking*), (2) providing an affiliative response to the report, which allows the participants to circumvent the question of the accuracy of the report (*affective stance-taking*), and (3) challenging the report on epistemic grounds, thus refraining from providing affiliation (*epistemic stance-taking*). The consideration of these three patterns in detail sheds light on the dilemmas and paradoxes of accounting for subtle transgressions in interactional conduct, which may nonetheless be psychologically disturbing for those who are targeted by the transgressions.

Social and health care professionals' narratives of interactionally troublesome exchanges with their clients: accounting for and against the active role of the client

Panel contribution

*Dr. Elina Weiste*¹, *Ms. Nanette Ranta*², *Dr. Melisa Stevanovic*², *Mr. Henri Nevalainen*², *Ms. Annika Valtonen*², *Dr. Minna Leinonen*²

1. Finnish Institute of Occupational Health, 2. Tampere University

A current trend in health and social care is to involve clients in the development, evaluation, and production of services. Whereas clients have traditionally been treated as objects of treatment and their role has been restricted to agreeing with the professionals' decisions, today they are expected to have a word to say in their own treatment and to actively express their opinions about the services that they use. Indeed, giving the client such an active role is a central ideal and of value in itself. However, prior research has noted that there is a gap between the ideal and practice. Social and health care professionals appreciate client involvement but may simultaneously be hesitant about adopting it as their guiding work practice. Some professionals feel that equalized power relations with active clients threaten their professional competence and the boundaries between the professional and the client. From this perspective, social and healthcare professionals may sometimes experience their encounters with clients as interactionally troublesome.

In this presentation, we aim to investigate the contradicting views between the ideal and practice in social and health care professionals' narratives about interactionally troublesome exchanges with their clients. The data come from 14 audio-recorded thematic interviews with social and health care professionals working in municipal health organizations in Finland. By utilizing Bamberg's narrative positioning analysis, we ask how the client's role is constructed in these narratives, and how it is constructed in relation to the agentic roles the professionals assign to themselves.

We found that the social and health care professionals' experiences of interactionally troublesome exchanges with their clients were consistently related to the professionals' evaluations of clients along a continuum of their activity versus passivity in the service encounters. Clients' active participation was often seen as a straining disturbance that required the professionals' interactional competence to be resolved. The clients' passiveness was needed to smoothen out the service encounter, but it was also experienced as problematic. If the passiveness was considered to be caused by the client's illness and difficult life-experience, the professionals saw the passiveness as an interactional problem, and explored the ways in which they could reactivate the client in the service-process. If, however, the passivity was explained as being due to the client's attitude, the professionals cast themselves as unable to do anything to help the client. In the presentation, we show how the professionals in and through the narratives construct, adopt and contest moral obligations of an active client who should not "be laying around" but be motivated to actively participate in their services. We also show how the professionals allocate division of responsibilities between clients and themselves in mobilizing, and restricting, the clients' activeness.

The prosodic construction of inevitability of gender-based intergroup discrimination

Panel contribution

*Dr. Melisa Stevanovic*¹, *Mr. Henri Nevalainen*¹, *Dr. Minna Leinonen*¹, *Ms. Annika Valtonen*¹, *Dr. Elina Weiste*²

1. Tampere University, 2. Finnish Institute of Occupational Health

Discrimination is a deeply hurtful and widespread phenomenon in human social life, argued to be rooted in the fundamental psychological disposition of humans to categorize and differentiate between in-group and out-group members. While discrimination based on intergroup differences may be gender-neutral, it sometimes overlaps with, and becomes strengthened by, considerations of gender. Gender-based intergroup discrimination and the severe limitations it constitutes to women's freedom and capacity to obtain social recognition is common across cultures. This commonality of the problem only increases its severity. However, the paradoxical consequence of the commonality of the problem involves people's tendency to normalize it. The idea of such discrimination thus being inevitable has consequences for the ways in which people can tell other people about their experiences of thereof.

Problematic social experiences have been discussed in many conversation-analytic studies on complaints. These studies have shown that complaining is a delicate activity, which necessitates careful management of the degree of self that the teller invests in the complaint, as a complaint may easily cast them in a negative light. Therefore, complainants commonly work to distance themselves from the negative dispositional identities of a moaner, whiner, or an otherwise irrational and overly emotional person. Such distancing may become particularly relevant when the topic of the complaint is about a very common discriminatory behavior, which may hardly be considered as "news" to anyone.

In this paper, we analyze accounts of gender-based intergroup discrimination. Drawing on a data set of 11 video-recorded theme-based individual interviews (900 min in total), collected from December 2021 to July 2022 in Finland, we investigate the ways in which the speakers account for the events in which they experienced having been discriminated by their gender. We analyze the prosodic realization of these event-references, focusing specifically on those in which the speaker deploys a flat-stylized pitch contour with a relatively high tone on an unstressed syllable.

In line with previous conversation-analytic research on Finnish prosody, we show how the pitch contour can be used to mark the information conveyed in the utterance as routine for the speaker—that is, as something that is "no news" to anyone or as something like a destiny that one simply needs to endure. The stylization underlines the ritual nature of the utterance, which allows the speaker to distance from it. At the same time, the flat pitch span conveys a notable lack of enthusiasm in what is being said. Here, we show how these prosodic displays of fatalistic emotional stance serve the construction of inevitability of gender-based intergroup discrimination, allowing speakers to tell stories about their problematic experiences—their typical precondition, characteristics, and consequences—in a morally unproblematic way. However, the paradoxical consequence of these displays is that, in underlining the lack of newsworthiness of the problem of discrimination, the speaker implicitly undermines the need to act against it.

Does Age Influence Intergenerational Interaction? Experiences from the UnVergessen Project

Panel contribution

Prof. Katrin Karl¹, Mrs. Aldona Rzitki¹

1. University of Bern

Age is a complex construct that includes numerical, biological, social, and interactive characteristics (Fiehler/Thimm 2007). Based on these characteristics, we perceive another person's age, as well as our own. What are the implications of this for the interactions among people who differ according to some or all of these characteristics?

This is the primary research question, which is discussed with the help of the experiences from the long-standing intergenerational project UnVergessen (UnForgotten). In this project, couples are formed consisting of a student and an older person, usually in need of care. The couples meet over several months and exchange ideas on a variety of topics. A sub-project, called Letters against Loneliness, transfers the same personal exchange between representatives of two generations to the written space.

During the project, different data are collected:

- 1) General (biographical) data on the participants.
- 2) Excerpts from the conversations (audio recordings of the couples' free conversations) or letters.
- 3) Testimonies of the student's reflection (written and oral reports).

In our talk, we will present five of these partly multilingual couples and their data and evaluate them from different perspectives and with the help of different methods:

- Sociolinguistic analysis: presentation of the linguistic context of the persons involved (speaker biographies, including multilingualism) and classification of numerical and biological age.
- Discourse or text analysis: evaluation of conversation recordings or letters and elaboration of passages in which certain facets of age play a role in the interaction, either explicitly or implicitly.
- Qualitative content analysis: evaluation of the written and oral reflections regarding students' perception of age differences and their influence on the level of the relationship.

With the help of these results, we will discuss which facets of age are especially focused on and if and how they influence intergenerational interaction. Finally, we ask: Can a feeling of belonging arise in intergenerational exchange despite perceived differences? After considering the individual specificities, the average result is that differences are perceived, but they are not a hindrance to the constitution of the relationship. Rather, they serve to rethink and refine the concept of age.

Generations through time: Investigating ‘ageing talk’ via re-interviewing

Panel contribution

*Dr. Agnieszka Kielkiewicz-Janowiak*¹

1. Adam Mickiewicz University Poznań

As Nikander (2009) has demonstrated, a qualitative approach to discourse analysis can successfully capture continuity and change in language and in life. The aim of our long-term research has been to investigate ‘ageing talk’ over the life span, specifically the way language constructs life(time) and how it is used to express attitudes to growing older at different life-stage points.

This study presents interactions, 15 years apart, between members of two generations across time via a young(er) interviewer re-interviewing (Gerstenberg 2015; Andrews 2018) older interlocutors. Polish participants (aged 65-76 in 2006 and 80-91 in 2021-22) discussed “being old” with the same interviewer (in his early twenties for the first interviews and mid-thirties for the second). Additionally, the original interviewer was interviewed by a second researcher about his experiences of travelling through life side by side with others. The interviews were then qualitatively analysed, with the aim to uncover the discursive patterns and strategies used to mark:

- participants’ responses to their own passing to another life stage
- older adults’ constructing their lifetimes, fine-grading the later part of life, in particular, their constructing the difference between young-old and old-old
- younger interviewer’s expressing attitudes to ageing through the lens of his own growing old(er).

Both parties, now friends, refer to their own and each other’s lives. They share their (changing) perception of ageing, both having experienced growing older themselves and having witnessed each other’s ageing. They refer to their previous encounter as the interviewer introduces excerpts from earlier conversations. Specifically, late life seniors address their earlier assessments of what it takes to be old (in Poland); they sympathize with their younger selves, but are critical of their attitudes.

In both rounds of interviews, participants were observed to position and re-position themselves in order to manage their aged selves vis-à-vis their age peers and other generations (children, parents), and in the context of social expectations (Gullette 2004), i.e. the Polish context of growing social awareness of societal ageing (Leszko et al. 2015), yet with ageism rarely being challenged (cf. Gorman 2021).

The analysis of the initial round of interviews showed interviewees’ flexible attitudes to age categorisation, claiming and, at the same time, disclaiming age categories. Speakers were also ready to collaborate with the (younger) interviewer to recognize common ground (e.g. events shared). The comparison with re-interviews revealed interlocutors’ ability to understand the process of ageing from multiple viewpoints and positions (Biggs and Lowenstein 2011). Again, much of the shared understanding was achieved interactionally (and collaboratively).

The interviews revealed the expected redefining of speakers’ understanding of life experience and their perception of life time as well as relations between generations (cf. “[understanding] on the basis of a newly gained complexity and changed coherence – realization in hindsight” Pawelczyk and Graf 2020). Methodologically, the conclusions address the idea of using parts of previously recorded interviews as input in a follow-up study and the usefulness of re-interviewing as a research approach in longitudinal studies.

Keywords: ageing, discourse, constructing life(time), interaction, re-interviewing

Intergenerational encounters and multilingual resources in the talk of older adults

Panel contribution

***Prof. Boglárka Straszer*¹, *Dr. Kaarina Hippi*²**

1. Dalarna University, 2. Tampere University / University of Helsinki

The aim of this presentation is to discuss how older adults construct meanings and identities when they describe their changing repertoires and language choices in the past and present with their own parents and children and how they reflect on the transmission of languages to younger generations.

Ethnolinguistic analyses are done on semi-structured in-depth interviews with linguistic biographies in two datasets. In the first dataset, there are six interviews (á 46-87 minutes long) among Swedish- and Finnish-Hungarians elderly. All of them had moved to Sweden respectively Finland as adults directly from Hungary. The three Swedish Hungarian informants (68-83 years old) have a refugee background (during the year 1956) and they moved to Sweden with a Hungarian speaking spouse. The another three informants (59-65 years old) moved to Finland because of marriage with Finnish-speaking partner. In the second dataset, there are six interviews from a project *A Hundred Finnish linguistic life stories*, in which there are interviewees of other linguistic minorities residing in Finland (70–104 years old). Three of them represent the so called old minorities and three another official language group in Finland, Swedish Finns. Interviews were about 1 hour each.

In both of the datasets, there are questions on interviewees' relationship to different languages in their life and their language attitudes. Despite slight differences, these datasets offer an interesting possibility to compare and discuss language use between generations. We explore the subjectively expressed experiences of languages in relation to the societal situation and the linguistic biographies (cf. Busch, 2017) that can be seen as social and cultural itineraries (Blommaert & Backus, 2013). The descriptions comprise norms and expectations of the interviewees. In addition, we pay attention to language political and language ideological changes in societies, as in line with Busch (2017) we regard linguistic repertoire reflecting linguistic practices that are bound to a certain time and place.

We find personal descriptions among the interviewees when they talk about the role of heritage language versus majority language and other linguistic resources in their family. The Hungarian older adults seem to have a more multilingual repertoire than their grandchildren. All of the Hungarians speak Hungarian with their children but they express that the language choice with the grandchildren generation depends on the choices of the children generation. In case of minority speakers in Finland, the picture is more complicated, and thus, we end up comparing the role of individual choice and status of the language in respective (micro)society. The heritage language is sometimes emotionally most significant but sometimes pragmatic reasons override the use of it.

Perceptions of language use and generational differences between young and old

Panel contribution

*Dr. Kaarina Hippi*¹, *Prof. Hanna Lappalainen*²

1. Tampere University / University of Helsinki, 2. University of Eastern Finland

Our paper discusses perceptions of age in intergenerational interactions. We focus on the perceptions that older adults have of the language used by young, and the views young people express of the language used by old. We explore how language use between generations is conceptualized, and which opinions are explicitly mentioned, but we also pay attention to how these perceptions are negotiated in interviews.

Our main data come from a project called A Hundred Finnish linguistic life stories. The data for this study consist of 60 interviews. Half of the interviewees were born in 1913–1948 and another half in 1990–2011. We focus on their views on intergenerational communication and differences they have noticed in the language use between young and old. As a complementary data, we use notes written by students on the basis of interviews they have conducted on the topic. We approach the data in the sociolinguistic framework, identifying the parts in interview data where intergenerational communication is discussed and then analysing the topics discursively, as part of interview interaction (Liebscher & Dailey-O’Cain 2017). The written comments of the students are classified using qualitative content analysis.

On the basis of our findings, many interviewees identify clear differences between age groups and express also emotions concerning the language use of old and young. First of all, addressing older people by using T or V forms is a topic that is frequently commented. It proves to be a complicated question in Finland, as the age is most prominent factor in choosing an address form, but personal preferences vary: some older adults value more distant addressing while others prefer informal forms also in institutional encounters. Secondly, other perceptions on the differences of the language use are described. For instance, lexical choices of the young generation are frequently commented on, and in particular, these choices are connected to the digitalization and social media. Older adults find this kind of language difficult to understand. In addition, the dialect use and tempo of the speech are issues that are mentioned as generational issues. However, many informants express reservations to their comments that show the multifaceted nature of the topic and that informants do not only circulate stereotypes but recognize individual variation.

Our study offers new insights into the questions of language use and ageing. It focuses on people who are not under institutional care, and in addition to obvious stereotypical remarks, it sheds light on how these perceptions are presented and dismantles the perception of older adults as a homogeneous group.

**Internet memes of
everyday life (organized
by Loukia Lindholm,
Tuija Virtanen)**

A semio-pragmatic analysis of the meme “El Risitas”: a trajectory from laughter to politics

Panel contribution

Dr. Michel Marcoccia¹

1. *University of Technology of Troyes*

In the early 2000's, Juan Joya Borja, known by the pseudonym of El Risitas (the laughter), tells jokes in a TV program hosted by Jesus Quintero, in the local Andalusian television channel *Canal Sur*. El Risitas is the embodiment of an “ordinary” man, rather socially disadvantaged, poorly educated and expressing a form of common humor. A joke posted on YouTube in 2007 was a big hit: El Risitas tells a funny story to Jesus Quintero (whom he calls “Issou”), interrupted by contagious laughter. This video has been viewed more than a million times, has been the subject of numerous variations and become an emblematic meme of internet culture since 2015. Thus, El Risitas can be seen as the memefication of an ordinary man.

In France, El Risitas is very popular in the very frequented discussion forums of the *Jeuxvideo.com* website, in particular “*Blabla 18-25 ans*”, whose members produce many diversions of the image of the laughter: the memes of El Risitas and the word “Issou” become a sign of recognition for the core members of this forum.

This study will focus on the use of El Risitas in this forum and will address three aspects. First, a semiopragmatic analysis of the meme allows us to address the following questions: what forms (visual or scripto-visual language)? What type of propagation: replication or variation (Paveau, 2017)? What functions: expressing emotions, especially laughter and joy (Danesi 2017), enacting collective identities (Yus, 2018), etc.

This analysis highlights the polysemic nature of the meme (Jost, 2022) and its role in the building of a community, based on cultural references shared in the group but incomprehensible outside the group.

A dialogic analysis will allow us to define the function of the meme in the interactional dynamics of discussions. Does it appear in messages opening sequences or as a reaction meme? What types of reaction does it express and what types of reaction does it elicit?

Finally, this study shows the way the meme becomes a political object. Like “Pepe The Frog” in the USA, El Risitas is used in France by extreme-right Internet users to express their support for a set of extremist, racist, anti-feminist or homophobic opinions. The meme then becomes a means of redefining the community as a political community; it makes it possible to enter into public debate and constitutes a new form of political commitment (Wagener, 2021).

Beyond bonding icons: Memes in interactional sequences in digital communities of practice

Panel contribution

Dr. Ying Tong¹, Prof. Chaoqun Xie²

1. Nanjing Xiaozhuang University, 2. Zhejiang International Studies University

Existing research on memes has pointed out their prevalence in identity negotiation and community-building (e.g., Yus 2018; Wiggin 2019; Newton et al. 2022), apart from being humorous literacy practice (e.g., Knobel & Lankshear, 2007, Lewis, 2012, cf. Dynel 2021). Yet limited attention has been paid to memetic practices within interactional sequences, i.e., How are memes actually employed in everyday communication to facilitate discursive exchanges? What role do they play in initiating, facilitating, ending digital conversations, strengthening, and mitigating the illocutionary force of utterances within? For the present study, internet memes, in the form of animated GIFs as well as image macros, are examined as utterances embedded in the unfolding task-based interactions that may further, counter, or re-direct a discourse. Situated within the digital communities of practice (henceforth DCoP), this study focuses on the way community members practice stance imitation through memes deployment and their uptakes, which will be analyzed, following Shifman (2013), in terms of participation structures, keying, and communicative functions. Given that different platforms may be perceived as evoking different feelings and flavours, DCoP members interacting on different platforms may engage memes in variable ways. At the same time, one member of a particular DCoP may actively engage in other DCsoP that are equally task oriented. As such, this study on meme roles in discourse development attempts to address the following issues:

- 1) In what interactional sequences are internet memes used?
- 2) How do meme-framed digital utterances contribute to task and identity negotiations?
- 3) To what extent would digital affordances promote/prohibit the use of (particular) internet memes from an emic perspective?

By focusing on five DCoP members and drawing on their meme practices from more than one DCoP they belong to, the study follows the virtual ethnography for data collection (starting from May 2022 and ending in March 2023), and CA-informed analysis for data interpretation. The data triangulation through in-depth individual and group interviews (scheduled in March and May 2023) allows first-order conceptualization of memetic practices to inform second-order theorization on memefied ways of life. The study is expected to contribute to the move of excavating the wealth out of the coupling of memes and digital communication.

From me to you: building relatability in academic Tumblr posts

Panel contribution

Dr. Celia Schneebeli¹

1. University of Burgundy / Centre Interlangues

Tumblr is a “microblogging and a social networking site” that “enables users to post and share a variety of different types of media (text, photos, videos, GIFs) on their individual blogs” (Vasquez 2019: 87). It hosts a few popular blogs where users share their experiences of academic and / or PhD life thanks to posts combining a caption describing a situation and a GIF mirroring the situation in question. In this contribution, I explore how posters construct relatability in such posts. The data mostly originates in one particular Tumblr blog, PhD in Gifs!, including content posted since January 2020 .

Building up on previous research about GIF use, humour online and Tumblr posts, the study looks at four potential (mutually inclusive) factors of relatability:

-form of caption. The posts deal with situations appealing to common experiences shared by the expected audience of the blog . Their captions often use a first person singular, but a large portion also go for a second person singular, which directly projects the poster’s experience on the receiver, be it quite general or very specific.

-content of caption. Most posts in the dataset can be described as self-defeating while only a minority is self-enhancing: they recount what can be vaguely called “negative” experiences rather than “positive” experience. This self-defeating style of humour has been found to be the most viral (Taecharungroj & Nueangjamnong 2015).

-image choice. GIFs enable users to illustrate the recounted experience with scenes from famous pictures, cartoons, series, or popular figures from the fictional and real world. As Miltner and Highfield write, “The selection and presentation of GIFs are also a performance of cultural knowledge. The GIF is not just a proxy for the individual’s particular affective or emotional state, but an illustration of the user’s knowledge of a certain text or cultural conversation” (Miltner and Highfield 2017: 6-7). In selecting a GIF, users may then make a statement about themselves while creating a sense of belonging with other users who are familiar with the same culture the GIF comes from.

-interaction between caption and illustration. Posts often rely on tropes (metaphor, hyperbole, irony), which dramatize the rather banal experiences recounted in the captions. Incongruous associations (Dynel 2009), discrepancy between caption and GIF, are the main source of humour and comic relief in the posts.

The study takes a broad discursive approach to the analysis of the posts, considering traditional linguistic material (linguistic markers used in the caption) and semiotic features (non-linguistic communication markers used in the GIFs) within the broader perspective of posting as a social practice.

Internet memes in China: multimodal creativity in a translocal discourse system

Panel contribution

*Dr. Freek Olaf de Groot*¹, *Ms. Zhuoli Gao*²

1. University of Kurdistan Hewler, 2. University of Pennsylvania

This paper reports on the translocal ludic internet meme practices of a student community at a private university in China with the aim to present a different perspective on the role that internet memes play as part of digital practices. Internet memes are part of a genre of ludic multimodal digital practices and their production involves multiple processes of multimodal digital remixing (Jones and Hafner, 2021), entextualization (Blommaert, 2005; Bauman and Briggs, 1990) and resemiotization (Scollon & Scollon, 2004; Iedema, 2003). Internet memes are generally produced and shared within a particular genre or across or within various cultural, national and linguistic boundaries. In addition, they are often studied as independently operating artifacts ‘going viral’ and ascribed a certain degree of agency without taking into account the discourse system (Scollon, Scollon and Jones, 2012) they are shared within. This study takes a social semiotic (Kress, 1996, 2009) and Mediated Discourse Analysis approach (Scollon, 2001; Scollon and Scollon, 2004; Norris and Jones, 2005) to understand the processes of creation of these memes, the meaning potential these memes create when used in social interaction, and how this meaning potential and use result in these memes being unique to a distinct discourse system. The data was collected using a form of digital ethnography (Androutsopoulos, 2015). The researchers were participants and members of discourse system within which these memes were produced and used. The memes were collected and translated by a native speaker of Mandarin who is also a member of the discourse system. This enabled us to understand the translations and meanings of the memes within the context of the discourse trajectories leading up to these moments of creation. These trajectories are essential to understanding the meaning potential of these memes as they are used in digital communication among members of the discourse system. The memes studied in the current paper are unique in two ways. First, they combine both local and global visual elements deploying both Chinese and English texts and effectively forge semiotic trajectories between highly localized digital meme practices and more global mainstream meme practices. Second, the practices of producing, sharing and remixing these memes are exclusively situated and bounded by a distinct discourse system. Based on our findings, we conclude that the internet memes analyzed as part of this study are multimodal ensembles that create a meaning potential that is unique to the discourse system of a student community. In addition, these signs perform an important function in mediating a wide range of ludic digital literacy practices within this discourse system.

Multimodal creativity, narrativity, and daily life in the “Breaking things down” meme

Panel contribution

Dr. Loukia Lindholm¹

1. Åbo Akademi

Adding to recent work on multimodal creativity and humor in internet memes (e.g., Dynel, 2020; Piata, 2020; Vásquez & Aslan, 2021), this paper focuses on the memetic construction and mediation of everyday, commonplace experiences by examining a set of image macro memes known as “Breaking things down” or “Sections of”. This meme format features an up-close image of an object labeled in sections, with each section marked off by curly or square brackets. Meme creators use the objects depicted in these image macros as visual references for experiences of everyday activities (e.g., eating and drinking, driving, going shopping, reading, using social media), which they comment on and typically—though not always—cast in a humorous light in the labeled sections. The dataset comprises a sample of 200 “Breaking things down”/“Sections of” memes collected from three different social media platforms. Drawing on multimodal discourse analysis (e.g., Jewitt, 2013) and cyberpragmatic approaches to memes (e.g., Yus, 2018), the analysis focuses on how the visual and verbal components in the multimodal ensembles under investigation interact to articulate and comment on personal experiences of everyday activities. The study shows how meme creators use the brackets as a creative semiotic resource for narrativization to organize labeled sections in a temporal frame, show cause-effect relationships, and indicate contrasting stances that generate humorous meanings. The analysis also demonstrates how meme creators establish common ground and shared identities through creative iterations of the same image macros in local discourse contexts, such as Twitter threads.

The Language Play and Social Indexicality of Internet Memes: An Analysis from Turkish, English, and Bilingual Memes

Panel contribution

Mr. Ümit Can Tunçer¹, Dr. Didar Akar¹

1. Bogazici University

The phenomenon of Internet memes has been a point of interest for many communications studies (Shifman, 2014; Wiggins 2019). Recently, this phenomenon has caught the attention of scholars of linguistics as well, especially in the domain of pragmatics (Xie, 2020, 2022). Vasquez & Aslan (2021) categorizes the humor in memes under three categories which are *voicing*, *wordplay*, and *register humor*. The works such as Yus (2016, 2021) approach a subgroup of memes (image-macro memes) in the framework of incongruity-resolution, treating them similar to verbal jokes but with visual elements to either aid or complement the meaning. Some studies in sociolinguistics (George, 2020) have also recognized Internet memes as significant facilitators of social meaning and interaction. However, considering the vast diversity of memes, these frameworks remain inadequate for capturing the role of language in memes in terms of social meaning and humor. This study builds on these frameworks by adding additional categories based on examinations of a dataset of Turkish, bilingual, and English memes (n=500) collected from various social media platforms. These new categories are determined by adopting Vasquez & Aslan's (2021) three categories and expanding them into a total of eight categories by adding *labeling*, *framing*, *foreign effect*, *distorted use of language*, and *narration*. These additional categories are used to classify the language play, code-mixing, written narrative, and the relation of visuals and text inside Internet memes. While these categories together provide a broader tool to analyze Internet memes, humor and meaning achieved in them can be a result of a complex social structure of meaning and interaction. Words and phrases used in memes can have multiple distinct social meanings available only to their specific communities and subgroups via indexes. Therefore, this study also utilizes the framework of indexicality (Peirce, 1935) as it was used in sociolinguistic studies (Ochs, 1992; George, 2020) to further explain the source of humor and meaning in Internet memes. With the help of concepts such as *indexical order* (Silverstein, 2003) and *indexical field* (Eckert, 2008), the study shows the meaning-making process of memes, by exploring the layers of meaning and identity construction from the language and imagery used in memes. Overall, this study aims to provide an analysis of the language, social meaning, and humor in Internet memes. Building on what is already available in the newly emerging literature, it presents a set of tools that can capture the meaning and humor within the domains of pragmatics and sociolinguistics.

What can visual aphorisms tell us about multimodal internet memes?

Panel contribution

Ms. Kukka-Maaria Wessman¹

1. University of Turku

Aphorisms – short statements containing a truth of general import – circulate through speech and writing, and they have been combined with pictures in postcards and decorative paintings. Thus, aphorisms are memes of everyday life; cultural ideas spread by imitation (Blackmore 1999). The internet speeds the circulation of memes (Shifman 2014), and has also transformed the way people share and create visual aphorisms on social media. This paper explores online aphorisms as multimodal internet memes. Focusing on visual aphorisms in a Finnish Facebook group, I examine collective meaning-making and stance-taking from the perspective of Construction Grammar. The research questions addressed are the following:

1. How are the aphorisms in the data constructed?
2. What is the role of the visual mode in visual aphorisms in this group?
3. What are the communicative functions of visual aphorisms within the group?

The data consist of a collection of online aphorisms from a Finnish Facebook group meant for sharing bad or shallow aphorisms called *Paskat teepussiaforismit eli kuinka lakkasin rakastamasta ja opin vihaamaan 'shitty tea bag aphorisms or how I stopped loving and learned to hate'*, which at the time of data collection had 16 000 members.

The visual aphorisms comprise a textual and a visual mode. The text is an aphorism, either a well-known quote or one made up by the creator of the visual aphorism. Arguably, the text is completely understandable without the image in most of the visual aphorisms under investigation. This differentiates the visual aphorisms from other multimodal internet memes, such as image macros, where the image is often an integral part of the linguistic construction (see e.g. Dancygier & Vandelanotte 2017). Therefore, these visual aphorisms challenge our understanding of multimodal internet memes.

Visual aphorisms are multimodal, for two reasons. First, a difference in form always entails a difference in meaning (Langacker 1987); adding a mode thus affects the meaning. Second, it is speculated that pictures are preferred to plain text by Facebook algorithms. Marketing professionals encourage users to add pictures to posts to boost engagement, which makes multimodality intrinsically important (Li & Lie 2020).

The role of the image varies across the visual aphorisms. In some the image is a plain color background, whereas in others it contributes to the stance of the aphorism. The study shows that most visual aphorisms shared to the group originally contain an encouraging stance, which is reversed and ridiculed in the context of the group. The visual aphorisms may not have been originally intended as amusing, but by adding a caption and sharing them with the group, the members reframe the aphorisms with a humorous stance.

How K-wave Fandoms Create Language that is Between and Beyond Korean and English

Panel contribution

Prof. Jieun Kiaer¹

1. *University of Oxford*

This paper focuses on the agentive role of K-pop, K-drama, and K-film's fandoms in the creation of a language that is between and beyond Korean and English. Over the last two decades, Hallyu (the Korean Wave) has swept across the globe, gaining global fame in recent years. K-dramas, K-films, and K-pop now have fandoms made up of young people all over the world. These fans take to Twitter to discuss their favourite K-content, the most famous of which includes *Parasite* (2019), *Squid Game* (2021), and an array of BTS' songs. In 2021, #Kpoptwitter amassed 7.8 billion tweets. K-fans have become so numerous and active on Twitter that the platform now has a dedicated Global K-pop and K-content Partnerships team. This paper is written in collaboration with this team at Twitter.

As K-fans discuss Hallyu content in online spaces, they employ translanguaging. English is the lingua franca of social media, and so fans innovatively mix Korean and English together, regardless of the border between the two languages. Fans use translanguaging to go back and forth between the two languages, flexibly and creatively interweaving various linguistic features (Garcia & Li, 2014). K-fans absorb Korean words through K-content. They use these words on social media so often that traditional linguistic authorities have started to pay attention. In 2021, the Oxford English Dictionary added 26 Korean words because the words were being used so often online. Fans often romanise Korean words as they perceive, picking spellings that look most friendly to the eye of the English speaker. These words are not limited to verbal expressions. The finger heart is now a commonly recognised gesture amongst the younger generations, and it was added to the emoji keyboard in 2021. Thus, K-fans innovatively create translingual expressions (Kiaer, 2018).

K-fans fiercely debate the accuracy of translations in online spaces. They scrutinise subtitles and translations of their favourite K-content. For example, *Squid Game*'s translation of address terms caused much debate on Twitter. K-fans often create their own translations. These fans are known as *fandom translators*. They actively engage in creating the language and culture of the K-wave, meaning that the K-wave is a grassroots linguistic phenomenon.

Overall, this talk will explore how K-fans are a transnational, transcultural, and translingual body. They engage in matters of nationality, culture, and language without limitations from nation-state borders. K-fans' impact now goes beyond being loving fans, and extends into linguistic developments. They actively construct the meaning of Hallyu and the significance that it has in the world. They have changed the *K-* in the *K-wave* to mean something bigger than 'Korean'. *K-ness* is now a phenomenon that is being shaped globally.

Stancetaking by book bloggers in public and private: Investment in relation to audience

Panel contribution

*Ms. Jenia Yudytska*¹

1. University of Hamburg

This paper presents an investigation of stancetaking by a small group of ‘book bloggers’ within the sci-fi and fantasy book fandom. Book bloggers are fans who post reviews and recommendations of books on their own websites and/or across social media platforms like Twitter, Reddit, YouTube, etc. They have complex identities within their communities. To some extent, they are simply passionate fans, sharing their thoughts on books, authors, and the hobby of reading more generally. However, as a blog gains popularity, they typically develop connections with publishers and authors, e.g., receiving free books in exchange for ‘an honest review’. Book bloggers are thus also a semi-formal part of the marketing branch of the publishing industry, acting as influencers on its behalf (cf. Steiner, 2010).

Drawing on Kiesling’s notions of investment as a dimension of stance (2020), this paper investigates the same book bloggers’ stancetaking in public and private, focusing on their use of discourse markers to vary their degree of investment. Investment refers to how committed the speaker is, that is, the extent to which they commit to their evaluation of a stance object. Using hedges, boosters, and other linguistic cues, the speaker can lower or heighten the strength of positive and negative evaluations. I examine to what extent a difference in audience leads to a difference in commitment for the book bloggers: mitigating negative reviews in public or alternatively boosting a positive evaluation while promoting a book on behalf of publishers, compared to the way they express the evaluation in private.

The analysis is two-fold: a corpus study comparing the frequency of hedges and boosters across two platforms, followed by a small-scale case study of the bloggers discussing the same book in public and private. The corpus used comprises ca. 50,000 messages across the platforms Discord and Twitter, collected from a small group of voluntary participants; they all use both platforms to interact with each other and others in the community. The bloggers’ Discord server is small and private, consisting of only several dozen close-knit friends. However, on Twitter, they fall into the category of micro-influencers, promoting books to several hundred/thousand followers. Thus, while on Discord, they can discuss books freely as fans, on Twitter, they must decide more carefully what and how to promote or critique in order to maintain their connections within the publishing industry, while nevertheless maintaining their integrity as honest reviewers. Comparing their practices in public and private allows a thorough analysis of how book bloggers navigate the sometimes-conflicting identities of fan, critic, and influencer.

The discursive construction of online fandom: Stancetaking in Chinese e-commerce live streaming interactions

Panel contribution

*Mr. Jialiang Chen*¹, *Dr. Ping Liu*¹

1. Guangdong University of Foreign Studies

Fandom has become a social and cultural phenomenon in the digital era, especially in e-commerce live-streaming discourse. This study explores how Chinese livestream shopping celebrities present a particular ‘public private self’ through their interactional stance with their fans. To address this question, we draw on a self-built corpus comprising 100 h of transcribed texts from live streaming interactions on top Chinese social media platforms Taobao and Douyin. After identifying stance expressions in the corpus (cf. Fuoli, 2018), we find that Chinese livestream shopping celebrities constantly disclose their actual interior state through epistemic, evaluative, and affective stances. These stance expressions are used to dynamically construct and display preferred celebrity identities based on ongoing interactions and foster a strong feeling of connection and empathy with their fans. The present study is expected to enlarge our understanding of stance-taking in Chinese e-commerce live-streaming interactions and provide insights into the mechanism of the discursive construction of online fandom in the digital era.

‘It just had a sneaky vibe is all’: Stancetaking and the collective negotiation of advertising norms in YouTube comment sections

Panel contribution

Ms. Olivia Droz-dit-Busset¹

1. *University of Bern*

Orienting to recent research on elite language work (Thurlow, 2020), this paper addresses the negotiation of advertising norms on YouTube. As ‘new-generation’ copywriters, social media influencers strategically blend commercial and social discourses in peer-to-peer recommendations (cf. Kelly-Holmes, 2016), and walk the fine line of catering to both audiences and advertisers. As part of a larger project, this paper documents the expectations of an influential group of stakeholders in this exchange: audiences who actively contribute to YouTubers’ audience design efforts by leaving evaluative comments. Specifically, I analyse commenters’ stances towards a contentious ad created by YouTuber Casey Neistat. The video in question elicited over 17,000 comments – about double the usual number – of which a considerable amount pertains to the format of the ad featured in the video. The 500 top-rated comments were sampled for analysis. Using a discourse analytical framework developed by Droz-dit-Busset (2022), I explore how audiences use stances to (de)legitimise Neistat’s advertising practices. I argue that, in doing so, they collectively create advertising norms for their community of practice. My paper ends by considering the sociopragmatic implications of such controversial ‘participatory spectacles’ (Androutsopoulos 2010) and the rare moments in which audiences attempt to dictate rules for ‘correct’ social media advertising.

“OMG I ship them like crazy”: Acts of self-positioning through evaluations in Korean TV-drama fan comments

Panel contribution

*Prof. Miriam Locher*¹, *Dr. Thomas Messerli*²

1. University of Basel, 2. Univers

On the online platform viki.com, fans of Korean TV drama series meet and use the affordances of the platform to engage with each other and with the series they stream. We have previously explored how these fans orient towards the community and the audiovisual artefacts they are engaging with, constructing common ground (e.g. Kecskes, 2014: 151–175) and community in comments written primarily in English (as a Lingua Franca). While scholars such as Richardson (2010), Androutsopoulos & Weidenhöffer (2015), Lee (2016) or Bednarek (2017) work on fandom practices in diverse spaces such as reviews and social media affordances, we also build on our previous research on fan-generated subtitles (Locher, 2020) and on comments that users post, so-called timed comments (Messerli & Locher, 2021; Locher & Messerli, 2020), *within* the same streaming platform. We work with KTACC, the “K-Drama Time Aligned Comment Corpus”, which is a corpus of 320,000 timed comments that were written to exchange thoughts about 80 different K-Drama episodes. The timed comments, by being tied to the video stream, create an effect of pseudo-synchronicity (Johnson, 2013) and thus of communal watching and at the same time let many viewers contribute their thoughts and opinions to the K-Drama discourse.

Fans construct their own identity as viewers and community members in many different ways: They laugh together; they develop shared understandings of the genre they are engaging with; they look for others with shared common ground; they use Korean terms as jargon to position themselves as experts and to affiliate with others even across linguistic borders; and not least of all they share evaluations and opinions about the streamed K-drama episode and aspects within and outside of it. We have noticed such evaluative practices when manually coding a subcorpus of KTACC exhaustively, e.g. discovering the importance that is given to the physical appearance of actors, but also the actions of characters within the plot.

Using corpus-assisted discourse analysis, we now ask how acts of evaluation contribute to the construction of the Viki fandom. We systematically searched our corpus for documented and novel patterns of evaluation, addressing the objects and the polarity (positive/negative) of evaluation as well as their linguistic realization by means of established general patterns (e.g. adjectives such as *good*, *bad*, *amazing*, *cute*, etc.) and more local, genre-specific realisations (including e.g. evaluations initiated by *omg* and other acronyms, emojis, and expressions like *ship* in the sense of ‘wanting someone to begin or continue a romantic relationship’, as in our title “OMG I ship them like crazy”).

By expressing what they like and dislike about the shows they are watching, Korean TV-drama fans perform acts of motivational evaluation, establishing which aspects are worth to be foregrounded and collectively evaluated. They also position themselves relative to these evaluated aspects, primarily by means of adequation and distinction. And they thus discursively construct their own identity as a fan community, as separate fan groups and as individual fans, e.g. of particular plots, actors, and dramas (see Bucholtz & Hall, 2005).

Pilar Garces-Conejos
Blitvich, Maria Sifianou)**

Aggression, conflict and the interactional emergence of discriminatory discourse in social media

Panel contribution

Prof. Stavros Assimakopoulos¹

1. University of Malta

As evidenced by the extensive literature in the field of Critical Discourse Studies, textual analysis can provide significant insight into the particular ideological stances that underlie discriminatory attitudes. Within this setting, the relatively recent growth of social media into what is increasingly being recognised as a main player in the realm of ideological control has led to a shift of analytical interest from elite to social media discourse (see, e.g., KhosraviNik 2018). While research in this vein is still in its infancy, it appears to have so far focused, for the most part, on the analysis of individual posts, with a view to assessing the extent to which discriminatory attitudes surface in some delimited context; be it a single thread, a topic of interest or even a whole social media group or platform. Obviously, this approach has its merits, but it downplays the role that the interactive social media setup plays in the process of discursively constructing a stance. As Giles et al. (2015: 46) note, however, “it is important to be able to track the spread of ideas or opinions through hundreds of thousands of [social media posts...], but to ignore the interactional dynamics at the local level would be losing sight of the trees in order to understand the wood”.

Acknowledging that stances are not simply expressed, but are primarily negotiated in the social media setting, the main objective of this paper is to elucidate the central role that interactivity plays in both the dissemination and confrontation of discriminatory discourse. More specifically, it aims to pinpoint the main interactional patterns that underlie stance negotiation within the social media polylogical context. Drawing on an analysis of comment threads found under six YouTube videos that deal with migration, LGBTIQ issues and abortion in turn, this paper zooms in on the ways in which commenters engage in conversation and evaluate each others' opinions. The upshot of the analysis is that there is a distinction between aggression at a personal level and conflict at an ideological one and that the two categories are not necessarily co-extensive, even though they do appear to criss-cross when it comes to stance negotiation. Following this, an attempt is made at providing a preliminary analytic taxonomy of the observed patterns, while its implications for the identification of specific participatory online spaces as echo chambers or fora for more democratic deliberations are also briefly discussed.

Annotating hate speech: particular challenges and opportunities along the online-offline continuum

Panel contribution

*Dr. Didar Akar*¹, *Dr. Ayşecan Terzioğlu*², *Mr. Burak Işık*¹, *Ms. Pelin Önal*¹, *Ms. Elif Erol*²,
*Mr. Halil İbrahim Ergül*²

1. *Bogazici University*, 2. *Sabancı University*

Recently, hate speech has gained a new visibility in academia, partly because of the increasing popularity of social media. Political and cultural polarization at both global and local levels also fosters and is fostered by hate speech. Due to the voluminous number of social media users, hate speech reaches a larger audience expeditiously, and this, in turn, facilitates its normalization as a common form. Most studies on this topic take an NLP (natural language processing) and computational perspective, focusing on hate speech detection models. As the exponential growth of hate speech data makes manual detection unsustainable, AI (artificial intelligence) solutions have become indispensable. Although there are several studies on social media, distribution of hate speech through newspapers is largely overlooked in Turkish academia. Through an interdisciplinary perspective including linguistics and cultural studies, we seek to understand the similarities and differences between offline and online hate speech patterns in Turkish print and social media.

In this study, we use data from two research projects aiming to develop an algorithm to detect hate speech in Turkish, one focusing on print media and one on Twitter, using Twitter's Academic API (application programming interface). Methodologically speaking, only target groups and texts containing hate speech were analyzed in the project on hate speech in newspapers. On the other hand, the Twitter data have been annotated regarding general tone of the tweet, the degree of hate speech, the category of hate speech, and discriminatory speech. Apart from this, the target group of the tweet is predetermined, independently of hate speech. Within these target groups, there are countries, races, nationalities, gender groups, as well as people of certain views, status and profession.

The data we examined in these two projects are different from each other in various ways which offer valuable opportunities for a deeper understanding of hate speech patterns in Turkish print and social media. To begin with, people often know the ideological position of a newspaper, which gives us contextual clues about what is being said. On the other hand, obtaining contextual clues is not always possible on Twitter using the limited amount of available information. It is difficult to trace the users' political stance or any contextual information due to the limitations caused by working with a large data set. While the articles in the newspaper can be supplemented with longer texts and photographs and fonts, the data from Twitter consists of very short sentences and often does not have more contextual clues. Based on the semi-structured interviews we have conducted with ten annotators from both projects, we contend that inter-annotator disagreements are more pronounced regarding tweets than news articles, not only because of the lack of contextual information but also because of the annotators' disciplinary and academic backgrounds.

Covid-19 and “Divine” hate speech against women on Arabic Twitter

Panel contribution

*Dr. Najma Al Zidjaly*¹

1. Sultan Qaboos University

In this paper, I examine the appropriation of Covid-19 pandemic by Arabs as a resource to unleash systematic hate speech, including some which border on violence, against women on Arabic Twitter. To systematically analyze the connection between pandemics and hate speech, I highlight the hostile posts Arabs published on Twitter in reaction to the Covid-19 pandemic. Analytically, I draw upon a relational approach toward impoliteness (Locher 2018); the concept of *moral order* (Kádár 2017), defined as ritualistic practices; and research that has identified the role that intertextual references can play in facework and identity negotiation in the digital Arabic context.

Specifically, I pose the following research questions: What are the types and functions of systematic hate speech against Arab women used by Arabs on Twitter during the Covid-19 pandemic? What are the linguistic strategies used by Arabs to construct impolite-oriented discourse in favor of keeping the traditional Islamic moral order which highlights patriarchy? (e.g., directives, metaphors, intertextual references, sarcasm, and irony)? What is the role that *divine impoliteness*, or intertextually referencing religious texts in favor of or against an existing (im)moral order (Al Zidjaly 2019), and facework play in the negotiation of the Islamic intersubjectivity as apropos to gender equality? And what are the ramifications of such discursive actions for women and gender reform in Arabia and social justice research in general?

I have identified five types of hate speech used in tweets against women during the pandemic: 1) ridiculing Arab women by using metaphors that construct them as deadly viruses, 2) attacking the character/behavior of Arab women through erroneously positioning them as immoral, 3) encouraging physical violence against Arab women (taking advantage of the lockdown that shut down police stations), 4) directly requesting the removal of women's rights which have erroneously been constructed as the reason behind the pandemic, and 5) positively constructing the pandemic for forcing women to stay at home and cover up (i.e. verbally welcoming the coronavirus for “disciplining” or bullying women into abiding by sharia laws [e.g. staying indoors, covering face]). Collectively, the strategies legitimize violence against women and uphold outdated patriarchal norms.

The paper contributes to impoliteness research by examining the connection between pandemics and hate speech against women in understudied Arab societies. The findings further illuminate the role that impoliteness can play in the negotiation of the Islamic moral order and gender reforms in the Arabic context. More importantly, the paper adds to the special topic of the conference by demonstrating how atypical events (e.g., pandemics) turned Arabian Twitter into a site of atypical linguistic behavior (e.g., aggression), threatening the female members of Arab society.

Digital Discourses of Arab Feminism: Intersecting Layers, Conflicting Visions, Emerging Transnationalism

Panel contribution

*Dr. Eleonora Esposito*¹, *Dr. Francesco L. Sinatora*²

1. *University of Navarra*, 2. *The George Washington University*

Embedded in a post-colonial context characterized by deeply rooted cultural and ideological divisions, Arab feminist digital platforms currently advance their local and global agendas while facing different degrees of religious conservative backlash and delegitimization as mere neo-imperialist projects.

This paper examines the digital discursive strategies of contemporary Arab feminist social movements through a corpus of over one-hundred multimodal texts and comments drawn from the public Facebook and Instagram accounts of thirty-two feminist groups in Jordan, Lebanon and Morocco. A longitudinal, “screen-based” observation (Androutsopoulos 2017) of data published between 2011 and 2021 allowed us to “purposefully sample” (Patton 2002) texts grounded in historical events such as the Arab Spring, the #MeToo movement, as well as the 2019 wave of protests in the Arab Levant.

Within a social media critical discourse perspective (SM-CDS) (KhosraviNik and Esposito 2018), and through the notion of “entextualization” (Bauman and Briggs 1990), we build on the concept of “digital mirroring,” (Esposito and Sinatora 2021) to show how the digital circulation of multimodal texts across the Arab world constitutes an informal, subtle practice of grassroots activism with regional repercussions. This translates in a critical analysis of multimodal digital discursive practices (Kress and van Leeuwen 2006), that is further enriched by a linguistic analysis grounded in the notion of “diglossia as indexicality” (Bassiouney 2014)

The analysis unravels the complex interactions between different layers and contexts of digital discourses (and counter-discourses) of Arab feminism.

Firstly, the “fourth wave” of (cyber) feminism in the Arab world is consolidating as a (multifaceted) movement. Social media emerge as a leading space for the multimodal discursive negotiation of internal debates and historical differences, as well as for growing networking and transnationalism.

Secondly, the creative and transgressive Arab feminist semiotic repertoire is fully exposed to virulent backlash rooted in postcolonial nationalist and religious patriarchal discourses.

Thirdly, a further counter-discourse also emerges, as activists appropriate this conservative pushback through entextualization. As a result, they engender a digitally facilitated dialogue surrounding their counter-hegemonic post-Arab Spring struggle on a local and global socio-political scale.

Face-threats and Aggression in Televised Political Debates: A Case-Study of U.S. American Presidential Debates

Panel contribution

***Ms. Lin Jiao*¹, *Prof. Dániel Z. Kádár*², *Prof. Fengguang Liu*¹, *Prof. Juliane House*³**

1. Dalian University of Foreign Languages, 2. Hungarian Research Centre for Linguistics, 3. University of Hamburg

In this talk, we examine the realisation of face-threats in U.S. American televised presidential debates from the perspective of interaction ritual. Presidential debates provide a ritual frame in which the candidates are expected to aggressively interact. Failure to do so implies face-loss and long-term political consequences for the participants, and so aggression in such debates can be intensive. At the same time, such aggression also must be kept within strict ritual boundaries, and the role of the moderator in the debates is to prevent trespasses of the aggressive moral order of such debates. While some previous studies have examined language use in presidential debates, to the best of our knowledge no previous research has attempted to investigate such data from an interaction ritual perspective. We aim to fill this knowledge gap, by exploring how aggression is realised through recurrent ritual patterns (Kádár, 2017), including speech act realisation patterns (Edmondson, 2023) in a corpus of U.S. American televised presidential debates.

Linguistic violence and online metapragmatic disputes on the aggression against a Brazilian newswoman

Panel contribution

Ms. Amanda Vallada¹

1. *Universidade Federal de Goiás*

This research investigates the linguistic violence episode (Silva & Alencar, 2014) practiced by Douglas Garcia, a candidate for the Legislative House of the State of São Paulo (Brazil), against the journalist Vera Magalhães. In order to carefully look into the online/offline nexus of contemporary language conflict situations in post-digital societies (Blommaert, 2019, 2020), this research also analyses the online discussions that took place on Twitter, right after the end of the event. These Twitter debates were centered around the possibility to truly characterize the verbal threat as somekind of actual violence.

This study is a Digital Ethnography (Hine, 2015) investigation conducted on Twitter throughout the month of October 2022, shortly after the language aggression event happened, in late September 2022, at the end of a state gubernatorial debate among the candidates. The empirical material constructed during the ethnography highlights the ongoing metapragmatic dispute (Pinto, 2019; Silverstein, 1993) around the appropriateness to name a verbal offense or threat against a woman as an act of violence. In relation to this, the research has shown that the choosing between naming or not naming an act of verbal abuse as violence is highly based on some ideological and political affiliations, such as feminism (or sexism and misogyny) and some other progressive (or conservative) positionings.

The political proximity of Garcia and the far-right presidential candidate Jair Bolsonaro has also been evidenced during the analysis, since some Twitter users questioned another previous moment of verbal abuse against the same journalist, which was practiced by the then president himself. Thus, the question is posed: could the ex-president also be an agent of violence in the second conflict event? This situation is analysed based on Judith Butler's (1997) *Excitable Speech*, and her account of injurious speech as a violent act, and her interpretation of John L. Austin's work (1962).

Metapragmatic conflicts via memes: A Greek case study

Panel contribution

Prof. Villy Tsakona¹

1. National and Kapodistrian University of Athens

Recent research suggests that internet memes, whether humorous or not, constitute ideological texts referring to a wide variety of sociopolitical events which become well known through the media. Memes thus constitute a “discursive response” (Wiggins 2019: 52) to such events: meme creators and disseminators comment on various aspects of the events, offer their criticism, and build online communities on the basis of common values and/or interests, even though the members of such communities may never meet offline (Tsakona 2018; Denisova 2019; Wiggins 2019).

Among other things, memes convey speakers’ views and values concerning language use. White-Farnham (2019) claims that such memes constitute arguments in ongoing conversations and conflicts about ‘(in)correct’ and/or ‘(in)appropriate’ language use. She also makes a distinction between *traditionalist grammar memes*, which support ‘correct’ language use often through extreme expressions of strictness; and *backlash memes*, which oppose traditionalist grammar ones and criticize and parody those who support ‘correct’ language use. In this sense, speakers seem to employ memes to participate in metapragmatic debates and to convey their (often opposing) metapragmatic stereotypes, namely their culture-dependent and context-specific internalized models on how language should (not) be used (Agha 2007).

The present study investigates a corpus of Greek backlash memes collected from the social media during 2020-2021 and referring to a proposal for translating specific English loanwords into Greek, which was also posted on the social media. In particular, I intend to examine how memes become part of a public online conflict concerning loanword translation: they express online participants’ disagreement with the proposed ‘correct’ or ‘appropriate’ translation equivalents, and even their resistance to the translation practice itself. The analysis concentrates on the humor attested in these memes, which plays a significant role in expressing participants’ conflicting views about, and resistance to, loanword translation. More specifically, it is suggested that humor is employed to frame the proposed translation practices and equivalents as incongruous (on incongruity as the core of humor, see among others Attardo 2020). The analysis of memetic humor also brings to the surface participants’ metapragmatic stereotypes concerning when a translation equivalent is deemed (un)successful, (un)usable, stylistically (in)appropriate, etc.

Morality, civility, and aggression in the attribution and ratification of the Karen social identity

Panel contribution

*Dr. Lucía Fernández-Amaya*¹, *Prof. Pilar Garcés-Conejos Blitvich*²

1. Pablo de Olavide University, 2. University of North Carolina, Charlotte

The main goal of this talk is to explore the off/online nexus of post digital societies (Blommaert 2019) and how it may affect the synergy between off/online public spaces in what regards conceptualizations of in/civility and concomitant evaluations of morality. In that respect, it will be argued that off/online public spaces are mutually co-constitutive. It does so by continuing the exploration of a stigmatized social identity, Karen (Garcés-Conejos Blitvich 2022a). Applying mainstream im/politeness models (Brown & Levinson 1987; Culpeper 2011, 2016), general notions of morality (Monroe & Plant 2019, Workman et al. 2020, among others), moral emotions (Haidt, 2003) and conceptualizations of digital technology facilitated (DTF) violence against women (Esposito & Alba Zollo 2021), we analyze posts evaluating 12 videos depicting Karen-like behavior and posted to Instagram's Karens Gone Crazy (KGC). Results showed that, from an emotional geographies' perspective (Davidson et al. 2005), KGC constitutes an "other condemning" emotional space where behavior considered antinormative in off-line public spaces is, in turn, uncivilly evaluated; further, the dynamic between incivility against Karen and ingroup civility emerges as key to the site's normativity. The analysis also unveiled the widespread use of DTF in the data, which would lead to preliminary conclusions regarding essential connections between widespread misogynistic ideologies and the emergence of Karen. In sum, these uncivil online public spaces become sites of normativity and moralizing about what constitutes civil behavior in offline public spaces, effectively co-constituting each other.

Offensive gestures and taking offense: Precision grip gestures, penis size and the cross-modal construction of anti-feminist discourses in South Korea

Panel contribution

Dr. Lucien Brown¹

1. Monash University

Offensive gestures and taking offense: Precision grip gestures, penis size and the cross-modal construction of anti-feminist discourses in South Korea

This paper examines the emergence of a new offensive hand gesture in South Korea in 2021, which became the locus of struggles between pro-feminist and anti-feminist communities. The goal is to explore how a gesture or bodily visual practice (Ford et al., 2012) can become a cross-modal semiotic location for conflict and aggression across online and offline spaces.

In May 2021, male-dominated online communities in South Korea complained that an advert for convenience store chain G25 was misandric (i.e., man-hating). This was not due to the language in the ad, but rather the representation of a hand in a pinch-like position reaching out to pick up a small sausage. This “precision grip gesture” (Hassemer & Winter, 2018; Lempert, 2011) was visually similar to the logo of defunct radical feminist group Megalian, who had purportedly used this gesture (which denotes small size) as an emblem mocking men for having small penises. Over the next few weeks, these complaints snowballed as male-dominated online communities complained about numerous adverts that featured precision grip gestures and other hand configurations that vaguely resembled them. To the dismay of many, some brands accepted these complaints and issued public apologies for using gestures that were offensive to men.

In this paper, I apply critical multimodal discourse analysis (e.g., Jewitt et al, 2016; Kress & van Leeuwen, 2001) to explore the emergence of this precision grip gesture as a locus for discourse on feminism in South Korea, as presented in media discourse. I analysed all articles that appeared in the month of May 2021 in online versions of the seven top South Korean newspapers, and also the influential news website OhmyNews.

The analysis captures a discursive dispute surrounding the hand gesture and its potential to cause offense. Politically conservative newspapers position the hand gesture as being part of an intentional campaign by radical feminists to offend male sensibilities and to create gender conflict. In contrast, the progressive press sees the backlash to the gesture as another instance of women being silenced.

In the analysis, I focus on the different indexical meanings ascribed to the hand gesture, as well as its representation across different modalities (photographs, illustrations, emojis, verbal descriptions). I demonstrate how a variety of different visual representations of various related handshapes all become identified with the offensive gesture, which is a process I treat as a form of “indexical bleaching” (Squires, 2022). I propose that it was the ambiguous appearance of the hand gesture that helped it to emerge as an important semiotic in ongoing discourses surrounding feminism in South Korea. As communication transcends online and offline spaces, this type of indexical bleaching may be central to the social semiotics of “taking offence” (see Haugh 2010; Mitchell & Haugh, 2015).

Reciprocity and impoliteness online

Panel contribution

***Prof. Jonathan Culpeper*¹, *Dr. Vittorio Tantucci*¹**

1. Lancaster University

Culpeper and Tantucci (2021) proposed that (im)politeness in interaction is governed in large part by a Principle of (Im)politeness Reciprocity (PIR). However, that paper focussed more on politeness than impoliteness, and on relatively short face-to-face dyadic interactions. The latter “micro” focus led Grainger and O’Driscoll (2022: 5) to comment that the PIR “as articulated so far only deals with adjacency pairs”. This paper explores impoliteness online, or, more precisely, digitally mediated impoliteness interactions, whose analysis will require a move beyond the “micro”, both theoretically and methodologically.

We examine both how impoliteness might differ in digitally mediated interaction from face-to-face dyadic interaction (building on extant work, e.g. Lorenzo-Dus et al. 2011), and whether the PIR can offer a better explanation than has been postulated for at least some impoliteness differences (e.g. the role of anonymity). We also aim at some methodological innovations. Impoliteness online research often claims that at least some features are in some way specific to that domain. It is, however, rare that that research sets out to make an empirical comparison, something which is not entirely surprising because of the challenges involved. For our face-to-face dyadic data, we chose the highly conflictive arguments between neighbours posted on YouTube (deemed by the posters to contain “rude”, “nasty” interactions). For our digitally mediated data, we chose controversial political debates on the social platform Reddit (deemed by participants to contain “rude”, “sarcastic”, etc. interactions). Neither type of interaction constrains participants within particular institutional power structures. We focussed on threads starting with disagreement, and analysed how and when these lead to ‘spirals’ of impoliteness reciprocity, that is, when participants would (repeatedly) respond to a previous comment with the same or an even higher degree of impoliteness. Our methods involve novel plotting, visualisation, and statistical assessment of network analysis graphs (e.g. Tantucci et al. 2022), in combination with multiple linear regression of features (e.g. personal vs impersonal impoliteness, taboo language, sarcasm, participants’ word counts).

Initial results, centred on 250 online disagreement threads, show that 20% led to clear impoliteness reciprocity, with an average of 3.5 turns before the beginning of impoliteness escalations. In 3 cases, the degree of impoliteness reached a point where the final comment was removed by the website administrators. In all these cases, impoliteness reciprocity exceeded 8 turns of online interaction.

The metapragmatics of “offence” in Chinese in online discourse

Panel contribution

Dr. Wei-Lin Melody Chang¹, Dr. Alvin Cheng-Hsien Chen², Prof. Michael Haugh¹, Prof. Hsi-Yao Su²

1. The University of Queensland, 2. National Taiwan Normal University

The notion of “offence” lies at the core of the theorisation of impoliteness and language aggression in pragmatics (e.g. Bousfield 2008; Culpeper 2011; Kádár 2017). However, while it is broadly understood as a moral emotion (Haidt 2003), “offence” is a multi-faceted concept in English that can refer to: (1) interpersonally transgressive conduct; (2) (perceived) moral transgressions; (3) a complex moral emotion occasioned by (perceived) transgressions; (4) the acts of ‘causing’ and/or ‘taking’ of offence; and (5) the act of verbally attacking someone (as opposed to defending oneself) (Haugh and Sinkeviciute 2019; Haugh, Kádár and Márquez Reiter 2022). In addition, despite its central import to the theorisation of impoliteness, there has to date been little consideration of how “offence” is conceptualised across languages and cultures. The aim of our paper is to contribute to the growing body of work on impoliteness and language aggression in Chinese (Kádár and Pan 2011; Kádár, Ning and Ran 2018), and broader issues in theorising the metapragmatics of offence across languages (Culpeper and Haugh 2021; Chang, Haugh and Su 2021), through systematic examination of the metalanguage used in Mandarin Chinese by ordinary speakers when talking about “offence”. We focus on analogous terms in Chinese, including *màofàn* (cf. *offence*), *gōngjí, qiàng* (cf. *offend*), *bù shuǎng* (cf. *offended*), and *dúshé, guòfèn* (cf. *offensive*), in order to provide an account of how these terms relate to each other (within a semantic field), how they compare with analogous terms in English, and what participants are doing through using such terms in different contextual settings. Our metapragmatic dataset draws both from elicited metapragmatic discussions in Chinese about events where participants report have taken “offence”, as well as such discussions on online discussion boards and related broadcast media. Drawing from methods in corpus pragmatics (Aijmer and Rühlemann 2015; Haugh 2018), we undertake vertical (i.e. aggregated) and horizontal (i.e. sequential) analyses of metapragmatic uses of terms for “offence” in Chinese, thereby contributing towards the groundwork necessary for constructing a cross-culturally valid theory of impoliteness and language aggression.

‘We are nationalists, not hate-filled supremacists’: A Corpus Assisted Discourse Studies Approach to Categorising (Online) Extremism

Panel contribution

Prof. Nuria Lorenzo-Dus¹

1. Swansea University

There is a long-standing academic debate around the meaning of terms like extreme-right, far-right, radical-right and right-wing extremism. This debate chiefly concerns which actors, ideologies, and behaviours should (or should not) fall within the ambit of one or another term (Jupskås and Segers, 2020). While there is a high degree of consensus among scholars (Carter, 2018), no universally accepted definitions of these terms exist - each has been employed, at various times, as blanket terms, simultaneously describing political ideologies, parties, and violent rhetoric and actions. This can be problematic for the purposes of policing and the criminal justice system (Bjørge Ravndal, 2019). Law enforcement, for instance, may use different terms – such as extreme-right or far-right – to determine who, what and why needs prioritising.

This presentation discusses a study that sought to contribute discourse analytic insights to resolving this important terminological/conceptual debate. Specifically, the study aimed to identify the ‘discourse signature’ of certain groups that were yet to be ‘categorised’ by law enforcement within the extreme-far right spectrum at a particular point in time, in this case 2018-19. The data consists of three corpora shared by UK law enforcement and comprising tweets from: 6 groups categorised as extreme right (277,600 words); 4 groups categorised as far right (481, 759 words), and 2 groups that, at data collection time, were yet to be ‘categorised’ (161, 244 words). These corpora were respectively labelled group clusters A, B and C.

A Corpus-Assisted Discourse Studies (CADS) methodology (see, e.g., Mautner, 2019; Partington, 2010; Partington and Marchi, 2015; Taylor and Marchi, 2018) was employed - with keyword and collocation analyses being conducted, alongside subsequent examination of subject-positioning (Anton and Peterson, 2003) within extended concordance lines. The analysis showed that, on the whole, the cluster C groups displayed more commonalities with the cluster B than they did with the cluster A groups. This is not to say, however, that cluster C and cluster B were homogenous. Significant differences emerged, including a more prevalent reliance on self-promotional discourse in cluster C, in contrast with a more salient use of a crime/terrorism discourse in cluster B. Similarly, a reflexive discourse around the concepts of far-right/extreme-right ideology and identitarianism emerged as being discursively unique to cluster C. Across all three clusters, these groups constructed subject positions of victimhood for themselves and their (to-be) members (see also Wodak, 2015; Lorenzo-Dus and Nouri 2020; Lorenzo-Dus, 2023). These were legitimised through othering strategies whereby various out-groups were blamed for a chaotic reality that must be changed. Expectedly, change was presented as being possible through affiliation to their group. Use of this ‘out-group provoked crisis – in-group enabled solution’ strategy is common across other extremist ideology formations, ranging from jihadi (e.g., Lorenzo-Dus et al., 2018) to populist (de Vreese et al, 2019) groups.

This presentation will also reflect upon the challenges and opportunities of integrating, on the one hand, CADS methods with those used in other disciplines (specifically, Criminology and Public Policy) and, on the other, academic results and stakeholder needs.

“If you don’t fight like hell, you’re not going to have a country anymore.” Violence, ambiguity and metaphors we fight with in Donald Trump’s speech of January 6, 2021

Panel contribution

Prof. Massimiliano Demata¹

1. *University of Turin*

Trump’s speech of January 6, 2021 has often been indicated as the key factor behind the Capitol Hill riots that took place on that same day. The speech is notable for its violent language and, on the basis of alleged conspiracies of vote fraud, seemed to incite the crowd to forcibly prevent Senators and Representatives from certifying Joe Biden’s victory. In the aftermath of the Capitol riots, most of the debate about the speech focused on the true nature of Trump’s war language. Many commentators argued that the audience was instigated by Trump’s words to commit violent actions, while those who defended Trump claimed that his speech was based on figurative, non-literal language, which would supposedly pre-empt the possibility of inviting people to action: according to Trump’s lawyer Michael van der Veen, “No human being seriously believes that the use of such metaphorical terminology is incitement to political violence” (van der Veen 2021), while Mark Meadows, Trump’s former chief of staff, claimed that when Trump incited attendees to march down the Capitol, he was “speaking metaphorically” (Meadows 2022).

By applying a discourse approach to metaphor (Charteris-Black 2005 & 2009; Musolff 2016), this paper analyses Trump’s speech and the semantic ambiguity of its violent style and contents. Trump’s use of the traditional metaphorical use of war in politics was both in line with the tradition of US political discourse and deliberately ambiguous. On the one hand, as Trump’s defenders rightly argued, war metaphors are traditionally used in political communication as they are used to raise the *pathos* (Charteris-Black 2005 & 2009); specifically, metaphors of war have heightened the polarized US political discourse and have contributed to making it a very emotional arena (Kalmoe 2014; Kalmoe, Gubler & Wood 2017). On the other hand, by raising certain emotions, war metaphors are known to effectively *mobilize* people around a common goal, often turning the metaphor into reality: for example, Trump himself often used war metaphors in his anti-immigration agenda, using the scenario of immigrants as invaders in order to advocate the necessity of real, effective military intervention, as borders were seen as a security issue and, as a consequence, had to be protected militarily (Demata 2017).

1. King's College London

Recently, online impoliteness studies have been drawing links between digital political communication and the ‘trench warfare dynamics’ (Karlsen et al., 2017) that may develop in social media interactions between users with different political ideologies, particularly when such discussions concern critical national issues (e.g. Blitvich, 2010; Bahaa-eddin, 2019; Teneketzi, 2022). However, within this growing line of research, grounded on various impoliteness conceptualizations and categorizations, impoliteness strategies that utilize the language system itself and the linguistic resources available to users have not been extensively discussed. In such conflictual instances, posters can mobilize linguistic corrections related to diverse aspects of opponents’ contributions/comments (e.g. grammar, orthography, syntax, or in the case of Greek online posts, the use of Greeklish) to offend, thus diverting attention from the expressed political viewpoints to the linguistic realization of the outgroups’ arguments. Hence, the resulting impoliteness, which approximates a straw-man fallacy (widespread in politics- see Talisse & Aikin, 2006), bears links to the concept of ‘Grammar Nazism’, that involves self-appointed linguistic ‘vigilantes’ (Sherman & Švelch, 2015).

Therefore, drawing from my research on online political impoliteness in relation to the 2015 Greek socio-economic crisis (July 2015 referendum and subsequent elections), this study focuses on public Facebook and YouTube comments (pertaining to a left-vs-right political divide), in which different types of linguistic corrections are featured as a clearly manifested impoliteness strategy. Through an NVivo-assisted qualitative close analysis of the dataset, I am examining how linguistic corrections contribute to ‘otherising’ the perceived political opponents. I am also investigating how users exploit their shared linguistic background (which encodes facets of their cultural identity and collective memories) to target co-interactants, thus allowing distinct linguistic ideologies, perceptions of the national self and interpretations of Greekness to materialize through the corrections.

Findings suggest that linguistic corrections hold a special place in the arsenal of users attacking disagreeing addressees, since the ability to highlight others’ linguistic errors is associated with occupying an epistemic high-ground (Eriksson, 2014), which in turn further validates the correctors’ viewpoints. Thus, this type of grassroots online gate-keeping of appropriate language use (particularly prevalent in ‘classical’ languages such as Greek) divides commenters into those who, due to their linguistic/argumentative expertise, are accepted within the community of ‘knowing participants’ (Georgakopoulou, 2016) and are granted the right to partake in political debates regarding the national future, and those who are being denied such an access, since their perceived linguistic inefficiency undermines their authority and their national/Greek identity. Moreover, results indicate that users resorting to impolite linguistic corrections do not always compose error-free posts. This underlines that corrections are not necessarily motivated by pure linguistic interest- their purpose may be to establish intellectual/cultural capital and discursive power. Generally, the use of impoliteness based on background knowledge of linguistic rules and standards foregrounds the need to theorise the existence of linguistically-shaped (and not just verbally expressed) impoliteness strategies- i.e. metalinguistic impoliteness, through which interactants “make active and local use of the metalinguistic function of language in goal-oriented ways in communicative acts and events” (Jaworski et al., 2004, p.3).

A study of metalinguistic comments in the Ukrainian comedy series “Servant of the People”

Panel contribution

Prof. Helena Halmari¹

1. Sam Houston State University

The main character, a history teacher, wins the Ukrainian presidential election, against all odds. The actor portraying the history teacher in this political satire is, as we all now know, Ukraine’s current actual President, Volodymyr Zelenskyy, who won the post as a representative of the “Sluha Narodu” -party.

In this presentation, I explore the interplay of Ukrainian and Russian, focusing on the metalinguistic comments and jokes in the three seasons of the political satire “Sluha narodu” (Servant of the People) (2015–2019). While the languages of the series are listed as Russian and Ukrainian, some interesting changes over the four-year period of the series surface: from Russian-dominated discourse, a shift to more Ukrainian takes place. The division of Ukrainian- vs. Russian-speaking characters may be somewhat predictable, but what is significant is the strong tone of rational and comic detachment, which reflects the voice of Zelenskyy’s “Sluha Narodu” -party (Ash and Shapovalov 2022), underscoring cohesion and moderation rather than division and polarization (Lytovchenko et al. 2021). The series pokes fun at both Russian-speakers and Ukrainian-speakers. Metalinguistic comments address characters who speak Ukrainian poorly. Some thinly veiled jokes about Vladimir Putin become understandable in the light of the 2014 annexation of Crimea.

This popular satirical series serves as a window into the years between Russia’s annexation of Crimea and Russia’s 2022 invasion of Ukraine. The two languages in “Sluha narodu” could serve as symbols of polarization, but the series manages to bridge the serious divide by humor. The third season makes heroes of Russian firemen; a professor, in Russian, leads a discussion with medical students pointing to a bright future for Ukraine (a paradox in the current situation); and one student reveals unity in his heterogeneous DNA profile, which makes him—a Ukrainian. Through an analysis and discussion of metalinguistic comments in “Sluha narodu,” I argue that the series reflects Zelenskyy’s judgment on the production company Kvartal 95’s page: “Our ambitious objective [...] is to make the world a better place, a kinder and more joyful place with [the] help of those tools that we have, that is humor and creativity” (Kvartal 95).

Current challenges and language choice among Transcarpathian Hungarians

Panel contribution

***Dr. Daniele Artoni*¹, *Ms. Timea Lucsok*¹**

1. University of Verona

According to the last Ukrainian census (2001), Transcarpathian Hungarians are the largest ethnic minority in the Ukrainian region of Zakarpattia (12.08%), followed by Romanians, Russians, Romani, and Ruthenians. Hungarians are a recognised minority and have the right of schooling in their language, albeit criticism has been raised against the laws “On education” (2017) and “On supporting the functioning of the Ukrainian language as the State language” (2019), which aim at widening the use of Ukrainian without protecting minority languages (see Csernicskó 2021). Furthermore, the already multilingual landscape of Zakarpattia has been recently enriched by the presence of a large number of Internally Displaced Persons (IDP) – more than 165,000 (about 13% of the entire population of the region) as of September 2022 (IOM-DTM 2022) – who fled towards Western Ukraine after Russia’s invasion in February 2022. The majority of IDP are Russophone Ukrainians.

Our presentation aims at investigating the sociolinguistic status of today’s Zakarpattia, especially among its Hungarian-speaking population.

The present research was conducted in the summer of 2022 and involved eighty-six Ukrainian citizens with Hungarian L1 living in the Zakarpattia region. The informants were asked to fill in a survey on (a) their linguistic habits in different contexts, i.e., within the family, in the education sphere, in their workplace, in official contexts, and during their leisure time, and (b) to spell out their own and their children’s language choices.

A preliminary analysis of the data collected suggests that even though Hungarian is by far the dominant language within the Hungarian-speaking population of Zakarpattia, most of the informants are fluent also in Ukrainian (93%) and Russian (72%).

Two opposite tendencies are noted in the domain of education: on the one hand, those parents who want their children to be educated in the Hungarian language (70%) are willing to preserve their children’s Hungarian identity (71% of them) by even providing them with future job opportunities in Hungary (18% of them); on the other hand, most parents are aware that schooling in the Ukrainian language would give their children better opportunities, as 78% of the informants want their children to be fluent in Ukrainian.

A recent shift in language habits that emerges from our survey is the growing usage of the Russian language, primarily to communicate with the Russophone IDP who fled the occupied territories and settled in Zakarpattia.

In sum, in our paper we will account for the current language shifts among the Hungarian Transcarpathians, and how the war and the presence of IDP in Zakarpattia have affected this multilingual region.

Has the war influenced the choice of the preposition: *na* Ukraine or *v* Ukraine?

Panel contribution

Prof. Arto Mustajoki¹

1. University of Helsinki

Country-specific language varieties, such as American vs. British English, differ mostly in pronunciation, spelling, or lexicon. Grammatical differences are less common. As to Russian, the existence of country-specific varieties is controversial (Moser 2020), and some usage norms have gained political significance. One of the most famous questions is whether to say *na Ukraine* or *v Ukraine*.

The Russian prepositions *v* and *na* correspond to similar pairs for instance in English (*in/on*) and German (*in/auf*). A certain inconsistency in the usage of *v* and *na* prevails: *v universitete* (in a university) but *na fakultete* (in a faculty); *v laboratorii* (in a laboratory) but *na zavode* (in a factory). Sometimes both prepositions are acceptable: *v firme* and *na firme* (in a firm).

When referring to a country or state, the usual preposition is *v*: *v Italii* (Italy), *v Laose* (Laos). Countries on islands make exceptions—*na Kube* (Cuba); *na Kipre* (Cyprus)—but not systematically: *v Japonii* (Japan); *v Novoj Zelandii* (New Zealand).

The case with *na/v Ukraine* became highly relevant after Ukraine's independence declaration in the 1990s (Krivoruchko 2008). Citizens of the new state felt that the phrase *na Ukraine* did not reflect the country's independent status. The version *na Ukraine* was associated with *na okraïne* (on the outskirts), which implied that Ukraine was not regarded as a sovereign state. Russian's answer to the demand of using *v Ukraine* was: "We are not taking advice concerning the norm of Russian from people representing a country which is neglecting the status of Russian." Some Russian observers (e.g., Kalutskov 2017) argue that, in fact, the name *Ukraine* originally referred to a borderland or far-away place. Such contrasting views have ignited a "language war."

In this presentation, I provide data about the change in the use of *na/v Ukraine* after Russia's February 2022 attack against Ukraine. My data come from the Integrum database, which covers a large number of Russian-language media and internet sources in Russia, Ukraine, and other countries (Mustajoki 2006). Findings show that after the beginning of the war, the share of the preposition *na* has increased in Russia while the share of *v* has increased in Ukraine, indicating the political significance of the choice of the preposition. An interesting additional point of view is to examine how Russian-language media of countries other than Russia and Ukraine use these preposition in this context.

Mediated Receptive Multilingualism: a case study of communication between Estonians and Ukrainians

Panel contribution

Ms. Anna Branets¹, Prof. Anna Verschik²

1. University of Tartu, 2. Tallinn University

In 2022, about 50,000 Ukrainian refugees ended up in Estonia, a country with a population of 1.3 million. This creates new communicative situations and needs. As a rule, Ukrainians are proficient in Russian, and some Estonians are as well. However, both sides may refrain from using Russian because of its symbolism and association with the aggressor. All Ukrainian refugees learn Estonian, but it would also be reasonable for Estonians to acquire some proficiency in Ukrainian. The current study demonstrates that this is possible in the framework of Receptive Multilingualism (RM). In this mode of communication, interlocutors can still understand one another even though they speak in their own native languages (Rehbein et al. 2012). Since Estonian and Ukrainian belong to different language families and there is no history of intensive contacts between speakers of these languages, Estonians can learn to understand Ukrainian through already existing proficiency in Russian. This mode is called mediated RM (Branets et al. 2020).

This study is based on an experimentally controlled design with forty participants (20 speakers of Estonian as L1 and 20 speakers of Ukrainian as L1). All Estonian participants have proficiency in Russian at least at the B1 level and all Ukrainian participants have been learning Estonian. Participants were grouped into twenty pairs, each pair consisting of one speaker of Estonian and one speaker of Ukrainian. Prior to the experiment, the participants were given the questionnaire on biographical details and sociolinguistic background, the guidelines, the two MapTasks (two sessions with the same complexity), and the Implicit Association Test (IAT) test on the language attitudes toward Russian. Half of the Estonian participants received instructions about similarities and differences between Ukrainian and Russian and the other half did not. The experiment was conducted online and resembles a phone call (without using a video). The task had to be completed in 10 min.

The results showed that Estonians and Ukrainians can communicate with one another, using a mediated RM mode. Inventories of the meta-communicative strategies the speakers and hearers used (vocabulary and other linguistic features, discourse patterns, etc.) were established. As for the comparison between the two sessions with different MapTasks, it came out that the same participants in the second session were more successful than in the first one. The participants who had received instructions were also more successful than those who had not. Communicative strategies (e.g., the use of other communicative modes such as code-switching) and meta-communicative practices (such as explicit negotiation of meanings and form) are attested. Our study suggests that there is a potential for learning and communication between Estonians and Ukrainians via the mode of mediated Receptive Multilingualism.

Plain Language in Ukraine: What War Does to Public Communication

Panel contribution

Dr. Thomas Rosén¹

1. *university of Gothenburg*

Extreme situations such as armed conflicts or natural disasters put severe strain on society. Such circumstances call for easy access to clear and understandable public information. Indeed, information may constitute the difference between life and death. Therefore, governments around the world strive to use *plain language* in order to reach their citizens.

The concept of plain language, as it is commonly understood today, was introduced in the Western hemisphere in the 1970s. The U.S. federal plain language agency defines plain language as “communication your audience can understand the first time they read or hear it.” (PLAIN 2022). Definitions in other Western countries more or less echo this definition: Plain language is “language that is neat, simple and comprehensible.” In Swedish this translates to “språk som är vårdat, enkelt och begripligt” (ISOF 2022).

In Ukraine, the concept of plain language does not appear to have caught on, although the topic is being studied (Barovska 2016). Discussions have taken place among specialists concerning what an appropriate rendering of the term *plain language* could be. Adjectives such as “легка” (easy), “проста” (simple), “ясна” (clear), and “зрозуміла” (comprehensible) have been suggested, but thus far no legislation has been passed that regulates the use of plain language by the Ukrainian state (Khemiy 2021). The conclusion that plain language has yet to permeate the Ukrainian public administration is supported by the fact that handbooks on bureaucratic language appear continuously (Katsavets’ 2017; Shevchuk 2022).

In many countries, state agencies have formulated guidelines for plain language. They often include guiding principles such as reader focus, emphasis on major points, simplicity of structure, economy of expression, and straightforward syntax (cf., e.g., NARA 2019). Such guidelines may also function as tools for analyzing texts in order to determine whether or not their language can be considered “plain”.

During this presentation, results from content analyses of Ukrainian public information will be presented. Using a broad selection of information taken from Ukrainian state-controlled websites during 2022, this investigation aims to ascertain if and how the invasion by Russia has affected the use of plain language in public information in Ukraine.

Shifts in attitudes toward the Russian language during the Russian-Ukrainian conflict

Panel contribution

*Ms. Hannah Ackerman*¹, *Dr. Lisa Johnson*¹

1. Brigham Young University

In recent years, Vladimir Putin has weaponized the Russian language to justify aggression in Ukraine (e.g., Machado, 2020; Motyl, 2022). Reports in international media indicate that Ukrainians have staged a linguistic response, with Russian speakers shifting to Ukrainian in a show of defiance (e.g., Bilewicz, 2022; Davlashyan, 2022; Stern et al., 2022).

Has there been a similar shift among Russian speakers in diaspora, those geographically removed from the conflict but connected through linguistic, political, and personal history? Anecdotal reports suggest that Russian speakers living abroad have changed linguistic practice (Kaminsky, 2022), though the extent of this shift is unknown. The purpose of this study is to investigate potential changes in attitudes toward the Russian language during the Russia-Ukraine conflict.

Focused primarily on members of the private Facebook group Russian Insider, the study investigates attitudes toward written and spoken Russian in online and in-person contexts before and after Russia's invasion of Ukraine on February 24, 2022. The 17,700+ Russian American members of Russian Insider use the group to share—in either English or Russian—local news, issues, and other topics that concern their community.

The survey, available in both English and Russian, collects participant information including demographics, connection to the Russian language, and attitudes toward the language both before and during the 2022 conflict. We hypothesize that attitudes toward the Russian language have shifted from generally neutral to generally negative over the course of the conflict, predicting that individuals with close connections to the conflict will identify a complex struggle between their language use, their nationality, and their identity.

Wartime language preferences: The shift in language use in Odessan online media

Panel contribution

***Mrs. Inna Kabanen*¹, *Mr. Francesco Bressan*²**

1. University of Helsinki, 2. University of Verona

The city of Odessa has always had a special status both geopolitically and linguistically. The ‘language of Odessa’ (Одесский язык) is known to be a unique phenomenon in the linguistic landscape, being a mix of various languages with a Russian superstrate. Statistically, the city’s population is prevalently Russian-speaking, the fact prominently reflected in online communication (websites, online news media, social media) regarding the city. However, since the beginning of the Russian-Ukrainian conflict, this has drastically changed.

Using Odessan online media content (vgorode.ua – Odesa, related Facebook pages, and users’ comments) as primary research material, this study illustrates how the discourse and language use (Russian vs. Ukrainian) have changed following the crisis. We focus on this particular web content because it has been subject to our analysis and observations over an extended period of time in the framework of a research project that concentrated on the language of Odessa. Thus, the comparison between the current and the past situation is made possible.

Over the past years, the content published by vgorode.ua – Odesa (including the users’ comments) has been prevalently in Russian, but since February 2022, the use of Ukrainian language has increased significantly.

The study is ongoing, and its goal is (1) to demonstrate a possible correlation between the type of online content and the preferred language (Russian or Ukrainian) and (2) to analyse whether the overall shift in language use has taken place in all types of content in a similar way. Furthermore, we aim to illustrate the use of the language of Odessa in this context.

Creating Public Discourses with Personal Expressions in Japanese Linguistic Landscapes

Panel contribution

***Prof. Momoyo Shimazu*¹, *Prof. Andrew Barke*¹**

1. Kansai University

Over the past few decades, linguistic landscapes have got more attentions from researchers in pragmatics in relation to the features of messages they convey (Backhaus, 2007; Cenoz & Gorter, 2006; Landry & Bourhis, 1997; Long, 2014). For example, Long (2014: 1-2) defines linguistic landscapes in Japan as visual messages in written languages and identifies their pragmatic functions. In his study, Long assumes that linguistic landscapes are addressed to an unspecified number of people in public and their purpose is not aimed for private communication with a specific individual. However, visual messages on linguistic landscapes, when placed in a particular location, can also be considered as “subjective representations rather than objective physical environment” (Leeman & Modan, 2009: 2).

This study examines “warning signs” among linguistic landscapes in Japan - handwritten notes that have been left in public places, with a specific focus on the creative use of warning signs in a more personal communicative style. Such signs create public discourses. Since the meaning of expressions employed by speakers is constructed with the audience in the “here and now” of actual communication (Bauman and Briggs 1990: 73), handwritten notes left in public places become a mutual interaction and cooperative constructive activity with invisible and unspecified recipients. Those exchanges sustain the public space beyond time and they would have some kind of effect on the recipients, or people who read them.

In this study, we will qualitatively analyze and describe specific examples of warning signs, in order to highlight the diversity of warning signs and bring the linguistic landscape picture into focus as a whole. The results of the study reveal that such discourses of warning appear to allow the creators of the notes to 1) include their own personal feelings in addition to the direct warning itself, 2) convey consideration, politeness, humor, perception, beliefs, stories, etc., to readers through these personal messages and 3) reveal their own behavioral characteristics and attitudes as an active participant in Japanese society. The findings clearly suggest that linguistic landscapes serve as a way of making us aware of, and understanding public discourses, and offer an alternative method of creating different kinds of relationships and interactions with others.

Creative language use during interpersonal talk and storytelling: Accounts from a Japanese izakaya

Panel contribution

Dr. Todd Allen¹

1. Kansai University

Izakayas ('pubs') are ubiquitous in Japan and serve as a place for people to consume food and beverages. Customers also use these social spaces to mitigate loneliness, foster relations with others in the community, and often serve as a 'home away from home' (Futamura & Sugiyama, 2017; Ohnishi et al., 2012). Language behaviours performed in such contexts are both routine (e.g., greetings, ordering) and creative (e.g., interpersonal talk). Although these places are critical to the community, limited research is available that has focused on the sociolinguistic activities that occur in these spaces. As a result, in this study, I examined instances of interpersonal talk and storytelling that frequently occur in the drama series *Shin'ya Shokudō* ('Midnight Diner'). Specifically, using a sociopragmatic approach, I examined these social activities from micro, meso, and macro perspectives as representations of everyday talk in a specific context (Haugh, Kádár, and Terkourafi, 2021). The results show that interlocutors use a variety of strategies to be creative with their language use. For example, when telling a joke, a male interlocutor used masculine forms of speech and deliberately changed his voice qualities to enact different characters in the anecdote. Furthermore, during moments of interpersonal talk, an interlocutor used mockery to maintain their identity and protect themselves during a conflict (e.g., name-calling). Moreover, interlocutors used different linguistic forms of speech at various times due to the relationship they share and the topic of talk (e.g., shifts from polite to casual forms of speech). Overall, the study demonstrates the varied forms of interactions that take place within an *izakaya*, and how interlocutors use language creatively to achieve interactional goals (e.g., build rapport, reinforce identity, be humorous) in a specific context.

Hard jacket with soft scarf: The language of Japan's female political leader Koike Yuriko

Panel contribution

*Dr. Yoko Yonezawa*¹

1. The University of Sydney

On 31 July 2016, Yuriko Koike was elected the Governor of Tokyo and became the first woman to lead Japan's capital. Since then, Koike has been described in numerous different ways, often with a combination of distinct attributes that indicate her capacity for hard and provocative argument while giving a soft and feminine impression, such as 'dressed as a woman but a hawkish man' (BBC News 2016). Koike continues to portray herself as one who works in a 'hard' political arena, having previously experienced the role of Defence Minister, but as having a 'soft' and 'feminine' character. Fashion journalists describe her fashion choices as 'strategies', for example 'wearing a hard jacket but making a soft impression with a coloured scarf and skirt' (Gunchi 2017). Readers of a women's magazine describe Koike as *miryokuteki* 'attractive', *shitashimiyasui noni oora ga kookyuu* '(has a) friendly but classy aura' and *ochitsuita shaberikata* '(has a) calm way of speaking'.

Koike's self-presentation is strongly supported by her language forms and structures. This study analyses Koike's authentic speech data, which are drawn from the Minutes of the National Diet Committee Meetings (cross-referenced to the relevant videos to ensure verbatim speech), and recordings of her press conferences, both quantitatively and qualitatively. The study investigates the speech strategies Koike uses to construct her public persona which matches the way the public sees her.

The most intriguing findings of this study relate to Koike's creative use of honorific forms. The result of a preliminary analysis shows that Koike uses highly elaborate, multiple layers of addressee and referent honorific forms in the same predicate, which sometimes involve so-called 'incorrect' combinations (see Shibamoto-Smith 2011). This also involves the creative use of an 'extra' (syntactically unnecessary) accusative case particle *o* in productive 'humble' referent honorific forms to make additional room for elaboration. She uses the 'hyper-polite' copula *de-gozaru* with the addressee honorifics *-masu* suffix much more often compared to male politicians in the data (e.g., more than twice as often as Shinzo Abe and three times as often as Yoshihiko Noda).

In many ways, Koike's speech style evokes the ongoing legacy of what is ideologically constructed as *Japanese women's language* (e.g., Nakamura 2014). In this sense, Koike enacts the macro-level demographic category 'female' (Bucholtz & Hall 2005: 585). At the same time, she also skillfully creates her public persona to present herself as someone with a 'demeanour', 'classy aura' and 'calm way of speaking' while she talks about 'hard' content.

Japanese usernames on the internet: Creativity and self-characterisation

Panel contribution

*Dr. Xiangdong Liu*¹

1. Western Sydney University

This paper examines Japanese naming practices on the internet. The data used for this study are usernames and internet users' comments collected from a Japanese news site – “Yahoo! Japan News”. While online communication has attracted considerable attention among linguists, most research so far has focused on what people wrote on the internet when discussing creative language use (North, 2007) and identity construction (Matsuda, 2002). The study of how internet users name themselves is still scarce.

This study observed an eye-catching variety in Japanese usernames, many of which completely flout normal cultural conventions for naming (Unser-Schutz, 2016). The usernames in the data present all the common processes of new word formation in Japanese (Barešová & Zawiszová, 2013) and many go far beyond. For instance, some contain only a single symbol/emoji or an adverb/adjective (e.g., モフモフ “fluffy”); some play with homophonic Chinese characters (e.g., 高貴香麗者, literally meaning “a noble, sweet and beautiful person”, but sharing the identical reading with 後期高齢者, literally meaning “later-stages elderly person”, a term used in Japan referring to people aged 75 and over); and some consist of a sentence (or more) (e.g., 酒だ☐☐もってこい☐ “Sake! Give me some sake!”).

Names reflect the naming person's attitude or affective stance (Unser-Schutz, 2012) and can affect the named person's identity and personality (Harder, 1989). A username could mean more to and about the person than his/her real name, since internet users normally name themselves. A username can become even more informative when we examine, at the same time, what s/he posts. This study confirms that while people with “softer” usernames are more likely to show sympathy or understanding toward the issue/person of concern and to use polite language, people with “powerful” usernames tend to be more critical and aggressive and often use impolite language.

This study concludes that Japanese usernames on the internet demonstrate the internet users' knowledge level, language creativity, and/or attitudes towards online communication and issues in their daily life. In other words, usernames are indicators of self-image and self-characterization. Naming practices on the internet play an important role in identity construction and indication.

Language creativity in business Japanese discourse between native and non-native Japanese speakers

Panel contribution

Dr. Yun Meng¹

1. Niigata University

This presentation focuses on how linguistic resources are selectively chosen and utilized by native and non-native Japanese speakers in creative and dynamic ways in their business workplace discourses (e.g., Drew and John, 1992; Ikeda, 2005). The study investigates the challenges experienced by multinational subordinates in making suggestions for improvement to their Japanese supervisors (formal style) and participating in small talk with their Japanese supervisors (informal style). Formal and informal styles in business Japanese discourses were compared and business Japanese interactions between native and non-native Japanese speakers in role-playing conversational data were analysed (e.g., Coupland, 2000; Murata, 2014).

The results of the qualitative analysis are as follows:

- More instances of language creativity were observed in the informal style than the formal style, e.g., topic change, reconfiguring or reshaping social relationships (e.g., Nakayama, 2008; Murata, 2015).
- Non-native Japanese speakers (multinational subordinates) had more difficulties than native speakers (Japanese supervisors) in linguistic, sociolinguistic, and sociocultural competencies (e.g., Pomerantz and Jenny, 2005). Nevertheless, both groups displayed the influence of the sociocultural norms of their native country and language.
- Non-native Japanese speakers (multinational subordinates) revealed that they faced several challenges while responding to chitchat.
- Adjustments by native Japanese speakers (Japanese supervisors) were found to be important for facilitating smooth interaction.

The results of this study suggest that special attention should be paid to the difficulties and problems encountered by international workers in linguistic, sociolinguistic, and sociocultural competencies, in the field of support for career formation and job hunting. In addition, it is important to utilize animations and conversational examples, or similar ones used in this research in classroom activities (e.g., Okada, 2013). Furthermore, we suggest that considering the influence of multinational sociocultural norms and the conversational adjustments made by Japanese superiors can be used as concrete examples to improve the working environment in the field of cross-cultural management and communication training. Further details will be discussed in the presentation. (318 words)

“With reluctance, I humbly venture to say one thing”: Creative use of Japanese honorifics in the performance of linguistic rituals and Face Threatening Acts

Panel contribution

*Prof. Andrew Barke*¹, *Prof. Momoyo Shimazu*¹

1. Kansai University

The assumption of a direct one-to-one mapping between honorific forms and the conveyance of politeness is widespread and pervasive. However, a growing number of studies (e.g. Cook, 2011) have begun to provide evidence that casts doubt on such ideologically based assumptions, arguing instead that patterns of use of honorifics in real-world interactions suggest speaker motivations are much more varied and complex than traditional explanations have claimed.

To account for instances of honorific use that appear to have little direct connection with the conveyance of politeness, this study assumes a social-constructivist perspective in which interlocutor creativity plays a crucial role in the construction of social reality (Archakis & Papazachariou, 2008). Examples sourced from both ‘natural’ and dramatic representations of natural interactions among Japanese speakers are presented that show evidence of referential and addressee honorific forms being used in creative and socio-pragmatically marked ways for interactional functions other than the conveyance of politeness and/or respect. ‘Creativity,’ is described by Boden (2001) as the “ability to come up with new ideas that are surprising yet intelligible, and also valuable in some way” (p.95) and in relation to language use, it has the potential to play an important role in the reshaping of relationships in dynamic ways (Jones 2016). The focus of this study is on the creative use of honorific forms in two key aspects of relational work: the linguistic performance of relational rituals (Kádár 2017) and FTAs or Face Threatening Acts.

Results of the study include the following:

- Non-adherence to linguistic norms concerning the ritualistic exchange of greetings that include honorific forms traditionally associated with negative politeness was found to be used as a strategy to reduce social distance rather than maintain or increase it between interlocutors;
- Addressee honorific shifts among intimates were found to mark shifts in stance rather than the expression of politeness, and led to the addressee to interpret them as being an indirect attempt to modify the addressee’s behaviour;
- Instances of *sonkeigo* ‘respect forms’ and *kenjōgo* ‘humble forms’ were found to be used as a strategy to strengthen rather than redress the force of Face Threatening Acts.

These results offer further evidence that speakers make use of linguistic forms in a variety of creative and dynamic ways as they attempt to negotiate and transform the relationships they have with others, and Japanese honorific forms are one of the tools speakers use in this creative process.

homogeneity (organized
by Kazuko Tanabe, Yuko
Iwata)**

Crossing, gender, and identity

Panel contribution

Dr. Yuko Iwata¹

1. Meiji University

The term ‘language crossing’ (or ‘code-crossing’) refers to “the use of a language which isn’t generally thought to ‘belong’ to the speaker” (Rampton, 2019, p. 287). “Language crossing involves code alternation by people who are not accepted members of the group associated with the second language that they are using (code-switching into varieties that are not generally thought to belong to them)” (Rampton, 1995, p. 485). For example, London teenagers from families who came to England from Pakistan or Jamaica speak Panjabi or Jamaican Creole in addition to various varieties of English. They use all these codes in various ways within multiethnic social networks to index various stances and identities (Rampton, 1995).

Unlike teenagers in big cities in Europe, language crossing is not a common phenomenon yet in Japan except for those who have grown up using two or multiple languages since the number of immigrants whom the Japanese government legally accepts is notoriously tiny. However, there exist people who ‘cross’ gender using *onee kotoba*, hyper-feminine language, or non-normative gendered speech in Japanese. They are gender-queer male personalities. *Onee kotoba* is literally translated as ‘big sister’s speech/language’ (Maree, 2013) or defined as effeminate speech variety (Maynard, 2016). The image of the trans-gendered *onee* has become a central character in variety television programs and print media since the turn of this century.

This study investigates how gender-queer male personalities on Japanese TV programs ‘cross’ gender by using *onee kotoba* to index their identities and stances. A discourse analysis was conducted to analyze conversational data collected from Japanese variety television programs and written data from print media. The data analysis demonstrates that gender-queer male personalities on TV programs have managed to construct a synthetic sisterhood (Talbot, 1995) and that they often position themselves as women’s trusted advisor by linguistically constructing a sense of ‘we-ness’ (Maree, 2013) through *onee kotoba*. Using *onee kotoba* helps them to evoke a sense of gender for entertainment purposes. Furthermore, gender-queer male personalities often position themselves as ‘others’, in other words, as those failing in both femininity and masculinity in Japanese society. This positioning enables them to make their ‘sharp criticism’ attitude and harsh-tongued comments more acceptable.

Diversification and leveling in the end of sentence expression -ssu as a new honorific in Japanese

Panel contribution

Dr. Kazuko Tanabe¹

1. Japan Women's University

This study sought to determine the extent to which the end-of-sentence expression *-ssu*, which has been noted as a recent change in the Japanese language of young people, is spreading in general society by grammatical item, gender, and age. Subsequently, aspects of whether the emergence of this *-ssu* constitutes diversification or levelling in linguistic change in Japanese were analyzed.

Ssu is an abbreviation of the Japanese polite form 'noun or adjective + *desu*' (e.g. *kore wa ringo desu* 'This is an apple'), and was first used in university athletic clubs in the 1960s (Kuramochi: 2009). Nowadays, it is used mainly by men, as well as for seniors in the workplace and university sports clubs. The range of use has been expanded to include verbs. In this way, the polite form serves the function of conveying respect in a casual atmosphere (Nakamura: 2020).

In this study, a questionnaire survey was conducted in 2021 on the usage of *ssu*, *desu*, and *masu*. The participants were men and women in their 20s to 50s (250 people of each gender, 500 people in total) from all over Japan. The questionnaire comprised 20 questions.

Below is an example of the questions (adjective + *ssu*).

What do you think about the underlined wording in the conversation below? 'whether you use it or not' in daily life, please select one of the four options.

College Senior: '*Oi, Nakamura, raigetsu atari sakkā dōkōkai no nomikai shinaika* (Hey, Nakamura, why don't we have a soccer club drinking party next month)?'

Nakamura: '*Sore wa ii-ssu-ne* (That sounds good).'

(1) often use it (2) sometimes use it (3) hardly use it (4) never use it

Regarding *desu*, we asked about non-grammatical usages such as *iku-desu*, *katta-desu*, and *kowareteiru-desu*. Among the results of this survey, those where two-way analysis of variance identified differences in acceptability for each usage depending on age, gender, or a combination of both (interaction) are reported. The overall trend is that the acceptability for men was generally higher than that for women in their 20s to 40s. Among men, the acceptability for men in their 20s was higher than that for men in their 50s. This tendency was especially strong for non-grammatical forms such as *tabeta-ssu-yo*, *nusumareta-ssu*, *iku-desu*. The most prominent of these in acceptability among men in their 20s was *iku-desu*, showing a large difference from women in their 20s and men in their 50s, indicating a notably higher level of acceptability in this group.

Based on the above, the use and acceptability of *-ssu* can be considered as resulting from a combination of two contradictory linguistic changes: the emergence of new language of the youth as part of the diversification of the Japanese language versus a general process of levelling in the Japanese language from *masu* to *desu*, as attested in the numerous examples of the 'verb + *desu*' form in materials from the Edo (1603~1867) and Meiji (1868~1912) periods (Tanaka: 2008).

Exploring what are atypical and typical in modern Japanese: Newspaper imperial honorifics and language policies

Panel contribution

*Dr. Noriko Sugimori*¹

1. Kalamazoo College

This presentation explores the fluidity of being typical and atypical in the Japanese language using newspaper honorifics as a case. For this purpose, building on past studies (Sugimori 2010, 2016), the presentation examines the diachronic change in honorific policies at the newspaper and national levels as well as the use of Japanese imperial honorifics in newspapers representing different political slants in modern Japan.

A still-dominant discourse about the change in newspaper imperial honorifics is that special Chinese vocabulary was used in Japanese newspapers for the imperial family members as honorifics until the end of World War II, but that these imperial honorifics were replaced with simpler common alternatives in the postwar period (Shimbun Kyokai 1947, Monbusho 1952). Although the simplification took place during the Allied Occupation of Japan, the period of Japan's unprecedented intense contacts with non-Japanese, the Occupation's involvement with this policy has not been explored deeply.

Language policies behind the simplification are found in Newspaper Publishers' and Editors' Association's imperial honorific simplification policy (Tsuda 1947) and the National Language Council's *Korekara no keigo* [Forthcoming Honorifics] (1952). This simplification is aligned with a broader process of homogenization and leveling (Fischer 1999) of the Japanese language. However, various misrepresentations were found in these policy documents (Sugimori 2006, 2010, 2016): the policy documents referred to the more conservative honorific use as simplification, suppressing more radical simplification of imperial honorifics by reporters that had taken place in the aftermath of World War II. Grammarians who spread the discourse of simplified imperial honorifics made the generalization of the use of imperial honorifics in newspapers based on their observation of several "typical" reports of the emperor from the major national dailies such as *The Asahi* and *The Yomiuri* only (Nishida 1998), of which the political slants tend to be neutral. Therefore, based on the understanding that language change is driven by conflicting forces, more *atypical* newspapers with different political slants and national language policies need to be incorporated into the diachronic analysis. For this reason, this presentation juxtaposes the diachronic change in the use of imperial honorifics in national newspapers with two newspapers with political slants in the extreme ends: *The Jinja Shimpō* [Shrine News Report], the organ of the Shinto community that aims to maintain and spread the traditional language use, and *The Akahata*, which is the organ of the Japanese Communist Party. Their honorific uses will be tested against the related national language policies. Furthermore, the Occupation's involvement is also examined by policy documents and memoirs by newspaper reporters.

Despite the fact that using honorifics for the imperial family is ubiquitous, the efforts to incorporate them in historical sociolinguistic research in the postwar period were limited, with some exceptions (Satoh 2001, Azuma 2006, Sugimori 2010, 2011, 2016). However, the royal family system has been maintained in more than twenty countries worldwide, influencing people's perception and uses of hierarchical language use, and this research deepens the understanding of language diversification and homogenization.

Gender bias in teachers' use of address terms across cultures, languages, and educational contexts

Panel contribution

*Ms. Aviv Orner*¹, *Dr. Hadar Netz*²

1. The Hebrew University of Jerusalem, 2. Tel Aviv University

Studies show that classroom discourse is saturated with gender biases, which affect students' learning experiences and shape their identities. Address terms are highly influenced by changes in social norms and are therefore useful for exposing gender biases (Phillips, 1990). In class, address terms are used by teachers not only for designating speakers but also for additional instructional purposes, such as creating a friendly atmosphere or managing discipline (Parkinson, 2020; Tainio, 2011). Previous studies mainly focused on terms addressed to groups of students (e.g., 'boys'), whereas individualized address terms and their contribution to gender construction were rarely explored. Furthermore, most previous studies examined address terms in English, i.e., a 'natural gender language' (Stahlberg et al., 2007), whereas less is known about address terms in 'grammatical gender languages' (ibid.), such as Hebrew. The current study addresses these gaps.

We analyze two corpora drawn from two different cultural and educational settings: 15 hours of English Language Arts lessons in gifted classes in the US, and 30 hours of Hebrew Language Arts lessons in mainstream classes in Israel. Data analysis reveals different frequencies in teachers' use of address terms in the two corpora: 1.6 address terms per hour in the US classes, vs. 3.3 terms per hour in the Israeli classes. Furthermore, while in the US classes, boys and girls received address terms in similar frequencies, in the Israeli classes, boys received significantly more address terms than girls. Interestingly, despite the apparent balance in the frequency of terms addressed to girls and boys in the US, and despite the fact that English is a natural gender language, gendered biases were actually found in both settings: In US classrooms, the most frequent address term for boys was 'sir', which was used to express respect and appreciation, while girls were given diminutive terms, such as 'girl' or 'kiddo'. This finding may be indicative of a higher appraisal of gifted boys than of gifted girls. In Israeli classes, boys were mostly called 'cutie', while girls were given a wider variety of terms, such as 'darling' and 'sweetie'. Importantly, 'cutie' was used mainly for managing discipline problems, which may explain its high frequency specifically among Israeli boys.

In conclusion, the current analysis reveals that gender biases are present across diverse cultures, languages, and educational settings. The reproduction of gender biases perpetuates educational gender inequality. The findings of this study provide sociolinguistic and pragmatic evidence that the struggle for gender equality in education is still underway and far from being complete.

‘Face’-related Expressions in Historical Chinese Peking and Teochew Opera Scripts

Panel contribution

*Ms. Jiejun Chen*¹, *Prof. Daniel Kadar*², *Prof. Juliane House*³

1. Hungarian Research Centre for Linguistics, 2. Dalian University of Foreign Languages & Research Institute for Linguistics, 3. University of Hamburg

In this study, we investigate the use of ‘face’-related expressions in historical Chinese data drawn from Peking Opera and Teochew Opera scripts. Peking Opera is the most well-known type of Chinese opera, written in variants of Mandarin spoken in Beijing and Hubei Province; Teochew Opera is a traditional drama written in the Chinese Minnan Dialect. In a previous study (Chen et al., 2022), we found a significant difference between ‘face’-related expressions in the Minnan Dialect and Mandarin. On the basis of this result, we challenged the long-held assumption of ‘face’ as a homogeneous concept in Chinese. We also pointed out that while in Mandarin the expressions *mian* 面 and *lian* 脸 exist in a duality, there is only a single ‘face’-related expression, *mian* 面, in the Minnan Dialect.

In the current paper, we started from the hypothesis that our previous outcome also applies to how ‘face’-related expressions are used in historical Mandarin and Minnan corpora. To investigate this hypothesis, we collected and categorised ‘face’-related expressions from 19 Peking Opera scripts and 19 Teochew Opera scripts, mainly compiled during the Ming and Qing periods (1368–1912). The results of our investigation were consistent with our previous research in that we found remarkable differences between ‘face’-related expressions in our historical Mandarin and the Minnan Dialect corpora. However, our hypothesis was disconfirmed: we found that in historical Minnan texts *mian* is used in a duality with another ‘face’-related expression, just like its Mandarin counterpart: *mian* in historical Minnan co-exists with *yan* 颜, an expression which was found to conventionally describe physical face only in previous research. This outcome shows that ‘face’-related expressions can significantly vary not only among various dialects of Chinese, but also diachronically. Furthermore, our results reveal that it may be worth investigating ‘face’-related expressions in historical data because historical pragmatics provides new insights into the use of such expressions.

A contrastive study of speech act realisation between CFL learners and Chinese native speakers

Panel contribution

*Ms. Puyu Ning*¹

1. *Hungarian Research Centre for Linguistics*

A surge of research has been focusing on Chinese as a foreign language (CFL) in recent years; however, little attention has been given to the development of learners' pragmatic competence. The current research aims to explore the development of CFL learners' ability to realise the speech acts of Apologise and Request (Edmondson and House, 1981; Edmondson et al., 2022). I adopt a contrastive pragmatic perspective to examine the similarity and difference in the speech act performance between young CFL learners and Chinese native speakers in a similar age group.

The study is based on the data collected from CFL learners who are in their eighth grade at a Chinese-Hungarian bilingual public school. The young CFL learners completed a perception assessment test and a discourse completion task. I compare these test results with the parallel data produced by a comparable group of Chinese students in Beijing, who completed the same tests. The data are coded according to the Apologise and Request realisation strategies drawn from the Cross-Cultural Study of Speech Act Realization Project (CCSARP; Blum-Kulka et al., 1989). I find that CFL learners perceive less necessity in performing the speech acts under certain circumstances than Chinese native speakers. The statistics show that young native speakers use slightly more strategies in realising the speech acts than the CFL learners. However, young native speakers use significantly more address terms and more diverse strategies in the performance of the speech acts. The findings not only identify the most salient linguistic features of the Apologise and Request among the young speakers, but also have strong implications for CFL education.

Keywords: Chinese as a foreign language; discourse completion task; Apologise; Request; young learners

A Preliminary Study on Footing Selection and Ritualised Context Determination

Panel contribution

***Dr. Song Yulong**¹*

1. Nanjing University

In recent years, using ritual theory to explore the phenomenon of linguistic politeness has gained more and more attention. However, current research tends to default to the fact that the data analysed occurred in ritualised contexts while pays little attention to the problem of determining the ritualized contexts. With data collected from diplomatic notes between China (the Qing Regime) and United States in 19th century, this paper explores the functions of “footing” in determining ritualised contexts and the pragmatic rationale behind it through the lens of historical pragmatics. The inquiry reveals that in the dyadic context of diplomatic notes, where both the speaker and the hearer are explicit, there is a clear “shift” of footing through the address terms used by the interlocutors to refer to themselves and others. The study concludes that footing plays an important role in determining whether a context is ‘ritualised’ or not. By investigating the pragmatic rationale behind the relationship between footing and ritualised context, this paper intends to increase the operability of ritual theory in practice.

Chinese as a Foreign Language – A New Pragmatic Pathway

Panel contribution

***Prof. Fengguang Liu*¹, *Prof. Daniel Z. Kadar*², *Prof. Juliane House*³**

1. Dalian University of Foreign Languages, 2. Dalian University of Foreign Languages & Research Institute for Linguistics, 3. University of Hamburg

In this lecture, we present an alternative view on Chinese as a foreign language, which allows us both to invigorate the field of Chinese as foreign language and provide innovative insights into intercultural pragmatics. We introduce a methodological take through which one can identify often unnoticed pragmatic failures in the Chinese classroom, which is difficult to capture with traditional methodologies of foreign language learning and teaching. This methodological take also allows us to view intercultural interaction in the global Chinese classroom beyond sweeping overgeneralisations, such as “Chinese speakers are face-sensitive”, i.e. in a bottom-up and language anchored way. By way of illustration, we report on both a major applied linguistic project conducted at Dalian University of Foreign Languages under the lead of the first speaker, as well as a new book project of the second and third speaker (House and Kádár, 2023). As a case study, we will present a recent empirical research dedicated to the interactional act of disciplinary criticising in Chinese classroom.

Criticising in Chinese and English Classroom Contexts: A Contrastive Pragmatic Inquiry

Panel contribution

*Mrs. Wenrui Shi*¹, *Prof. Fengguang Liu*¹, *Prof. Dániel Z. Kádár*², *Prof. Juliane House*³

1. Dalian University of Foreign Languages, 2. Hungarian Research Centre for Linguistics, 3. University of Hamburg

Abstract: In the research presented in this talk, we examine how criticising is conventionally realised in classroom contexts in the typologically distant Chinese and U.S. American English linguacultures. We believe that this comparison is of particular interest because studying realisation patterns of criticising allows us to unearth deep-seated differences between the ways in which speakers of Chinese and U.S. American English produce and perceive this face-threatening act. We devote special attention to instances of disciplinary criticising in classroom setting, i.e. cases when a lecturer restores the order of a classroom after a breach of appropriate behaviour.

We propose a new bottom-up and speech act-anchored approach for the study of criticising. While a body of previous studies defined criticising as a speech act, we ourselves define criticising as an interactional move, in the spirit of Edmondson (1981) and Edmondson and House (1981). Our research builds on a previous study (Liu et al. forthcoming), which has shown that instances of Chinese disciplinary criticising are difficult for foreign learners of Chinese to recognise.

Sympathise in Chinese: A Contrastive Pragmatic Inquiry

Panel contribution

Ms. He Cang¹, Prof. Dániel Z. Kádár², Prof. Fengguang Liu¹, Prof. Juliane House³

1. Dalian University of Foreign Languages, 2. Hungarian Research Centre for Linguistics, 3. University of Hamburg

In this talk we examine how the speech act Sympathise is realised by foreign learners of Chinese and native Chinese speakers. We interpret the speech act Sympathise by following Edmondson et al. (2023) as a speech act used when hearing that something unfortunate has happened to the addressee. Sympathise is an attitudinal non-future-related speech act, which often manifests itself in ritual forms. This highly ritualised and formulaic nature of Sympathise can make it difficult for learners of a foreign language to realise this speech act. This is all the more so because realisations of this speech act often manifest themselves in the form of expressions popularly associated with other speech acts, such as so-called ‘apology formulae’ in English. Considering that Sympathise in Chinese has not received sufficient attention, the present study will fill a knowledge gap, by focusing on the L2 implications of this topic.

A computational approach to embodied responsive actions in multimodal video analysis

Panel contribution

***Ms. Clara Lachenmaier*¹, *Dr. Kathrin Weber*²**

1. Universität Bielefeld, 2. Friedrich Schiller University Jena

In recent years, conversation analytic research has been pervasively affected by the “embodied turn” (Neville 2015; Mondada 2019). In this framework, participants organize linguistic practices not only through language but through the mobilization of a range of resources including gestures and other aspects of bodily conduct, e.g., body postures or movements, in so-called “multimodal packages” (Hayashi 2005). The interest in how social interaction works multimodally has prompted the study of video recordings of naturally occurring activities, aimed at understanding how participants achieve the complex coordination of their actions (Mondada 2006). Methodologically, conversation analysis and multimodal interaction analysis frameworks remain predominantly qualitative research fields. Thereby, embodied practices are analyzed based on the basis of individual examples at great expense. Quantitative analyses are not yet feasible due to the lack of automatization of gesture and facial resources. Moreover, due to the predominantly manual annotation in this field, the researcher has a high impact on how gestures are defined and tagged.

Attempts have been made to recognize facial gestures using supervised Machine Learning. Cohen et al. (2003) used facial landmarks as features to predict facial emotion expressions. In our talk, we would like to present a computational approach on automatically tagging data for multimodal resources in interactional video data. In particular, we look at how facial gestures like eyebrow raisings can be tagged automatically in order to enable the analysis of embodied conduct in larger corpora. To this end, we apply *Mediapipe*, an end-to-end neural network-based model for inferring an approximate 3D mesh representation of a human face from a single camera input (Kartynnik et al. 2019). We hope to show that computational approaches can support qualitative analysis in the methodological preparation of data through precise measurements of the eyebrow position and the application of Machine Learning algorithms. On the other hand, we also discuss the limitations of the technology when it comes to fine-grained analysis of interactional functions.

Facial gestures in multimodal feedback signals: Comparing response tokens in spoken and signed conversation

Panel contribution

*Dr. Jana Hosemann*¹, *Dr. Anastasia Bauer*¹, *Dr. Sonja Gipper*¹, *Mr. Tobias-Alexander Herrmann*¹

1. University of Cologne

Feedback is omnipresent in human interaction and reflects interlocutors' perception and monitoring of the success (or potential failure) of communication. Feedback signals – for instance, in the form of response tokens (Gardner 2001) such as English *yeah* or *mhm* – serve to coordinate interaction, direct the advancement of narrative, manage attention and establish common ground (e.g., Tolins & Fox Tree 2014). While there is a considerable amount of literature on response tokens in spoken languages (e.g. Dingemanse & Floyd 2014; Knudsen et al. 2020), research on response tokens in sign languages (Coates & Sutton-Spence 2001; Mesch 2016) is extremely sparse to date. Moreover, both signers and speakers may demonstrate forms of engagement through visible cues (e.g., gaze, body orientation, facial gestures) with or without providing vocal feedback, an area that is less well studied.

We aim to take a first step at filling this gap in this paper by comparing the use of facial gestures constituting or accompanying response tokens in the discourse of speakers and signers in corpora representing four different languages and lingua-cultures: spoken German, spoken Russian, German Sign Language (DGS) and Russian Sign Language (RSL). We use data from the German Sign Language (DGS) Corpus (Hanke et al. 2020), Russian Sign Language (RSL) Corpus (Burkova 2015), multimodal video corpus of spoken Russian (Kibrik & Fedorova 2018) and a video corpus of spoken German (unpublished).

The current study provides a first cross-modal and cross-linguistic look at feedback mechanisms in signed and spoken languages. With this study we call the linguists' attention to the multimodal nature of feedback signals as a crucial tool for monitoring mutual understanding.

Multimodal responsive actions: Turn-initial particles and raised eyebrows in video-mediated interaction

Panel contribution

Mrs. Marina Reis de Souza¹

1. Hildesheim University

This paper addresses the role of facial gestures in social interaction and how they are accompanied by vocal conduct at the beginning of responsive actions. Participants can mobilize one or several multimodal resources simultaneously to respond to a question. Previous studies have shown the significance of pre-turn or turn-initial facial displays in responses (Kaukomaa et al., 2013, 2014). Likewise, turn-initial particles such as *oh* and *well* have been widely investigated in responsive turns. Some turn-initial particles have been described as being backward-looking, that is, they reveal information about the previous turn (Heritage, 1998, 2015, 2018; Schegloff & Lerner, 2009). Nonetheless, the co-occurrence of turn-initial particles and facial gestures, such as raised eyebrows in responsive actions is still understudied, particularly in video-mediated interaction (VMI). In this type of setting, besides speech, the face is one of the main resources available to interactants, which is defined as the “talking head” configuration (Licoppe & Morel, 2012). Therefore, I analyze how the face and turn-initial particles are used as multimodal resources in responsive turns. The paper draws on Skype calls taken from the corpus of video-mediated English as a Lingua Franca conversations (ViMELF, 2018). These calls are dyadic interactions between university students of different nationalities. I adopt multimodal conversation analysis to show how participants adjust to a video-mediated setting and to investigate how responsive actions are designed as multimodal Gestalts (Mondada, 2016). My contribution focuses on a collection of cases in which the turn-initial particle *oh* co-occurs with *raised eyebrows* to respond to “inapposite” questions (Heritage, 1998).

The use of silent mouth openings to show upcoming intervention in triadic screen mediated gaming interactions

Panel contribution

Ms. Lydia Heiden¹

1. ICAR Lab

The human face plays an important role in communication as facial expressions can convey various information to frame the verbal turn they accompany, precede or follow. They can also display how a co-participant's current verbal turn (or other action) is perceived and/or understood (e.g. Gudmundsen & Svennevig, 2020). Facial expressions also play a significant role in the systematics of turn taking (e.g. Duncan & Niederehe, 1974) but have yet been far less analysed in detail than other bodily behaviour such as changes in posture and head movements.

Our French data come from three party interactions in a collaborative digital game where the players can communicate via their webcam image representations. This 'talking head' format (Morel & Licoppe, 2009) gives only partial access to a participant's body. As the most visible part of the player is their head, mimics represent a communication device that is accessible with the least possible effort (since the head is by default centred in the webcam frame, whereas for example hand gestures have to be realised in a particular, and not always natural, zone in order to make them visible for the other participants). In the context of this collaborative game, the players need to jointly make decisions to achieve their shared goal. Thus, while discussing and arguing, they constantly need to display their (dis)agreement. The triadic interaction is regularly organised around dyadic exchange which the third participant has to find their 'way back' into.

In the present talk, I will show one particular way of 'coming back into a discussion' in which turn-initial facial movements play an essential role: the player who tries to bring themselves into the discussion comes to a rather neutral (relaxed) facial expression, which can express concentrated listening. Reacting to a prior turn, they either ask for more information that is needed to be able to do a particular action and that had been expected to be given by the co-participants, or they give additional information on a topic at hand which could influence the decision to make on it. To prepare or announce their upcoming intervention, they open their mouth, sometimes in combination with audible inbreath, but due to the screen mediated interaction context, breathing is not always audible to the co-participants.

By conducting a sequential analysis of three examples, chosen from a corpus of six different groups of players, I will show how this mouth opening followed by a speech fragment is sequentially treated and allows the player to make themselves heard.

A hierarchy of supernatural languages: Structure, function, and evolutionary dynamics

Panel contribution

Dr. Aritz Irurtzun¹

1. CNRS-IKER

Over the last decades intensive research has been done on language evolution and change, uncovering some of the biases that humans act upon when acquiring their languages. Experimental work in this area is generally done with the use of conlangs and the iterated learning paradigm (Kirby, 2017; Raviv et al., 2019). I propose a characterization of supernatural ritual languages as ‘natural conlangs’, comparable to the ‘laboratory conlangs’.

I present the Ritual Language DataBase (RLDB), which provides a typology of such languages around the world. A comparative analysis of the RLDB uncovers patterns and the significant role of users, functions, and alternate languages when shaping the structure of linguistic practices seeking the performance of a supernatural/magical act (cf. Wheelock, 1982). The RLDB, which at the moment comprises data from over 270 linguistic practices related to supernatural rituals across the world, systematically documents 46 features of each practice (the function; user type, use of an alternate language...). The variables display different degrees of association showing that the linguistic features of ritual languages are not distributed randomly but tend to cluster in patterned ways, which suggests the effect of universal biases. This is a remarkable fact, given the fragmentary and uneven evidence reported in the ethnographical and linguistic records where these languages are attested.

From this, a hierarchy of supernatural ritual languages can be established as a tension between the search for Strangeness (the more the language employed departs from the normal human ‘norm’, the most plausible the magical powers of the user look to the community) and Learnability (the more systematic and predictable a language is, the easiest its replication by a next generation). On one extreme of the hierarchy we would have the shamanic practices, archetypically represented by the Siberian shamans and their idiosyncratic speech which constitutes a ‘theatre of strangeness’ (Eliade, 1951). They do not show clear patterns of grammaticalization (but are full of extreme renderings with high pitch, falsettos, ventriloquism, animal sounds...), and the particularities of each linguistic practice typically die with the shaman. At the other extreme, we would have community-based practices which alter the local language with special lexicons derived via transformation rules (e.g. the antonymic patterns of the Tenda (Ferry, 1981)). In a middle point are the liturgical languages employed by designated individuals of established religious societies –priests, etc.– (Latin...) which require explicit teaching (with L2 effects). As a matter of fact, ritual languages show again that ‘larger communities create more systematic languages’ (Raviv et al., 2019).

Bata blessings: Ancestors' words in Kazakh cultural world

Panel contribution

Dr. Eva-Marie Dubuisson¹

1. Nazarbayev University

The *bata* tradition in Central Asia is one where older relatives pass along their blessings and wishes to the younger generation. Bata blessings may be given in a wide variety of social contexts, ranging from a daily family meal, to life-cycle ritual gatherings or events (*toi*). Bata blessings take the form of statements in the grammatical third person imperative, where the English language equivalent might read, "Let it be so." Blessings might be one short line, such as "*Zholynq bolsyn*" (may your road be [good]) when a relative departs on a journey. They may also be poems constructed of many stanzas, such as the blessings pilgrims receive from shrine caretakers at sacred sites throughout the region, where the prophecy of a saint is shared by an intermediary to his or her many 'descendants'. In this paper, I present *bata* as an oral tradition of a cultural world, where the blessings of ancestors and living relatives are passed to families and loved ones, in order to provide support and care, as well as a proper upbringing (*tarbiye*).

In this paper I will explain the tradition as a whole in the context of Kazakhstan, giving several examples from various cultural contexts ranging from home, to life cycle celebration, and pilgrimage. I will also take examples from broader national and social media contexts, where *bata* is shared and discussed by contemporary musicians, artists, and cultural or political leaders. I argue that the performative efficacy of these 'words of the ancestors' should be seen not only in individual contexts; rather, it is the pragmatics of the tradition as a whole that matters. Ancestors' words contain a valuable repository of wisdom and care, which remains necessary in the fractured post-socialist and semi-authoritarian environment of Post-Soviet Kazakhstan, where the dynamics of power and authority can be volatile, and where maintaining a shared sense of the proper 'way forward' across this cultural world seems urgent. The *bata* tradition of blessings and wishes is a canonical – and in the tradition of Malinowski's gardens, perhaps even magical - way in which words can truly shape the world. The context for this paper is based on many years of research on Kazakh culture and oral traditions in over six different regions of Kazakhstan (2016-2018 supported as part of a Marie Curie CIG grant from the European Commission, and 2019-2020 sponsored by a Social Policy Research Grant from Nazarbayev University). Social text examples presented here come from a current and ongoing collaborative project with a team of doctoral students and undergraduate research assistants at Nazarbayev University.

Central Himalayan Ritual as Magical Speech

Panel contribution

Dr. John Leavitt¹

1. Université de Montréal

A fundamental aspect of human language is the ability, or necessity, to refer to states of affairs that are not empirically perceived, and perhaps have never been empirically perceived. This is the fifth of Charles Hockett's design features of human language, which he labels "displacement". J.R.R. Tolkien proposes that since the linguistic isolation of aspects of the world dissociates qualities from their bearers, mere recombination of words creates new virtualities: "The mind that thought of *light, heavy, grey, yellow, still, swift*, also conceived of magic that would make heavy things light and able to fly, turn grey lead into yellow gold, and the still rock into a swift water. If it could do the one it could do the other; it invariably did both." Once situations and beings outside the empirical have been posited, by language and/or another sign system, language can be used to interact with these virtualities "as if" they were perceived actualities; for serious participants, they *are* perceived actualities. It could be argued that much of what we think we recognize as "ritual" is the effort toward such interaction, through movement, ostension, and words.

Much of the literature on magical language has concentrated on specifically performative, indeed illocutionary, instances, as Roman Jakobson's exemplification of the "magic, incantatory function" with a third-person imperative: "May this sty dry up, *tfu, tfu, tfu*." But as he himself states, this is a means of operating "some kind of conversion of an absent or inanimate 'third person' into an addressee of a conative message." Here I will argue that such conversion depends less on the specific linguistic form than on the total situation of speaking. It can involve what are linguistically perfectly ordinary third-person narration, second-person address, and first-person expression.

The Central Himalayan region of northern India offers particularly transparent and clearly articulated rituals of interaction with virtual beings to whom is attributed the ability to help and to harm human projects. The ritual progresses through clearly marked stages: the virtual landscape and chronotope are put in place and the regional gods invited to be present, provoking their apparent presence; stories of high and ancient gods are then told *to* these local gods in the third person; local gods' own stories are told to them in the second person; and finally they respond in the first person, allowing a direct dialogue with otherwise occult forces. This whole process is part of transforming the emotions of these beings, making them happy; their happiness in turn has effects in the perceived world.

Divine punishment and magic in Japan - an analysis of tenbatsu and kami -

Panel contribution

Dr. Yuko Asano-Cavanagh¹, Prof. Robert Cavanagh¹

1. Curtin University

In times of global uncertainty, people can experience powerlessness. This is exacerbated by calamities such as pandemics, earthquakes, floods, bush fires, and wars. For some, these unfavourable events and incidents seem unpredictable and uncontrollable. In contrast, others seek to identify causes and reasons.

In the case of Japan, when people face misfortunes, it is common for them to say *tenbatu ga kudatta*. This expression can be roughly translated as ‘we are being divinely punished’. In using the phrase, people are reflecting on their past and accepting the negative incident as punishment. The phrase can lead to people correcting their actions and behaviours. For example, parents use the expression when disciplining children. *Tenbatsu* can be roughly translated as ‘divine punishment’, and cultural outsiders may approximate the meaning. However, the problem of lack of precision in translation remains, including the source of the divine punishment. In Japan, the divine entities who are responsible for administering the punishment are called *kami*. According to bilingual dictionaries, the translation of *kami* is typically *God*. However, *God* is rooted in Christianity, while *kami* originated from Shintō. Additionally, Japanese people believe that there are as many as eight million *kami* who govern people’s lives by helping people and sometimes by punishing them. Unsurprisingly, the meaning of *kami* is not the same as that assigned to the monotheistic *God* which is generally understood as single entity by English speakers.

This paper investigates the meaning of *kami* and *tenbatsu ga kudaruru* using the reductive paraphrase methodology of the Natural Semantic Metalanguage approach. The study directs attention to the religious life of the Japanese and discusses the semantic and pragmatic differences between the Western understanding of *God* and its Japanese counterpart: *kami*. The corpus of naturally occurring examples illuminates the polytheistic nature of *kami*. The study also shows that the phrase *tenbatsu ga kudaruru* is one of the powerful magical speech act verbs which control and discipline Japanese people’s daily lives.

Emoji spells as speech acts

Panel contribution

Prof. Ellen Hurst¹

1. University of Cape Town

The phenomenon of emoji spells is a relatively recent development among modern followers of paganism. A digital practice, it involves the creation of a string of emojis to cast a spell, and is utilised on digital platforms such as blogs and messaging apps. The spells include the use of specific emojis such as the crystal ball or a girl with a raised hand to signal the magical intention. Sharing the spell with a community is intended to cement the intention. Users argue that the use of emoji spells can ‘act as a powerful manifestation of shared thoughts and emotional energy’ (<https://zoealderton.medium.com/emoji-spells-as-modern-witchcraft-bec126abfed0>), or alternatively the practice can be seen as simply having fun with a ‘cheerful visual lexicon’ (ibid).

This paper firstly introduces the phenomenon of emoji spells, presenting examples from a dataset gathered from online sources to demonstrate the typical structure of the spells and some commonly used symbols. The analysis then applies speech act theory to the dataset to examine the range of illocutionary acts being undertaken.

The analysis shows how the majority of the emoji spells act as requests, directed at an external force (the universe), and appear to be expressed externally to achieve actual change in the reality of the spell caster. Developed as a community practice within an online community, the shared symbols and structure of the emoji spells mean that each illocutionary act is understood as intended by other members of the community. The discussion considers how emoji spells may therefore function as a ritual to change the world through the magic of intention.

Love charms and curses at the beach: Approaching Mijikenda verbal magic in a Kenyan mass tourism context

Panel contribution

Dr. Nico Nassenstein¹

1. JGU Mainz

Kenyan beaches are known as a popular site for sex tourism, especially for European women, an essential component of what Meiu (2017) calls powerful “ethno-erotic economies.” While the sociolinguistic context of this environment is well researched, little to nothing has been said about the power of verbal expressions in bonding strategies on the coast. Between hotel castles and all-inclusive packages, young men (often disparagingly referred to as “beach boys”) attempt to attract the attention of potential clients, using love spells to secure a woman’s interest or spells and curses to inflict harm or retain clients. An interview excerpt in Omondi & Ryan (2017: 222) summarizes this as, “You can’t attract a tourist with nothing! You have to have some spells to help you lure him in and confuse him into bringing money.” These common charms and spells require regular visits to a *mganga* (sorcerer) and include artifacts such as amulets, aphrodisiacs, bodily substances, empty bottles hung from trees - but also spoken words in certain contexts attributed with the power to strengthen relationships between client and sex worker. In this presentation, I focus on “magical speech acts” aspired to and performed by Mijikenda men (an umbrella term for various coastal ethnic groups such as Digo, Rabai, Ribe, Giryama) and analyze ritualized language and its functions. Drawing on several months of ethnographic research on the Kenyan coast since 2015, I analyze and compare love spells and charms in the mass tourism sector through an ethnolinguistic lens, focusing on multilingual adaptations and pragmatic (re)contextualization of Mijikenda magical utterances and familiar spells in languages such as Rabai and Digo. I am interested in how these have been adapted to tourist encounters and whether similar speech acts are associated with the same performative and transformative power as in surrounding villages. This presentation is based on ongoing field research in the Rabai community conducted in collaboration with Laura Seel (Goethe University Frankfurt) and Dennis Jira (Rabai Mpya, Krapf Museum).

Magic as Real Virtuality?

Panel contribution

Prof. Adam Głaz¹

1. Maria Curie-Skłodowska University (UMCS), Lublin, Poland

In what is now a classic work, Malinowski (1923) frames the language of ritual magic in terms of Ogden and Richards' semiotic triangle, whereby the linguistic symbol is linked with the referent through an activation of a ritual, based on traditional belief. That ritual-and-belief sphere is hypothesized in this study to be a virtual space as defined below.

Virtuality is understood here, not as virtual reality (i.e., an "almost" reality, a simulacrum) but as *real virtuality*, a positive notion deriving from *virtus* 'power to produce form or create a notion in the mind' (cf. *virtu* or *virtue*, both positive). The idea has been developed by Deleuze (2004) or Žižek (c. Wright 2004): virtuality is felt, perceived, or taken as real as long as it remains virtual, or unactualized. This idea is considered here in the context of contemporary cognitive linguistics: according to Langacker (2009), several categories of language use, including metaphor, fictive motion, or perceived (vs. actual) change, are said to be virtual.

Analogy can thus perhaps be recognized between magical formulas and language use of the kinds listed by Langacker, both operating within real virtuality. As examples I will use folk Polish magical incantations believed to augment the growth and harvest of green peas and cabbage (Prorok 2017). For the incantations to be truly magical, they have to be virtual, located in what Malinowski identifies as ritual-and-belief and what is called here virtual space. Similarly, virtual space is activated in non-magical language use, as in *The telegraph poles get taller through the valley* (perceived change), where a certain non-actual status quo is taken as real by speakers. Thus, both magical and non-magical instances of language use can be taken as real (they "feel" real), not *despite* but *because of* the fact that they are located in virtual space (recall the positive sense of *virtus* as potentiality). Malinowski's account of magic and contemporary cognitivist account of non-magical linguistic symbolization can both be captured in terms of virtuality. Does that mean that magic sends echoes even through non-magical uses of language? Such claim is not being forcefully made here but the panel participants are welcome to consider it.

Magical Affirmations – Affirmative Statements in the Pick-up Artist Paradigm

Panel contribution

***Prof. Daria Dayter*¹, *Dr. Sofia Rüdiger*²**

1. Tampere University, 2. University of Bayreuth

This study looks at the language of self-proclaimed seduction experts, the ‘pick up artists’ (PUA) – a community that learns and practices speed-seduction for short-term mating. PUAs belong to the less extreme fraction of the ‘manosphere’ and encourage men to use manipulative strategies to select, pursue and sexually conquer women. Complementing our earlier work on linguistic pragmatics of a variety of PUA genres – in-field conversations with women, educational events, forum posts – in this study we focus on another key genre of the community, the confidence affirmations. Affirmations are positive statements that are meant to build confidence and self-esteem, for example, “I feel proud” or “I feel like a successful individual”. There exists research in well-being studies and positive psychology that demonstrates the value of positive self-affirmations, which may promote adaptive functioning, for example, adherence to the drug regimen (Howell 2017, Jaser et al. 2014).

Affirmations are wide-spread in the PUA community and can be found, for example, in the form of YouTube videos where the PUA ‘guru’ or a seductive female voice repeat affirmative statements on an hours-long loop. In contrast to the practices tested in experimental psychology, these affirmations are meant to be listened to during sleep, as background noise during daily activities, or are used as chants at group events. PUAs orient to the affirmations as a magical artefact that has a direct impact on the achievement of their seduction aims rather than as a tool of promoting self-integrity.

In our study, we look at a sample of 50 PUA affirmations collected from the YouTube channels of a popular PUA guru. We classify them according to their locutionary, illocutionary and desired perlocutionary effect. While according to the classic pragmatics framework the affirmations are representative speech acts, PUAs treat them as declaratives. We also identify the linguistic elements that serve as contextualisation cues for affirmations, for example, the modifier “naturally” which can be found in the majority of examples. Statements modified with “naturally”, for instance, “Women are naturally drawn to me” invoke an existing state of affairs (i.e., “I have always been attractive to women”), as opposed to a change to be brought about by affirmations. Finally, when comparing the PUA affirmations to the self-affirmations attested in positive psychology experiments, we find a difference in the social actors figuring in the affirmations: while affirmative statements in psychological interventions primarily involve the self (evident in the high frequency of the 1st person singular pronoun relative to other categories), PUA affirmations involve a broad variety of other actors. This reflects the magical thinking behind the affirmations, showing that PUAs see them as capable of having an effect on third party feelings and actions.

Rationality and magic

Panel contribution

Dr. Katja Jasinskaja¹

1. University of Cologne

Magical speech acts do not fit comfortably into classical speech act theory because of its focus on conventional effects of illocutionary acts (cf. Austin, 1962). In a world where people believe in supernatural powers, the relation between a magical speech act and its effect is (believed to be) causal, and the function of the speech act is best understood in terms of its perlocutionary object. The present paper develops a mathematical model that predicts that whenever the speaker holds the (perhaps irrational) belief of being able to directly affect the state of the world by their words alone it is absolutely rational to perform magical speech acts.

The basic assumption of probabilistic decision theory that constitutes the core of Rational Speech Act Model (Frank and Goodman, 2012) is that a rational agent always chooses an action A with the highest expected utility EU (A), for which I adopt Skyrms' (1982) definition in (1). Applied to (2), A stands for the speech act, i.e. the proposition 'the speaker utters (2)', O stands for the perlocutionary outcome, i.e. the proposition 'there will be light'. P (O | A) stands for the conditional probability of the outcome given the action and reflects the strength of the causal connection between A and O. The utility of the action-outcome combination U (A ∩ O) reflects the combined effect of the action cost and the desirability of the outcome O.

(1) $EU(A) = \sum P(O|A) \times U(A \cap O)$

(2) Ancient Greek:

Γενη-θή-τω φῶς

be-AOR-IMP.3SG light

'Let there be light!'

The probability distribution P reflects the speaker's beliefs about causal connections between events in the world. One can formally prove that in a world without magic, where words cannot directly affect the world, (2) can only be uttered if the speaker indirectly intends to bring the hearer to do something about making light. I argue that inferences of hearer involvement constitute the pragmatic pressure that shapes mood systems of the languages of the world, making the second person the canonical form for imperatives, whereas third person imperatives, or hortatives, like (2) are relatively less frequent and marked.

In a world or in a belief system that does have magic, speech acts like (2) do not give rise to an inference that the hearer should act on it or that there even should be a hearer. This makes third person imperatives one in a range of suitable linguistic forms for magical speech acts, which is historically attested (e.g. Kropp, 2009).

In sum, probabilistic decision theory allows to capture some crucial properties of both non-magical and magical speech acts and makes non-trivial predictions with respect to tendencies in their linguistic realization.

Siekopai Uja formulas as magical speech acts

Panel contribution

Dr. Jorge Gomez Rendon¹

1. Pontificia Universidad Católica del Ecuador

Siekopai are one of the fourteen Indian nations recognized by Ecuador's intercultural and pluri-nation state. Their language (Paikoka) is part of the Western Tucanoan language family. Siekopai live in the Amazon lowlands along the Aguarico river in the province of Sucumbíos. One of the most salient genres of Siekopai verbal art is known as *uja*, which has an equivocal meaning but may be translated as "advice". The *uja* genre comprises a set of formulas that fulfill different functions including protection from the jaguar in the forest and from the big fish in the river, umbilical cord care, snake bite treatment, fishing efficiency, fertilization and sterilization of women, among others. Nowadays, *uja* formulas are still known and used by a small number of male and female elders who hoard them secretly. While their formulaic nature makes them relatively easy to learn, they are not taught openly either in the family or in the school due to their magical efficacy which must be handled responsibly.

Interestingly, the linguistic features of *uja* formulas are not very different from those of everyday language. In this regard, Cipolletti insists that "the wording [of formulas and shamanic chants] can be understood by any Secoya speaker, and that unintelligibility has to do mainly with semantics, since the text cannot be 'read' correctly, that is, decoded, without the intervention and information of the religious specialist" (1988: 11). Still, a preliminary analysis of the corpus shows the occasional use of suffixes absent in common inflection and derivation as well as the presence of ideophones, i.e., words which describe sensory images associated with color, sound, action, state, or intensity (Dingemanse 2012: 25). The analysis suggests as well that most *uja* formulas are recited with intonation patterns different to those of another associated Siekopai verbal genre known as *wiña*, composed of chants used for human-nonhuman communication in shamanic contexts. Both genres of Siekopai verbal art played a decisive role in the past as the most effective medium to teach spirituality and values to Siekopai children, hence their importance today as a source of traditional wisdom.

The first linguistic documentation of *uja* formulas – undertaken along with that of *wiña* chants – among the last elders who know these genres is currently underway as part of a project oriented to safeguard this verbal art in order to teach them in the framework of an ethno-education program. With this background, this contribution has three objectives: 1) propose a functional typology of *uja* formulas; 2) describe the felicity conditions to be fulfilled for an effective performance of *uja* formulas according to their type; 3) describe the contexts of teaching and learning of *uja* formulas in the past and the present.

The Metapragmatics of Black Magic: Cross-Cultural and Postcolonial Perspectives

Panel contribution

Dr. Carsten Levisen¹

1. Roskilde University

This paper explores the discourse of “magic” in a cross-cultural and postcolonial-pragmatic perspective, focusing on “black magic” and related concepts. The aim of the paper is threefold. Analytically, the paper seeks to identify and articulate the cultural scripts that guide European and Eurocolonial conceptualizations of “black magic”, including the role that the visual semantics and the tropes of “darkness” and “blackness” play for the socio-spiritual and cosmological logics of meaning-making. Secondly, the paper aims to investigate how the European conceptions of *black magic* have been adopted, reinvented or resisted in postcolonial linguacultures in the Eurocolonial influence sphere. Employing cultural scripts theory (Goddard 2006; Ameka 2020), and informed by research in postcolonial pragmatics (Anchimbe & Janney 2011; Levisen & Sippola 2020), the paper seeks to contribute theoretically to the establishment of a post-universalist pragmatics, and especially to emerging cross-cultural and postcolonial frameworks.

To make progress on all these three fronts, the paper provides an in-depth case study on Bislama linguaculture. Bislama is a contact-zone language spoken in the South Pacific (Vanuatu). Lexically, the majority of words of Bislama has origin in English, but the pragmatic orientation of Bislama is “Pacific”, rather than “Anglo”. Comparing key concepts in Bislama cosmology, including *nakaemas* and *blakmajik*, *kastom* and *daknes*, the case study teases out the underlying cultural scripts of Bislama. Apart from being salient in discourse, these words also act as metapragmatic pointers for understanding “magical speech acts”: *Nakaemas*, a word which is commonly translated as ‘sorcery, witchcraft’, and *blakmajik* (from ‘black magic’) provide evidence for local understandings of the specific workings of socio-spiritual practices (Levisen, *forthc.*) and as key constructs of sociality, *kastom* (from ‘custom’) and *daknes* (from ‘darkness’) provide further metapragmatic evidence for local understandings of cosmology, culture and change (Levisen & Priestley 2017). The case study on magic-related concepts, and pragmatic tensions in the contact zone reveals some major gaps in universalist-pragmatic theorizing. This leads us to consider how cross-cultural and postcolonial pragmatics can assist in the development of adequate accounts of meaning-making in this area of discourse.

What's 'magic' about Tongan honorifics, speech precludes and other taboo-related practices?

Panel contribution

*Dr. Svenja Völkel*¹

1. University of Mainz

The Polynesian languages and cultures, of which Tongan is a part, have not really been associated with the word 'magic' so far. Nevertheless, within the realm of the traditional notion of *mana* (spiritual power) and taboo, there are a variety of linguistic and non-linguistic practices that have many elements of 'magic'. These include formulaic speech elements, ritualized practices, words with attributed power, on-stage effects, feared negative consequences in the case of improper handling of the invisible power, and so forth. Thus, words and speech acts are powerful, and their use has desired consequences while their misuse entails hardly controllable negative outcomes. These linguistic forms and practices go hand in hand with non-linguistic practices and are to be seen in the overarching framework of the conceptual idea of an invisible power and its control.

This paper will present the concepts of *mana* and taboo and then analyse Tongan honorifics, speech precludes and other taboo-related practices in terms of their magical elements. In Tongan culture, the idea of spiritual power is linked to the social rank and status. Traditionally, the chiefly societies of Polynesian have a highly stratified social structure. On the societal level, the sovereign as closest descendent of divine ancestry is ascribed the most *mana* and their rank is higher than the rank of chiefs or commoners, and within the *kāinga* (extended family), the *mehekitanga* (father's sister) has special status and power 'to curse or to cure' (Douaire-Marsaudon 1996). There are verbal and physical taboo vis-à-vis people of higher rank and status; they are neither touched physically nor verbally as the honorific vocabulary, the use of these registers, the use of their titles instead of the given names, and the speech precludes demonstrate (Völkel 2021). These linguistic strategies are rather a means to protect the power of *mana* items and to handle the danger they pose, while taboo-breaking behaviour causes negative consequences (e.g., illness or misfortune), which can only be released by ritualised practices. Thus, the 'magical' power of language becomes more evident in the nonconformist use of the circumnavigating language strategies (e.g., cursing or offensive speech acts).

The consideration of language (words and speech acts) as well as artifacts and non-linguistic rituals as 'magical' depends on the power cultures attribute to them in causing certain effects. Thus, magic is ultimately anchored in a particular worldview. As Tambiah (2017: 471–472) has described, we have to be careful from which perspective linguistic practices are considered as 'magical' or not – from an emic or a Western-centric perspective.

“I herein and hereby claim liberties”: Pseudolaw and Magical Speech Acts

Panel contribution

*Dr. David Griffin*¹

1. Cardiff University

Law is a system of speech acts (DeLong 2015, p.82) and legal texts are frequently, if generally metaphorically, compared to magic texts (e.g. Yelle 2006) or more broadly to a form of “social magic” (Bourdieu 1987, p.840). Goodrich (1990, pp.140–141) has suggested that government’s historic opposition to magic practices has resulted less from any lack of efficacy of those practices than it has from magic rivaling the law’s claim on being the ultimate expression of access to truth and power. This paper examines that contentious relationship between law and magic by comparing the use of explicit performative speech acts in a corpus of courtroom filings written by American attorneys to their use in a corpus of courtroom filings written by American members of the Sovereign Citizen movement, a group of anti-government pseudolegal conspiracy theorists found around the world (Berger 2016). Sovereign Citizens and members of related movements have been described as using features of legal language in their own writings as if they were magic “words of power” (Wessinger 2000, p.160; Dew 2015) whose use allows them to magically appropriate the authority of the legitimate legal system. By comparing the use of speech acts in these two corpora, this paper explores the intersection of pragmatics, secular ritual, and imitative magic practices.

Mensel)**

Analyzing family instant messages through interactional sociolinguistics and multimodality

Panel contribution

Dr. Hanwool Choe¹

1. School of English, University of Hong Kong

My study demonstrates how integrating interactional sociolinguistics (Gumperz 1982) and multimodality (especially text-image relations in Kress and van Leeuwen 2021[1996]) serves as a powerful methodology for studying family instant messages where everyday photos and videos, along with language, are used as the major means of communication. By using instant messages from 5 chatrooms of 5 Korean families(-in-law), or 17 adult participants, on KakaoTalk, an instant messaging application popular in South Korea, I explore how family(-in-law) members make meanings, create family, and maneuver power and solidarity through text (instant messages) and audiovisuals (everyday photos and videos) in family chatrooms. Although the photo/video exchange is commonly practiced in everyday family instant messages and greatly affects how family members talk about prior experience, it is little understudied with a focus on intertextuality in interactional sociolinguistics (see Tannen 2006 for intertextuality in interaction, or repetition of words and utterances in everyday life) and text-image relations in multimodality (Kress and van Leeuwen 2021[1996]). Everyday photo-/video-sharing reveals that family members, as senders and receivers, have different anticipation, expectation, and appreciation of meaning-making. This not only allows them to use different strategies to take part in constructing meanings of shared audiovisuals but also generates new forms of mutual participation. I show 1) that the ways in which same everyday photos and videos are shared across chatrooms – create different intertextual trajectories of making and interpreting meanings of shared audiovisuals; and 2) that everyday photos and videos are used as interactional devices to manage and negotiate power and solidarity dynamics, especially between parents(-in-law) and children(-in-law). My analysis highlights how family instant messaging is representative of family as a discursive construct as well as a multimodal act. Addressing the gap in previous research on everyday family discourse, primarily based on face-to-face spoken communication; Western family discourse; and parent-child interaction (e.g., Tannen, Kendall, and Gordon 2007; Gordon 2009), my study also offers the wider spectrum of family discourse analysis that ranges over various family discourse types from offline (e.g., family mealtime conversations) to online (e.g., family instant messages); from western family discourse to Asian family discourse; and from nuclear family discourse of working parents and young children to extended family discourse of adult family(-in-law) members. My study contributes to updating family discourse studies in light of our new digitally mediated reality by interrogating how instant messages (re)present contemporary family discourse.

Enacting and negotiating family roles in multilingual interactions: Insights from an ethnographic perspective

Panel contribution

Dr. Rafael Lomeu Gomes¹

1. UiT The Arctic University of Norway / University of Oslo

Studies on family multilingualism have recently foregrounded the role of emotions in everyday online and of-line family interactions (e.g. Curdt-Christiansen and Iwaniec 2022, Naborn et al. 2022, Lomeu Gomes 2022). Contributing to these ongoing developments, in this paper I examine the discursive construction of familial ties in multilingual family spoken discourse. While centring the analysis around the role of emotions as participants discursively enact and negotiate subject positions in interactions, a particular focus is given to the affordances and limitations of the employment of an ethnographic approach to the study of family discourse. Resulting from a three-year project conducted in Norway, this paper examines how members of two Brazilian-Norwegian families draw on their multilingual linguistic repertoires as they accomplish mundane tasks in the home. A discursive analytical approach was employed to examine audio-recordings of interactions in the home made by one of the parents of each family (i.e. around 15 hours of recordings in total). Conceiving of family talk as a locus where meaning is interactionally negotiated, results indicate that three social actions are achieved in parent-child interactions: (i) conveying parental value-laden aspirations of child-rearing, (ii) positioning children according to expected social roles, and (iii) forging parent-child ties. The analysis is theoretically anchored in the notions of linguistic repertoire (Busch 2017), affect (Clough 2007), and emotions (Ahmed 2004). Combining this theoretical framework with language socialisation scholarship on the affective dimension of monolingual parent-child interactions provides insights into affordances and limitations of an ethnographic approach to multilingual family discourse.

Everyday language practices in the family: ‘After the beep, say a command’

Panel contribution

Prof. Luk Van Mensel¹

1. XJTLU

Drawing on interactional data from a study on multilingual families in Belgium, this presentation builds upon previous work that investigates how family interactions may be studied in terms of a family language repertoire, i.e. a set of shared multilingual practices within the family that play a significant role in creating and maintaining family life (Van Mensel, 2018). In this view, a family’s everyday language practices can be regarded as a de facto language policy (Shohamy, 2006), which is interactionally negotiated by all family members. The present paper wishes to expand on the previous work by focusing on ‘the relationships between language practices and tangible and intangible factors of everyday family life, such as artefacts, events and tasks,’ as suggested by Hiratsuka and Pennycook (2019, p.1).

The episode at the center of this presentation involves a father, his two children, and his daughter’s friend driving home from music school in Brussels (Belgium). Their discussion (recorded by the father, researcher absent) involves both French and Dutch, and all participants also engage in a bout of language play with the car’s navigating system, the system’s posh British English pronunciation being the cause of great hilarity. The episode not only illustrates how technical devices such as these have become part of this family’s linguistic environment, thus providing particular semiotic affordances to the family repertoire; it also stresses that language practices cannot be disentangled from social practice (the events and tasks at hand). In our example, we can observe the participants drawing on the linguistic resources available in order to engage in a collective ‘game,’ namely communicating with a navigating system (in English). The observations lead us to a critical discussion as to what extent these language practices can be considered policy.

Multimodal approaches to meaning-making in family dinners

Laboratoire PRISMES EA 4398 / EA 370 GReMLIN, Université Paris Nanterre, 7. Paris Nanterre University, 8. INSPE-Sorbonne University, 9. University of Rouen

Family dinners grounded in commensality are a collective ritual that plays a key role in family members' identity and constitutes an inherent part of their cultural heritage. Those shared moments of everyday life present a perfect opportunity to study how language and interactive practices are transmitted to and used by children in order for them to construct meaning. Because the subtle interweaving of these practices while eating fully engages the body, our study highlights the semiotic differences between hearing and deaf adults and children using a spoken language, French, and a sign language, French sign language (LSF) respectively.

Our theoretical framework combines language socialization, cognitive grammar, interactive and multimodal approaches to *linguaging* (Linell, 2009: 274) expanding the term to include speaking, gesturing and signing. We study how children's socialization to a variety of modes of expression in their daily experiencing (Ochs, 2012) through dinners shapes their language development.

Ethnographic methods were used to collect dinnertime data with two standard cameras equipped with good quality microphones, one 360° camera placed at the center of the table and one 360° sound recorder. We annotated all participants' actions, gaze, and *linguaging* (Linell, 2009) throughout our data. We also coded the participation framework (Goffman, 1981) to conduct comparisons between participants according to their modality of expression and their age. Qualitative analyses were combined with quantitative methods based on manual annotations in the software ELAN (<https://archive.mpi.nl/tla/elan>).

We show how family members collaboratively manage the accomplishments of multiple streams of activity and coordinate their temporal organizations through the embodied performances of dining and interacting. Through family dinner conversations spiced with food and the company of loved ones, we aim to capture how speaking and signing children become increasingly expert at orchestrating semiotic resources within the framework of everyday experience. We uncover different profiles according to participants' status in the interaction, age and modality of expression. The hearing adults use the affordances of both the visual and vocal channels to maintain the simultaneity of the two activities and the integration of all participants. The deaf adults skillfully alternate smoothly between dining and interacting in a continuous flow. The deaf and hearing children manifest how they develop their competence to progressively manage multi-activity, and multiparty conversations according to their age, and the use of one versus two channels in their "inter-acting" and "inter-linguaging".

The goal of our participation in the panel *Meaning-making in the family* is to present not only some of our results, but also the analytical framework and method that we use to annotate and study a corpus of natural multiparty interactions in family dinner settings, our methodological challenges in data collection and coding, and the importance of using mixed methods to analyze the data.

Online heteroglossia as a resource for ethnicity and kinship in mediatized Indian families

Panel contribution

*Dr. Usha Kanoongo*¹

1. The LNM Institute of Information Technology, Jaipur

This paper uses Bakhtin's concept of heteroglossia (1981) to explore how it serves as a resource for manifesting ethnicity and kinship by a multilingual, multi-ethnic Indian family during their online socialization. It also attempts to show how linguistic variability is constitutive of and is constituted during identity performance and group work achievement by the members.

Digital media have penetrated the Indian socialscape enabling interaction, knowledge exchange, identity projection and community formation by the users. Online spaces have become sites of linguistic and discursive heterogeneity as evidenced in orthographical, phonological, morphological, syntactic and lexical variability, multilingualism, multi-semioticity and intertextuality in communicative exchanges.

The present study examines interactions of a WhatsApp group of 55 extended family members who hail from a small town in western India. They are native speakers of a Rajasthani dialect and most of them have migrated to different parts of the country. Qualitative analyses of this group's text exchanges enriched with semiotic analyses and ethnographic observations reveal how the family flexibly exploits the diverse lingua-communicative affordances of the digital medium for celebrating ethnicity, maintaining culture and performing relationships in the digital space. Findings reveal that practices of meaning-making via phonetic typing, innovative spelling, Romanized transliteration, mixing of utterances from multiple varieties, multimodality like audio and video and semiotic artifacts like emojis, gifs and memes etc., need to be viewed as heteroglossic moves by the group members. The creativity and stylization are instrumental for them in double voicing, i.e., communicating the stated meaning as well as the pragmatic one.

The clan's online interactions are reflective of their offline lives which are an amalgam of three realities, viz. immersion into the lingua-culture of their current inhabitation, exposure to popular culture, new media, and technologies, and attempts to sustain their indigenous traditions.

Sociolinguistic studies generally use heteroglossia as a lens to investigate socially-diverse, multilingual communities (Blackledge and Creese 2014). The present study is grounded on the idea that online communities like WhatsApp family groups should be viewed as distinctive communities that are connected yet distant, cohesive yet separated. They share common lingua-cultural roots but have acquired diversity over time and space. In light of this, the study proposes that compositions of everyday interactions between their members offer a fertile test bed for an analysis of heteroglossia. The framework of heteroglossia serves as an inclusive tool that encompasses the translanguaging and trans-semiotizing practices during the textual, gestural and visual means of social meaning-making within the digital environments.

Playful approaches to take family language policy seriously, one brick at a time-space

Panel contribution

Dr. Judith Purkarthofer¹

1. University Duisburg-Essen

Research on family language policy (FLP) has used many different approaches to capture language practices in the family, to understand parental attitudes and to engage with child agency as a contributing factor of FLPs (Lanza & Lomeu Gomes 2020). However, FLP proves to be a complex matter and it is hard to pin down the specific moments that shape language repertoires and activities.

In this paper, I discuss a multimodal method that centers collaborative building activities to understand how FLP came into being, is negotiated in everyday actions and is ultimately leading to expectations for the future (Purkarthofer 2019, 2022). Drawing on research with Lego™ building blocks in use with multilingual families, my aim is to discuss the advantages of playful approaches: Winnicott (2005) stresses the playful nature of learning, calling for spaces of free development to be able to realize one's potential and to advance to the next step. Playing is in this respect characterized by a positive absence of consequences, thereby enabling participants to explore options without the fear of bringing about immediate change to themselves and their family. The ongoing negotiations between parents are thus set in a space of potential where several parallel outcomes can be discussed. In therapy, methods like sandplay are used to foster a spirit of creation and to experience the potential to design a person's environment. These approaches have been discussed in language learning (e.g. Gee 2004) but have been rarely explored in FLP research so far.

The results from my own research with six families in Norway and Austria demonstrate how the collaborative nature of these approaches takes parents further in their reasoning and might help them to explore different time-spaces and language policies. The playfulness of the encounter also sheds light on language ideologies while at the same time saving face of speakers. In the interpretation of said data, the context of the interview, the materiality of the resources and their imaginary potential have to be taken into account.

Playfulness in (multilingual) family interaction

Panel contribution

Dr. Ragni Vik Johnsen¹

1. *UiT The Arctic University of Norway*

During the past decade, research on family multilingualism and family language policy have received considerable attention in sociolinguistic inquiry. Similarly, research on youth's language practices in heterogeneous contexts has been extensively studied, but primarily *outside* the family. This paper combines insights from studies of children and youth's linguistically hybrid and playful language practices with research on family multilingualism and language socialization and investigate playful talk in family interactions with children and parents. The paper shows examples of playful talk, which includes *inter alia* teasing, joking, mock speech (cf. Lytra, 2017), and investigates how family members' make use of and target each other's multilingual repertoires in these interactions. The data material comprises self-recorded interactions (ca 14 hours) from three multilingual families in (Northern) Norway. The families have in common that one of the parents has emigrated from Central- or Southern America, that they have at least one child in the age between 13-19, and that Spanish is one of the linguistic resources the family members share, in addition to Norwegian. Drawing on the notion of *translingual family repertoires* (Hiratsuka & Pennycook, 2019; Van Mensel, 2018) and research on language socialization (Ochs, 1996), the analysis points to how family members use humor and playfulness to negotiate social positions and generational hierarchies, display affective stances, and perform social identities. In sum, the paper explores how a detailed, interactional sociolinguistic approach to playfulness in multilingual families, can shed new light on family multilingualism by drawing attention to how affect, social identities and family bonds are displayed, negotiated, and constructed with and through multilingual repertoires.

The family home as unique opportunity to explore the meaning of language varieties: A mixed-methods approach

Panel contribution

*Ms. Freja Verachtert*¹, *Prof. Eline Zenner*¹, *Prof. Dorien Van De Mieroop*¹

1. *KU Leuven*

The family environment provides a dynamic research context where phenomena such as parenting styles, language socialization and parental feedback come together. Moreover, it offers a unique opportunity to further our understanding of language use and variation. Within the local context of the family home, caregivers tend to adjust their language when talking to their children according to what they deem appropriate in the macro societal context. (Nardy et al., 2013). Therefore, studying the way in which family members interact provides more insight into broader societal norms and expectations.

The focus of this paper is family language within the Dutch-speaking community of Belgium. This case is selected because of its exoglossic norm, history of hyperstandardization and persisting standard language ideology. Self-recorded dinner table conversations for eight Flemish families constitute a corpus of nearly 25,000 utterances of spontaneous language production, which is complemented with semi-structured metalinguistic interviews with the 16 caregivers separately.

The data is analyzed through a mixed-methods approach. First, we look at language production and assess the variation that can be found in caregivers' use of standard and non-standard variants in child-directed speech as compared to adult-directed speech. Three sociolinguistic variables are considered that portray varying degrees of salience and anticipated awareness: pronouns of address (N=5269), adnominal flexion (N=2397) and word-final t-deletion (N=9655). Multifactorial inferential analyses uncover style-shifting patterns that depend in significance and extent on the speaker and hearer in question, and the salience of the variable. Next, we complement these quantitative variational results with a qualitative analysis and examine how they relate to caregivers' explicitly voiced opinions on language variation as evidenced in the interviews.

The combination of these research traditions allows us to investigate to what extent data converge across methods and/or across families, and whether there are any recurring language profiles to be uncovered. Preliminary results reveal both seemingly aligned as well as contradicting style-shift patterns and attitudes on variation. For instance, some caregivers use significantly less vernacular variants in child-directed speech and explicitly orient towards standard language, while others show the same variation yet do not voice an opinion on the matter whatsoever. It seems, then, that there are different underlying motives; the abiding standard language ideology still being one of them.

Thus, our results confirm the potential of this mixed-methods approach to examine the meaning of language varieties in society. They pave the way to dive further in family discourse and to explore language attitudes not only through general style-shift patterns but also through specific speech events such as parental feedback and repair.

A Spontaneous Crowd of People or an Illegal Organised Gathering? Identifying and Resisting the Omni Relevance Device ‘Organised Event’ in the Sarah Everard Vigil.

Panel contribution

*Terry Au-Yeung*¹, *Prof. Richard Fitzgerald*²

1. Cardiff University, 2. University of Macau

On 13th March 2021, a vigil for Sarah Everard, who was abducted and killed by a serving police officer on March 3rd 2021, was to be organised at 6 pm at Clapham Common bandstand by a local activist group, Reclaim These Streets (RTS). However, after the police declared the vigil unlawful and refused to facilitate the assembly under the then-current Covid-19 lockdown rules, the group called off the event. Despite the Police warning and the organisers’ cancellation, well over a thousand mourners came to the scheduled location and gathered around a central bandstand but without a formal organiser being identified. Approaching the time when the now cancelled event was supposed to take place, at 5:45 pm two individuals and a group one after another took the bandstand delivering speeches to the gathered crowd. They each received different reactions from the crowd and around the time of the third speech the police commander changed his assessment of the gathering’s nature and subsequently ordered a police intervention to disband the gathering, leading to a controversial nationally televised stand-off between the crowd and the Police.

In this paper we examine this event through the lens of omnirelevance (Sacks 1995) to explore how the participants actively navigated the categorial boundary of two competing omnirelevant devices ‘a legal spontaneous crowd’ and ‘an illegal organised event’ and orient to presenting the former whilst avoiding the latter. Through the analysis, we explore and expand upon the idea of omnirelevance by elucidating a hierarchy among the two devices of ‘legal/illegal’ along with other contextual omnirelevant devices, and how participants invoked these contextual devices to negotiate and re-negotiate the categorial boundaries of the devices. Focusing on the bandstand at the centre of the vigil we examine how the three speakers address the crowd whilst orienting to the boundary between the omnirelevant devices. In particular we are interested in how the participants around the bandstand, both the speakers and the crowd, initially oriented to *speaking to the crowd* and not as *speaking on behalf of the crowd* or even *leading the crowd*, but later used a novel mode of interaction, ‘mic-check’, to perform *speaking to the crowd* in a way that produced a sense of solidarity in front of cameras. Arguably, the novel way of *speaking to the crowd* led to a ‘categorisation disjuncture’ between the participating crowd and a category of participating observer, i.e., the police. That is, whilst the gathering participants ongoingly resisted the alternative device ‘an organised event’ through *speaking-to-the-crowd-but-not-on-behalf-of-the-crowd*, as they navigated the categorial boundary the police judged that at some point the gathering becoming ‘an organised event’ and therefore policeable. We conclude by highlighting how the analysis offers a particular perspicuous insight into crowd control and police action as well as further understanding of the dynamics of omni relevance.

Age stereotyping and ageism in Belgian job interviews

Panel contribution

Ms. Melina De Dijn¹, Ms. Federica Previtali², Prof. Dorien Van De Mieroop¹

1. KU Leuven, 2. Tampere University

Because of the inference-rich nature of categories, categorizations are a crucial means for people to make sense of the world and for instance gauge others' anticipated beliefs or capabilities (Sacks, 1972). As such, category work is ubiquitous in encounters between people who want to get acquainted efficiently, for instance in the job interview (JI). However, due to the JI's gatekeeping function, categorization work in this context may have severe consequences.

To study this category work, researchers often draw on membership categorization analysis (MCA - see Stokoe, 2012). While this approach has been used to analyze interviews with candidates with migrant roots (e.g. Tranekjær & Kappa, 2016; Van De Mieroop & De Dijn, 2021), there is a dearth of research on age categorizations in JIs (Previtali et al., 2022). This is surprising since age stereotypes are considered to influence recruiters' decision-making processes and produce systematic discrimination in recruitment (Turek et al., 2022). Hence in this presentation we investigate how age dynamics may shape the interactions between recruiters and job applicants and how stages of life categorizations are made relevant during JIs.

In particular, we study a corpus of 81 JIs recorded in the Flemish part of Belgium between 2011 and 2021, which we scrutinize using MCA to examine age-related category practices and their re-production of age norms in organizations from an emic perspective. Our findings indicate that age categorizations appear in more than 10% of the JIs in our dataset. These categorizations can be initiated by recruiters, sometimes in problematic ways, but are also talked into being by candidates who link age categories to negative and positive stereotypes - disparaging outgroups and commending ingroups - to construct a 'best candidate' identity. By investigating how these age categorizations are talked into being on a turn-by-turn basis, we can shed light on the stereotyping processes associated with age which in their most extreme form can lead to exclusion of certain age groups in the recruitment context.

Category relations and norms of feelings in children's performances of a boyfriend-girlfriend culture

Panel contribution

Mr. Fredrik Andreasson¹, Prof. Ann-Carita Evaldsson¹

1. Department of Education, Uppsala University

This study explores how preteen children in everyday interaction mobilize relationship categories to negotiate what counts as appropriate romantic feelings among peers. It draws on ethnographic research (by the first author) of children's everyday peer language practices in a multiethnic school setting in Sweden. The analysis is based on ethnomethodological work on membership categorization and conversation analysis, (Sacks, 1992; Stokoe, 2006; Housley and Fitzgerald, 2009) integrated with ethnographic knowledge of how children utilize members' categories, and evaluative commentaries, as resources for constructing social relationships with peers (Goodwin & Kyratzis, 2011). Particular attention is given to how children in making playful evaluative commentaries on other's romantic performances enact, maintain and even resist membership in a particular relationship category (that of boyfriend/girlfriend) (Pomerantz & Mandelbaum, 2005). Two interrelated aspects of membership categorization analysis (the invocation of norms and the organization of social relations and social order) are in focus in the analysis (Evaldsson, 2007; Goodwin, 2011). The sequential analysis shows how category-based claims of "liking someone" and "being together", indexing a boyfriend-girlfriend relationship, are responded to with playful acts of resistance and denials. Categorical claims are also turned into public and playful embodied performances of relational pairing invoking the normative character of romantic matchmaking. The findings suggest that norms of feelings play a central role in how preteen children organize their social relationships, and that category based claims serve as important cultural resources for children to address their emergent concerns regarding peer group relationships (c.f. Simon, Eder & Evans, 1992).

How to Criticize an Authoritarian Regime without Getting Caught: Practices of Mitigating Criticism in Letters to the Editor in the GDR through Membership Categorization

Panel contribution

*Dr. Maximilian Krug*¹

1. *University of Duisburg-Essen*

In the authoritarian system of the German Democratic Republic (GDR, 1949-1990), letters to the editor were considered one of the few state-accepted forms of system criticism and took the position of a functional pivot between state control of language in newspapers and suppressed individual communication.

However, writers in authoritarian regimes always take a risk when criticizing the system. Therefore, the analysis of these texts is of crucial importance since they convey, on the one hand, the methods with which writers mitigate their criticism and, on the other hand, reveal what was considered *criticizable* in the GDR. In this context, membership categories (Housley/Fitzgerald, 2015) are essential, as members construct identities behind which they can hide or refer to people or groups of people they wish to criticize (Eglin/Hester, 1999). Mitigating criticism is vital in the GDR, where the act of criticizing is a category-bound activity closely intertwined with the category *enemy of the state*. Thus, writers need to formulate criticism in such a way that they do not risk being associated with this category (which could have had severe consequences for the safety of the person criticizing).

Letters to the editor can be seen as interactive elements in an otherwise monologic, one-way mass media process of newspapers. Therefore, this paper examines criticizing practices primarily from an interactional perspective, utilizing membership categorization analysis (Sacks, 1972). The data basis for the paper is the DFG-funded newspaper portal, which includes three exemplary newspapers of the GDR (1945 - 1994). Thus, a total of 8,000 documents from 49 years can be accessed.

For the purposes of this paper, the analysis will focus on those letters to the editor in which the writers propose an improvement of a governing practice and thus criticize the existing practice. The analysis shows that the writers support themselves in their argumentation through family categories and categories of work colleagues, which are both particularly important for the self-image of the workers' state GDR. However, the analysis also suggests that impersonal and indeterminate categories are used to avoid assignment of concrete responsibility. Thus, to criticize the state, the writers use, on the one hand, those categories firmly anchored in the linguistic repertoire of the GDR leadership. On the other hand, categorical gaps become apparent in which state leaders (as addressees of the critique) are not explicitly mentioned. By reproducing the state's linguistic practices, the writers increase the chance that their letters to the editor will be printed, but they also reduce the impact of their criticism.

Manifesting epistemic hierarchy in the doctor-patient relationship: Self-answered questions as a resource for membership categorization in German and Russian oncological therapy consultations

Panel contribution

Ms. Valeria Schick¹

1. University of Hamburg

Regardless of a particular medical culture, doctor-patient interactions are characterized by a predetermined participation framework (cf. Gofman 1981). Especially in oncological therapy consultations, it seems evident that doctors (as medical experts) reflect epistemic authority (cf. Heritage 2012), since they are in the position to transmit information about the diagnosis or the therapy options, whereas the patients (as medical laypersons) find themselves in an exceptional health-threatening situation which they mostly know nothing about. In order to manage the communicative task of informing the patient about the oncological findings and the therapy processes, doctors draw on routinized categorization mechanisms to classify a patient – as an individual case – into a particular group of patients that share the same indications. Within the examined 56 German and 54 Russian oncological therapy consultations[1], this kind of categorization emerges through the ascription of category-bound activities or features (cf. Sacks 1974) via self-answered questions (cf. Bückler 2018), as the following example demonstrates:

Док: у меНЯ предложЕние,

I have a suggestion

вот войТИ;=

to join

=вот в эту ГРУПпу активного наблюдЕния.

this group for active surveillance

((...))

каКИМ образом,

how

очень ПРОСТО;

very simple

РАЗ в три месяца-

once every three months

вы будете сдаВАТЬ анализ крОви,

you are going to have your blood work done

This contribution shall show that self-answered questions provide a cross-linguistic categorization resource from the perspective of the MCA (cf. Sacks 1992) as they are used by German but even more so Russian doctors to establish different membership categorization devices (e.g. ‘patients with low-risk prostatic cancer’ or ‘breast cancer patients’) and categories (e.g. ‘patients with low-risk prostatic cancer in active surveillance’ or ‘breast cancer patients with an indication for a chemotherapy / an operation’). Since both the question and the answer part of the adjacency pair are produced by the doctors due to their higher epistemic status (cf. Heritage 2012) and hardly commented on by the patients, this categorization mechanism displays the manifestation of epistemic hierarchy within the doctor-patient relationship.

[1] The German audio files were collected from 2014–2015 in the context of the Krebshilfe-Projekt (Cancer Aid Project) by Prof. Dr. Wolfgang Imo (University of Hamburg). The Russian contrast corpus was built from 2019–2021 during the partnership between the University of Hamburg (Prof. Dr. Wolfgang Imo) and the Medical

Sechenov-University in Moscow (Dr. Viktoria Fedorovskaya). All audio recordings were subsequently transcribed according to GAT2 (cf. Selting et al. 2009).

Morality and Credibility of Friends and Family under Cross-Examination

Panel contribution

*Ms. Tianhao Zhang*¹

1. *University of North Carolina, Chapel Hill*

Membership categories can be deployed by both parties of the interaction during cross-examinations to accomplish various actions (Atkinson and Drew 1979; Lynch and Bogen 1996, 1997). In this paper, I examine how membership categories of friends and family are deployed by interrogators and witnesses during cross-examinations to either impugn or defend both witness' credibility and morality (see also Brannigan and Lynch 1987). I also examine how the overhearing audience respond to such categorization work. Everyone is expected to know about "family" and "friendship." In addition, categories in these two devices are often consist of standardized relational pairs (e.g. "husband and wife," "friend and friend," etc.) that are understood as carrying moral obligations and responsibilities towards each other. Given these two characteristics of the friends and family devices, they can serve as an especially strong inference-making device for both legal experts and lay persons. Without direct access to the past events, the examining counsel and the overhearing audience can assess the plausibility of witness' account and implicate witness's moral culpability through the use of such devices (Lynch and Bogen 1996). By the same token, the witness can mobilize these devices to resist interrogator's characterization of past events, defend their credibility and morality, and gain common understanding from the audience.

Video recordings of Johnny Depp v. Amber Hear defamation trial uploaded to YouTube and viewers' comments serve as data for this study. I first show that interrogator deploys categories of friends or family along with a description of the witness's action(s) in a specific sequential position (after the witness has confirmed with the interrogator's prior descriptions of their action(s)) to put the witness in a dilemma where answering the interrogator's question would undermine their credibility (lied) and/or morality (e.g. "a bad sister"). Witness orients to the moral implications in their response through practices such as resisting the description and qualifying the applicability of the categories. I then show that witness also mobilize categories of friends or family to resist interrogators' challenge to their credibility and morality. Finally, I show that audience can either agree or disagree with such categorization work. Audience can make the implicit moral claims made by either party explicit by spelling out the categorial inferences. However, when audience disagree, the perceived incompetence in using categories such as friends and family is then in turn treated as reflecting the moral culpability of the user. In this way, the use of friends and family categories can also lead to public scrutiny of the credibility and morality of the interrogator and their client.

Observable implicit categorization and defeasible explicit categorization: Doing “being friends” on YouTube

Panel contribution

*Dr. Ryo Okazawa*¹

1. *Aichi Shukutoku University*

Interactional participants achieve actions under their understanding of interpersonal relationships, which can be described with membership categories, including “friends,” “acquaintances,” and “strangers.” From a conversation analysis and membership categorization analysis perspective, interpersonal relationships, such as friendship, are not necessarily given before interaction but are established, maintained, and sometimes threatened and restored in the course of interaction: the participants are doing “being friends” (Nishizaka, 2012). Notably, membership categorization is not always achieved through the explicit mention of category terms (Stokoe 2012; Whitehead 2020). For instance, we would rarely say “we are friends” or “you are my friend” when talking as friends. The explicit mention of participants’ friendly interpersonal relationships might imply that they are not friends in that at least one participant cannot confirm their friendship without such explicit categorization. Such explicit mention might also be employed as a resource to achieve actions other than the provision of confirmation (e.g., to coerce someone into doing what he does not want to do by saying, “you are my friend”).

How do interactional participants categorize themselves as “friends” without explicitly mentioning the category term? This study uses YouTube videos in which well-known Japanese figures talk to each other and users’ comments provided with the videos as data to illustrate implicit categorization practices in talk-in-interaction and explicit categorization practices in written texts. The YouTube videos and comments provide a starting point for membership categorization analysis because, in some cases, viewers (i.e., YouTube users) explicitly categorize the well-known figures’ relationships as “friends” in comment sections, showing that the participants’ categorial relationship is observable to the viewers who do not have personal access to their relationships. By contrast, in other cases, viewers’ comments cast doubt on friendship among participants on videos even though the participants explicitly describe their relationships as “friends” in the videos. The analysis of such cases would illuminate the observability and defeasibility of membership categorization.

By elucidating participants’ behavior that allows viewers to explicitly categorize them as “friends,” this study argues that a perspective of membership categorization analysis is beneficial for research on interpersonal relationships that are made observable in social interaction.

The Morality of Categories in Contrastive Descriptions

Panel contribution

*Dr. Jessica Robles*¹

1. *Loughborough University*

This project examines how descriptions in conversation are formulated as contrastive—where at least one alternative description is compared to another—and how the categories of person around which such descriptions are built are invested with a moral character. An analysis of video recordings of mediated and private conversations transcribed in accordance with Jefferson’s and Mondada’s conventions are inspected for descriptions of emotional trouble and/or mental health challenges. Membership categorization and interaction analysis are used to trace how categories are deployed in contrastive descriptions to sequentially produce identity hierarchies. Results show that alternative descriptions are produced to mitigate interlocutor judgement by positioning self as morally “normal.”

For example, in the following excerpted conversation from an interview, Kat provides two explanations of parents who have a “bad day”:

1 KAT: [you’re j’st having a BAd DAY] and the house’s upside

2 down: [an’] .HH

3 NIC: [Yeah.] ((nodding))

4 KAT: there’s a screaming chi(hh)l(h)d and they’re having a

5 tantru:m when you think °god no:° .HHH u:m >but if< I

6 tell someone #tha#t (.) I’m not coping to

7 [da:y, they’re gonna] think [°well must]

8 NA?: [mm mm] [mm]

9 KAT: be because you’ve got °°bipo°°lar.° (.) whereas °it’s

10 just° the fact #tha#t <Everyone ha:s> £really shhit

11 dAY(HH)s:

In line 1 “just” in “just having a bad day” minimises the non-ordinariness of bad days. A three-part list characterises recognisable features of a bad day, particularly for parents (e.g., “house’s upside down” lines 1-2; “screaming child” line 4; “not coping” line 6). This is followed by a hypothetical attribution: “must be because you’ve got bipolar” (line lines 7, 9). The telling (supported by others in lines 3 and 8) then introduces an alternative explanation with contrastive “whereas” (line 9) plus an assertion of facticity (“It’s just the fact” lines 9-10) followed an extreme case formulation: “everyone has really shit days” (lines 10-11). This brings the telling back to “you’re just having a bad day” as a common, universal experience with no intrinsic relationship to a diagnosis of poor mental health.

Kat works up to this distinction in building the complaint that when one is diagnosed as bipolar, it becomes a ready-made explanation for situations that would otherwise be commonplace. In doing so, she reproduces a moral hierarchy between normal and diagnosed people, distancing herself from “bipolar” as a condition or identity and orienting to the greater acceptability of “just having a bad day” as an ordinary person. This is linked to the parental category, as the scrutiny of behaviour is characterised as especially powerful where Kat feels the need to hide her self-harm scars when she’s with her daughter at the playground.

Kat’s formulations assert that the categories of “parent” and “bipolar” become interactionally problematic when they overlap because of the moral judgments that will be made of her. In this and other examples, participants wrestle with how descriptions of behaviour implicate moral categories of person, and use contrastive descriptions to manage their own category entanglements.

When identity categories are imposed: Vocative second-person pronoun + nominal in interaction

Panel contribution

*Mr. Pepe Droste*¹

1. *University of Münster*

Who we are to one another depends to a large extent on how we talk to each other. In conversational interaction between speakers of languages such as English or German, the negotiation of identities may surface through a particular form of direct address: Vocative expressions consisting of a second-person pronoun and a nominal that classifies or typifies the person so addressed. These vocatives have been dubbed “exclamatory vocatives” (Welte, 1980), “evaluative vocatives” (Corver, 2008), “expressive vocatives” (Gutzmann, 2019), and “pseudo-vocatives” (d’Avis and Meibauer, 2013). So far, research has dealt with syntactic and semantic issues, with insults assumed as their home environment. Interactional questions, on the other hand, remain open or have not ever been asked: In which sequential environments do participants rely on that specific form of address? What do they ‘do’ when they directly address their co-participants this way? And in what ways such categorizations are sequentially intertwined with issues of accountability and remedial work?

This paper examines vocatives consisting of a second-person pronoun and a nominal in German talk-in-interaction. It draws on a large collection of video recordings of maximally informal face-to-face interactions among speakers of German. The analytic approach is conversation analytic and interactional linguistic: sequences of talk-in-interaction in which co-participants are addressed by vocatives featuring the second-person pronoun and membership categories or category-implicative descriptions (Sacks, 1992; Hester and Eglin, 1997) are analyzed for their design, sequential placement, and action orientation.

The analyses reveal that the occurrence of such vocatives is not limited to sequential environments of offense, but that they occur more generally in delicate moments in interaction (e.g., moralization and teasing). In these moments, they are used to accomplish a variety of actions through ‘imposed’ identity categories.

The paper highlights the role of direct address terms that explicitly say something about the addressed party as a privileged window into relationship management. It contributes to our understanding of what speakers are doing relationally through membership categories in interaction.

When Karen is calling the cops: using categorisation to sanction public conduct

Panel contribution

*Dr. Linda Walz*¹, *Dr. Jack Joyce*², *Ms. Natalie Flint*³

1. Leeds Trinity University, 2. University of Oxford, 3. Loughborough University

This paper explores how social categories and relationships are co-constructed in public encounters and on social media. The focus lies on how interactional conduct becomes observable as transgressive and how (the threat of) the transposition onto social media achieves the action of imposing public accountability. The growing collection currently consists of 21 recordings of public encounters spontaneously recorded by participants or by bystanders and uploaded to TikTok, YouTube and Twitter. The analysis focuses on sequences of interaction which feature an interlocutor explicitly branded *in-situ*, or *post-factum* on social media, as a “Karen”. Using membership categorisation analysis (Hester and Eglin, 1997; Housley and Fitzgerald, 2002), this paper tracks how the branding of “Karen” is generated, how it is responded to via rejection, counter-challenge or some other action, and in *post-factum* descriptions on social media, how members’ conduct is categorised and thereby sanctioned.

The analysis shows firstly how the term “Karen” targets a speaker who is exhibiting some form of entitlement that is ostensibly based on certain characteristics, which magnifies the culpability by packaging the interactional transgression with the interlocutor’s ostensible categorial status. Secondly, through the action of filming the interaction, participants orient to social media as a space where future holding to account can take place and mobilise this as an interactional resource during the encounter. The categorial work thus functions on multiple layers both to challenge co-present parties and resonate with potential future third parties.

This paper contributes to the growing literature on how ostensible wrongdoing is construed and behaviour evaluated (Haugh and Sinkeviciute, 2018) and how the transposition of an encounter onto social media imposes public accountability akin to a ‘degradation ceremony’ (Garfinkel, 1956) where a person is reconstructed as a new social object. The findings provide insight into the position and composition of transgressions and accounts on and for social media, and thus contribute to an understanding of how *in-situ* transgressions are worked up in talk for a future online audience.

“Tamara, y Sam?”: The relational and categorial negotiation of doing “being a (non)cheater” in implicit account solicitation

Panel contribution

*Ms. Andrea Rodriguez*¹

1. *The University of Queensland*

People’s understanding of the rights and responsibilities that are appropriate for incumbents of a particular relational category (e.g., boyfriend-girlfriend) is essential to how they ascribe and negotiate actions in interaction (Pomerantz & Mandelbaum, 2005). While research has predominantly focused on the sequential implications of invoking categories to accomplish particular social actions mostly in institutional settings (Stokoe & Edwards, 2007; Stokoe, 2009), fewer studies in ordinary interaction have examined the central role of relationships in action and category negotiation (but see Mandelbaum, 1987, 2003; Hester & Hester, 2012; Fitzgerald & Rintel, 2013). Drawing on interactional pragmatics and MCA, this case study explores how participants orient to implicit relational categorisations in instances where the implemented and ascribed action are treated as accountable. The data comes from multiparty, video-recorded interactions between Spanish-speaking friends living in Australia.

This study focuses on a sequence where four friends, all of whom are married or engaged, talk about dating apps used by “commitment seekers”. As one of the participants displays marked interest in the app, what the others know about her relational status clashes with her turn-formed relational stance (i.e. a potential online commitment seeker) visible through the category-implicative action “requesting for information”. This triggers her being held accountable via a jocular, implicit account solicitation that invokes her relational status (i.e., a girlfriend) and implicitly ascribes to her the category of “a cheater”. While she works to deny and block the unwanted category through doing “being innocent” and treating the additional meaning ascription as accountable, another participant initiates negotiation of the category, attempting to normalise “cheating” as a justifiable category-bound activity on the grounds of being prepared. This action is ultimately used by the initial target of criticism to (1) deflect criticism towards the negotiator, (2) distance herself from the category, and (3) claim incumbency in the “loyal person” category, entitled to sanction the negotiator. The analysis shows that participants orient to the gap between action and expectation as inextricably linked to categories via sanctioning potential behaviours, rejecting/negotiating ascribed actions and accountabilities, and locally attempting to update the category in question. In doing so, they display thinly veiled criticism about the moral inconsistency between their known relational status and the constructed relational stance, thereby treating categorisation and action ascription triggered via category-implicative actions as procedurally consequential. This analysis of “turn-formed categories” (Watson, 2015) also contributes to a more nuanced understanding of how “category-formed turns” can be reconstructed while avoiding reifying categories.

“Then Mum will scold you”: Identity construction in sibling talk in a Chinese-Australian family

Panel contribution

*Ms. Zhiyi Liu*¹

1. *The University of Queensland*

Research on family discourse has paid attention to how identities of different family members are discursively (co-)(de-)constructed and negotiated in daily family talk (e.g., Tannen et al., 2007; Butler & Fitzgerald, 2010; Li, 2022). Yet, limited research has examined how identities of non-present family members can be invoked by interactants and how the latter constructs their identities in relation to the former in talk-in-interaction. This study, therefore, aims to fill this gap by exploring daily conversations (audio-recorded) between two sisters in a Chinese-Australian family, focusing on how an older sister positions herself in relation to a non-present family member (their mother) in interaction. Guided by Harvey Sacks's (1995) work on membership categorization combined with sequential analysis (Stokoe, 2012), the study investigates (1) how mother identity is invoked in sibling talk and (2) how the older sister categorizes herself in the process of such invocations of mother identity. In the data, the invocation of mother identity functions as a tool for both the older sister and the younger sister to achieve their conversational goals in different situations. This is done by their deploying explicit category terms (e.g., *mama* “mother”) and, in some cases, linking such a term to specific category-implicative actions or categorial attributes in their turn design and action formation. Such imports of mother identity into sibling talk are accompanied by the invocations of the rights and entitlements associated with the mother category in relation to family management (e.g., making family rules). How the older sister orients to the invocations of mother identity, indeed, unveils her understanding of what ‘being a member of the mother category’ should be like and simultaneously indexes how she positions herself in relation to their mother. Two types of memberships – as a mother assistant and a home educator – are invoked by the older sister in interacting with her younger sister via proactively orientating to mother identity and disregarding the younger sister’s mention of their mother. By presenting an older sister’s self-categorization intertwined with an invocation of a third-party family member’s (here, the non-present mother’s) identity, this study contributes to our understanding of identity work in family discourse.

“You surely can’t colour using all of them at the same time?”: The role of the parent category in sanctioning the other child’s behaviour and in mobilising ‘sharing’ as a moral foundation in sibling disputes

Panel contribution

Dr. Valeria Sinkeviciute¹

1. *The University of Queensland*

Socialising children into the responsibilities, rights and expectations as relevant to the categorial, relational and moral work is a crucial aspect of family talk. As research has shown, an important site for such socialisation practices can be argument and dispute sequences (e.g. Goodwin et al. 2012; Goodwin & Loyd 2020). While research has predominantly focussed on parent-child interaction, including some work on disagreement and conflict (e.g. Goodwin & Loyd 2020), fewer studies examine siblings’ arguments (but see Hester & Hester 2010, 2012; Busch, 2012; Friedland & Mahon, 2018). This paper explores both child-child and parent-children talk, in particular, how one of the moral foundations – sharing – emerges in and through sibling disputes and what role the parent category plays in such sequences, both as oriented to by children or parents themselves. The data comes from video-recorded family interactions collected for a project on multilingual family talk in Australia. This study examines the extended sibling dispute sequence taken from the Russian-speaking family conversations that involve two brothers, age five and two, mother and father. Using a combination of membership categorisation analysis and interactional pragmatics approaches, thus paying attention to lexical, prosodic features and embodied action, the analysis explores how the dispute sequence starts, develops and closes and focusses on (1) the role of parents as oriented to by children and parents themselves in the dispute resolution and sequence closure, and (2) how ‘sharing’ as moral responsibility pertinent to the brother category emerges through the parents’ explicit and category-implicative actions. Preliminary results show each brother’s orientation to individual ownership of items in question and their attempts through lexical, prosodic and embodied means to recruit their parents in order to sanction the other’s behaviour. Interestingly, the parents’ involvement is primarily visible through their mobilising ‘sharing’ practices that are illustrated both verbally and through embodied action. Throughout the sequence, both children are directed to remedial action – socialising into sharing as moral responsibility – as relevant to the category of doing being a brother.

Miscommunication and Repair in ‘Smart Homecare’ Interactions

Panel contribution

Ms. Lauren Hall¹, Dr. Saul Albert¹, Prof. Elizabeth Peel¹

1. Loughborough University

This paper asks how repair is organized in interactions where a disabled care service user and a care worker use voice activated virtual assistants and ‘smart home’ systems in homecare routines. So-called ‘smart home’ technologies including virtual assistants connected to voice-controlled plugs, lights, and thermostats are increasingly integrated into homecare settings. This is happening despite there being very little evidence as to if—and how—such tools may enhance independence and quality of life for disabled people. Worse still, and as anyone who has used one knows, virtual assistants are barely able to string two error-free turns together. Here we explore this perspicuous setting for repair.

We used conversation analysis to study extracts from a corpus of approximately 100 hours of video featuring a homecare routine in which a virtual assistant is frequently summoned and used by a care service user and their care worker. Our analysis shows how repair methods are adapted to this setting in ways that engage both service user, care worker, and the virtual assistant in a collaborative homecare routine. When human users engage in repair procedures with the virtual assistant in this highly routinized sequential context we observe how, and suggest why, intersubjectivity with these devices so often fails. We also highlight moments of miscommunication and repair where the participants achieve intersubjectivity and uphold the progressivity of joint tasks within the collaborative homecare routine.

This research contributes key interactional evidence to our understanding of how smart homecare systems may enhance the quality of life of disabled care service users. It points to opportunities for the designers of virtual assistants and ‘smart home’ systems to integrate their devices into the collaborative interactional landscape of a homecare routine. Crucially, it shows how repair methods in themselves constitute an assistive technology through which virtual and human assistants work together to enhance their shared interdependence.

Out of sight, out of mind? Speech recognition transcripts as a resource during miscommunications with a robot

Panel contribution

Mr. Damien Rudaz¹, Dr. Christian Licoppe¹

1. Telecom Paris

On the commercial humanoid robot Pepper, the default parameter is to display on its tablet (attached to its torso) a transcript of what human interlocutors are saying, as heard by the robot. This “audio speech recognition transcript”, even though it is commonly found on smartphone vocal assistants, is rare among commercial “social” robots. Indeed, it can be said to open a window on what is going on “inside the robot”, before this robot produces any verbal or embodied response (speech, sound effects, gestures, LEDs, etc.) to the previous turn of an interlocutor. Even in the absence of any other content on this robots’ tablet, this transcription reconfigures the informational ecology of the interaction: we argue that it is consequential on the way miscommunications are detected and dealt with – compared with other commercial robots not relying on a transcription, or even with human-human interactions.
