To investigate the impact of this feature in situated interactions, we base our analysis on a corpus of interactions recorded in July 2022 in Paris, at the *Cité des Sciences et de l’Industrie*, one of the biggest science museums in Europe. The first half of this video corpus consists of 100 naturally occurring interactions with a Pepper robot placed in the hall of the *Cité des Sciences et de l’Industrie*. The second half is comprised of 100 additional interactions which occurred with the same robot in a laboratory open to the public at the *Cité des Sciences et de l’Industrie*, where participants were asked to wear an eye tracking device. In both cases, participants (groups or single individuals) interacted with the same Pepper robot, on which was running a chatbot designed to converse on a wide variety of topics. The tablet attached to Pepper’s torso was entirely blank at the exception of the speech recognition transcript.

We attempt to describe several typical ways in which the tablet was used as a resource by participants in situations of miscommunication, and, more specifically, when the robot misheard a human’s previous turn. First, we focus on the way the display screen may constitute a resource to indicate and manage trouble. In particular, we focus on the specific timing and packaging of “self-initiated other-repair” sequences which are observably indexed to the troublesome speech recognition transcript. Then, we investigate recurring cases where the “erroneous” transcript is treated as a more-or-less autonomous resource: i.e. as disconnected from the embodied robot’s vocal and gestural responses, or even as taking priority over them. We focus on the way troublesome displays may become resources to distinctive interactional performances and we try to highlight a typical format through which the incorrect speech transcription is reported to other human co-participants by the principal speaker.

We finish by linking these qualitative findings with an interesting pattern visible in the data obtained from our eye tracking device: as the interaction unfolded, the attention of humans (materialised by their gaze) slowly focused more and more on the robots’ tablet, while its head and gestures were gazed at less and less.

Repair in interaction with smart speakers in German – Repeating, insisting, altering and giving up

Panel contribution

***Dr. Silke Reineke*¹, *Dr. Henrike Helmer*¹**

1. Leibniz-Institute for the German Language, Mannheim

Repair is a conversation analytic term for various operations aimed at resolving troubles during conversation (e.g., Schegloff et al. 1977, Kendrick 2015). Different repair initiations (e.g., open class repair initiators like “huh?”) are apt for displaying specific troubles of understanding. Research has shown that after failed requests in interaction with interactive virtual agents the users’ reactions resemble repair practices (Krummheuer 2008). Although systems are also designed to display troubles to help users diagnose and repair trouble, they are not designed to constantly secure intersubjectivity as humans do in interaction, which leads to users adapting their talk themselves in order to improve interaction with the system (cf. Reeves et al. 2018, Fischer et al. 2019).

With an interactional linguistics approach, we are analyzing repair practices that users deploy after a failed request in interaction with a smart speaker to shed light on how troubles in interaction with smart speakers are unfolding and on how users change their initial requests in order to ‘get things done’. The paper is based on audio data of interactions of people using a smart speaker device in their homes. The data have been recorded with a conditional voice recorder (CVR, Porcheron et al. 2018) that we adapted for our purposes. We recorded mainly inexperienced users over periods of around 4 weeks in their home, in order to allow for a micro-longitudinal analysis of the data. So far, we have recordings of around 350 snippets of requests to Amazon Echo Dot (Alexa). Our data showed that in sequences after failed requests, users deploy different repair practices (both at different times as well as subsequently after several failed requests). They range from:

- Orienting to acoustic problems by using repetitions (together with speaking louder, slower, more enunciated, with more pauses and more focal accents and no or minor changes in the lexico-grammatical design),
- ‘insisting’ (by using several repeats subsequently),
- more substantial alterations in request formulation (e.g., by adding more specific information regarding referents, or by changing the formulation altogether, sometimes going back to one that has worked previously)
- to giving up completely.

When the formulation of a failed request has proven to work before in the ‘interactional history’, users often seem to first use repair practices that are formulated more similar to the initial request before they go on to try other formulations or new requests. This shows how users adapt their repair practices in interaction with smart speakers on two levels: Sometimes they adapt their repair on a local level, orienting to the smart speaker’s local reactions in the respective sequence. But they also show to have adapted on a more global level by using requests that have worked previously and ‘insisting’ – which in turn leads to less (or sequentially delayed) local adaption. These findings shed light on users’ practices of repair in interaction with a smart speaker as well as on their (growing) expectations of what should be a well-working request, which can also inform the programming of smart speakers.

Repair-capable Conversational AI: what's missing

Panel contribution

Dr. Arash Eshghi¹

1. Alana AI Ltd.

Miscommunication is rife in everyday human interaction. Yet people usually detect and repair misunderstandings immediately, employing a set of universal (Dingemanse et al., 2015) and highly systemised interactional processes which have collectively been called *repair* (Schegloff, 1992, 2007; Purver et al., 2018). Even though the crucial role of these processes in sustaining successful interaction and coordinating meaning and joint action has been widely recognised in the cognitive science community (Clark 1996; Healey et al, 2018; Mills, 2013; Dingemanse et al, 2015 a. o.), there is still a paucity of research within the Conversational AI, Computational Linguistics community on the challenges it poses, including its classification, parsing, execution, contextual integration, as well as generation.

In this talk, I will review some of the state of the art in computational models of repair (see Purver et al. (2018) for a comprehensive overview) and use this to set out a few requirements imposed by this phenomenon on the topology of modular Conversational AI architectures, their various component models, and the flow of information between them. I will then describe our repair-compatible, interactive Natural Language Understanding (NLU) infrastructure at Alana AI and use it to illustrate some of the existing challenges of creating repair-capable Conversational AI, including what component models are needed and what kind of data is needed to train these. Time permitting, I will present an ongoing, crowd-sourced data collection effort to fill one of these gaps: that of creating machine learning models for wide-coverage, open-domain classification, execution, and contextual integration of *third-position repairs* (Schegloff, 1992). To conclude, I will argue that computational repair processing with all its inherent challenges is the missing ingredient in creating robust, controllable, and adaptive Conversational AI that can truly collaborate with people in real everyday tasks.

“I have learnt the Alexa-language” – A conversation analytical reconstruction of users’ incidental learning of how to talk to a voice agent

Panel contribution

Mrs. Christiane Even¹

1. Heidelberg University of Education

Talking to voice agents (VAs) is often considered easy and intuitive (e.g., Siegert, 2020). Yet, in recent studies, users report of having had to learn how to talk to a VA (e.g., Pins et al., 2020). However, insights into users’ learning processes are mostly drawn from retrospective self-reports in interview studies. There are only a few articles that present a micro-analytical reconstruction regarding user adaptations (e.g., Pelikan & Broth, 2016; Velkovska & Zouinar, 2018). In these articles, users’ adaptation work is analyzed for problems in terms of turn-taking and repair, leading to users’ adjustments in form of reducing the complexity and length of turn construction in subsequent sequences.

This presentation is going to update previous findings by presenting complementary user practices of adaptation or incidental learning that are preceded by – often recurrent – incidents of repair. Based on a heterogenous sample of 50 adults (aged 25 – 83), who are novice users of the VA Siri or Alexa, it is investigated how they gradually adapt – or struggle to adapt – to the interface structures when using the VA in one function several times or in different functions over a period of 4 weeks.

Analyses are carried out following the multimodal conversation analytical approach (e.g., Mondada, 2008), showing users’ adaptations complementary to findings in previous research:

1. *Lexical changes in turn construction:*

a) *Linguistic alignment in repair initiations:* Users change successively their practice of repair initiation. They adopt expressions used by the VA after having encountered trouble before when speaking naturally.

b) *Suppression of linguistic alignment in sequences of information transfer:* In the Siri data, users avoid repeating the VA’s wording presented in the request for temporal information, as such linguistic alignment leads to an unintended task shift by the VA and ensuing repair.

2. *Changes in sequential ordering:*

a) *Anticipatory turn construction:* As a result of becoming aware of the VA’s dialog structures, a user may produce anticipatory formulations for opening a task that entails an otherwise stepwise information transfer.

b) *Non-conform turn expansions:* Users deviate from the interactional pattern of delivering type-conforming answers to questions after having encountered trouble: Instead, they add non-requested information to avoid otherwise ensuing repair.

This presentation concludes with a discussion of conversation analytically based implications for relevant practitioners like VA designers.

“Pepper, what do you mean?” Miscommunication, repair and multimodality in robot-led survey interaction

Panel contribution

Mx. Lynn de Rijk¹, Dr. Wyke Stommel¹, Dr. Roel Boumans¹

1. Radboud University Nijmegen

In this presentation we analyze various kinds of interactional trouble occurring in task-oriented human-robot interaction. We focus on users' repair strategies using an existing dataset consisting of 36 video-recordings in which elderly people complete a lengthy health survey with a Pepper robot. The interaction was structured in three phases: 1) instructions by a nurse; 2) a practice round of three general questions after which the nurse left; and 3) the interview proper between participant and robot. Miscommunication was abundant in the data, with some types of miscommunication being more common than others. These were mainly related to “hearing trouble” on the side of the robot, leading to participants' repeats and rephrasings. Interactional trouble was also found to escalate, with multiple repair initiations, sometimes leading to “second best answers”. Other escalating trouble strategies were skipping the question or using scripted commands outside their design purposes (e.g., applying the command “What do you mean” to solve a lack of response from the robot, while the command was designed for clarifying something on the side of the participant). We also found that in trouble contexts non-verbal robot behavior was brought up as a diagnostic tool. When repair initiations failed while the nurse was still present, participant or nurse sometimes noticed (cf. Schegloff, 2007) non-verbal conduct of the robot, thereby collaboratively seeking explanations or solutions for the miscommunication. Nodding was noticed when Pepper did not respond verbally after the wake phrase, contrasting the nodding with an expected but yet absent verbal response (e.g., “He does nod, but...”). The robot's gaze was noticed (e.g., Par: “He's looking at you”), when the robot was expected to direct questions to the participant while not gazing at the participant. When no other person was present in the room, robot non-verbal behavior was not verbally addressed when trouble occurred, even when the robot's behavior was deviant (e.g., staring at the wall while asking a question). This suggests that the non-verbal behavior noticings are done to solve trouble in collaboration with other humans rather than repairing the trouble with the robot directly. Overall, miscommunication and repair in these human-robot interactions involve a multitude of strategies. Where types of repair other than repeats/rephrasings occur, it stands out how miscommunication escalates as repair attempts fail. When trouble escalates, restoring progressivity is prioritized over getting the originally selected answer across (cf. Fischer et al., 2019). Noticings of robot non-verbal behavior that occur when another person is still present in the room suggest that solving miscommunication is a multimodal affair, with participants drawing on robot behavior to collaboratively make sense of the trouble.

Facilitating Residents' Mobility in Caregiving Interaction

Panel contribution

*Ms. Yu-Han Lin*¹

1. *University of Hawaii at Manoa*

The mobility of residents in care facilities may become an issue as a result of not only their physical impairments (e.g., wheelchair-bound due to lower limb muscle weakness) but also their cognitive impairments (e.g., wandering due to dementia). These residents need caregivers' assistance with nearly all of their body movement, including standing up, sitting down, walking with or without a walking frame, and moving around with a wheelchair. This study examines how caregivers respond to this mobility issue—specifically with the use of touch.

This study builds on two research traditions: mobility and interpersonal touch. Mobility and interpersonal touch have received increasing attention in ethnomethodology/conversation analysis research in recent years. Among the studies on touch, more current research has begun to center on caregiving interaction. Marstrand and Svennevig (2018) were the most relevant predecessors who explored how a caregiver facilitated mobility of a resident with physical and cognitive disorders through touch in a residential home in Denmark. In their single case study, the caregiver often began her instructions with talk or gesture. When the approach did not work, she resorted to touch. To extend the findings in a different country, the current study analyzes the navigation of resident's mobility among various residents and caregivers in Taiwan.

One hundred and forty four cases were drawn from 96-hours of video data from a residential home in Taiwan. Participants include local residents with mobility and/or cognitive impairments and caregivers from Taiwan and Vietnam. Multimodal conversation analysis reveals that the caregivers' facilitation displays their orientation to the residents' cognitive impairments, physical impairments, or a combination of both. For instance, first, the caregivers grab the residents' arm to help them stand up or sit down, which orients to the residents' physical impairments. In contrast, this haptic assistance is regularly coordinated with talk (e.g., "don't get up. Watch out" in Chinese) when assisting the residents with cognitive disorders (e.g., dementia). Second, the caregivers hold the residents' arm when walking with them to minimize their risk of falling, which orients to their physical limitations. The same action can also be utilized to guide wandering residents back to their seats, which targets their cognitive disorders (e.g., dementia). In addition to confirming Marstrand and Svennevig's finding that caregivers delay their use of touch until talk or other less intrusive practices (e.g., gesture) turn out to be ineffective, this study finds that the caregivers deploy touch to facilitate the residents' mobility before the residents have a chance to reply to talk. This indicates the caregivers' orientation to the residents' impairments and their need for haptic assistance. From a large corpus of data, this study demonstrates the complexity of mobility assistance, and how this assistance is recipient-designed for various impairments.

How mobility disabilities and wheelchair use shape closures of social interaction and dissolutions of interactional spaces

Panel contribution

Prof. Gitte Rasmussen¹

1. *University of Southern Denmark*

Social interaction is ordinary ended through sequentially organized closures (Button, 1990) in combination with dissolutions of interactional spaces accomplished through the coordination of multimodal actions (Mondada, 2016). Research in the framework of Ethnomethodology and Conversation Analysis has shown how co-participants e.g., retract bodily from interactional spaces as they orient to subtle changes in each other's bodily orientation away from the space. The change of bodily orientation concerns often lower body segments (Kendon, 1990), e.g., a foot, which co-participants respond to (vom Lehn, 2013).

This study aims at demonstrating how wheelchair users draw on different modes to achieve the same ends: closures are initiated through talk in combination with the use of upper body segments, i.e., arms to e.g., release the breaks. Following Schegloff and Sacks (1973) any sequential closure and topic termination may lead to closure and termination of the conversation. The study shows how the co-participants orient towards the arm movement as an initiation of conversational closure. It is followed by steps to dissolve the interactional space in terms of changing the position of the wheelchair and consequentially the orientation of lower body segments. Furthermore, it shows how the co-participants establish an interactional order of multimodal actions to close the conversation and dissolve the interactional space in an interplay with the physical environment.

The study draws on approximately 10 hours of video-recordings of mobility impaired sports students, sports instructors, and researchers in interaction at a sports high school in Denmark. The school enrolls sports students with and without mobility impairments. The recordings are part of a larger corpus of video-recordings collected by the SDU contexture for interdisciplinary research in mobility disorders. The data were transcribed using conventional methods for multimodal interactions.

The study falls within the area Atypical Interaction research (Wilkinson et al., 2020) in multimodal interaction (Rasmussen, (forth)) that aims at investigating if and how impairments shape interaction.

The consequences of ocularcentric participation frameworks for the ability for visually impaired people to be mobile in situ

Panel contribution

Dr. Brian Due¹

1. *Copenhagen University*

Ocularcentrism is when vision is privileged over other senses for reasons of practical organization (Chandler & Munday, 2011). Visual practices of seeing, looking and gazing are important for perception and action-construction but are taken for granted in various ordinary interactional projects. I suggest the concept of “Ocularcentric participation frameworks”, building on Goffman (1974) and Goodwin & Goodwin (2005) occur whenever vision becomes a collectively anticipated resource for joint activity in mobile formations. These types of visual organizations become observable and accountable when visually impaired people are part of the framework. An ocularcentric participation framework is not only an emerging issue for situated members but also a methodological problem that researchers must address in their analyses. The research question is: What methods do sighted members of society apply when trying to achieve intersubjectivity with and adopt a visually impaired member’s perspective in a context of being mobile?

This presentation builds on video data from a larger ethnographic project studying visually impaired people in contexts of new technologies. The presentation will show examples of a visually impaired person being involved in trying a robot-dog (Due, 2021) and I will show how this mobile organization is complicated due to the production of the ocularcentric organization. There are atypical aspects in interaction involving visually impaired people which specifically relates to the problems of visually projecting next actions instead of applying touch as primary sensory resource in interaction.

Based on EM/CA methodology this presentation contributes to studies of vision, perception and complex participation frameworks by showing and discussing the limits of vision in interaction and when conducting analyses. In addition, the presentation contributes to the discussion of the researchers prior knowledge, what Garfinkel and Wieder (1992, p. 182) called the “unique adequacy requirement of methods” that refers to how the researcher must be “vulgarily competent in the local production and reflexively natural accountability of the phenomenon of order he is ‘studying’”. As vulgar competence in atypical populations is almost impossible, this presentation contributes with a more nuanced approach.

“I feel like a normal person”: The interactive accomplishment of walking normally

Panel contribution

Mrs. Emilie Nicolaisen¹

1. *University of Southern Denmark*

Studies on walking have demonstrated the fine coordination between talk, bodily movements, and the physical environment in office encounters (Tuncer, 2015), guided tours (Mondada, 2018), and traffic (Merlino & Mondada, 2019). However, in these studies, the walk and the ability to walk are often taken for granted. This study seeks to understand how people interact to achieve what others take for granted: walking normally. For this purpose, it focuses on walking-impaired persons who are learning to walk using a bodyweight unloading robot. Through an ethnomethodological and conversation analytic approach to atypical multimodal interaction (Rasmussen, in press), the study examines the participants' practices for evaluating and intervening with the walk. It describes how co-participants rely on what they see, whereas the participants convey the kinesthetic experience (Katila & Turja, 2021) of what they are feeling and how they all work to achieve a common understanding based on these different approaches. The study is based on video recordings of students with various kinds of mobility disabilities trying out robot-assisted gait training at a sports high school and in a gait lab at the University of Southern Denmark. The video recordings are transcribed by EMCA standards for talk and multimodality. Katila, J., & Turja, T. (2021). A case study on pragmatic meaning: The plasticity of third-person forms

Panel contribution

Dr. Naomi Truan¹

1. Leiden University

Large-scale corpus examinations have already shown that words do not mean something by themselves, but only in relation to one another (see Rühlemann 2018: 121 for an overview). A typical tool in corpus linguistics, aimed at assessing how often words appear together (and how likely it is that they do, and whether this is more than expected), is collocations. Collocations measure “the above-chance frequent co-occurrence of two words within a pre-determined span, usually five words on either side of the word under investigation (the node)” (Baker et al. 2008: 278).

Now, we only know very little on how to integrate this quantitative perspective into a more qualitative one, looking at utterances in context. In the corpus of German, British, and French parliamentary debates (Truan 2016a; Truan 2016b; Truan 2016c) I closely look into, some lexical items are preferably used to convey an oppositional stance from the speaker’s point of view. This is notably the case for French *certain*s (‘some’) and German *manche* and *einige* (‘some’), and, to a lesser extent, to English *some*: All these forms are predominantly used to show that the speaker disaffiliates from the indeterminate and indefinite group of people they are referring to. This means that these lexical items referring to discourse participants convey an evaluative stance that helps understand the speaker’s positioning towards the referent(s). This phenomenon can be described as ‘evaluative prosody’ (Partington 2015), ‘semantic prosody’ (Louw 1993), ‘discourse prosody’ (Stubbs 2001), or ‘pragmatic meaning’ (Channell 2000) – the denomination I opt for in this talk, as it highlights the pragmatic component of the reference via third-person forms.

I apply the idea of pragmatic meaning to third-person forms denoting human participants that are marked with a certain connotation. By this, I mean that without being restricted to certain contexts of apparition, some lexical units co-occur primarily in positive or negative contexts. Specifically, in the corpus, some third-person forms are used to denote out-group members, i.e. discourse participants the speaker constructs as distant. This tends to show that in political discourse (but this could be a more general property), some third-person forms activate a particular pragmatic meaning. This new layer of meaning is pragmatic insofar as it does not belong to the semantic core of the word, and, conversely, is not to be found in dictionaries (and has not been reported in the literature).

A same message in two different situations ?

Panel contribution

Prof. Irmtraud Behr¹

1. Sorbonne Nouvelle University

A same message in two different situations ?

Irmtraud Behr, Sorbonne nouvelle, Paris

Signs and posters can be considered as statements issued to be read in specific situation. Assuming that certain situations can be considered sufficiently standardized to serve as a basis for the interpretation of signs and posters, we examine two messages which have the same linguistic form, even the same semantic content, but whose social meaning differs according to the situations in which they appear.

The sign “maximum capacity 4 people” (1) in an elevator means : the weight supported and the volume of this elevator are sufficient for four people. The technical characteristics of the lift determine its capacity and therefore the use that can be made of it. The sign functions as a regular diacritical mark (Bühler 1934, Behr / Lefeuvre 2019).

Between spring 2020 and spring 2021, the sign “maximum capacity 4 people” (2) appears on the door of café-restaurants in Paris, requiring other interpretative factors. The weight criterion cannot be taken into account for a café-restaurant, but the interior volume is a valid criterion. If in normal times, the number of people present at the same time inside the establishment is fluctuating and depends only on the material capacity, the reception capacity of 4 people is fixed by the health authorities during Covid-19. Social distancing and ‘gauges’ have been surprising restrictive measures with limited time validity. To understand the sign “maximum capacity 4 people” on the door of a café-restaurant, receivers must therefore know the health discourse and the measures taken, but also the normal working of a café-restaurant in order to appreciate the points which are modified by the measure announced on the panel (Schank/Abelson 1975, Behr / Liedtke 2021). They can then align their concrete (social, bodily) reaction with the elevator instructions.

We can suppose regular utterance-context-pairings for example (1), but not so easily for example (2). Starting from a concrete case, the aim of the presentation will be to model the mechanisms of interpretation by locating the differences in the scripts mobilized by both speakers and receivers (Behr, upcoming presentation),

Conversational Contributions in Discourse: Contextualization, Entextualization and Recontextualization

Panel contribution

Prof. Anita Fetzer¹

1. University of Augsburg

Interaction-based conceptualizations of context are based on the premise of indexicality of communicative action, relating its exclusively product-oriented conceptualization of context-as-given, which is external to a conversational contribution, to an inherently dynamic process of contextualization, which is interdependent on a conversational contribution and its surroundings. Context is thus no longer solely a social or linguistic construct but rather a dynamic socio-cognitive construal feeding on the contextualization of communicative action.

This paper examines the pragmatics of meaning-making processes in discourse focussing not only on the interpretation and processing of linguistic utterances, but also on their production in context. While there seems to be general agreement about participants relying on context in their processing of utterances, the production of utterances in discourse has not yet attracted a huge amount of attention. Instead, the tacit assumption of semantic meaning encoded in syntactic structure still seems the standard approach.

The paper argues for a change in perspective, supplementing the interpretation-based processes of contextualization, and re- and decontextualization with production-based entextualization of context-dependent discursive meaning. It expands Norén and Linell's (2007) concept of meaning potential to a discursive frame of reference with conversational contribution as the minimal unit of investigation. Conversational contributions are constitutive parts of the delimiting frame of discourse genre which functions as a blueprint constraining meaning-making and meaning-production processes. Situated sense-making and situated sense-construction are thus not solely approached from the semantics of tokens but rather from the dynamics of the interaction of context and token. From that angle, meaning-making processes do not proceed from linguistic part(s) – or lexical semantics – to a linguistic whole, but rather from the linguistic whole – or genre as a blueprint – to linguistic parts and back again. The interaction between linguistic parts and a linguistic whole considers their connectedness across varying levels. As for meaning-production processes, contextual information is not only a constitutive part of pragmatic enrichment. Rather, context is a constitutive part of the production of discursive meaning and entextualised in conversational contributions.

The argument put forward in the paper is illustrated with meaning-making processes in mediated political discourse for the semantic concepts of citizen (Weizman and Fetzer 2021) and appropriateness, and of their functional synonyms (Fetzer, submitted).

From context to constructions? A usage-based approach on German “wollen wir” and “sollen wir” question formats in written interactions

Panel contribution

Ms. Marie-Louise Bartsch¹

1. *University of Hamburg*

Modals are characterized by two main aspects. First, they are specific because of their auxiliary verb like behavior. What then distinguishes them from being an auxiliary verb is their ability to contribute meaning, that is modality. While the formal properties of the modals are quite fixed, modality remains indeterminate until its specific use. Considering now that meaning emerges through use (Tomasello 2003), the question arises, how elements of the concrete usage context can be integrated into a holistic description of modal verbs.

Therefore, the presentation puts forward an approach which combines Interactional Linguistic methods (Couper-Kuhlen/Selting 2018; Deppermann 2006) with Construction Grammar premises (Cruise 2001; Goldberg 2006). It focusses on *wollen wir* and *sollen wir* question formats taken from a corpus of German WhatsApp interactions. While there is a small amount of action specific usage that seems to distinguish the stable syntactic patterns clearly from one another, the data shows that more than 70 percent of the cases are used in appointment sequences to initiate and coordinate joint activities, such as “sollen wir uns zum Eis essen treffen?” or „Wollen wir ins Einkaufszentrum fahren oder so? “. Since they are recruited to perform the same action, the question arises in which aspects these patterns differ and how modality is related to them. I am going to show, how aspects of the usage context – e.g. sequential position and preference organization– interact with aspects of the modals core meanings as well as with the semantics of the interrogative pattern. Based on this, I assume that the two formats span a functional continuum on which they move gradually due to their specific correlations. This finally leads to the discussion, if *wollen wir* and *sollen wir* question formats can be regarded as two instantiations of the same construction (Goldberg 2006).

Assuming that “a set of properties or entities forms a structured whole with characteristic features which is acquired and used as a linguistic or semiotic unit together with pragmatic factors of its use” (Liedtke 2013: 185), the case study puts forward an argument for a maximalist and strictly usage-oriented approach by fundamentally asking how aspects of use can be empirically validly captured and conceptualized as elements of constructions to be finally made accessible to a holistic language description.

Goal-schemas as contexts for understanding

Panel contribution

Prof. Marco Mazzone¹

1. Department of Humanistic Sciences (University of Catania)

The notion of schema has been used to account for the structured representation of information across different cognitive domains: perception, action, language, emotions, conceptual system. It is also thought to allow for the representation of (hierarchically organized) systems of goals which motivate action (Baldwin & Baird 2001; D'Andrade 1992; Mazzone 2018; Miceli & Castelfranchi 2014).

This notion of hierarchically organized goal-schemas will be used to provide a diagrammatic analysis of three pragmatic phenomena. The first is the dynamics by which conventions *about* language (or “situation-bound utterances” in the sense of Kecskes 2010) may turn into conventions *of* language (Morgan 1978). Conventions about language seem to involve “short-circuiting” of inferential reasoning through chains of goal-schemas, which eventually can be lexicalized in actual conventions of language. The second phenomenon is negotiation of meaning. I will suggest that the amount of (implicit, non-conflictual) meaning negotiation is an inverse function of the strength of the goals which constrain the “activity type” (Levinson 1992): the more an activity type is constrained by goals, the less room there is for negotiation of meanings. The third phenomenon is conflictual communication, which involves a variably complex combination of goal sharing and goal conflict between interlocutors.

Taken as a whole, these analyses speak in favor of the Gricean claim that pragmatic understanding is not only inferential, it is essentially a case of practical reasoning based on tentative recognition (in fact, attribution) of goals.

Inferences from, and about, context in a joint inference model of utterance interpretation

Panel contribution

Dr. Chris Cummins¹

1. *University of Edinburgh*

Much research in experimental pragmatics has addressed quantity implicature, as exemplified by the use of *some* to convey the negation of the stronger alternative *all*. A number of contextual factors have been argued empirically to influence whether a quantity implicature is available. These include whether the speaker is knowledgeable about the stronger alternative (Bergen and Grodner 2012), whether the stronger alternative is blocked by politeness considerations (Bonneton et al. 2009), whether the stronger alternative is relevant to the current discourse (Breheny et al. 2006), and potentially whether the speaker is strategically refraining from making a stronger statement for argumentative reasons (Cummins and Franke 2021).

In real-life contexts, however, the state of these contextual variables is not typically known to the hearer: it may be unclear whether the speaker is knowledgeable and what they perceive to be relevant or polite. Most strikingly, it may be unclear whether the speaker is attempting to present information selectively in order to advance an argumentative agenda, e.g. to convince the hearer of the largeness or smallness of the quantity under discussion. There is evidence that hearers use the content of a speaker's utterance to draw inferences about these factors, with some linguistic expressions being especially associated with speaker uncertainty (Geurts and Nouwen 2007) and some being associated with particular argumentative orientations (Ariel 2004).

A promising approach to integrating these sources of knowledge is to treat the interpretation of utterances as a joint inference problem, in which the hearer draws inferences not only about the world state but also about other potentially relevant social interpretation dimensions. This can be captured in a Bayesian model, building upon ideas pursued within the Rational Speech Act framework (Goodman and Stuhlmüller 2013). In this talk, I outline such a model and discuss how to evaluate it empirically. I consider the extent to which it is possible to integrate cultural and interpersonal factors into such a model, and how readily it generalises to other varieties of pragmatic inference. And I discuss how the model relates to established accounts of how linguistic content triggers pragmatic enrichment.

Inferential significance of ascription as pragmatic patterns

Panel contribution

Prof. Ulf Harendarski¹, Mr. Joschka Briese¹

1. Europa-Universität Flensburg

Intentions (e. g. goals) and intentionality (e. g. normative significance) in everyday interaction are accessible only by traces (signs)—we assume based on Robert B. Brandom's inferentialism (1994). Inferences are the nexus of normative pragmatics. Nevertheless, they tend to be axioms in ordinary language theory. Brandom on the other hand considers intentionality with reference to ascriptions and attributions, which are grounded in discursive norms of commitments and entitlements.

Based on normative inferentialism, our approach to discursive practices and pragmatic significance (e. g. illocutionary force) proceeds from third-person descriptions of everyday action. These descriptions of actions seem to signify traces to former interpretations which therefore can be reconstructed in regard to implicit pragmatic processes of social interaction. Being heuristic, these descriptions are inferentially significant regarding the semio-cognitive aspects of action and utterance interpretation. Our perspective is therefore more focused on the cognitive concepts constituted in semiosis (e.g. Brandt 2013, Brandt 2020) than on preconditioned mental processes.

Following the assumption that "intentional verbs" are key elements of understanding the daily routine of social actions as well as interpretation of utterances (e.g. Briese 2019, 2020, submitted; Descombes 2014; Harendarski 2021; Short 2007), we discuss pragmatic patterns signified by these verbs, especially by verbs of social-normative and communicative action. These patterns are significant pre-structures, coming along by means of certain verbs, and work as inferential roles in the ascriptions or attributions of intention and intentionality. We assume that these pre-structures are relatively universal across cultures on the one hand and are a basic framework for culture-specific action and speech-act typologies on the other.

We present some pragmatic patterns, which are analyzed corpus based. By means of a small sample size we show how third-person descriptions of everyday intentional actions can be used to elaborate on the interpretation of linguistic behavior as intentional action.

Integrating shared and individual realities in communication: A model of emergent aspects of common ground in interactive situations

Panel contribution

Dr. Elke Diederichsen¹

1. *Technological University Dublin*

This paper proposes a model for the integration of knowledge portions for interaction. These involve background knowledge, including cultural knowledge, that is shared a priori to the interaction, but also information that is interactively processed and edited in an ongoing discourse situation.

A priori shared knowledge has been termed *common ground* (Clark 1996) and *core common ground* (Kecskes 2014, Kecskes and Zhang 2009). It is shared due to a common cultural background or a shared history of experiences and conversations. Common ground, cooperation, regularities and conventions are known to be prerequisites for successful communication. This paper will, however, explore a counter-influence, namely the egocentric perspective that every participant brings into the interaction.

As a consequence of each participant's individual access, a shared knowledge base may have to be interactively established in the discourse situation. This has been described as *emergent common ground*. It entails that previously unshared issues are introduced and explained by the interactants in order to be useable as a knowledge base for the conversation. Some issues may figure only in the reality of one participant and affect conversational turns latently. A background that is treated as shared but is not actually shared has been discussed in terms of *dark-side commitments* (Walton and Krabbe 1995) or *uncommon ground* (Macagno and Capone 2016). The resolution of such mismatches in communication constitutes a case of *emergent common ground* (Kecskes 2014).

There is also a factor I call *Hiding in Plain Sight*: Not all aspects of an interactive situation are necessarily seen or accepted by all participants alike. For personal reasons, including the experience, profession or health situation of an individual, some people might perceive and focus things differently than others. There has to be a convergence of point of view among interactants. Any communicative situation is evoked, built and/or processed interactively in order to serve as a knowledge resource for the conversation. The situation, as it is utilised for the conversation, is, after all, emergent common ground.

The paper will provide a model of the knowledge factors thus interactively integrated in a conversational interaction. It will be demonstrated that this account incorporates the description of online interactions, where there is no guarantee for an a priori shared knowledge base, let alone a shared space. If the exposure to a shared situation is regarded as something interactively achieved rather than a priori given, then this holds for all communicative encounters, including online conversation.

The role of multiple viewpoints in utterance interpretation

Panel contribution

Mrs. Aleksandra Uttenweiler¹

1. University of Leipzig

The contribution explores the role of complex viewpoint networks (Dancygier and Vandelanotte 2016) in utterance interpretation. The approach relies on the emergence of multiple viewpoints in a single utterance, implying that in the process of interpretation several points of view must be taken into account. Accordingly, an utterance can be interpreted on many levels depending on the viewpoint considered. A relevant point of view may not be expressed directly by the speaker, but the hearer may need to rely on their pragmatic competence to be able to interpret an utterance from a given viewpoint. I suggest considering viewpoint patterns as constructional templates (Van Valin and LaPolla 1997), that come as ritualized formations (e. g. memes, forms like “unpopular opinion”, irony) providing additional information about possible viewpoints in discourse and the hierarchies between them.

In a Twitter corpus I have compiled there are numerous formations, which express the writer’s stance while conveying multiple viewpoints. Examples include the expressions “unpopular opinion” or “friendly reminder” used as conventionalized markers of a subjective point of view by projecting the writer’s opinion. However, they also express an opposing or a more general viewpoint. The conventional use of the expressions mentioned above implies that in order to interpret them and the utterances they introduce it is not only important to account for individual viewpoints but also the cultural and situational knowledge influencing online discourse. The findings suggest that utterance interpretation requires taking multiple viewpoints as well as the connections between them into account. The production and comprehension of viewpoint patterns relies on core common ground (Clark 1996; Kecskes and Zhang 2009), including shared knowledge about cultural conceptualization and norms. The assumed common ground needs to account for possible viewpoints that may occur in a society. Furthermore, the emerging common ground informs the reader about the hierarchy of viewpoints expressed in an utterance. When it comes to Twitter discourse previous postings and biographical information need to be considered. Throughout the presentation, I aim to model the comprehension of complex viewpoint patterns in relation to cultural and situational contexts.

The role of the situation in utterance interpretation: How context and common ground informs a speech act

Panel contribution

*Dr. Brian Nolan*¹

1. *Technological University Dublin*

It is argued that the situation is an essential component within a model of utterance interpretation with a clear role in binding together relevant aspects of context and common ground. As a cognitive frame, a pragmatic template, the situation encompasses context and common ground in informing the uttered speech act.

A speech act is part of a collective behaviour, within a dialogue, that evolves within the context of a social environment and grounded in the situation of the utterance. Interlocutors draw on the associated context, and establish a shared common ground. Employing the situation, we model speech acts based on the Searle (1979) taxonomy, such that their respective underspecified meaning can be computed. In characterising speech acts, we show that, in order to compute utterance meaning, a consideration of the situation, its context and common ground is necessary.

A situation can be formalised as a structured entity with important attributes that reflect its real-time pragmatic functions (Nolan 2022a, 2022b). We propose that the templatic structure of a situation includes the constructional signature, illocutionary force, initial context at the time of the speech act utterance and the initial common ground of the speaker and hearer along with the real-time preconditions that exist, the speech act proposition, the cognitive states of belief, desire and intention (BDI) of the speaker (and hearer), and the post-context ‘as it is’ after the utterance of the speech act. As a schematic template, the formalisation of the situation also needs to be able to show the realisation factors and the resulting post conditions that exist following a successful felicitous utterance. We address the following key questions:

1. As a template, how does the situation of the utterance encapsulate those relevant parts of context and common ground in support of the speech act?
2. In a situation, how can we represent the contents of context and common ground, with the appropriate level of specificity?
3. How might the situation be represented such that it becomes operationally useful in linguistic analysis?

An appealing advantage of employing a situation in the analysis of speech acts, as instances of real-time language-in-use, is that the situation provides us with the means to relate relevant context and common ground to the resolution of underspecified components of the utterance. A speech act must be interpreted in the context of a given situation, taking into account the different speech act types, along with context, and common ground.

Unarticulated constituents versus ad hoc concepts

Panel contribution

Dr. Alison Hall¹

1. De Montfort University

Contextualist approaches to utterance interpretation posit two broad kinds of ‘free’ (non-linguistically mandated) enrichment processes contributing to what is said, as opposed to implicatures: (i) ad hoc concept construction, where a concept’s denotation is narrowed or broadened so that the concept conveyed differs from the concept linguistically encoded, and (ii) unarticulated constituents (UCs), which do not correspond to any element of the uttered sentence. For example, what is said with an utterance of “It’s raining”, given the appropriate context, would be that *it is raining in Paris*, where the location *in Paris* is a UC.

A frequent concern voiced about UCs is that it is unclear how they ‘get into’ what is said given that, unlike ad hoc concepts, they are not the value of any element of the linguistic meaning: Jodlowiec (2015) argues against the relevance-theoretic account of what is said, and the concern is also reflected in ‘overgeneration’ arguments against UCs (e.g. Borg 2016, Stanley 2002), and a suggestion from Recanati (2010), himself one of the most prominent contextualist philosophers of language, that UCs are part of the context against which the Austinian proposition (roughly the semantic content or what is said) is assessed for truth or falsity, rather than part of that proposition (see also Corazza and Dokic 2012’s ‘Situated minimalism’).

In this talk, I consider whether we can draw a principled distinction between UCs and ad hoc concepts, and therefore whether the above criticisms are warranted. A key difference is that it tends to be easier to articulate the content of UCs, such as *in Paris*, than of ad hoc concepts, giving the impression of two different processes. However, this is a difference of degree rather than kind, and I will suggest that at least some UCs can be re-analysed as ad hoc concepts, while others, following a proposal in Hinzen (2015), may not in fact be part of communicated content at all.

Uttering sentences and using templates

Panel contribution

Prof. Frank Liedtke¹

1. University of Leipzig

As a rule, in uttering sentences or sentence fragments, speakers express more than they articulate. I distinguish two strategies for capturing the underdetermination of the articulated with respect to the information which is expressed by an utterance. The first strategy is to assume unarticulated constituents as part of the utterance which is understood by the addressee; the second is to avoid this assumption and to rely instead on information of the utterance context, not being projected upon the utterance content itself. I argue that the second strategy should be pursued, and a proposal is made for capturing the relation between linguistic and contextual aspects of the utterance situation by means of the notion of a pragmatic template. The latter is defined as a holistic cluster of relations between uttered sentences with a meaning on the one side and elements of the utterance situation on the other, a cluster which can be highly standardized in cases of more ritualized communication or which might be shaped according to the utterance situation. It is assumed that we as addressees have such clusters at our disposal in order to form a representation of an utterance with respect to its contextual determination. Several examples for using templates are discussed in the contribution. These include “and”-conjunctions, which have to be enriched in order to obtain a complete proposition. It is shown that these enrichments belong to different types, encompassing “and then”, “and therefore”, “and consequently” etc. The hypothesis is that these enrichments are possible only if the participants rely on pragmatic templates, covering different types of standardized utterance-situation-clusters.

Pragmatic Templates and Free Enrichment. In: F. Liedtke / Cornelia Schulze (Eds.) *Beyond Words. Content, context and inference*. Berlin / New York: Mouton de Gruyter, 2013, 183-205.

“I only wrote that to frighten her” – Threatening speech in the Late Modern English period

Panel contribution

Dr. Theresa Neumaier¹

1. TU Dortmund University

While speech act analysis on commissives has often focused on ‘positive’ promises, “evil promises” (Christensen 2019: 119), i.e., threats, have often been neglected when it comes to historical periods (but see, e.g., Peters & van Hattum 2021). Since threats do not involve a specific performative speech act verb, they cannot be extracted automatically. Moreover, speech acts are always socially situated, i.e., in order for them to be successful, interactants need to have access to a similar set of sociocultural categories and schemas associated with them. Hence, the realisation of threats in general and the typical structure of a threatening letter can change over time.

This paper investigates the linguistic realisation of threats in the Late Modern English period. Using courtroom data from the *Proceedings of the Old Bailey* (1674-1913), I first compiled a corpus of speech acts which were perceived as potentially threatening by contemporaries – otherwise they would not have made it into the courtroom. I then manually analyse the formal structure of 100 written and 100 reported verbal threats and use corpus linguistic tools to search for recurring lexical bundles and determine keywords. Finally, I look at the rhetorical organisation of the written part of the corpus to identify recurrent moves which might be considered obligatory for threatening letters in Late Modern English.

The findings reveal interesting differences to modern threats. While analyses of modern courtroom data found the vast majority of threats to be indirect (Christensen 2019), threats in the Old Bailey data are mostly direct, i.e., they explicitly specify threatener, victim, and type of threat. Additionally, more than a third of all threats can be classified as unconditional, as the victims are not provided with an option to prevent the threat from being carried out. This is less than has been reported for Modern English (Muschalik 2018) but considerably more than found in Middle English literary texts (Rudanko 2004), which might indicate a decrease over time in how openly conditions are expressed in threatening language. Apart from that, this finding could be explained by context-dependent schematisation patterns, as many of the letters are clearly influenced by contemporary social grievances, such as the Swing riots. Hence, the study not only shows that the analysis of speech acts in general and of historical speech acts in particular needs to be based on an ethnographic approach, but also provides a first glimpse into the historical development of a yet under-researched speech act type.

„hä (-) wie meinst du das?‘ Sequential construction of non understanding in German spoken interaction

Panel contribution

Dr. Robert Mroczynski¹

1. University of Leipzig

This paper will outline the sequential construction of (non) understanding in German spoken interaction. The idea of the sequential construction is based on thoughts of Langacker (2001, 2008), Fischer (2010), Deppermann (2006) and Linell/Lindström (2016). They all claim that linguistic structures are never merely formal, but always have a functional site and this units are not isolated but a part of social interaction. I am assuming that abstract sequential structures are used in interaction in conditions where interactants have difficulties understanding each other. These sequential structures have the function of monitoring or repairing failures in understanding. In my paper, such form-function pairs Goldberg (2006) will be presented and discussed at different levels of abstraction (Imo 2011) based on empirical (Schegloff 1996) spoken data. The analyses in this paper build on several corpora of DGD (Database for Spoken German). Additionally, the paper will address the contextual conditions that have to be given in order to activate certain sequences of non-understanding.

Developing Multilingual Young Students' Pragmatic Awareness through Pedagogical Translanguaging

Panel contribution

Dr. Laura Portolés¹, Ms. Gema Gayete Domínguez¹

1. Universitat Jaume I

Students' pragmatic awareness has been widely researched in recent decades, although most of these studies have ignored the multilingual background of the participants (Kim & Taguchi, 2015, 2016; Myrset, 2022; Savić et al., 2021; Taguchi, 2019). The multilingual turn in education has led to the need for a more multilingual approach to the study of pragmatic awareness (McConachy, 2019). A number of studies have addressed this issue by examining the pragmatic awareness of multilingual students at the primary level (Portolés, 2015; Safont & Portolés, 2015, 2016; Portolés & Safont, 2018), in secondary education (Martín-Laguna & Alcón-Soler, 2018; Martín-Laguna, 2020; Nightingale & Safont, 2019), and in higher education (Safont, 2005; Safont & Alcón, 2012; Martínez-Buffa & Safont, 2022). These studies have reported that multilingual learners have an enhanced pragmatic awareness. Similarly, several studies have examined how instruction affects students' pragmatic awareness and found that explicit instruction is beneficial (Safont & Alcón, 2012; Usó-Juan, 2021, 2022; Usó-Juan & Martínez-Flor, 2021). However, these instructional treatments have been conducted in secondary and higher education and followed a monolingual bias. Very current research has explored the effects of implementing a multilingual approach on students' language awareness (Duarte, 2020; Cenoz & Santos, 2020; Leonet; Cenoz & Gorter, 2020; Cenoz, Leonet & Gorter, 2021; Galante, 2020; Yasar Yuzlu & Dikilitas, 2022), although none of them has focused specifically on pragmatic awareness.

Given the limited number of studies investigating pragmatics and multilingualism in elementary school contexts, the present study analyses the effect of multilingual instruction, referring to pedagogical translanguaging, on multilingual young learners' pragmatic awareness, paying particular attention to the sociopragmatic dimension of the speech act of requesting. The sample consisted of 28 primary school students from a public trilingual school in the province of Castellón (Valencian Community), where three main languages (Catalan, Spanish and English) are used as languages of instruction. Elementary school students were asked to complete a pre- and post-test on multilingual pragmatic awareness of requests before and after receiving multilingual pragmatic instruction. Using computer-animated scenarios created with Nawmal software, the treatment included three sessions focused on the sociopragmatic dimension of requests through pedagogical translanguaging. Data were coded and analysed using the SPSS programme. The results showed that students' understanding of requestive behaviour improved after the implementation of multilingual pedagogies. Thus, in our study, the multilingual approach of pedagogical translanguaging was found to be beneficial for the development of young students' pragmatic awareness. In conclusion, we believe that using learners' whole language repertoire through a multilingual teaching approach, such as pedagogical translanguaging, may provide a rich environment for developing students' understanding and awareness of pragmatic issues.

Pragmatic awareness of multilingual teenagers. Examining the effect of pedagogical translanguaging.

Panel contribution

Prof. Pilar Safont¹, Dr. Richard Nightingale¹

1. Universitat Jaume I

Pragmatic awareness in third language acquisition contexts has received scant attention (Jessner, 2017; Portolés, 2015; Safont and Alcón-Soler, 2012; Martínez-Buffa and Safont, 2022). Given their pancultural nature (Brown, 2017), requests have been widely examined in cross-cultural and interlanguage pragmatics. Nevertheless, further research is still needed that considers a sociopragmatic viewpoint (Kecskes, 2019) and a multilingual focus (Cenoz and Gorter, 2011; Cenoz, 2013).

Bearing this purpose in mind, the present study focuses on the effect of pedagogical translanguaging on the pragmatic awareness of third language learners of English. Participants include 50 adolescent learners of English as L3 from a multilingual sociolinguistic setting, namely that of Castelló. Three languages coexist in the instructional setting in which data were collected, Catalan, Spanish and English. In an attempt to consider all their languages, participants were tested on their pragmatic awareness in these languages before (pre-test) and after (post-test) the instructional treatment which incorporated pedagogical translanguaging in the tasks performed. The control group was not involved in explicit instructional activities. Results from our analyses show the extent to which an explicit multilingual focus on pragmatic instruction may benefit multilingual learners of English as well as the peculiar characteristics of multilingual pragmatic acquisition.

The effect of pedagogical translanguaging on young learners' metapragmatic awareness of requests

Panel contribution

Mrs. Irene Guzman¹, Mr. Ignacio Martinez Buffa¹

1. Universitat Jaume I

The present study focuses on the effect of instruction on young multilingual learners' understanding of requests. The limited number of studies targeting this age group has evidenced their ability to reflect on pragmatic-related issues (Portolés, 2015; Savić, 2021). In addition, previous research has shown the positive effect of short periods of instruction on young learners' metapragmatic development (Myrset, 2022). However, as suggested by Portolés and Safont (2018), further studies are needed to consider learners' multilingual backgrounds as a resource for metapragmatic development. From this perspective, the aim of the present study is to examine the effect of a translanguaging approach focused on the construction of requests on primary school learners. An intact class of Spanish-Catalan bilingual sixth graders learning English as an L3 participated in this pre-post-test design study. A translanguaging –Spanish, Catalan and English– instruction was implemented to foster pragmalinguistic and sociopragmatic awareness in the comprehension and production of requests. Quantitative and qualitative analyses were conducted to describe changes in learners' conception of appropriateness, social distance, as well as the formulation of request forms. Results are in line with previous studies highlighting the benefits of translanguaging instruction for the teaching and learning of pragmatics. More specifically, findings from the present study provide further evidence regarding the relevance of a multilingual approach to engage young learners in pragmatic-related discussion by drawing on their multilingual experience.

Focus types and the prosody-gesture link in Catalan and German: A production study

Panel contribution

***Ms. Alina Gregori*¹, *Ms. Paula G. Sánchez-Ramón*², *Prof. Pilar Prieto*³, *Prof. Frank Kügler*¹**

1. Goethe Universität Frankfurt, 2. ICREA-Universitat Pompeu Fabra, Goethe Universität Frankfurt, 3. ICREA-Universitat Pompeu Fabra

Research has shown that gesture and speech are highly interconnected (McNeill, 1992) and that information structure and prosody correlate in terms of prominence (Féry & Kügler, 2008; Dufter & Gabriel, 2016). The role of focus types in this correlation and in the attraction of gesture use has rarely been considered. Esteve-Gibert et al. (2021) found that (children's) head gestures were used to indicate the informational status of referents, suggesting that gestures may play a structural role in communication.

We investigate the impact of focus conditions on prosodic prominence, gestures, and their synchronization. Following Krifka (2008), focus conditions are classified as: information focus, contrastive focus or corrective focus. As contrastive and corrective conditions have a stronger prosodic prominence than information focus conditions (Krifka, 2008), we hypothesize that pitch accentuation and gesture will be mostly associated with corrective and contrastive constituents, rather than with information focus. A comparative analysis is carried out for German and Catalan.

A production study will be conducted relying on an adaptation of the elicitation method by Esteve-Gibert et al. (2021). The method consists of pictures prompted in a digital board game. Participants request certain objects from an animated conversation partner. The focus types can be controlled by the responses of the animated "speaker". For data coding, prosody will be analyzed using ToBI adaptations (Grice et al., 2005; Prieto et al., 2015), assuming that pitch accents are associated with different levels of prominence (in accordance with Baumann et al. (2006)). Gesture apexes will be annotated using the M3D labeling system (Rohrer et al., 2020). We expect to conduct and analyze the data in the upcoming months for both German and Catalan.

Head movements and pitch accents as cues to information status in L2 French

Panel contribution

***Prof. Stefan Baumann*¹, *Dr. Florence Baills*¹**

1. IfL-Phonetik, University of Cologne

Languages differ in the way prosodic prominence is implemented to mark information status or focus (e.g. Kügler & Calhoun, 2020). At a parallel level of description, gestures have been found to occur more frequently with new and inferable referents than with given ones (e.g. Debreslioska & Gullberg 2020). For foreign languages, previous research has shown that deaccenting given information may be challenging for speakers of languages which use this strategy less (e.g. Rasier & Hiligsmann 2007). As for gestures, there is evidence that learners tend to over-explicitly mark referring expressions such as pronouns (Yoshioka 2008). To our knowledge, an analysis of information status expressed through both prosodic and gestural prominence (here: head movements) in L2 speech has not been carried out so far.

In the present study, 25 Catalan learners of French were video-recorded giving a short description of their best friend in French. The recordings were annotated in terms of information status (RefLex Scheme, Riester & Baumann 2017), pitch accents (F_ToBI, Delais-Roussarie et al. 2015), perceived prominence (DIMA, Kügler et al. 2022) and head movement types and apexes (M3D, Rohrer et al. 2020). Results show that Catalan learners of French marked new and inferable information more than given information either with pitch accents alone or with a combination of pitch accents and gestures. Given information was generally marked as less prominent than new(er) information (more initial accents, fewer rises, lower level of perceived prominence, fewer head movements) but still received a large proportion of pitch accents. However, no difference between the types of accent or the types of head movement were found in non-given categories.

Currently, the annotation and analysis of comparable speech by ten French native speakers who performed the same task is being annotated and the results of their analysis will be contrasted with the present results.

Prosodic marking of contrast in signed languages: the case of LSFb (French Belgian Sign Language)

Panel contribution

Ms. Clara Lombart¹

1. Université de Namur

The relationships between prosody and information structure (IS) have been documented for spoken languages (SpLs) before being investigated in signed languages (SLs) in the 2000s (Kimmelman and Pfau 2016). Research has highlighted that the prosodic marking of IS in SLs follows patterns similar to those documented for SpLs, and relies on manual features (e.g. duration of the signs) and non-manual markers (e.g. facial expressions or eyebrow movements) (Wilbur 2012).

Among information units, we find contrast, defined as the opposition between two or more alternatives that share dependency in discourse (Navarrete-González 2021). A recurrent problem in the literature is that contrast is regarded as a homogeneous notion. However, some authors (e.g. Umbach 2004) have claimed that its marking can only be understood by considering different subtypes, such as discourse opposition, selection, and correction. Furthermore, studies on IS in SLs have been limited to a few languages, and have been based on elicitation tasks and translations from a SpL to a SL. Thus, more diversity in data and more studies on spontaneous language use are needed (Kimmelman and Pfau 2016).

This presentation aims to overcome these shortcomings by examining contrast in a SL in which IS has not yet been studied, LSFb (French Belgian Sign Language). In particular, the present study seeks to address the following questions: Which prosodic features of LSFb are used to encode contrast? Does this marking differ across contrast subtypes (i.e. discourse opposition, selection, and correction)? To tackle these questions, we analysed videos extracted from the LSFb Corpus (Meurant 2015) produced by six native deaf signers who interacted with someone familiar. We examined the prosodic marking of the contrast subtypes in comparison to the signed units (i.e. sequences of signs delimited by stops of the hands) that precede or follow them, and thus form their surrounding context. With this aim in mind, we annotated 1500 manual signs according to manual holds, sign repetitions, dominance reversals, duration, and displacement of the hands. In addition, 1200 non-manual signs (eyebrow, head, and torso movements) were considered.

The results show that contrast has a specific prosodic marking in LSFb compared to non-contrastive items. More specifically, the prevailing prosodic cues that encode contrast are changes in displacement (e.g. a sign is placed higher in space than the previous one), variations in duration (e.g. a sign is longer than the preceding one), non-manual cues, and combinations of these markers. Contrast is also characterised by a form of prominence that is stronger than non-contrastive items. Moreover, we observed either i) the gradual marking of the contrast subtypes or ii) the use of a specific marking for one subtype that was distinct from the other two. Patterns (i) and (ii) manifest differently depending on the prosodic cue. The interactions between prosody, IS, and articulatory constraints (i.e. types of sign, movement, and position in an utterance) are discussed to explain the different tendencies highlighted in the data sample.

Ultimately, this study opens new avenues for a more thorough definition of contrast in SLs.

Speech-associated gestures reflect topic-comment structures

Panel contribution

***Dr. Sandra Debreslioska*¹, *Prof. Pamela Perniss*²**

1. Lund University, 2. University of Cologne

How speakers linguistically express the difference between new/given or topic/comment information in discourse is a well-established field of research. What role the visual/gestural parts of language play, however, is less well understood. Previous studies have predominantly focused on the information status of referents and shown that gesture frequency and mode of representation vary according to a referent's accessibility (Debreslioska & Gullberg, 2019; Perniss & Özyürek, 2015). However, other information structural dimensions such as 'aboutness' (topic vs. comment elements of the clause) and how they influence gesture use remain largely unexplored. This study therefore examines *when* and if so, *how* gestures accompany discourse referents with a focus on 'aboutness', in addition to referent accessibility and referential forms.

The data set consisted of 30 videotaped narrative retellings produced by 10 native speakers of German. We used three short Charlie Chaplin movie clips as stimulus material. We divided the narratives into clauses, identified all referential expressions, coded them for form (lexical NP vs. pronoun), referent accessibility (maintained vs. (re)introduced), and 'aboutness' (referential expression as part of the topic or comment element of the clause). For gesture, all strokes that co-occurred with referential expressions were identified and classified as *referential* or *non-referential* (Kendon, 2004).

We analyzed the data from three perspectives. Analysis 1 examined how likely different types of referential expressions are accompanied by gestures (DV: presence/absence of gesture). Analysis 2 took the gestures as starting point and examined how they pattern with the different properties of the referential expressions (DV: number of gestures). Analysis 3 examined gesture referentiality in relation to 'aboutness'.

Preliminary results for analysis 1 showed that gestures tend to occur with lexical NPs and (re)introduced referents. However, there was no relationship between 'aboutness' and the presence/absence of gestures. Analysis 2 revealed that more gestures are produced with lexical NPs, (re)introduced referents, as well as referents that are part of the comment. Analysis 3 showed that non-referential gestures associate with topics whereas referential gestures pattern with referents that are part of the comment.

The findings suggest that speech-associated gestures play a role in the expression of information structure. That is, if we take speech as a starting point, referential form and referent accessibility predict whether a gesture will be produced. Furthermore, if we start with gestures, that is, if we come across a gesture in discourse, it is highly likely that the co-occurring speech will be part of the comment element of a clause. Finally, the findings suggest that gesture referentiality co-varies with 'aboutness', which highlights the importance of information structure for our understanding of gesture functions. Thus, the study also provides new insights into the speech-gesture relationship in general.

The multimodal marking of information status of referents in English academic discourses

Panel contribution

*Dr. Patrick Louis Rohrer*¹, *Prof. Pilar Prieto*²

1. *Universitat Pompeu Fabra*, 2. *ICREA-Universitat Pompeu Fabra*

When managing the common ground between speaker and addressee in discourse, speakers may use a number of cues which signal the information status of discourse referents (henceforth ISR) where discourse referents correspond to Noun Phrases or Prepositional Phrases which may be new to the discourse, accessible from context, or given (see Krifka, 2008; Götze et al., 2007). In Germanic languages speakers tend to use pitch accentuation to mark new referents, while given referents are often deaccented (e.g., Kügler & Calhoun, 2021 for a review). Some studies have also suggested a close relationship between pitch accent types and the degree of newness in discourse (e.g., Pierrehumbert & Hirschberg, 1990). Similarly, co-speech gestures seem to be produced with accessible and new referents more than given ones (Debreslioska & Gullberg, 2019; 2020b, Im & Baumann, 2020; among many others), and that, similarly, the production of certain gesture types are related to the newness of information in discourse (McNeill, 1992). However, no study to our knowledge has investigated the joint use of pitch accentuation and gesture as highlighters of new information in discourse, while accounting for pitch accent type and gesture type. Furthermore, phrase-initial prenuclear pitch accents have been found to largely act as attractors for gesture production (Rohrer, 2022), indicating that phrasal prosodic structure may also guide gesture production patterns. Thus, the objectives of this study are a) to better understand the multimodal (joint prosodic and gestural) cues to the information status of referents; b) to assess the role of pitch accent type as a prosodic cue to information status via pitch accentuation; and c) to assess the role of gesture type (referential vs. non-referential) as a gestural cue to information status, as well as any potential interaction between gesture production and prosodic phrasal structure (i.e., gestures which associate with prenuclear pitch accents) in the marking of ISR.

A corpus analysis was carried out on the English M3D-TED corpus containing over 23 minutes of multimodal discourse across 5 speakers, which was independently annotated for gesture, prosody, and information status. We found that both gesture and prosody seem to work together to mark information status, particularly that given referents were found to be deaccented and produced without gesture more than accessible or new referents. However, no significant relationship was found for pitch accent type. That is, all pitch accents associate with new information equally. Similarly, no effect was found for gesture type, showing that both referential and non-referential gestures associate with new information equally. Crucially, in prenuclear pitch accented positions, an interaction between gesture and prosody was found for the first time, showing that gestures marked accessible referents significantly more than given or new ones, playing a complementary role with pitch accentuation. In our view, even though these results reflect a good degree of integration between pitch accentuation and the production of gesture, which jointly act as multimodal highlighters of information status, they also reveal a more nuanced situation where gesture is not directly dependent on prosodic structure to convey pragmatic meaning.

**Multimodal stancetaking
– the (a) typical case of
taking a stance?
(organized by Cornelia

Affective stancetaking in mediatised political speeches of ‘Bündnis 90 / Die Grünen’ (The German ‘Green Party’)

Panel contribution

***Mrs. Clara Kindler*¹, *Prof. Cornelia Müller*¹**

1. Europa Universität Viadrina, Frankfurt (Oder)

Based on the ongoing DFG/NCN research project “Multimodal Stancetaking: Expressive Movement and Affective Stance” (<http://mmstance.home.amu.edu.pl/>), this talk takes a closer look on the specific *affective stancetaking in political speeches as multimodal actions*. Multimodality is addressed in a double sense: First, as the dynamic interplay of hand and body gestures with the spoken utterance. And secondly, it includes the media-specific contexts in which the political speeches are embedded, concerning the audiovisual orchestration of camerawork, shots, montage and sound. Both levels of multimodality form an inseparable unit that unfolds temporally as *expressive movement* in the moment of perception (Kappelhoff & Müller, 2011). Affectivity unfolds as movement quality and rhythm of expressive movements and in this way mobilizes affective stance in the perception of the viewer. It is the goal of this talk to illustrate this approach with analyses of two speeches given by members of the German party “Bündnis 90 / Die Grünen”: a parliamentary speech delivered in person in the German Bundestag in 2019 and a speech made at the national congress of the Green Party in 2020, held digitally.

The speeches under scrutiny are 16:13 Min (parliament speech 2019) and 4:20 Min (party congress 2020) long. They are official video recordings from the German Bundestag and the Green Party and were free for download on the official websites. Transcribed, annotated and analyzed were only the areas of the speeches that showed high affective engagement, in total around 3-3:30 Min unfolding within four expressive movement units (EMU) per speech. These EMUs were analyzed with the *expressive movement analysis* developed by Kappelhoff and Müller (2011; Müller, 2019; Müller & Kappelhoff, 2018) and as far as multimodal utterances are concerned the analysis draws on Müller’s Methods of Gesture Analysis (Müller, 2010, Kappelhoff & Müller 2018, Müller, in press). The analysis of stancetaking on the semantic level is based on the approach by DuBois (2007).

The analyses of the two speeches illustrate that a systematic consideration of the audiovisual orchestration of mediatised political speeches not only broadens the perspective on media-specific contexts of forms of multimodal stancetaking, but shows that and how the form of affective stancetaking changes with them. The face-to-face parliament speech unfolds as a live interaction between *audience and speaker*, where the reactions of the audience affect and shape the speech and thus stancetaking can be conceived as interactive and multimodal. The digital party congress speech, on the other side, lacks this immediate interactive feedback and in its place we find a *cinematic staging of affective stancetaking*. It is concluded that it is the unfolding of media specific dynamics that shapes multimodal affective stancetaking.

Approaching multimodal stancetaking by viewpoint analysis in intercultural interaction

Panel contribution

Prof. Ulrike Schröder¹

1. *Federal University of Minas Gerais*

Most work on multimodal stancetaking so far has been implemented in the field of conversation analysis and interactional linguistics (cf., e.g., Goodwin, Cekaite & Goodwin 2012; Couper-Kuhlen & Selting 2018; Deppermann 2015) while the major work on viewpoint has been carried out primarily by scholars from cognitive linguistics and gesture studies (e.g., McNeill, 1992; Parrill 2009, 2012; Sweetser & Stec, 2016; Mittelberg, 2019). Recently, interest has arisen in bringing these fields together. Feyaerts et al. (2017) studied amplifiers and comical hypotheticals as markers of mental viewpoint and revealed how amplifiers offer a straightforward view of a speaker's evaluative stance that may be copied by the interlocutor in gesture, posture, gaze, or intonation, as well as how comical hypotheticals provide an intersubjective account of a viewpoint construal. Rekkittke (2017) unveiled that stancetaking relates to the deployment of gestures from a C-VPT as opposed to an O-VPT hinging on a given discourse topic if this topic is seen as taboo. This is to say, an O-VPT abstracts away from details and allows for a wider and more critical scope of interpretation.

The work of the Research Center *Intercultural Communication in Multimodal Interactions* (www.letras.ufmg.br/icmi) is based on transcribed video data stored in the ICMI corpus. Recent analyses of these data have shown that prosodic and gestural-corporal means such as wide open eyes, frozen gaze and gesture movements, pitch jumps, and accent density, etc. are recurrent resources for constructing and organizing shared affective stance toward episodes experienced as culture shock by exchange students (Schröder 2017, 2020). A current project on the analysis of the cultural conceptualization of Brazilian *jeitinho*, a 'way of muddling through', focuses, inter alia, on the analysis of an intercultural encounter between two Brazilian and two German professors, who have lived in Brazil for more than twenty years (Schröder & Streeck, 2022; Schröder 2021). Although all four participants have deep knowledge of this concept and know it by experience, they enact it from quite different viewpoints. In this talk, I aim to present the results from a fine-grained analysis of sequences including a form-based notation of the gestures (Bressemer 2013) in order to highlight the interconnectedness of stancetaking and viewpoint: The two Brazilians adopt a C-VPT with an iconically rich action description (Bressemer, Ladewig & Müller 2018) that involves the entire body. This points to higher engagement, additionally marked through laughter, extra strong accents, and pitch jumps. In contrast, the two Germans deploy predominantly deictic and metacommunicative gestures and adopt an O-VPT. One recurrent gesture is the Raised and Stretched Index Finger serving the function of calling attention (Bressemer & Müller 2014). This gesture has also a rhetoric-rhythmic impact, frequently co-occurs prosodically with the list construction (Selting 2004) and displays an 'epistemic authority' (Inbar in press) here. Hence, the two different viewpoints and multimodal ways of incorporating *jeitinho* clearly represent stancetaking actions: engaged versus detached, close versus distanced, affective versus critical, from the inside versus from the outside.

Discourse markers and pragmatic gestures in Russian

Panel contribution

Dr. Yulia Nikolaeva¹

1. Lomonosov Moscow State University

Co-speech gestures can be divided into two distinct groups: (1) referring to the world and events being described and (2) revealing the speaker's attitudes, discourse structure, interaction with the interlocutors, and the process of making the narration. Gestures with this kind of meaning (or their sub-types) can be referred to as pragmatic (Kendon 1995, 2004), interactive (Bavelas et al. 1992), recurrent gestures (Bressem & Müller 2014), or regulators (Ekman & Friesen 1969).

Their meta-discursive meaning combines with an easily recognized recurrent form (Bressem & Müller 2014), which seems to be very similar in Russian and German.

The study based on retellings of "The Pear Film" (Chafe 1980) in Russian showed that pragmatic gestures have some features that distinguish them from narrative-level iconics and deictics. First, they can be combined in one gesture (simultaneously or successively) with other gestures (referential or rhythmic). For example, while saying "The gardener goes down the ladder", the speaker shows the trajectory (diagonal down with a few stops marking the rungs of the ladder) and holds her hand with the open palm up, so the iconic gesture for climbing down the ladder is combined with PUOH presenting the gardener. Pragmatic gestures can be easily combined with deictics too, since the main distinctive feature of a pragmatic gesture is its recurrent form, while iconics or deictics can use space to show direction or movement. At the same time, pragmatics often cover more than one clause (when a speaker is holding her hand for a while, marking, for example, uncertainty or doubt), which is unusual for referential gestures, which mostly follow McNeill's rule "one gesture – one clause". This sort of temporal flexibility of pragmatics brings them closer to pragmatic means in speech which can range from a morpheme to several clauses.

Matching pragmatic gestures to discourse markers showed that gestures can add some information to the words. Thus, markers of preparative substitution used when the speaker is looking for the right word (kind of, be like, type) can either reveal a word search or, on the contrary, draw attention to the speaker's pantomime. In the first case, there will be pragmatic gestures meaning word search or approximation. The latter case is illustrated with a clear iconic gesture or pantomime.

Evidential discourse markers describing the source of information (we can see, it sounds like, there's a feeling) can either be accompanied by iconic gestures (thus marking important discourse events, plot shifts, or a new protagonist) or have no gesture illustration. In this case, the markers are separate clauses and are not connected to the story being told but rather to the speaker's attitude and her interaction with the interlocutors.

Hedging markers (I'd say, evidently, probably) revealing the speaker's cognitive processes can appear with pragmatic gestures and thus highlight the meta-discursive layer of the statement; if these markers are accompanied by other gestures, the latter most likely are iconics or deictics and add some essential information to the verbal message.

Multimodal Comparison in Orchestra Instructions

Panel contribution

*Ms. Katharina Meissl*¹, *Dr. Paul Sambre*¹, *Dr. Kurt Feyaerts*¹

1. KU Leuven

Orchestra conductors essentially evaluate and instruct musicians to improve their collective performance, thus rendering rehearsals an inherently stance-laden setting (Meissl et al., in press). They use a wide range of semi-otic resources, often expressing comparisons between undesired and desired performances (cf. Messner, 2020). Comparative constructions have been studied from a monomodal, primarily lexico-grammatical perspective in different sub-disciplines of linguistics (cf. Hilpert, 2010; Treis, 2018). In this contribution, we approach comparative constructions from a multimodal, cognitive linguistic, interactional perspective (Zima & Bergs, 2017; Cienki, 2022) in the setting of orchestra rehearsals.

We investigate how conductors express comparisons multimodally i.e. using both verbal and other semiotic resources. We use 25 hours of video data recorded during rehearsals of 5 conductors with their respective orchestras in Belgium; the language used in the corpus is Dutch (Schrooten & Feyaerts, 2020). From this dataset, we extract sequences containing verbal comparative constructions using the annotation tool ELAN (Wittenburg et al., 2006).

We analyze utterances surrounding scalable or gradable adjectives (e.g. *loud*, *soft*, *calm*) or adverbs (e.g. *less loudly*, *more clearly*), which reveal a combination of scalarity and subjective construal (Pander Maat, 2006, p. 279). Within these comparative constructions, we scrutinize the construal of evaluations and instructions; more specifically, how musical phenomena, aspects of performance as well as the intersubjective relation of participants are construed along the subjective-objective dimension (Feyaerts, 2013) across different semiotic resources.

Next to the conductors' verbal utterances, we analyze visual aspects such as facial expressions, head or body movements and manual gestures as well as vocalizations and sung depictions of music. We are specifically interested in the role of these resources for contrastive constructions, their sequential relation to speech, as well as the construal work they fulfil. While we do expect speech to be the dominant resource used to express evaluations and instructions, as observed by Stoeckl & Messner (2021), we presume that visual and acoustic components contribute substantially to comparative construal, foregrounding and managing past, present and upcoming usage events.

Multimodal Resources for Stance-Taking in Storytelling with an Aphasic Man

Panel contribution

*Dr. Marjorie Goodwin*¹

1. UCLA

This paper examines the resources utilized in stance taking (M Goodwin et al.) in the midst of family storytelling, and dispute in interaction with a man with aphasia (Chil) who can produce only three words (C. Goodwin 2004). Making use of a host of embodied resources he can express his stance of righteous indignation when told that a hospital bed has been ordered for him; for Chil such an action indexes the category of disabled person. Despite his lack of elaborate lexicon, the aphasic man is nonetheless able to participate fully in dialogue, utilizing prosody, body posture and gesture to animate characters in a story while simultaneously providing his commentary on the very actions he is depicting. His vivid character enactment recruits others' alignment with him. Family members initially positioned as bystanders to a dispute between Chil and his son, align towards the developing dispute through embodied stances of incredulity and amazement (shrugging shoulders, covering eyes while laughing), providing commentary on the action taking place between principal participants.

Rather than forefronting speech, we take participation (Goodwin and Goodwin 2004) as the framework for our analysis. Embodied participation is a temporally unfolding process through which separate parties demonstrate to each other their ongoing understanding of the events they are engaged in by building actions and stances that contribute to the further progression of these same events. While doing things together people display how they position themselves towards others with whom they are interacting *in the very midst of another's turn* — through their facial expressions, eye gaze, and body comportment as well as interjected verbal commentaries. Participation goes beyond the structure of talk to encompass the practices used by rich, feeling bodies to perform relevant operations on a public substrate provided by others. We conclude that action within interaction is thus not found in the stream of speech alone, but instead is emergent through the meaningful frameworks created by acting and interacting bodies. From this perspective, stance and affect are not individual phenomena or primarily manifestations of a single actor's psychological state, but instead core public features that interactively constitute the action of the moment to be what it is.

Prosodic cues to affective stancetaking in German and Polish parliamentary speeches

Panel contribution

***Prof. Maciej Karpinski*¹, *Prof. Katarzyna Klessa*¹, *Prof. Ewa Jarmołowicz-Nowikow*¹**

1. Adam Mickiewicz University Poznań

In the ongoing DFG/NCN research project “Multimodal Stancetaking: Expressive Movement and Affective Stance” (<http://mmstance.home.amu.edu.pl/>), we explore the multimodal process of stancetaking in German and Polish parliamentary speeches. In the subsequent steps of holistic expert analyses carried out in the expressive movement framework (e.g., Mueller & Kappelhof 2018), the recordings were manually annotated for foregrounding clusters and affective peaks by Polish and German team members. On our way to capture a coherent, comprehensive, multimodal image of stancetaking, we start from independent analyses of the motion and speech components. In the present contribution, we inspect prosodic features of the political speeches in the areas tagged as characterised by lower or higher affective engagement, including affective peaks. The selection of potential prosodic correlates of the affective expression and phonetic-acoustic parameters to be applied is discussed. Sample analyses of duration and pitch-related prosodic features in high and low affective engagement areas of Polish and German parliamentary speeches are presented. They include vocalic nPVI, Time Group Analysis, Rhythm Spectra, pitch range and the profile of its changes. An attempt is made to capture both general and language-specific tendencies, as well as individual idiosyncratic prosodic characteristics of particular speakers.

The study was carried out within the German-Polish MuMo Stance project funded by the National Science Centre (UMO-2018/31/G/HS2/03633) and DFG.

Stancetaking and adolescence. Multimodal positioning in dialogue among Italian teenagers

Panel contribution

*Dr. Emanuela Campisi*¹

1. Università degli Studi di Catania

The goal of this paper is to investigate the features of speech acts of stancetaking deployed by Italian teenagers during multi-party interactions. While a growing literature confirms that stancetaking is not only a matter of speech but of other bodily components as well, especially co-speech gestures (Kendon 2004; Debras & Cienki 2015; Bressemer & Müller 2014, 2017 among others), there are still some limitations to our knowledge of the phenomenon. For example, the majority of the available results concerns adults only, while almost nothing is known about adolescence, a fundamental moment for the development of the self through the first forms of social and ideological positioning, usually including a strong emotional component (Laursen 1995). Furthermore, while those studies do not concern English only, we still lack of a systematic description of multimodal stancetaking in languages such as Italian, usually considered a “gesture rich” one (Iverson et al. 1999) and for this reason usually investigated only from a quantitative point of view. Finally, very few studies explore multiparty conversations, even if this form of dialogue is pervasive in everyday life, and even if, as Du Bois (2007: 140) points out, “stances build each other dialogically”.

Drawing on a corpus of video recordings of a group of 12 Italian teenagers discussing (and arguing) about conflict in interaction in two high schools in Catania (Italy), analyzed in ELAN, the present study aims at identifying recurrent multimodal features of stancetaking, starting from the identification of all the instances of epistemic and affective positioning in speech (Du Bois 2007), transcribed and coded for their linguistic form (i.e. verbs, adjectives, adverbs). To expand on the linguistic analysis, all the co-occurring gestures have been identified and coded for their kinetic features (handshape, orientation, space, movement) and for other bodily cues involved (i.e. facial expressions and gaze). The analysis, still ongoing, has a dual purpose: first of all, the identification of recurrent patterns of form, both in speech and gestures, associated with an act of positioning; secondly, the measure of the degree (or the lack) of alignment among the young participants not only in speech, but in gestures as well.

The results of the analysis will be discussed in two directions: on the one hand in relation to their theoretical contribution to the notion of stancetaking, still predominantly based on speech, and its role in conflictual interactions among teenagers; on the other hand, questions will be raised from a methodological point of view, with a focus on how multimodal analysts can overcome the constraints of a speech-driven approach in order, for example, to include also instances of stancetaking not accompanied by speech (e.g. a pragmatic gesture of the away family) and yet sometime decisive in transforming a dialogue into a conflict.

Taking an affective stance: How affectivity is mobilized in mediatised political debates

Panel contribution

Prof. Cornelia Müller¹

1. Europa Universität Viadrina, Frankfurt (Oder)

Despite a rich and diverse literature on stance and stancetaking (Du Bois 2007; Englebretson 2007; Dancygier 2012), the role of gesture, posture, and prosody, as aspects of this communicative activity remains only scarcely studied. Moreover, stancetaking often becomes a vibrant multimodal activity when people are highly engaged affectively. This is the starting point for the argument presented in this talk and of an ongoing DFG/NCN research project (<http://mmstance.home.amu.edu.pl/>). Extending previous work on ‘expressive movement’ as a key concept for the analysis of multimodal phenomena (in face-to-face interaction and in audiovisual composition) multimodal stancetaking is considered as dynamic interaffective process (Kappelhoff & Müller 2011; Müller & Kappelhoff 2018). Drawing on analyses of political debates in the German Bundestag, it will be illustrated how the concept of ‘expressive movement’ serves as an analytical tool to capture affective stance taking as a dynamic, multidimensional and multimodal movement gestalt displaying characteristic affective profiles. The talk concludes on the specific media-aesthetic dimension of taking an affective stance in mediatised political debates – and suggests how affectivity is mobilized in audio-visual broadcasts of political debates.

Taking stance with the Slapping movement. Inter-affectivity in interactions among children

Panel contribution

Dr. Silva Ladewig¹, Ms. Lena Hotze²

1. Georg-August-Universität Göttingen, 2. Europa-Universität Viadrina

This paper introduces the Slapping movement as an embodied practice of dislike or meta-commentary recurring in conflictive situations between German children aged four to six (Ladewig & Hotze 2021, in press). Children move this way primarily in stopping a co-participant's action and protesting against the action to be stopped. In our data of seven hours of natural and everyday interactions among children between the age of four to six, we identified 20 cases of the Slapping movement which were embedded in conflictive situations or negotiations. All forms of the Slapping movement are linked to one another by a particular movement gestalt and by their communicative function.

However, the Slapping movements documented showed different manners of execution. Some forms appeared to be very expressive, others were more schematic. Inspired by a phenomenological approach to multimodal communication that sets affectivity center stage (Horst, et al. 2014; Müller & Kappelhoff, 2018; see also Fuchs 2017), our analysis reveals that the movement qualities show different degrees of communicative effort and affective intensity. Affective intensities are not considered as represented by single words or gestures, but they emerge during the interaction. They are discernable by the qualities of multimodal expressions such as intonation, tempo, or rate of turn takings in speech, and repetition, overlapping gesticulation of different speakers, speed, size, and accentuation in gestures (Horst et al., 2014; Ladewig & Hotze 2021). Based on our analysis of the temporal unfolding of affectivity, we argue that the Slapping movements do not stand out but form an integrated whole with speech which is embedded in a flow of emerging inter-affective dynamics. What is more, the affective intensities unfolding in the situations analyzed also influence how the hands are moved. In more detail, we observed that the higher the affective intensities become the larger and more vigorous the Slapping movements are.

The sequential and multimodal unfolding of enactments in VGT. A comparison of ‘enactment only’ and embedded enacted stance expressions.

Panel contribution

*Ms. Fien Andries*¹, *Mr. Geert Brône*¹, *Mrs. Myriam Vermeerbergen*¹

1. KU Leuven

In interaction, speakers and signers can make use of enactment, i.e., they combine “bodily movements, postures and eye gaze to ‘construct’ actions and dialogue in order to ‘show’ characters, events and points of view” (Hodge & Ferrara, 2014, p. 373). These enactments are often not a reproduction of real-world actions or dialogues. Rather, the interlocutor constructs their version of these actions or dialogues and presents them through a representation of other characters.

As a result, enactment is well-suited to be used in stance expressions (Authors, 2018). An interlocutor may use enactment to present the stance of the person they enact, their own stance, or both.

With a dataset of five hours of dyadic conversations in Flemish Sign Language (VGT), we compare stance expressions that consist of a (sequential or simultaneous) combination of enactment and lexicogrammatical and gestural information from a narrator perspective on the one hand, and stance expressions consisting of only enactment on the other hand (henceforth “enactment only”). In doing so, we will focus on 1) the types of stance expressions in these sequences, 2) the sequential organization of enactments, 3) the polyphonic strategies signers use.

Interlocutors can embed enactment in (lexicogrammatical/gestural) stance expressions, presenting stances from a character and narrator viewpoint sequentially or through body partitioning, but they can also make use of polyphonic strategies to make one utterance belong to the narrator as well as the character in such way that “it can carry two points of view (the quoted figure’s perspective and the ironic, mocking, evaluative perspective of the reporter)” (Günthner, 1999, p. 705). Facial expressions, mouthings and mouth gestures, body posture and code switching have been found to be used as polyphonic strategies in a few signed languages (Authors, 2016; Author, 2020). In other words, interlocutors can express stance through ‘enactment only’, or embed enactment in a bigger, (partly) narrated stance expression, providing information from two different viewpoints.

In this last case, the enactment and other lexicogrammatical or gestural activities can be combined simultaneously, given the fact that enactment can be realized in different degrees, leaving place for other information to be simultaneously expressed with the enactment.

We found that in VGT, ‘enactment only’ as well as enactment with narration appear in stance expressions. Polyphonic strategies include the use of facial expressions, (manual or mouth) gestures, body posture and spatial distancing. We expect to find that affective stances are most expressed in these sequences, compared to deontic and epistemic stance. Moreover, we hypothesize that signers make use of reduced and subtle enactment to present multiple stances. We analyze how gestural and lexicogrammatical stance markers are sequentially or simultaneously structured within enacted sequences.

“Cutting off” inappropriate formulations: A disalignment practice in Hebrew face-to-face interaction

Panel contribution

*Ms. Gil Newman*¹, *Dr. Anna Inbar*², *Dr. Leon Shor*³

1. The Hebrew University of Jerusalem, 2. University of Haifa, 3. Achva Academic College

In this talk, we explore a particular recurrent gesture used by Hebrew speakers—raising a slightly tilted hand (or two hands) in line with the head and moving the palm back and forth, with the right palm facing left (or the left palm facing right), as if cutting something in the air (Figure 1).

We show that the “cutting-off” gesture is usually coordinated with formulations that are framed by the speaker as being ill-suited to the interactional context. This use is illustrated in the following example taken from an interview with an Israeli philosopher. The interviewer summarizes the interviewee’s previously asserted proposal to divide a particular historical event into four periods, metaphorically referring to the entire event as a cake (lines 1–3).

- 01 I-er: 'ata mexalek 'et ha-
you.SGM divide.PRS.SGM OBJ DEF
You divide the
- 02 (a burst of laughter)
- 03 #(0.5) 'uga,#
#cutting-off gesture#
cake
cake,
- 04 lo batua'x she-ze ha-bituy ha-naxon,
NEG sure.SGM that-this.SGM DEF-expression.SGM DEF-right.SGM
[I'm] not sure that's the right expression,
- 05 I-ee: ken.
Yes.
- 06 I-er: le-'arba prusot?
to-four slice.PL
into four slices?
- 07 I-ee: naxon.
Right.

In line 1, the interviewer indicates trouble in producing the direct object after the verb *mexalek* ‘divide’, initiating a word search with a vowel stretch of the definite article *ha-* ‘the’ projecting a noun to come. The trouble in the formulation is further indicated by a burst of laughter and a silence of 0.5 seconds, during which the interviewer performs the cutting-off gesture, which is then extended to the projected formulation *'uga* ‘cake’ (line 3). The gesture-laminated formulation is followed by an explicit verbal elaboration that reveals the interviewee’s lesser endorsement of that formulation in greater detail (line 4).

Our data come from two sources of spoken Israeli Hebrew—television talk shows and video recordings of ordinary conversations among pairs of well-acquainted native Hebrew speakers in private settings. Employing multimodal Conversation Analysis (e.g., Kendrick & Drew, 2016; Mondada, 2006) and Interactional Linguistic methodology (Couper-Kuhlen & Selting, 2018), we analyze sequential environments yielding such multimodal patterns, discussing what the deployment of the gesture accomplishes in the immediacy of interaction. We suggest that the gesture constitutes a stance marker of disalignment that frames the verbal formulation coordinated

with the gesture as inappropriate in the interactional context. In line with previous research (e.g., Debras, 2017; Ford et al., 2012; Inbar, forthcoming; Inbar & Maschler, forthcoming; Jehoul et al., 2017; Marrese et al., 2021; Shor & Marmorstein, 2022), the present study shows that gestures can be mobilized to display a speaker's stance and make it interpretable, thereby furthering our understanding of the grammar-body interface.

“Arm Your Community”: Ideology in Vaccine Advertising Campaigns Across Countries

Panel contribution

Dr. Anna Islentyeva¹, Mr. Torben Scheffler²

1. Universität Innsbruck, 2. Universität Hamburg

The coronavirus pandemic has dominated public discourse since 2020 and has impacted society in major ways. Media and political discourses surrounding COVID-19 have primarily employed metaphorical framings, such as the pandemic as a force of nature, or depictions of the virus in the military terms (cf. Islentyeva 2020; Charteris-Black 2021).

The pandemic has also given rise to new waves of conspiracy theories; such theories and misinformation have become particularly prevalent with regard to the much-anticipated “solution” to the pandemic in the form of effective vaccines. Many members of the general public remained steadfast in their anti-vaccine views for a multitude of reasons, including misinformation shared on social media (Gunaratne et al. 2019). Governments followed suit by running advertising campaigns aimed at informing their citizens about the virus, while simultaneously urging them to receive their vaccinations. In doing so, the notions of ideology and persuasion coalesced; governments became pandemic explainers (Luzón 2022) providing the public with necessary information, while simultaneously using persuasive language to urge citizens to act against the virus.

This paper represents an intercultural comparative study that explores the governmental vaccine advertising campaigns that were authorised by and in two English-speaking and two German-speaking countries, namely Australia, Britain, Austria, and Germany, within the context of the global SARS-Cov2 pandemic. The data set in question comprises 40 vaccination posters issued by the respective governments between January 2021 and July 2022, all of which were displayed in public spaces. In terms of methodology, this cross-linguistic, intercultural study combines methods of multimodal analysis with critical discourse analysis (CDA). The major findings of this study highlight the various subversive elements of the vaccination campaigns; for example, how in the Australian campaign the visual mode of the poster softens its original military edge by revealing a play on words through the homonymy of the word *arm*, or exclusionary language is juxtaposed with a visual representation of community in the case of the sample of Austrian posters analysed. The study thus explores how these ambivalences are linked with the notions of ideology and persuasion, and how governments are using their ideological foothold to create action.

Analyzing a Creative Delivery of Covid-19 Advice: Metaphor, Multimodality, and Narrativity

Panel contribution

Prof. Ming-Yu Tseng¹

1. *National Sun Yat-sen University*

This study investigates how Covid advice is creatively delivered in a one-minute video produced by Taiwan Centers for Disease Control in February 2022. The video is atypical, and therefore, creative, in several ways. First, instead of directly telling the public what to do and what not to do, it features the story of a Taiwanese weightlifter who won an Olympic gold medal for women's weightlifting in the 2020 Olympics. The video is set in a stadium, and the activity shown is mainly the athlete's weightlifting practices, including her holding and lifting barbells. Second, the video uses multimodal metaphors throughout. For example, in the video the speaker—the featured weightlifter—applies grip powder to her hands and then chaps it off, a scene immediately followed by a quick image of her handwashing, with the words on the screen meaning “Wash your hands frequently to keep away from the virus”. This is a multimodal metaphor. Third, in the video the talk appears to concern the speaker's experience of weightlifting, and the pandemic is treated like a source domain because the speaker says “Faced with the barbell, don't utilize it by playing hardball, but find the right way to face it, just like beating the pandemic”. The verbalized simile is followed by the multimodal metaphors that suggest Covid advice. For example, toward the end of the video, the speaker holds and lifts up a weight, and this image is followed by a close-up in which her hands hold up a facemask featuring an Olympic logo, with the utterance of the Chinese four-character idiom *jǔ zhòng ruò qīng*, which means “Lifting something heavy as if it's light”. This is another multimodal metaphor that assists both the narrative of the weightlifter's experience and the delivery of the suggestion of facemask-wearing. Traditionally, a narrative of a past recovery experience can serve as offering personal health advice, and a clear, non-metaphorical instruction is favored over metaphor when advice is delivered. However, in the video under analysis, it uses a sports narrative and weightlifting metaphors for the delivery of Covid advice and speaks of the pandemic as if it is a source domain. By leaving the source and target domains somewhat unsettled and slippery, the multimodal narrative concerning the experience of an Olympic gold medalist generates a creative delivery of Covid advice in a less didactic manner, and, at the same time, it evokes a sense of cheerfulness and a sense of hope to fight the pandemic. The analysis of the video shows that the creativity in the delivery of Covid advice lies not only in language but also in the generation of affect and in the coupling of metaphor, narrativity, and multimodality.

Covid-19: an (a)typical discourse for an (in)visible enemy

Panel contribution

Prof. Roberta Giordano¹

1. *Università degli studi della Tuscia*

Since the onset of COVID-19 pandemic and its consequent health emergency, a relevant research effort have devoted to the topic of its discursive representation, which basically consisted in a narration, description and explanation of an event as novel, unexpected and dramatic as a pandemic can be. Through the construction of a small corpus of authentic spanish and italian journalistic and political texts, the present work brings this research stream forward by investigating the persuasive force of one of the key elements of the aforementioned representation: the metaphor, with which (a)typical expressions taken from the field of war or statistics have become typical of the journalistic and political language. Now the enemy coincides with whom violates the rules of social distancing, and with whom breaks safety protocols.

The discourse on Covid permitted to experiment a great creativity through different mechanisms: “creative realizations (verbal and visual) of wide-scope mappings; the use of *one-off* source domains, shifts in the valence of the source domain evoked, and the exploitation of source domains that are specific to particular discourse communities”. (Pérez Sobrino 2022: 127). This creative trend enhanced the multidimensional dimension of the metaphorical phenomenon (conceptual, discursive and social). With respect to this relationship, starting from the assumption that written or oral language is only one of the many means available for representing and conveying meaning, Multimodal Discourse Analysis constitutes an useful research perspective just for grasping the interconnection between the thought of a given community and its semiotic manifestations. In a Multimodal approach, in effect: “all modes are framed as one field, as one domain. Jointly they are treated as one connected cultural resource for (representation as) meaning-making by members of a social group at a particular moment. All are seen as equal, potentially, in their capacity to contribute meaning to a complex semiotic entity, a text, and each is treated as distinct in its material potential and social shaping”. Multimodal metaphors in environmental awareness campaigns: pre-pandemic narratives of crisis and hope

Panel contribution

Prof. Laura Downing¹

1. Universidad Autonoma de Madrid

This paper presents a study of the multimodal metaphors and metonymies used in a corpus of non-commercial advertisements of charities and Non-governmental Organizations (NGOs) concerned with raising awareness towards the impact of global warming, climate change and pollution, and with engaging audiences in joining in environmental activism. As such, this study explores one of the topics which have been a crucial source of concern in the pre-pandemic period, the state of our environment, and the future of the planet we inhabit. It can be argued that this situation of environmental risk has led to atypical situations across the world, which over the last years has witnessed natural catastrophes such as floods and fires on unprecedented scales and the invasion of rivers and oceans of plastic objects (IPCC, 2021).

Against this background, our study of environmental awareness advertisements (2007-2020) has the aim of exploring the figurative strategies adopted by charities and NGOs in their multimodal campaigns. Multimodal and visual metaphors are powerful discursive strategies which allow communicators to frame discourse topics and make complex abstract ideas such as climate change accessible to a broad audience (Nisbet & Mooney, 2007, Koteyko and Atanasova 2016). In our paper we identify the overarching frames that are used in our corpus, in order to determine preferences in the framing of the events we study and identify possible narratives of climate change, global warming and pollution. More specifically, our study explores the extent to which the metaphoric frames provide negative or alternative perspectives on the represented events (see (Koteyko and Atanasova 2016, Flusberg et al. 2017, Pérez-Sobrino et al 2022, Semino et al. 2018). Given the crucial role of metonymy in the construal of multimodal meaning, we also explore the types of metonymies that interact with the metaphors (See Pérez-Sobrino 2016, 2017, Pérez-Sornino, Littlemore and Ford 2021). Additionally, we analyse whether the campaigns evoke positive, negative or mixed value and how such value is manifested. Finally, we explore the occurrence of hyperbole in the corpus, which is used to magnify and exaggerate metaphorical representations, creating imagined worlds where the negative effects of global warming and pollution are highlighted.

Our results shed light on the way in which the topics of climate change, global warming and pollution are conceptualised and framed by means of multimodal figurative strategies and enable us to identify possible narratives of environmental awareness campaigns. Half of the campaigns use source domains which evoke feelings of fear and danger, such as war, natural catastrophes and threats, and cause effect metonymies are frequently used to highlight the negative effects of global warming and pollution. Negative value is by far the more frequent value identified in our corpus, though positive value is used to call the audience to take action. It remains to be discussed what are the implications of this study for future discourses and perspectives on environmental awareness in our post-pandemic world.

Parent, Child, School: A Triad of Multimodal Interactions during the Covid-19 Pandemic in India

Panel contribution

Dr. Annie Koshi¹

1. *St Mary's School*

Parent, Child, School:

A Triad of Multimodal Interactions during the Covid-19 Pandemic in India

The impact of Covid-19 generated isolation on the physical, mental and socio-emotional well-being of children has been widely documented. This study considers a more complex multimodal scenario in which the child and the teacher are the main interactionists in the the pandemic perforce engendered online teaching environment. It turns out, however, that the child's parents are also significant, if often silent and invisible, third party actors in these contexts.

This paper focusses on one 5-minute video out of a large archive collected by a English-medium school in Delhi during the pandemic. It shows 7 Indian children aged between 4 to 5+ performing school-tasks at home in order to specifically analyse the role of 'parental prompts' and the orientation of the child towards the embodied and physical presence of their parents in these non-normative learning contexts. Such parental prompts are evidenced by indexical gestures, sotto voce parental instructions, repetitions of the teacher's instructions, and so forth, while the child in turn looks repeatedly at the parent, rather than at the faraway teacher for approval and guidance. It goes without saying that this looming shadow figure of a parent by their child's side would be highly atypical in a pre-or post-pandemic setting. Some related parameters monitored in this paper are the contrasts between distal and proximate interaction as well as the bilingual contrasts between the language of the home (Hindi) and that of the school (English) with the children, teacher and parents moving fluently between the languages.

In this video, all the children and the teacher are visible on-screen throughout. Thus, we can putatively compare subtle differences between a number of home environments and individual children's agency and actions simultaneously via this multimodal medium. It should also be mentioned that, as a pedagogic imperative during the years of Covid-19, parents were routinely given a timetable of activities to be performed beforehand and often required to arrange their homes to simulate a classroom setup. They had, for example, to use everyday objects or toys available at home in innovative ways to enable their children to acquire the 'socio-emotional' or 'gross motor' skills that might normally have comprised part of their usual school activities. In this particular video, on the theme of 'what I want to be', the effort that parents put into getting not just their homes ready as learning spaces but into elaborately dressing up their children as aspirational Indian heroes (from the anti-colonial freedom fighters Rani Laxmi Bai and Bhagat Singh to a present day Prime Minister) is clearly non-trivial. Parents seem unselfconsciously to be working hard to prove to themselves as well as to the 'visible' teacher and other 'invisible' parents that they form a nationalist virtual community of caring, innovative and informed parent. Finally, then, this multimodal video seems to reveal a great deal about the

formation of cultural ideologies during anxiety prone pandemic times - extending even to very young children.

“I am Sher-locked” Atypicality, Typicality and Multimodality in Indian Students’ Pandemic Narratives

Panel contribution

Prof. Rukmini Nair¹

1. *Indian Institute of Technology Delhi*

Atypicality manifests in several phenomenological ways. Changes in linguistic genre and theme, the convergence of unexpected cascades of visual images, the upending of established institutional arrangements and the occurrence of unforeseen large-scale natural events all offer up examples of the atypicality of lived experience during a ‘once in a lifetime’ global crisis like the recent pandemic.

The present research analyses the intersections of these four aspects of atypicality, namely, the linguistic, the visual, the institutional and the natural in an unusually coherent dataset that is also rich in multimodal content. This corpus consists of 14 online student magazines 15 pages or so in length and broadly reflective of the views of students aged 18-22 at a premier educational institute in India between the years 2020-2022. Curated by an editorial team about 8-10 students who, in turn, represented a cohort of 800-1000 students distributed across 14 hostels, each magazine was actually supposed to be located in the physical space of an on-campus hostel. In reality, however, these hostels were ghost-outposts during the peak of Covid-19 when many students lived away and only communicated online. As one editorial put it: “Things were difficult ... because Google meets were not as successful as night-long sessions in the hostel common room.”

In this sense, these magazines provide researchers a valuable contemporaneous account of the narratives, visual images and metaphors deployed by a large group of young technological super-achievers (often expert gamers and graphic designers as well) to understand a world where their verities of language, vision, institutional location and bodily health were simultaneously threatened. In Labovian terms, then, these magazines each comprise 14 ‘tellable’ episodes in an overall Covid-19 ‘danger-of-death’ narrative. Each has a clear ‘Abstract’, signaled by names or onomastic tropes dripping with metaphorical content: *Adventum* (Latin for ‘arrival’ – in this case, minus the possibility of departure), *Allusion*, *Aporia*, *Arcadia*, *Enigma*, *Holocene*, *Lucidity in Darkness*, *Metamorphosis*, *Renaissance*, *Reviver* (a palindrome), *Sphinx*, *The Morrigan*, *Unrewarding* (a portmanteau) and *Zoiros* (Greek for ‘vibrant’). Each also has an evident ‘Orientation’, indicating the specific context for its pandemic story; a dense set of ‘Evaluations’, comprising intense emotions such as confusion, fear, hope, panic, surprise, etc.); and, crucially - a well-defined ‘Crisis’. But what these narratives conspicuously lack are the final elements of the Labovian schema: a ‘Resolution’ and a ‘Coda’ returning narrative time to present time. Using a simple set of tools such as frequency counts, semantic cluster analysis etc., in addition to metaphor theory, this paper argues that these absent narrative elements converge towards a single, paradoxically very typical, multimodal metaphor emerging from these 150+ atypical pages of text-cum-imagery – one of being ‘locked in’ and ‘locked down’ in perpetuity, resulting in utter loneliness, loss of identity and, often, fantastical ‘magical thinking’. Captured in vivid graphics that range from their hostels covered in barbed wire to smashed clocks and corseted bodies, escaping this existential prison created by the pandemic now poses, according to these Indian young-adult narratives, a Sherlockian challenge for all humanity.

“Stuck in a scroll hole”: Metaphor scenarios of social media’s effect on mental health before and during the Covid-19 Pandemic

Panel contribution

*Ms. Jennifer Foley*¹

1. *Universidad Autonoma de Madrid*

This paper explores the use of metaphor scenarios and the evocation of mini-narratives used to conceptualize social media’s effect on mental health and well-being in the context of two atypical situations that have changed our recent lives: the Covid-19 pandemic and the effects of our constant exposure to social media. The role of social media in our lives during the Covid-19 pandemic has been controversial. On the one hand, it played a pivotal role in helping people stay connected, informed, and entertained. On the other, however, it also played a key role in the spread of misinformation, and constant exposure to social media increased anxiety in some users (Goel and Gupta 2020; Tsao et al. 2021). Indeed, 24/7 digital connectivity may come with many drawbacks (Vanden Abeele 2022). Some people feel pressure to be constantly “switched on” and that their mental health and well-being are negatively affected by social media.

This study identifies and analyses metaphor scenarios used in opinion articles from the British newspapers *The Guardian* and *The Independent*. According to Musolff (2006: 23), scenarios are source concepts organized into “mininarratives...that dominate the discourse manifestations of source domains.” The notion of metaphor scenario is used to combine the concept of metaphorical framing with key aspects of narrative, such as agency and (dis)empowerment, which are crucial in the understanding of evaluative metaphors (Semino et al. 2018). Steen et al.’s (2010) MIPVU is used to identify metaphors in two corpora – a pre-Covid corpus and a Covid corpus. Findings reveal that metaphors are used primarily to evoke narratives of disempowerment in people’s relationships with social media. While the pre-Covid corpus focuses mainly on ADDICTION scenarios and on social media applications and platforms as agents who negatively impact our mental health in subtle ways, the Covid corpus focuses on narratives of social media as causing mental health problems. Furthermore, the Covid corpus features a preoccupation with deteriorating attention spans caused by social media, but also an awareness that healthier relationships with social media can be cultivated by practicing mindfulness when using digital devices.

Catchier than COVID: An analysis of pandemic coverage by Dutch news satire show *Zondag met Lubach*

Panel contribution

Mr. Jonas Nicolai¹, Prof. Pieter Maesele¹

1. University of Antwerp

The context of the COVID-19 pandemic was a challenging time for science communication, amongst others because of an increasing political instrumentalization of scientific discourse. In such times of crisis, political comedy may take up a vital role in public debate by voicing media critique or calling out political leaders (Nitsch & Lichtenstein, 2019). One particular voice taking up this role was Dutch news satire show *Zondag met Lubach* (*ZML*). Commenting existing news media footage while woven together with the host's comedic storytelling, news satire has the potential to critique and inform audiences simultaneously (Brewer & McKnight, 2017). The aim of this study is to investigate how *ZML* covered the COVID-19 pandemic by tracing the show's interactions with pandemic-related issues and actors, and evaluate its role in terms of critique and engagement with scientific discourse. To do so, we draw on the textual analysis of 30 COVID-19-related segments from March 2020 until April, 2021. Our analytical framework integrates two distinct theoretical bodies. The first places *ZML* within the context of the ongoing COVID-19 "infodemic" which refers to the general overabundance of information and the detrimental effects of the spread of misinformation (Simon & Camargo, 2021). Implicit to this notion of an infodemic is the agreement that the successful management of a global health crisis depends upon a largely unimpeded flow of clear and truthful information (McKay & Tenove, 2021). Such an idea reiterates assumptions of a deliberative view of democracy. We incorporate literature on deliberative democracy to interpret the dimensions of critique in *ZML* in as far as they discuss the disruption of COVID-19-related flows of information. A second body of literature concerns the social roles television news satire may take up. Here, we incorporate literature on science communication as well as humor to assess the way in which *ZML* engages with scientific discourse within and beyond its satirical critique. Our findings show how *ZML* critiqued news media and politicians of the incumbent Rutte cabinet for contributing to the infodemic during the COVID-19 pandemic, and ousted right-wing populist parties as illegitimate for their anti-democratic rhetoric: By comedically interrogating policy makers' statements and actions, *ZML* diagnosed as well as countered the "top-down misinformation" from politicians and other prominent social actors, which has been found to account for 20% of the general infodemic flow (Nielsen et al., 2020). In answer to its diagnosis of a distorted informational context, *ZML* also sidestepped its conventional satirical function to take up an informational role for its audiences by covering the pandemic measures. In doing so, it simultaneously reproduced a deliberative view of an ongoing infodemic, and promoted a mode of comedic science communication as a valid way of engaging with pandemic discourse.

From one scientist to another: A Post-Normal Science approach to scientist interactions in a citizen science project on air quality

Panel contribution

*Ms. Sofie Verkest*¹

1. Ghent University

At the height of the COVID-19 pandemic, Funtowicz and Ravetz (1993, 2020, p. 3) publish a new foreword to their nearly 30-year old- essay on Post-Normal Science (PNS) claiming that “we are now truly in a Post-Normal age”. PNS implies that the way we do science has been increasingly challenged by post-normal situations in which uncertainties are prevalent, values cannot always be distinguished from facts, stakes are high, and political decision-making is urgent (Funtowicz & Ravetz, 1993). The essay was once written as a normative piece, intended to give the field of science appropriate new problem-solving strategies, which included managing uncertainties, being transparent about values, and engaging stakeholders in an ‘extended peer community’ (Funtowicz & Ravetz, 1993) Brüggenmann et al. (2020) transformed this normative concept into an analytical framework for analyzing science communication against the backdrop of post-normal situations. In their outline of a PNS communication model, they note that new and divergent norms - such as transparency, interpretation, advocacy, and participation are emerging within the field of science communication and call for a closer inspection of how norms, roles, and practices are challenged or affirmed in PNS communication.

In this paper, I use the PNS communication lens in order to conduct a linguistic ethnographic study of a citizen science project on air quality. This project was set up by a newspaper, a university, and a government agency. In an intense year-long collaboration, they not only gathered a large amount of air quality data in Flanders but also published a series of news items on the results. I conducted fieldwork throughout this collaboration and investigated how the journalists and scientists interacted, analyzed the scientific results, and constructed news stories about those results. I focus on so-called ‘scientific committees’ in which the scientists met separately to discuss the scientific analyses and results, but also how the results would be mediated to the journalists in the project, the public at large, policymakers, and politicians. In particular, I explore how the scientists involved in the project attempt to interpret the scientific results and anticipate the interpretation of their various audiences as they construct their message. In doing so, I intend to answer the call of Brüggenmann et al. (2020) and investigate how norms, roles, and practices within the field of science and journalism are being challenged or affirmed in these meetings. Finally, I show that PNS communication can provide a useful framework to study how participation and collaboration are increasingly shaping the way science is mediated in society (Declercq et al., 2021).

Managing Fact and Uncertainty: Science Mediation during Telephone Contact Tracing in Flanders.

Panel contribution

*Dr. Sofie Van de Geuchte*¹, *Mr. Romeo De Timmerman*², *Ms. Anne-Sophie Bafort*¹,

*Prof. Mieke Vandenbroucke*¹, *Prof. Stef Slembrouck*³

1. University of Antwerp, 2. Ghent University, 3. Linguistics, Ghent University

Effective contact tracing was repeatedly noted as an essential public health tool in containing, and eventually exiting, the Covid-19 pandemic (WHO 2020). The WHO also stressed that a workforce of trained contact tracers and supervisors was crucial and that “communication about contact tracing should emphasise solidarity, reciprocity and the common good”. In this paper, we report on results from an applied project of interactional analysis which was aimed at mapping and optimising the interactional dynamics and functioning of contact tracing phone calls in Flanders. Our paper highlights those instances where the telephone contact tracers engaged with scientifically-informed pieces of information that had become publicly available in the course of the pandemic.

Between May 2020 and November 2021, contact tracing in Belgium via call centre dispatched telephone conversations formed an important large-scale, yet micro-level form of dialogic risk management with a specific topical-functional brief. Of central importance, no doubt, were the dimensions of risk management and fostering responsible behaviour (De Timmerman et al. 2023). A considerable part of the work was task-focused along the expected dimensions of registering and indexing a patient’s contacts during a critical period and instructing the caller-patient about when and how to quarantine and self-isolate. However, the telephone contact tracers also took on the role of representatives of public health policy, disseminating relevant information, while being instructed to conduct their phone calls under a brief of patient-centred care which stressed an empathetic response and a listening ear. In many instances, contact tracers attended to a patient-caller’s anxieties, worries and uncertainties and anything they would raise during the call as being of Covid-19 related interest (e.g., the current state of vaccine development, incl. whether the rapid course of action could be trusted; e.g., whether it would be risky to be vaccinated while being unaware that one is infected). Note in this respect that the Belgian telephone contact tracers were not expected to be (para)medically trained or qualified. Instead, they were recruited from an existing workforce of telephone helpline workers and new recruits from various professional backgrounds that had faced temporary unemployment during the lockdown (e.g., airline attendants, restaurant staff, actors, etc.).

Our focus in this paper will be on formulations of fact, opinion, speculation and uncertainty regarding Covid-19. In doing so, we analyse those dialogic instances where the contact tracers moved beyond their more narrowly defined brief, as they were called upon by the patient-caller to engage with especially bio-medical scientific knowledge that had become available in the public domain. In the background was a period of high public anxiety about the nature of sickness and its cure which in various ways sped up the process of scientific knowledge production, including its circulation in conventional media channels. The data base for this paper consists of roughly 170 contact tracing phone calls which were collected in one of the participating call centres over a period of roughly one year and half.

Mediating prostate cancer patient empowerment

Panel contribution

Prof. Ulrike Vogl¹, Dr. Ursula Vogl²

1. Ghent University, 2. Oncology Institute of Southern Switzerland (IOSI)

Within the field of oncology, communicating scientific results and treatment options has gained importance in the past decade. Patients have gained access to digital media that enhance their knowledge about therapeutic developments. Specifically, since the Covid-19 pandemic, online information campaigns and digital applications, e.g. apps to monitor your health, have gained importance. This paper addresses the case of the “Movember” movement, a global charity which started out in Australia in 2003 and is now active in more than twenty countries. Movember focuses on empowering men to make their health a priority. Patient empowerment has become an important concept in oncology: patient reported measurements (PREMs), enquiring about patients’ quality of life, have shown to correlate with progression-free survival and overall survival in combination with oncological treatment (Efficace, et al. 2021). The Movember movement unites specialists in global health care, renown genitourinary cancer specialists and public relations strategists. Movember uses the iconic moustache for its information campaigns and educational events, and supporters are encouraged to grow a moustache (or glue on a moustache) during the central campaign month November, under the motto “Whatever you grow will save a bro”. In our analysis, we focus on the Movember campaign’s website (<http://movember.com>), and its strategy to mediate prevention and treatment options for prostate cancer. We take both verbal and visual code into account, making use of critical discourse analysis (Kress 2010; Jancsary et al 2016) to uncover possible shifts in the conceptualization of the patient (as more “empowered”). We also critically examine how the scientific enterprise of optimizing treatment options is articulated: who has the authority, whose voice is being heard? In addition to our multimodal analysis of the global Movember campaign’s website, we examine how the central goal of Movember, patient empowerment, is enacted in a local event targeting prostate cancer in the Swiss canton of Ticino, in November 2022, featuring online expert presentations and an offline educational event for (prospective) patients and their relatives. The main objective of this paper is to assess how the Movember campaign reflects, masks and/or constitutes the social reality of men’s health from a global and local perspective.

Mediating Scientific Thinking and Engineering Judgement (STEJ) in classroom contexts

Panel contribution

Prof. Colleen Cotter¹, Ms. Agne Kocnevaite¹, Dr. Gabriel Cavalli¹, Dr. Janet DeWilde¹

1. Queen Mary University of London

Scientific thinking and engineering judgment (STEJ) are skills necessary to perform effectively as a scientist and an engineer. STEJ is expected from students and included in learning objectives (Bao et al 2009; MacRobert 2018); however, little empirical investigation has been undertaken into the practice of such skills (Weedon 2019), especially through collaboration with experts from non-STEM disciplines (Klassen et al. 2022). Explicit understanding of STEJ can help experts (on both subject knowledge and skills/communication) articulate knowledge more effectively to students, which can improve the quality of teaching and learning and potentially lead to greater inclusion within STEM – whether this is in person, online, or in a hybrid context.

We undertook ethnographic research through Queen Mary Engineering School (QMES) – a joint educational institute based in China between Queen Mary University of London and Northwestern Polytechnical University. QMES has created a learning community where language and subject lecturers collaborate to improve communication and skills support across the programme while encouraging students to actively reflect on and think explicitly about their professional and academic practice. The research uses frameworks and methods deployed in a range of sociocultural, ethnographic (Bernard 2018), and community of practice (Wenger 1998) linguistic paradigms to contribute rich data to create a more comprehensive understanding of developing STEJ. Evidence thus far – through quantitative analysis of student’s final outcomes as well as pragmatic evaluation of comments in individual student interviews – makes clear the key role of interpersonal mediation between the learner and the expert, and highlights the challenges to realize that, whether in the classroom, the newsroom, or the wider world.

Parascientific genres in the times of Covid-19: Engaging an online audience throughout multimodality

Panel contribution

*Dr. Miguel Ruiz-Garrido*¹, *Dr. Juan Carlos Palmer Silveira*¹

1. Universitat Jaume I

Online genres for science communication are the result of the democratization of science; an attempt to share research with the widest and most diversified audience (Luzón & Pérez-Llantada, 2019). Sometimes called parascientific genres (Kelly and Miller, 2016), they offer the gist of scientific research, and scholars try to make it simple enough to be understood by laypersons, aiming to overcome the image of difficulty that is often inherent to science.

COVID-19 has affected how science is communicated, forcing scholars to think of new ways to do so, reformulating and recontextualizing how it can be presented to the public. A case in point can be the international scientific talks competition called FameLab that, apart from bringing science closer to the general public, has adapted its original format to this new reality. FameLab talks are 3-minute presentations in English (for the international competition) on a scientific and/or technological subject, performed in front of an audience, but since 2020, due to the pandemics, they are performed online.

Content, clarity and charisma are the three elements evaluated by judges in this competition. It is charisma that allows speakers to engage the audience and command attention. Nevertheless, if the public is not present, that level of engagement has to be modified. To engage the audience, the role of multimodality, along with the linguistic interpersonal and rhetorical choices, need to be analyzed.

Our aim is to show the different resources and strategies used by the speakers to engage online viewers from a multimodal perspective. We have analyzed the 20 talks from the 2020 and 2021 FameLab finals, since they were not delivered as live events, but as pre-recorded ones. We have relied on previous research about a similar genre (3 minute-thesis) and its rhetorical strategies (Hyland and Zhou, 2021; Carter-Thomas and Rowley-Jolivet, 2020). Results show that some features also appear in our dataset, but a few multimodal characteristics are new for these short online presentations.

As ESP practitioners and EMI instructors, our research can bring new rhetorical tools to be applied in our own teaching, but also in the teaching of different scientific subjects that can be used for science dissemination.

The mediating role of science teachers in the dissemination of scientific knowledge

Panel contribution

Mr. Seppe Goddaert¹

1. Ghent University

While education is hardly a novel way of communicating scientific knowledge, both educators and scholars aim to create innovative pedagogical ways to increase scientific literacy, most notably by the use of so-called Socio-Scientific Issues (Levy et al., 2021; McNeill & Vaughn, 2012; Rudsberg et al., 2013). SSIs are presented to learners in order for them to make sense of scientific uncertainty, moral issues and personal agency within complex (socio-political) environments (Zeidler et al., 2005; Zeidler & Nichols, 2009). In terms of didactics, SSIs heavily favor interactional methods of knowledge construction, such as dialogue, debate and discussion, all of which allow for critical epistemologies to emerge (Dewey, 1910; Rudsberg et al., 2013; Simonneaux & Simonneaux, 2012).

This research focuses on the case of a Brussels-based project on air quality, with an educational branch focused on teacher training. An educational non-profit organization was asked to design teaching materials and seminars on the science of air quality. These seminars, organized by teacher trainers, were meant for in-service teachers who wanted to use the teaching materials in their classroom. The linguistic-ethnographic data for this research consists of two recorded interviews, seven recorded teaching seminars and fieldnotes.

The main focus of this research is twofold: (1) we aim to find out how these teacher trainers reflect on the scientific pedagogy on SSIs they present to teachers and (2) we examine what their actual teaching practice then is, in relation to their reflections. In essence, what do they consider the base principles of their SSI education and how are these base principles reflected in their own teaching practice?

The results of this research show that the teacher trainers construct an explicitly political and moral framework for their education as they claim successful scientific education implies emancipation and, by extension, a redistribution of power within society. In their education, they motivate teachers to take up argumentative and interactional roles in the classroom to provoke agency in learners.

The Misplaced Pragmatics of Official U.S. COVID-19 Mediatized Health Communication

Panel contribution

Prof. Charles Briggs¹

1. University of California, Berkeley

This paper explores the misplaced pragmatics of the mediatization of health communication during the U.S. COVID-19 pandemic. As with H1N1 in 2009, health authorities attempted to institute what I call the pandemic-discursive-industrial-complex. It relies on a set of discourse practices developed by the U.S. Centers for Disease Control and Prevention (CDC) for public health and security officials, politicians scientists, and journalists for mediatizing pandemic discourse. Its ideological infrastructure relies on biomedical authority communicability (Briggs and Hallin 2016), which projects pandemic discourse as a linear, hierarchically-ordered process: health professionals produce knowledge, public health officials, journalists, and physicians translate it into lay language, and members of “the public” become passive receivers who replicate biomedical interpretations and enact prescribed “behaviors.” The CDC model casts alternative discourses as “threats” to public health.

After announcing the pandemic, the World Health Organization (WHO) declared an associated “infodemic,” defined as “an overabundance of information, both online and offline” that includes “mis- and disinformation” that “disseminate wrong information to undermine the public health response and advance alternative agendas of groups or individuals” (2020). WHO created a “COVID-19 Mythbusters” website that features binary contrasts between “myths,” tiny bits of referential content that misrepresent COVID-19, with equally succinct biomedical “facts.”

Like much public-health discourse, Mythbusters” fundamentally misconstrued the pragmatics of COVID-19 discourse in two ways. First, COVID-19 scientific and medical knowledge was complex and uncertain. Its linear projections were often disrupted as new variants appeared and previous public statements proved inaccurate. Second, asking laypersons to develop creative practices for caring for themselves and family members (except in serious cases) and passively assimilate shifting biomedical knowledge produced a contradiction that led many to reject the injunction against lay contributions to producing knowledge about COVID-19. Lay discourses ranged widely from forwarding and discussing social media posts and YouTube videos by dissident health professionals to internet and social media networks formed by persons trying to make sense of “long COVID” symptoms that did not match clinical descriptions. Attempts by journalists and health professionals to fit this diversity of discourse into the same metapragmatic box—as anti-science, anti-medicine conspiracy theories—prompted even many U.S. residents who had initially accepted pandemic mitigation measures to increasingly reject pandemic biocommunicability.

Negotiating boundaries of scientific and popular discourse were further complicated by health officials’ attempts to temporarily suppress an another prevalent form of U.S. health mediation, which revolves around patient-consumer communicability (Briggs and Hallin 2016). Patient consumers are projected as self-interested, agentive, active seekers of knowledge relevant to their “risk factors” and health aspirations, a more desirable lay subject position than afforded by biomedical authority communicability. These two forms had become racialized: Whites were frequently projected as expert patient-consumers and racialized persons as defective receivers of biomedical discourse. In the politics of race associated with the Trump presidency, efforts to withdraw the social capital associated with patient-consumer communicability augmented rejection by persons who embraced White supremacist ideologies of the pandemic-discursive-industrial-complex and increased their investment in discourses that officials framed as “misinformation” and “conspiracy theories.”

Building empathy remotely: A strategic-style shift for creating closeness in online dialogues in Japanese

Panel contribution

Prof. Etsuko Yoshida¹

1. *The University of Shiga Prefecture*

This study examines the alternation of honorifics, i.e., the exchange of Japanese polite *masu/desu* forms and plain forms as resources for the speakers' desired social identities. It focuses on how strategic ways of style-shifting are subtly but dynamically co-constructed to create closeness among unfamiliar pairs of students in remote communication. As several studies of style shifts based on naturally occurring Japanese data have discovered, the practice of using honorifics is complex. The mechanism of style-shifting, in particular, is not straightforward, given the association of formal context with honorifics and that of informal context with non-honorifics (e.g., Cook 1996, 2008; Geyer 2008; Ikuta 2008; Jones and Ono 2008). Remarkably, style-shifting may be “a way to convey how closely connect different parts of a conversation” in negotiating the psychological distance between the participants (Jones and Ono 2008). Cook (2008) also noted that “a hierarchical relationship is co-constructed” by the exchanges between the student's use of *masu* form and the professor's use of plain form under the mutual consciousness of their social ranks.

The data for the analysis comprises dialogues by seven pairs of Japanese students (mixed male–female pairs, ranging from 18 to 26 years of age) who met online for a 20-minute talk, having never met previously, to share any experience of the COVID-19 pandemic that had affected their everyday lives. Our expectation is that the qualitative analysis will reveal that the alternation between *desu/masu* polite forms and their non-honorific counterparts can foreground a hierarchical relationship, especially when the two parties are conscious of their age difference or their relative social positions in a formal setting such as a Zoom meeting.

When the use of these two forms is observed, it is found that the plain forms do not occur frequently, but they do arise in a special interactive context. That is, the plain forms of speech style tend to emerge in the episodic small narratives in which a speaker tells a monologic story with a somewhat personal tone within the sequence of the polite forms as default.

Although all seven pairs continue to use polite forms even after realizing that they are nearly in the same school year, some parties, for instance, temporarily narrate their own episodes using plain forms, while others revert to *desu/masu* forms showing their listenership for the “recipient design.”

In conclusion, this mixed-style shift can create a sense of closeness between the parties in building empathy from a relational perspective..

The practice of this style-mixing as described above can be further investigated as a process of stance-taking in that the shift from polite form to plain form can be treated as an affective stance to the target objects co-constructed with the polite expressions, including fragments and reactive tokens (Clancy et al.) with particles (*ka/ne/yo/yone*).

Content Analysis of Narratives on COVID-19 by the Japanese Digital Native Generation Using Topic Modeling

Panel contribution

*Dr. Ryoga Ishihara*¹

1. Ryukoku University

Personal narratives of the unprecedented experience of COVID-19 provide various lessons learned for future pandemic responses. Nakahara and Nagaoka (2009) suggested that “common wisdom” of the pandemic could be generated through sharing personal narratives within the community, though learning embedded in verbalized experience is rarely replicable in other crises due to its high peculiarity. Accordingly, it is indeed essential to utilize narratives on the COVID-19 catastrophe in order to prepare the community for the next pandemic.

The purpose of this study is to quantitatively investigate the ways in which the Japanese digital native generation narrates the COVID-19 experience and the trends in their statements by employing text mining techniques. Data for this research is conversation collected from 30 pairs of Japanese youth on their first meeting. Participants were asked to talk for 20 minutes about their experiences of COVID-19. The conversation was analyzed in its totality (number of sentences: 4,496; the total number of words extracted: 55,357).

In this research, topic modeling was employed for analysis among other forms of text mining. Topic modeling is a method that summarizes the overall trend of a collection of textual material by first finding the topics that each sentence in the text contains and quantitatively illustrating the ways in which each sentence is generated from specific topics. To build this model, an estimated number of topics must be set in advance. Indicators used for making the estimation include Griffiths2004, Cao2009, Arun2010, and Daveaud2014, referring to Odanaka and Nakai (2019), in which the above four indicators were employed. The number of topics is considered optimum when the value is at its minimum for Cao2009 and Arun2010, and its maximum for Griffiths2014 and Daveaud2014. The number of topics for this model was set to 8, considering Cao2009 and Daveaud2014 indicated it as an optimum.

The following are interpretations of each topic based on its characteristics. Topic 1 is about vaccination. Topic 2 is about crowding. Topic 3 is about college life. Topic 4 is about friends. Topic 5 is about commuting. Topic 6 is about online classes. Topic 7 is about part-time jobs. Topic 8 is related to general experiences of COVID-19.

In conclusion, based on 30 pairs of youth conversations, this study reveals the trends in narratives of the COVID-19 experience by the Japanese digital native generation, which include vaccines, crowding, college life, friends, commuting, online classes, part-time jobs, and general experiences of COVID-19.

Contested Experience: Building the COVID Long-hauler Identity

Panel contribution

Ms. Brienna Johnson-Morris¹

1. University of California, Los Angeles

This paper examines how those with Long-COVID discursively carve out space for them and other COVID survivors to validate their experiences. Previous scholarship on disability activism, advocacy, and identity formation has shown that stigma and negative identity formation have been defining aspects of disability narratives. The COVID-19 Pandemic has created a number of new challenges, one of these emerging challenges relates to those who do not fully recover from being ill who are known as COVID long-haulers. The debilitating effects of Long-COVID affect the daily lives of people and prevent them from doing many of the things they were able to pre-COVID. Living with Long-COVID poses a personal and social challenge due to health changes but also social perceptions of COVID. As a contested experience, those with Long-COVID have to fight to be recognized as disabled. To combat invalidation long-haulers use discursive and semiotic practices to reify the idea of COVID being a disabling event. Social media has been an important site of discourse and has allowed for the development of support and advocacy groups to connect long-haulers globally. Finding community as a disabled person is complicated by social ideas of disability, but online spaces have allowed for further development of widespread disability discourse and culture. This paper explores identity formation in long-haulers by looking at online data and speaking directly with long-haulers. Using the relationality principle of identity, I outline the ways COVID long-haulers are negotiating their disability identity.

Digital natives' online first meeting discourse about COVID-19 Disaster: The boundaries between exclusion and empathy in the narratives

Panel contribution

Prof. Kaori Hata¹

1. Osaka University

Since the early 2020, the COVID-19 pandemic forced us to change our communication style drastically. After some blank for several months, most of us started to use online tool instead of meeting face-to-face. Especially for the teenagers and early 20s: the online communication is only the opportunity to see their face each other and it turned into a sort of new-normal communication style for them. Some have spent all of their high school life with masks and had classes only online.

In this study, the narratives represented in such situation should be defined as disaster narratives (Iwasaki 1997). By applying positioning theory (Bamberg 1997, 2004) and small stories (Georgakopoulou 2007), the collected narratives have been analysed.

This study is part of the results of a project initiated by Shoichi Iwasaki (UCLA) on conversations between neo-digital natives in five countries talking about COVID-19. The Japanese team, led by Kazuyo Murata (Ryukoku University), asked the participants aged 18 to early 20s for communicating each other by online. They were analysed qualitatively in this study to examine 1) the structure of the narratives from the beginning of the conversation to the end, and 2) what features are presented in the structure.

The analysis showed that from the beginning of the conversation to the end, they show a similar structure. It can also be pointed out that in the interactions in the first face-to-face discourse, where there is little prior information, there is a tendency that participants grope for the points to exclude others as 'different' in order to emphasise that they belong to the same category, and that the line between the two is produced context-based and arbitrary. These are observed that they frequently use "our generation" which has been analysed as "we" code and "they" code. These structures of empathy and exclusion are inextricably linked.

In this presentation, some salient examples of this phenomenon will be illustrated and suggestions for coexistence with the 'different' will be proposed.

How the Pandemic Divides Us: Analysis of Pandemic Narratives from the Japanese Generation Z

Panel contribution

Dr. Kazuyo Murata¹

1. Ryukoku University

The COVID-19 pandemic is a massive public health and economic crisis that has extensively reshaped the ways in which we see ourselves and others. As invisible social divisions polarized by the pandemic are observed worldwide in questionnaires and other quantitative surveys, it becomes critical to disclose what kind of social divisions they are, and in which ways they are being narrated. The purpose of this study is to qualitatively examine the Japanese Generation Z's narratives about the Covid-19 pandemic and discern the ways in which various types of social divisions are being narrated.

The data for this study is taken from a narrative data corpus which consists of thirty dyadic initial interactions in Japanese collected in 2021. The participants were between the age of 18 and the late 20s. They were asked to discuss their experiences during the COVID-19 pandemic on their first meetings. Audio and video recordings of their dialogues were captured over Zoom.

This study employs the analytical framework of interactional sociolinguistics (Holmes, 2008). The notion of "identity" referred to in this study is conceptualized not as a fixed attribute but as what is actively and discursively performed and carried out in social contexts (Marra and Angouri, 2011). This conscious and performative effort of identity is realized as "social positioning of self and other" by individuals and groupings of people as they express perceived similarities and differences with others (De Fina et al. 2006).

The result shows that various social divisions are constructed discursively and collaboratively between the participants. These social divisions are being experienced from the perspective of Japanese Generation Z, which include coronavirus and the divide between young and elderly, rural and urban, Asian and western nations, high and low levels of coronavirus awareness, those who go out and those who stay home, vaccine proponents and opponents, high and low-income occupations, etc. The narratives in the data set suggest the ways in which youth in Japan experience and struggle with these invisible social divisions in the quotidian.

Negotiating commonalities on COVID-19 experiences: An analysis of troubles-telling between unacquainted interactants

Panel contribution

*Ms. Satsuki Iseki*¹

1. The University of Tokyo

The unprecedented situation of COVID-19 provided an unusual shared experience, even to those who were formerly unacquainted. Generally, formerly unacquainted interactants do not share any personal common ground, or self-awareness of each other's personal information, and it needs to be justified in the interaction by pointing to shared bases (Clark, 1996). This lack of common ground could be an interactional obstruction when a participant reports their personal experience, since the recipients may face difficulties in displaying affiliation due to the lack of experience, epistemic knowledge, or subjective resources (Heritage, 2011). This study aims to elucidate how this difficulty may be resolved in troubles-telling between formerly unacquainted participants. It will also show how these participants establish common ground and thereby solidify their social and interpersonal bonds through this activity.

The data for this study is taken from a conversation data corpus which consists of thirty dyadic initial interactions in Japanese. The participants were asked to talk about their experience with COVID-19 for twenty minutes. Sixteen instances of troubles-telling found in this corpus were analyzed with the methodology of Conversation Analysis.

In all of the collected instances, the story recipient responded with a display of some kind of affiliative stance to the other participant's troubles-talk. In the subsequent procedure to arrive at a mutually agreed closing of the telling, participants collectively engage in the negotiation of the commonalities and the uniqueness of the reported experience. Two broad types of the sequential organization according to the characteristics of recipient affiliation were identified; a) the story recipient claims their independent access to the told experience which is followed by a co-telling sequence of the shared experience, and b) the story recipient displays an affiliative understanding towards the telling without claiming their independent access to the told event, which is then followed by a complementary sequence to explore the possible commonalities between the interactants. In instances of type (a), the recipient straightforwardly orients to the commonalities of their experiences which is approved by the teller. In instances of type (b), on the other hand, the story recipient respects the uniqueness of the teller's experience by being affiliative but not presenting themselves in the same position as the teller. This response in type (b) is treated as an interactional problem or a minor disagreement, which makes some remedial work relevant.

As the unacquainted interactants know very little about each other, they exploit the troubles-telling activity to establish common ground and to solidify their social and interpersonal bond by turning "how *I* experienced COVID-19" into "how *we* experienced COVID-19." It is the common ground from which they derive the basis of "our" experience, and to which "our" experience contributes in establishing.

Laughing off Troubles: Managing Social Distance Through Laughter on Delicate Matters in Social Interaction

Panel contribution

*Ms. Yi Ren*¹, *Dr. Yan Zhou*², *Ms. Ruyu Yang*¹, *Ms. Dayoung Jeong*¹, *Ms. Yukun Li*³

1. UCLA, 2. Northwestern University, 3. The University of Tokyo

Laughter has been found to mitigate face-threatening actions and maximize affiliation in delicate moments of conversation by framing them as “unserious” (Glenn & Holt, 2013). While previous research either focuses on ordinary conversations among family and friends or institutional talk with an unequal social status (Glenn, 2013; Jacknick, 2013; Ticca, 2013), laughter in delicate talk among unacquainted persons with an equal social status, which is a common scenario in social interaction, remains underdiscussed.

Drawing on research methods in conversation analysis and interactional linguistics, the present study investigates laughter in a specific type of delicate moments in conversations when speakers display a negative affective stance towards a personal experience, which put alignment and affiliation of the interlocutors particularly at stake. Specifically, this study seeks to examine the interactional functions of post-completion laughter at the initiating position of such delicate moments and their (dis)preferred responses. Our dataset contains 12 hours of naturally occurring dyadic Zoom conversations on COVID-19 experiences between unacquainted Mandarin native speakers.

A close examination of the data has yielded two initial findings. First of all, laughter produced by the current speaker in post-completion position serves as a powerful tool to manage social distance with unacquainted interlocutors. Laughter enables the speaker to frame their negative emotions as unserious and mark their distant relationship to the interlocutor. Second, we found that recipients of laughter in this environment tend to reciprocate laughter or smile, which shows a congruent stance on the distant social relationship while displaying alignment. In the following example, A complains about not being able to explore his city due to the pandemic. His laughter in the turn-final position frames the complaint as unserious and indicates his distant relationship with the recipient. B starts his response with laughter, which aligns with A’s laughter and shows his congruent stance regarding their relationship.

(1) 01 A: ranhou suoyi erling nian zhe yi nian
 then so twenty-twenty year this one year
 wo jibenshang dou meizenme chumen
 1SG basically entirely barely go.out
 ‘Then, so, during 2020, I basically didn’t go out the entire year.’

(0.51)

→ LA zhe hao difang ye meizenme wan hehehe.
 LA this good place also barely play hehehe
 ‘LA is such a good place, but I barely had fun here hehehe.’

02 → B: hehehe

keyi.
 good
 ‘Good/ (you) can.’

(0.39)

e: you- you de shi jihui.
 um have have GEN COP opportunity
 ‘Um, there- there will be plenty of opportunities.’

This study of laughter in delicate talk between unacquainted speakers contributes to the research on laughter in multiple aspects. First, our findings show that laughter might be a universal device to navigate delicate actions regardless of social relationships. Second, the frequencies of certain types of laughter and their interactional environments vary based on the social distance and power dynamics between the speakers. Our findings based on Mandarin conversations also contribute to the understanding of laughter in delicate talk across different languages and cultures.

Laughter and Affective Common Ground: How to get acquainted with a stranger in Covid-19 conversations in Thai

Panel contribution

*Dr. Yingyot Kanchina*¹, *Dr. Ratchadaporn Phonyarit*², *Prof. Shoichi Iwasaki*³

1. Mahidol University, 2. Walailak University, 3. UCLA

Using ten Thai conversations collected under the “Multilingual Covid-19 Conversation” project, this paper examines how laughter is used when two formerly unacquainted speakers interact with each other.

We employ the notion of ‘mutual common ground’ in this study, defined as ‘the sum of (interlocutors’) mutual knowledge, mutual beliefs, and mutual suppositions at the moment (H.H. Clark: 1996b: 327). Unacquainted speakers by definition do not share any ‘personal common ground,’ but they understand they share ‘communal common ground’ as soon as they recognize they belong to the same social, professional, linguistic or other group. Although the focus of Clark’s ‘mutual common ground’ is epistemic in nature, we will show that a different type of common ground called ‘affective common ground’ plays a crucial role for carrying out an engaged conversation (e.g., Enfield 2013). While epistemic common ground is based on the shared knowledge, affective common ground is based on shared interpretation of, or stance towards, such knowledge. Participants form emotional affiliation when they establish affective common ground.

While epistemic common ground knowledge such as “Fah Talai Jone,” the name of popular herbal medicine believed to be effective against Covid-19, can often be assumed without hesitation among the active members of the Thai speaking community, the affective common ground needs to be created locally between the participants.

Laughter acknowledges discovery of such affective common ground. There are three distinct types of affective common ground discovery we have identified so far. (Note: In the examples below, the Thai script is omitted; @ represents one beat of laughter token; <@ @> means laughter is added over words.)

(1) Affective common ground can be created when speakers recognize they hold a similar stance towards a stance object (Du Bois, 2007). After Speaker A said “Talking about vaccines makes me angry,” Speaker B responded with an utterance followed by laughter, ‘Umm, angry. Angry every time @@’.

(2) Affective common ground can also be created when speakers realize they belong to a common community with like-minded participants. One speaker compared her pre-Covid, busy morning ritual before going to work with her easy preparation during the Covid-period (C: Taking a shower and doing your hair, setting your hair up nicely, and now we have (online) apps that like (make) us look beautiful. @@@. D: Right @@@.) In this case, the two participants who had discovered that they belong to a community of working women assume they share some affective common ground.

(3) Another environment is when participants accidentally discover a shared object during a conversation. Speaker E suspected that Speaker F knew her friend. After F confirmed this, E uttered a turn with laughter (<@She is my friend@>.’).

As these examples above show, affective common ground is built upon shared epistemic common ground, and laughter indexes the existence of the former. While it may be possible to work only on the epistemic common ground by confirming each other’s knowledge (as in Clark’s experiments), participants in a naturalistic setting attempt to achieve affective common ground as laughter indicates.

Laughter and quotation of thought in Japanese conversation

Panel contribution

*Prof. Tomoko Endo*¹, *Ms. Satsuki Iseki*¹, *Prof. Shoichi Iwasaki*²

1. The University of Tokyo, 2. UCLA

Laughter has been the target of analysis since the very beginning of conversation analysis (Jefferson 1979, 1984, 1985). Recent studies of laughter have touched upon various aspects including the phonetic variations, positions in turn, and identity established by laughter (Glenn and Holt 2013). This study adopts the methodology of Interactional Linguistics and aims to further deepen the understanding of the functions of laughter in conversation, with a special focus on the syntactic structure of quotation of thought in Japanese. The data for this study consist of eight conversations taken from the Multilingual COVID-19 Conversation Corpus. For each conversation, two unacquainted participants talked with each other about their COVID-19 experience for 20 minutes on Zoom. Speakers often used the ‘*omou* (think) construction’ when reporting their thoughts. This construction consists of the reported thought with a quotative particle (QT), *to* or *tte*, and the cognition quoting verb *omou*. Unlike *I think* in English, which can be placed either before or after the reported thought, *omou* invariably follows the reported thought, taking the following format:

[Reported Thought - QT] + [Quoting Expression (*omou*)]

Laughter can occur either within the reported thought as in (1) or within the quoting expression as in (2). [Note: (h) indicates an interspersed laugh token; <@ @> indicates an utterance said with overlaid laughter.]

- (1) [nanka mukatsu(h)ku(h) na tte] [omoinagara]

somehow get.upset PP QT think.while

‘(I) thought [that it’s **upsetting** somehow].’

- (2) [sore to nani ga chigaun daroo na tte] [mata @< omoi @> nagara]

that with what NOM different EVI PP QT also think,while

‘[(I) also **thought (=wondered)**] how it is different from that,’

The implication of laughter in the two cases is different. We first note that the types of information expressed in the reported thought are different between the patterns represented by (1) and (2). When the reported thought appears with laughter as in (1), it tends to present the speaker’s evaluation/stance towards some fact. The speaker of (1), for example, is expressing his frustration towards restrictions imposed by the pandemic policies. Predicates appearing in pattern (1) include adjectives such as ‘difficult, not necessary, easy to live, rough, the best.’ Expressing one’s evaluation needs to be modulated in a conversation with an unacquainted partner, and laughter assumes such a role. In studies on laughter in troubles-talk in English conversation, speakers often use laughter to avoid the implication that they are in a pitiful situation. Laughter used in patterns like (1) eliminates the unnecessary implication associated with the speaker’s personal evaluation more generally.

When laughter appears with the quoting expression, *omou* ‘think’ as in pattern (2), the reported thought tends not to be a personal evaluation, but presenting a fact (e.g. ‘(COVID cases) are decreasing, you are wearing a mask, who is contracting the virus?’ etc.) In such cases, laughter mitigates the force of the quoting verb *omou*, and presents the fact as his/her hedged, personal opinion.

Laughter in opening sequences of initial conversations in English and Mandarin

Panel contribution

*Dr. Liz Carter*¹, *Dr. Yan Zhou*²

1. Vassar College, 2. Northwestern University

In initial interactions between two unacquainted speakers, interlocutors must establish common ground (Clark 1996) - including communal knowledge of cultural practices, personal information, and affective common ground driven by the affiliation imperative (Enfield 2008). In these interactions, laughter is observed to index interactional troubles as laughable, such as following extended lapses (Haul and Musgrave 2019) and in disaffiliative responses requiring remedial work (Flint et al. 2019). Drawing on English and Mandarin conversations from different regions, this study explores how cultural differences and countries of residence contribute to differences in the deployment of laughter in the opening sequences of initial conversations, where conversational norms and affective stance are unclear.

Our data consists of 90 Zoom recordings of 20-minute semi-free conversations in six different languages with the given topic of COVID-19 experiences. Participants include English native speakers based in the U.S. and Mandarin native speakers based in mainland China, the U.S., Taiwan, and Japan. Adopting an interactional linguistic approach, we examined fifteen recordings (four English, eleven Mandarin) and found noticeable differences across languages and regional subgroups regarding the sequential position of laughter and the recipient's responses.

In the English data, speakers' initial and reciprocated laughter occur in all four conversations following greetings and prior to the first questions seeking personal common ground.

(1): ECO #003 English

1 A: <okay> ((smiles))

2 hi ((raises hand to mouth))

3 A: ha[ha

4 B: [he-, hi::

5 A: umm are you at UCLA too?

6 B: N=ɔ I'm not.((Covers mouth with hand))

The Mandarin data varies regionally. U.S.-based Mandarin speakers tend to begin conversations by explicitly noting the situation's awkwardness or proposing to start the chat, and then laugh. The Japan-based Mandarin speakers, like the English speakers, share initial laughter after exchanging greetings, often while waving, demonstrating a potential influence of the L2 or the country of residence on the L1.

(2)MCO#002 (U.S.-based Mandarin)

1 A: *aiya. zhege kanbujian ziji zhende hahaha.*

Wow, not being able to see [my] self is really@@@

2 B: *haha hao qiguai haha*

((It's) really weird.

(3) MCO#010 (Japan-based Mandarin)

1 B: *Hi nihao hehehe*

Hi, hello.

2 A: *kaishi le shi ba,haha*

3 (It) has started, is it?

4 A/B *hahaha* ((joint laughter))

5 A: *nihao nihao.*

Hello hello.

Our findings on English and Mandarin data show that participants universally use laughter to establish solidarity and affective common ground in their shared stance toward the awkwardness of the situation, but do so in different ways. The regional variation within the Mandarin data shows that country of residence also impacts what speakers consider to be communal ground. Previous studies have found that language practices such as turn-taking display both universal and culturally specific features (Stivers, et al. 2010). Our study contributes to a more nuanced understanding of how laughter is used differently in initial interactions between unacquainted speakers depending on regional or linguistic background.

Smiles and Laughter with Style-shift: Mitigating Speakers' Face-Threatening Acts

Panel contribution

Mr. Yeonseob Lee¹, Mr. Hanbeom Jung¹

1. University of California, Los Angeles

This study analyzes Korean speakers' use of smiles and laughter as a device to modulate the level of politeness in conversation. While previous studies have discussed their function as a mitigator of a potentially face-threatening act (Haakana, 2001; Romaniuk, 2013; Wilkinson, 2007), the Korean data provides interesting examples of interplay between linguistic and non-linguistic modalities.

The Korean language uses intricate honorific systems and various speech levels to index speakers' awareness of politeness toward the addressees, and speakers shift their speech levels during conversation by using different verbal suffixes or sentence-enders (Brown, 2015; Kim, 2016; Koo and Rhee, to appear; Sohn, 1999; Strauss and Eun, 2005; M-J Park, 2017). However, this kind of speech level shifting, often known as style-shift, is a double-edged sword because it signals that style-shift initiator indicates his/her willingness to build closer social relationship with the conversation partners, but if the partners are not agreeable with such a move, it may threaten both the initiator and the recipients' face.

Our research shows that speakers employ smiles and laughter to alleviate such face threatening moments. We examined smiles and laughter co-occurring with style-shift in conversation between five unacquainted pairs. Participants in each dyad engaged in a 20-minute conversation, totaling 100 minutes of recorded conversation on Zoom. Since the conversation participants had never met each other before, in order to be seen as polite to their conversation partners, they tended to employ the sentence-ender *-yo*, a marker of polite speech level. However, after some time passed in the conversation, with smiles and laughter some speakers switched their speech level from polite to either intimate, plain or neutral by dropping the polite sentence-ender *-yo* (marked as \emptyset in examples below) or replacing it with intimate sentence-ender *-e*, plain or neutral sentence-ender *-(n)ta*, *-na*, *-(n)ka*, or sentence-final particle *-kwuna*.

We found that some speakers switched their speech levels while smiling or laughing especially when they reacted to their conversation partners' utterances. Notice in the following examples the null marking of politeness (\emptyset), or sentence final particle *-kwuna*: (i) when speakers showed that they completely agreed with their interlocutors (e.g., <@ **a maca- \emptyset maca- \emptyset @**> 'You're right. That's what I wanted to say. '); (ii) when speakers indicated that they just accepted new information (e.g., <£ **a kulen key iss-kwuna** £> 'Oh, I've never thought about it. '); (iii) when speakers declined their interlocutors' offer indirectly (e.g., **cikum kholona ttaymwuney- \emptyset <@ hahaha @**> '(oh yeah, but I can't.) Because, you know, we are in a pandemic...') [note : <£_£> and <@_@> indicate an utterance with smiley voice and that with laughter.]

Thus, we suggest that non-linguistic behaviors such as smiley voice and laughter are used as an interactional resource for offsetting potentially face-threatening acts caused by the linguistic markings which speakers employ to change their speech styles. This is a useful recourse that Korean speakers can use when negotiating appropriate interpersonal relationships in conversation with unacquainted conversation partners.

Using Laughter as a Stance Marker to Negotiate Group Identity

Panel contribution

*Ms. Ariel Chan*¹, *Ms. Cheer Wu*¹

1. University of California, Los Angeles

This paper addresses laughter's identity revealing function in conversations between pairs of unacquainted Cantonese speakers. Previous studies (e.g., Glenn & Holt 2013; Liebscher & Dailey-O'Cain 2013) have focused on the role of laughter in identity construction in conversations with family and friends, or professionals and clients in institutional contexts. For example, in the case of the construction of place identity, Liebscher and Dailey-O'Cain (2013) observed that solo laughter was employed to resist a membership category assigned by the other participant and indicate misalignment while shared laughter was used to construct common identity and achieve alliances. However, little is known whether laughter is used in this way, or employed at all for identity work in other contexts. To fill this gap, the current paper examines laughter used by non-acquaintances in non-institutional settings.

Drawing on conversational data collected from 10 pairs of unacquainted dyads of Cantonese native speakers from the Multilingual COVID-19 Conversation Data Analysis project, we examine how unacquainted speakers use laughter to manage affiliation and disaffiliation with each other via their assumed common ground identity. In particular, we focus on place and language identities, where the former refers to the identity related to a geographical location and the latter refers to the identity related to use of a language. In both cases, we consider not only instances that directly comment on the shared identity (e.g., *Nei5 dou1 hai6 hoeng1 gong2 jan4* "You are also a Hongkonger") but also a more subtle form of identity expression such as a mention of language practices (e.g., *Nei5 tung4 nei5 fu6 mou5 kau1 tung1 dou1 wui3 jung6 gwong2 dung1 waa6 ge3 hai6 mai3?* "You use Cantonese to communicate with your parents too, right?").

To explore the function of laughter in identity negotiation in the data, the current study focuses on the use of laughter in responding to an assumed or proposed in-group identity by another interlocutor. For example, when one speaker initiates an identity-related topic to establish common ground with another speaker, they may add laughter on their utterance (e.g., 'You are also a Hongkonger', 'as you already knew'), to signal their inclusion of the addressee as an in-group and invitation for affiliation. To show affiliation with their conversation partner, the addressee may either reciprocate the laughter with the same or upgraded intensity or respond with a verbal expression with a smiley voice. By contrast, the addressee may disaffiliate with the speaker using different epistemic downgrading strategies, including laughter with a lower intensity and no verbal elaboration, minimal response, evasion (e.g., look to the other side of the screen), or body gestures (e.g., leaning back to the chair). By disaffiliating with the speaker, the addressee negotiates the nuances or extent of the common ground shared by the assumed in-group identity or rejects the assumed in-group identity altogether. Findings of our study show that similar to other epistemic markers such as sentence final particles and classifiers, laughter can also be employed as a strategy to negotiate a stance towards participants' identity in conversation.

Chronicle of a Death Foretold: A Diachronical Study of the (Re)formulative Discourse Marker “esto” in the Course of the Twentieth Century

Panel contribution

Dr. Elena Pascual¹

1. Universitat de València

Linguistic change is dynamic and can take place in a short space of time. Owing to the proliferation and availability of oral and written corpora, the twentieth century offers a window onto diachronical changes in reformulative discourse markers that cannot be traced in other periods of history (Pons Bordería 2014; Pons & Llopis 2020). This paper analyses the rise and fall of the Spanish discourse marker (henceforth DM) “esto” in order to illustrate how the use of an oral DM evolves over the course of a single century.

The DM “esto” is a (re)formulative maker used to express hesitation. It is found at the beginning (a) or in the middle (b) of a speech act and shows the effort made by a speaker in solving communicative problems (Antos 1982, 1989; Gülisch & Kotschi 1995, 1983):

1. B.— [...] I am reading at the same time a book by... by Ismael Quiles, [a] **esto**... What is it called...? “Sartre and his existentialism” that more or less, [b] **esto**, has an introduction where the characteristics of existentialism are analysed (translated from Esgueva & Cantarero 1981: 291).

This study contrasts two micro-diachronic corpora (1980-1985 and 2010-2015) to show the evolution and loss of peninsular Spanish “esto” in everyday use and explores whether competing linguistic solutions are being adopted by language users in the twenty-first century. The function, position and frequency of “esto” are analysed in both corpora and quantitative techniques are applied to determine the decline in the frequency of this DM.

The study offers quantifiable and representative results, which can be used to trace the evolution of “esto” in contemporary peninsular Spanish. Pons (2014) suggests that a diachronic study of the twentieth century is suitable for proving the intuition of linguistic change, and this study demonstrates the validity of this assertion. Antos, G. Conversión, atenuación y refuerzo argumentativo en las enunciaci3nes reformulativas *Decí que Y (que si no X)* en el español del Río de la Plata

Panel contribution

*Dr. Maria Marta Garcia Negroni*¹, *Dr. Manuel Libenson*¹

1. Universidad de San Andrés

En esta presentaci3n, proponemos un análisis dial3gico-argumentativo de las reformulaciones introducidas por el marcador rioplatense *Decí que*. Los fragmentos (1) a (3) ejemplifican los tres valores fundamentales vehiculizados en este tipo de reformulaciones:

1. Todo ese tiempo que estuvo sobre, no la habrá pasado nada bien // Y no. La cárcel no es para cualquiera. Pero **decí que** el tipo, para esa altura, ya tenía su reputaci3n. Y un poco lo respetaban, que si no... - - (Corpus Davies)
2. Me encanta bailar, me encanta tomar. Me gusta reunirme con mis amigas. **Decí que** ahora estoy un poco grande. (Corpus Davies)
3. NORMA: ¿Sabés cuánto costó una docena de huevos hoy, sabés? //NELLY: ¿Cuánto? //NORMA: ¡Seis mil pesos! // NELLY: ¿Seis mil pesos? // NORMA: Seis mil. **Y decí que** camino las dos cuabras hasta la feria, que no soy vaga, que si no, no sé cuánto pagaríamos la docena de huevos. (CREA)

Las reformulaciones con *Decí que* materializan un determinado posicionamiento de respuesta frente a una formulaci3n previa X, propia o ajena, que retroactivamente queda vista como insuficiente (Roulet, 1987; Rossari, 1990; Pons Bordería 2013). Mostraremos que la nueva formulaci3n Y constituye un argumento relevante que, bajo la forma de una salvedad, un reparo o un comentario suplementario, obliga a releer la argumentaci3n externa (AE) (Carel y Ducrot, 2005) evocada por X como problemática y a reemplazarla por otra. Nuestro análisis revela que *Decí que Y* puede o bien suspender la AE a la derecha de X (reformulaci3n por conversi3n, cf. (1)), o bien atenuar la AE a la derecha de X (reformulaci3n por atenuaci3n, cf. (2)), o bien reforzar la AE a la izquierda de X (reformulaci3n por refuerzo, cf. (3)). Por otra parte, y tal como se observa en (1)-(3), *Decí que Y* habilita la ocurrencia de una construcci3n causal de la forma *que si no Y, X*, la que evoca un escenario contrafáctico en el que, de no haberse presentado Y, la argumentaci3n evocada por X quedaría totalmente vigente.

A la luz del enfoque dial3gico de la argumentaci3n y la polifonía (García Negroni, 2019 y García Negroni y Libenson 2022), en el que se inscribe nuestro trabajo, daremos cuenta de los diferentes posicionamientos de respuesta asociados a los tres casos ejemplificados. Para ello, caracterizaremos la relaci3n argumentativa entre dichos posicionamientos y la representaci3n de la causa dial3gica que explica y justifica las propiedades lingüístico-discursivas que manifiesta la reformulaci3n Y en cada caso.

Genre variation in reformulation: Italian marker *ovvero* ‘or’ in legal vs journalistic texts

Panel contribution

***Prof. Jacqueline Visconti*¹, *Prof. Maria Cuenca*²**

1. University of Genoa, 2. University of Valencia

Reformulation is a pragmatic function of textual re-interpretation by which a segment is presented in a different way, both formally and discursively (e.g. Rossari 1994, Cuenca & Bach 2007, Pons Bordería 2017). Although it can be seen as an equivalence operation, aimed at facilitating “the hearer’s understanding of the original” (Blakemore 1993: 107), reformulation can be strategically used to introduce the addressor’s point of view for argumentative purposes (Fløttum 1995, Mazzi 2011).

Reformulation has received attention from different perspectives (see e.g. the state of the art in Salameh 2021). However, some aspects, such as genre variation, are still understudied. In this presentation, we look into the effects of genre in the use of the Italian DM *ovvero* ‘or’ by comparing its uses in legal texts (both normative and courtroom proceedings) and in journalistic texts.

The corpora include *La Repubblica*, a large corpus of Italian newspaper text (approximately 380M tokens); the *LLI* archive of Italian legislative texts (2.5M tokens); the *ClearAct* database of Italian court proceedings (1.8M tokens). From each corpus, 200 examples from 1980 to 2000 were selected and classified according to the different types of reformulation (see, e.g., Fløttum 1995 distinction between equivalence or inclusion reformulation relations or Gülich and Kotschi 1995 distinction between paraphrastic and non-paraphrastic reformulators).

The analysis highlights the impact of variation on reformulation: whereas in newspapers (non-specialized texts) *ovvero* is frequently used as a paraphrastic reformulator, in legal texts its predominant use is that of alternative and non-paraphrastic reformulation.

We conclude that the differences in the use of *ovvero* relate to specificities of normative settings and courtroom interaction (Hansen 2008, Mazzi 2011), in contrast with a more general use deployed in newspapers.

This research focuses on reformulation with a new type of data (legal vs journalistic texts) within a language, Italian, in which, to our knowledge, reformulation has not been much investigated (see, e.g., Lumbelli & Mortara Garavelli 1999).

Performing reformulation in substandard Italian

Panel contribution

Dr. Giulio Scivoletto¹

1. Department of Humanities (University of Catania)

This study explores the topic of reformulation in the perspective of sociolinguistic variation, addressing the case of a substandard social variety of Italian, *italiano popolare* (lit. ‘popular Italian’; IP).

Italiano popolare is “a substandard social variety spoken and written by uneducated or low educated people, who use dialect as their mother tongue and as their usual means of communication” (Alfonzetti 2017: 250). It stems from the popularization of the national standard, which spread as a common language after Italy’s unification in 1861. As it is performed by uneducated people who use Italomance dialects as first language, this variety encompasses great diatopic variability (according to each geolinguistic area) but little diaphasic one (it is the formal variety in the repertoire of the individual). Compared to the standard, *italiano popolare* is characterized by simplification of structures, and by interference of the underlying Italomance dialect.

In a sociolinguistic perspective, the analysis is based on an original corpus: about two hundred texts from the postal correspondence exchanged by several members of a Sicilian family of illiterate peasants during World War I (Scivoletto 2021).

The aim of the study is to observe how users of *italiano popolare* reformulate in their texts, reflecting on how these data can contribute to a deeper understanding of reformulation. On the basis of the instances of reformulation identified in the texts, the actual forms are analysed, comparing them to those used in standard Italian (Bazzanella 1995), namely *cioè* (Dal Negro/Fiorentini 2014); *ossia* (Rossari et al. 2023), *anzi* (Visconti 2021), and *voglio dire* (Fiorentini/Sansò 2017). Moreover, it is assessed whether reformulation in *italiano popolare* is affected by orality, and to what extent it involves simplification or interference. Finally, the very function of reformulation is considered, assessing how its performance in a substandard sociolect appears to relate to contiguous discourse functions such as paraphrase and correction (Pons 2013).

Reformulation Markers in Spanish and Korean

Panel contribution

Dr. Heejung Kim¹

1. *Universidad Autonoma de Madrid*

This paper sets out to explain a corpus-driven contrastive study of Reformulation Markers (RMs) in Spanish and Korean. In order to carry out the analysis, following a line of previous research articles in Murillo (2007, 2012, 2018), the cases of RMs found in Spanish and Korean journalistic corpus were studied. The selected RMs were four items for each language: *es decir, o sea, esto es* and *a saber* (Spanish), *jeuk, got, geureonikka* and *malhajamyeon* (Korean). These items had previously been considered as RMs in the references addressed in both languages (Murillo, 2012; Portolés, 2016; Seo, 1995; Li, 2013).

Research on RMs in Korean is still in its early stages which is something that needs to be taken into consideration (Li, 2013; Kim, 2021). For this reason this paper seeks to ask whether there are any new features of reformulation and its markers in Korean in comparison to Spanish, and moreover to establish similarities and differences of reformulation and its markers observed in Spanish and Korean corpus data. These questions are approached from the perspectives of linguistic typology (Moreno Cabrera, 2021) and contrastive/intercultural rhetoric assumptions (Kaplan, 1966; Hinds, 1987; Connor, 2008; Cuenca, 2003, Murillo, 2007, 2012).

Finally, I discuss the origins and diachronic data of RMs in Korean (Yang, 2017; Seo, 2021) in comparison to those of Spanish RMs (Pons, 2013, 2017), in order to observe the relation between reformulation and other discursive functions (paraphrase, conclusion, consequence, etc.).

Reframing reformulation from negation: correlates between formal and experimental results in Peninsular Spanish.

Panel contribution

*Dr. Shima Salameh Jiménez*¹, *Dr. Adrià Llibrer*²

1. Complutense University of Madrid, 2. University of Salamanca

Recent works have established a distinction between reformulation and other closer functions, usually addressed as sub-types of reformulations (e.g., paraphrase, conclusion, summary, specification, etc.). These functions have been approached as part of a continuum in which paraphrase is placed to the left for identity ($\alpha = \beta$) and correction to the right for negation ($\sim\alpha, \beta$) (Pons, 2013). Such distinction is based on semantic-pragmatic properties (Pons, 2017). Further studies support this idea experimentally (Salameh, 2021).

Specifically, reformulation and correction overlap because of their negation nature: the notion of *distance* behind reformulation involves a contextual inferential negation between formulations (Charolles & Coltier, 1986; Roulet, 1987). In turn, *invalidation* in correction leads to a complete cancellation of the old formulation and presents the new one as the most appropriate (Gülich & Kotschi, 1987; Murillo, 2007). In Horn's terms, negation in correction is meaning-based, i.e., depends on both the propositional content and the aim of changing the discourse orientation (Ad Foolen, 1991, 222). As a result, some works tend to address them as subtypes or even identical functions (see Fuentes, 1993; Garcés, 2006, among others).

This presentation focuses on establishing boundaries between reformulation and correction by addressing their negation basis. To do so, two approaches are proposed: (i) formal and (ii) experimental. These approaches are applied (but not restricted to) Peninsular Spanish:

(i) Formal approaches define how the negation basis behind reformulation and correction is: correction builds implicatures based on negative presuppositions and metadiscursive denial. Reformulation, in turn, leads to a contextual analysis based on a propositional cancellation (Du Bois, 1974; Nolke, 1992; García Negroni, 1998). Distinguishing preposition and cancellation formally involves a distinction between both functions.

(ii) Experimental approaches build a bridge between theory, cognition and data: specifically, they contribute to determine how reformulation and correction are assimilated by naïve speakers and, specifically, how their negation basis is processed. To do so, eye-tracking techniques measuring ocular movements in online experiments have been employed (Rayner, 1998).

To sum up, formal and experimental approaches constitute new, unexplored dimensions for the analysis of reformulation and correction, with special interest on negation: on the one hand, the formal approach clarifies the relationship between negation and reformulation mechanisms through a set of propositional processes complementing the discursive analysis. On the other hand, the experimental approach supports the distinction between reformulation and correction with new data complementing theory and corpus-based studies, and provides a clearer picture on the negation basis in terms of reading times and types of ocular movements, in line with recent works (Larrivée & Lee, 2016).

TOTAL and O SEA: Viral transmission of conclusive meaning?

Panel contribution

Dr. Salvador Pons Bordería¹

1. University of Valencia

Reformulation is a discourse function (Fuchs 1994) whose limits are disputed, ranging from a narrow interpretation, where reformulation is strictly delimited (Pons Bordería 2013), to a broader interpretation, where reformulation blurs its boundaries and mixes with other functions, such as ‘concluding’, ‘summarizing’ or even ‘correcting’ (Gülitsch and Kotschi 1995). Although the theoretical question of what reformulation is has gained attention at least since (Antos 1982), the question of why reformulation markers often develop polysemies regarding conclusion or correction has hardly been addressed (Murillo 2016).

This presentation analyzes the development of conclusive meanings in the Spanish discourse markers *total* and *o sea*, and explores the possibility of meaning transfer from the first to the second. *Total* is a Spanish adjective meaning ‘whole’ and also a discourse marker meaning ‘conclusion’. This conclusion is the result of taking into account the whole of a pragmatically determined set of contextual assumptions.

The analysis of the contexts in which *total* develops its conclusive meaning shows that *o sea* could acquire this meaning through co-occurrence in the same environments. A corpus analysis is used to determine whether such transmission could have taken place.

***coof coof*: Metapragmatics and Narrative at the Intersection of 4chan's /pol/ and COVID Conspiracy**

Panel contribution

Dr. Dillon Ludemann¹

1. University of South Carolina

This paper examines the metapragmatic frameworks by which early COVID-19-pandemic discourse was framed within one of 4chan's most infamous boards, "Politically Incorrect," or /pol/ for short. This board, known for its constant circulation of far-right rhetoric, racializing and racist language, and a lauding of chaos and discursive violence, had become a nexus point for discussing COVID-19 conspiracy theories during the start, and peak of the pandemic, where users participated in a broad array of related conversations and threads. Drawing from data gathered between January and June of 2020, I highlight examples which demonstrate the mobilization of conspiracy-theory related discourse within the board. Expanding on research engaged with digital narrative analysis and media discourse, I outline the ideological and metapragmatic underpinnings of COVID-19 conspiracy theory as it emerged and was engaged with on this anonymous, lightly moderated, politically incorrect imageboard, and compare it between the arguably "lighter" contemptuous attitude of /pol/, and the "heavier" seriousness that conspiracy theory is frequently framed through. Further, I show how these users create solidarity amongst themselves first by circulating and weighing in on these shared narratives, oriented in a digital landscape of paranoia, contempt and derision for those who followed state and local mandates, and second by participating in uniquely 4chan practice of "general" threads. I will do this by connecting research and literature related to the discursive processes of conspiracy theory circulation and embodiment, and more specifically through rhetoric related to the broader reconfiguration of QAnon rhetoric and narratives. I argue, through these frameworks and examples, that the digital nature of 4chan, and the unique discursive environment of /pol/ more specifically, offers powerful insights into locating conspiracy talk, narrative, and general views online, and how potentially disparate users unite to troll, harass, and otherwise maintain a social and discursive reality on the website that has been historically described as "the place where the internet is born, and goes to die."

A “victory for white life”: Strategic mainstreaming of far-right conspiracy claims in abortion discourse

Panel contribution

Dr. Kristen Fleckenstein¹

1. Coastal Carolina University

On June 24, 2022, the United States Supreme Court (SCOTUS) released its decision in the case *Dobbs v. Jackson Women’s Health Organization*, which effectively ended federal protection for abortion rights. In the wake of this decision, far-right conspiracies regarding the “great replacement” theory – the white nationalist conspiracy theory that white populations are culturally and demographically being replaced by people of color – gained new traction and began moving from fringe to more mainstream political discourse as anti-abortion groups and politicians took on new efforts to encourage states to make abortion illegal; Illinois Representative Mary Miller, for instance, called the *Dobbs* decision a “historic victory for white life,” and while her spokesperson later issued a statement that she intended to say a “victory for a right to life,” during the speech, Miller made no attempts to initiate a repair sequence.

Previous research on the great replacement theory has found that it is a flexible political discourse, equally capable of being used by far-right and more mainstream right-wing political actors (Ekman 2022). Additionally, these kinds of far-right conspiracy theories are known to spread through intertextual and interdiscursive dimensions (Nilsson 2022; Rheindorf & Wodak 2019; Tebaldi 2020; Kosse 2022). The present study adopts these perspective and will apply corpus-assisted Critical Discourse Analysis (CDA) (Baker et al. 2008) to data collected from Twitter to examine how this ideology surfaces in anti-abortion tweets from far-right politicians in the U.S., as well as how it surfaces in far-right discourse from the general public, with a goal of examining how this conspiracy has become an increasingly mainstreamed part of abortion discourse. In addition, a separate corpus of tweets from reproductive-justice advocates will be collected and analyzed to determine how online communities discursively resist and push back against such dangerous and harmful ideologies while continuing their advocacy for the people most affected by abortion restrictions – often the very people that great replacement theory stokes fear against.

Analyzing political discourses: Argumentative strategies used by Donald Trump and Boris Johnson to structure fear-based arguments during the Covid-19 pandemic

Panel contribution

***Ms. Fatima-Zahra Aklalouch*¹, *Dr. Laure Lansari*²**

1. Université Paris Cité, 2. Université Paris Cité

In times of pandemics, leaders employ different argumentative strategies for the purpose of persuading the citizens to follow sanitary measures to fight the pandemic. Therefore, the language of fear is widely used in political discourses during sanitary crises (Plantin, 2000; Cislaru, 2012; Pennec, 2021). This study is based on the results of a prior work (Aklalouch & Lansari, 2022) in which we used the software DocuScope. The latter, which is specialized in corpus-based rhetoric analysis, was used to extract 100 fear-related occurrences from each of the political discourses of Boris Johnson and Donald Trump between September 2019 and December 2020. The words that were extracted refer explicitly to fear such as *fearful*, *afraid*, *scared*, etc. According to Plantin (2012), these words are categorized as emotive words (*termes d'émotion*). This research is now concerned with the context in which these words occur and more specifically with modal auxiliaries and periphrases (e.g. *will/be going to*), adverbs, adjectives, negation markers, etc. We will also analyze words that implicitly refer to either a positive or a negative emotion such as war, pandemic, victory, prosperity, etc., which are called *énoncés d'émotion* according to Plantin (2012). Moreover, based on prior research demonstrating that fear is linked to the epistemic stance of uncertainty, and to the related notions of unpredictability and uncontrollability, which arouse the emotion of fear, we will examine whether the language used by the two leaders includes different representations of fear (Wierzbecka, 1999; Zvolensky, Eifert, Lejuez, Hopko, & Forsyth, 2000; Scherer, 2005; Armfield, 2006). All these aspects will determine the different argumentative strategies and the different epistemic stances (e.g. certainty or uncertainty) that were chosen by the two leaders to either arouse or reject the emotion of fear. The findings will show how leaders use the language of fear to manipulate public opinion for the purpose of imposing certain regulations.

Keywords: Political discourse, Fear, Argumentation, Covid-19, Epistemic stances

Anti-vaccine activism and the pragmatics of expertise

Panel contribution

Mr. James Slotta¹

1. The University of Texas at Austin

The communication of expertise in the public sphere poses a vexing pragmatic challenge (Collins and Evans 2002; Turner 2003; Callon et al. 2011): how can expertise be effectively communicated to a public that does not have the specialist knowledge to understand and evaluate it? This pragmatic dilemma has received increasing attention in recent years thanks to the explosive growth of post-truth politics, conspiracy theories, and online misinformation, which have heightened concerns about the ability of the public to weigh expertise competently. Rather than trust the science, it appears that a sizable portion of the public is attracted more to claims that are novel (Vosoughi et al. 2018) and emotionally charged (Weeks 2015).

But it is important to note that the online world of conspiracies and misinformation is hardly devoid of experts of its own. QAnon, alt-right media, and the anti-vaccine movement among others are all characterized by a social division of knowledge that distinguishes some participants as expert sources of richer and truer insights. In this presentation, I explore one form of expertise prominent in the anti-vaccine movement that has proven particularly effective: expertise about scientists, doctors, and the process of scientific knowledge production. Many anti-vaccine experts are themselves (former) scientists and doctors, and the expertise they provide in their much-watched videos and documentaries often draws on their first hand experience to bring into question the reliability of scientific knowledge. In effect, anti-vaccine experts provide not only purportedly scientific expertise about viruses and vaccines, but “social scientific” expertise about scientists and scientific knowledge production.

As I show in this presentation, this use of a “knowledge of people” (e.g., scientists, experts) to gain “a knowledge of things” (e.g. vaccines, viruses) is hardly confined to anti-vaccine activism; it is a common way that scientists and journalists negotiate the vexed pragmatics of expertise as well (Shapin 1994). In that respect, anti-vaccine messaging more closely mirrors scientific and medical communication in the public sphere than is often appreciated.

Beauty, Bro-scientists and the end of men

Panel contribution

***Dr. Catherine Tebaldi*¹, *Dr. Scott Burnett*²**

1. University of Massachusetts, 2. university of Gothenburg

This analysis explores the pragmatics of “the end of men” - the ways in which academic registers are mobilised by far right “bro-scientists” and “raw egg nationalists” who advocate eating raw eggs or raw meat and weight lifting to become ideal white men. Particularly it looks at 4 books written by the the anonymous bro-scientist “raw egg nationalist”, and all 8 issues of his fascist bodybuilding magazine *Man’s World* as a register, part of the discursive construction of heroism and redeeming both a hard manliness and a masculine civilisation. It looks at what Gal (1993) called the “moral flavor” or how the ideological and the sensual intersect in fascist discourses; supremacist ideologies imbue everyday practices with deep meaning, while these practices provide a cluster of qualities which shape ideology. It further explores how these practices are metapragmatically regimented (Silverstein 1993) into two discourses: a science of desire which proposes white male beauty as the pinnacle of civilisation and platonic ideal, and a mythology of desire which posits male beauty as the redemptive force of the west under threat by the “soy globalists”.

Crucially, these “bro-scientists” mobilise multiple academic discourses from both biology and economics in their science of desire, to anthropology and folklore in their white male mythology. They cite James Scott on civilisation and nutrition studies from dentist turned pseudo-anthropologist Weston Price, but even invoke the concept of moral flavour when they explain the raw egg has both nutritional and symbolic value. In this presentation a close look at their use and abuse of academic registers, and the broader questions of far right alternative forms of knowledge production and circulation.

Discourses of climate-denial and capitalism at COP26: A critical ecolinguistic analysis

Panel contribution

*Ms. Kelsey Campolong*¹

1. Ulster University

As the catastrophic effects of human-propelled global warming have become more difficult to ignore, the annual United Nations Climate Change Conferences have received more attention from politicians and the concerned public. With a stated purpose of “uniting the world to tackle climate change,” the 2021 conference in Glasgow, Scotland (aka COP26) resulted in the Glasgow Climate Pact, the largest international agreement on the topic of climate change since the 2015 Paris Agreement. By the conference’s own admission, “many believed [COP26] to be the world’s best last chance to get runaway climate change under control” (ukcop26.org), largely due to scientists’ identification of ever-hastening climate “tipping points” (Lenton et al. 2019). However, despite the lofty goals of the UN’s various climate-related bodies—including the UNFCCC (which provides the framework for COPs) and the widely-lauded Intergovernmental Panel on Climate Change (IPCC)—these bureaucratic entities routinely adopt, normalize, and homogenize the fundamentally incompatible (cf. Ritchie et al. 2020; Wiedmann et al. 2020) discourses of capitalism and development economics into their own discourse surrounding climate activism (Higgs 2019; Kanerva & Krizsán 2021). This presentation explores how mandatory growth ideology, a cornerstone of Western neoliberalism, permeated the discourse of COP26, despite an increasingly widespread body of research arguing for degrowth (or a-growth) alternatives (Gumbert et al. 2022).

Adopting an ecolinguistic approach to critical discourse analysis (Stibbe 2014), I conceptualize COP26 in Glasgow as a discursive, semiotic space that ostensibly positions itself in favor of the protection of the planet, yet nevertheless uncritically adopts the language of capitalism and fossil fuel corporations (i.e. climate-denialism). By analyzing various aspects of the COP26 discursive space, including the official website, speeches, texts, and other features of the physical conference, I discuss how the UK/UN organizers allowed harmful, climate-denying discourses to undergird, and thus delegitimize, the stated goals of the conference. This includes, for example, the discursive framing of economic priorities, elements of “greenwashing” (Lamb 2008; Coppolecchia 2010; Budinsky & Bryant 2013) in the conference menu, corporate sponsorship, and right-wing political posturing (e.g. in introductions from the UK’s Boris Johnson and Prince Charles). At COP26, both the challenges and solutions of the climate catastrophe are firmly rooted in obstinate acceptance of the capitalist status-quo, including heavy reliance on “partnership” with private corporations, the current distribution of post-industrial/post-colonial wealth inequality, expansion of the energy industry (and associated wage labor, aka “green jobs”), and increased consumption of so-called “green” products, like electric vehicles. Indeed, the most commonly proposed solution to the climate crisis uses the discourse of capitalism as its primary metaphorical framing (i.e. “carbon markets”). Ecolinguistics researchers have increasingly focused on language relating to the climate crisis, identifying its popular discursive frames (Lakoff 2010; Plec & Pettenger 2012; Zeniakin 2022), stances (Poole & Hayes 2022), and other linguistic features (Niceforo 2021; Nielsen 2022). This presentation’s critical discourse analysis of COP26 sheds light on the ways in which our “best last chance” to combat irreversible climate catastrophe was unfortunately marred by complicity (Verschueren 2021) in the very discourses that brought us to the brink.

Discovery by Design: Toward a Semiotics of Found Contrarian Knowledge

Panel contribution

Prof. Mark Peterson¹

1. Miami University

Semiotic analysis often assumes a performative model in which senders craft messages for particular audiences using radial transmission or other forms of top-down distribution to “send” messages to the target audience. In the case of contrarian and conspiratorial claims, it is often assumed that message recipients are persuaded by the authority of speakers or the illocutionary force of the claims. The rise of Internet-based practices of message reception such as Alternate Reality Games (Kim et. al. 2009) and “doing my own research” (Tripodi 2018) reveals new genres of message construction in which networks of messages are laid out as potential nodes in webs driven by links and algorithms. In this paper, I analyze a 2017 blog post by an American conservative scholar who utilizes my work and well as that of Mary Poovey and Sally Engle Merry to construct a defense of the concept of the “alternative fact” (Turley 2017). Discursively, the post utilizes a radical recontextualization of the source texts which elides reference to the political economic and historic contexts in which facticity arose and retains importance, as well as those within which modern journalism has been practiced. More significantly, the actual argument is secondary to a frame that dismisses mainstream media in favor of alternative informational sources. I will argue that this blog post is best seen not only as a specific performance for a particular audience, but also as a node in a web of algorithmically linked similar texts that function to expose Google searchers engaged in evidentiary quests to contrarian alternative belief systems in which they can be “exploited by bad actors seeking to monetize such intellectual pursuits” (Tripodi 2018). The agentive process of searching for information, and the discovery of web texts offering and supporting claims provide persuasive power for contrarian and conspiratorial narratives.

Rightwashing resistance: The pragmatics of “protest” co-option and the colonization of leftist discourse

Panel contribution

*Dr. Addie Sayers*¹, *Mr. Hanson Egerland*¹

¹. *University of North Carolina Wilmington*

Creators of right-wing discourses utilize language to centralize and highlight Americans’ fears and to juxtapose them with so-called dangerous progressive ideas. Seemingly innocuous everyday items and concepts, including vaccines, masks, vegetarianism, immigrants, electric cars, critical race theory, and books, become framed as weapons wielded by woke snowflakes who are coming to take right-wingers’ guns, money, and freedom. Even leftist protest discourses and counterhegemonic stances are co-opted to fight right-wing fears, including *I can’t breathe* from Black Lives Matter protests of police violence and *My body, my choice* from reproductive, abortion, and gender rights campaigns (Sayers, 2022). In this project we examine the pragmatic and discursive moves of the rightwashing of resistance. That is, we explore how right-wing discourses co-opt, resemiotize, and shift the indexical fields (Eckert, 2008) of originally leftist protests, rhetoric, and political stances, as not just co-option, but as discursive colonization. Adding to the research about transgressive ways to promote and normalize authoritarian political agendas (Tebaldi et al., 2022), we specifically analyze the micropragmatic moves in a corpus of Twitter data around the 2022 attack on Paul Pelosi, husband of Speaker of the House Democrat Nancy Pelosi. Utilizing a multimodal critical discourse framework (Jewitt, 2016; Fuchs, 2019), we demonstrate how right-wing commentators utilize presupposition, implicature, information structure, symbolism, multimodal paralinguistic cues (emojis and creative misspellings), deixis, and flows of reference to frame, reframe, and reify rhetoric into right-wing stances. We connect these micropragmatic moves to larger macrolevel discourses, asserting that commentators simultaneously remove the counterhegemonic semiotics of protest, resemiotize such stances as right-wing ideologies, and then create intertextuality and braid these ideas into already established right-wing discourses which situate right-wingers as victims to leftist discursive and political tyranny. To do this, we triangulate our analysis with two different corpora – our randomly collected dataset from QAnon Reddit posts and a corpus of analog anti-vaccine protest signs – to show how Paul Pelosi’s attack interdiscursively mirrors racist, homophobic and transphobic, anti-Semitic, and anti-science rhetorics. We ultimately argue for the importance of micropragmatic analysis for understanding the mechanisms of right-wing political propagation.

The discursive construction of “truth” and “facts” in emails from a Polish ultraconservative NGO, Centrum Życia i Rodziny

Panel contribution

Dr. Dominika Baran¹

1. Duke University

Since “the outbreak of the ‘war on gender’ in the Polish context” in 2012 (Korolczuk and Graff 2018: 800), right-wing politicians, media, and the Catholic Church have been demonizing the LGBTQ+ community as promoters of the so-called “LGBT ideology,” a substitute term for “gender ideology” in Poland. The vitriolic anti-LGBTQ+ discourse has become a central resource in the right-wing construction of Polish patriotism and national identity. This discourse, adopted by many mainstream conservative public figures, is also part of the global anti-genderism register (Borba 2022) that has been taken up by local as well as transnationally linked actors and institutions. In Poland, right-wing actors have been promoting a historicized narrative that sees Poland as the perpetual savior of Christian Europe from invading enemies: the Muslim Ottomans, the communist Bolsheviks, and currently the “gender/LGBT ideology” (Author, forthcoming). In this paper, I adopt Wodak’s (2021), Reisigl and Wodak’s (2016), and Wodak and Boukala’s (2015) Discourse Historical Approach, in addition to CDA methods (Machin and Mayr 2012), to examine how anti-genderist actors in Poland construct the opposition between “us,” the “true Poles” who are loyal to the imagined notion of Poland as inherently and unquestionably Catholic, and “them,” the “anti-Polish” supporters of “gender/LGBT ideology.”

The data in this paper consists of two and a half years of emails, in newsletter format, from the ultraconservative NGO, *Centrum Życia i Rodziny* (Center for Life and Family), whose explicit goals are promoting an anti-reproductive rights, anti-feminist, and anti-LGBTQ+ agenda. Crucially, unlike typical anti-intellectual rhetoric of populist rightwing discourses (Wodak 2021), the authors of the Center’s messages (and in particular, its leader, Paweł Ozdoba) adopt the language of scientific argumentation, historical “facts,” appeals to academic authority, and pseudo-linguistic analysis trying to “unmask” the “true” meaning behind liberal discourse, and resignifying terms and concepts used by liberal, feminist, and queer discourses (Borba 2022). Some of the linguistic strategies they adopt include the use of deixis, suppression and lexical absence, presupposition, metalanguage, direct appeals to the audience as sharing the author’s views, and the use of quotation marks as a delegitimization tactic, as in the phrase *same sex “marriage.”* Through these methods, they construct their anti-genderist stance as rooted in “true” knowledge. Combing CDA and DHA methods, I analyze the discursive construction of “truth” in the emails sent out by the Center, situating this analysis in the broader context of the anti-genderist movement in Poland.

“Women deserve better”: An analysis of Generation Z pro-life ‘feminist’ discourses

Panel contribution

Dr. Polina Shvanyukova¹

1. Università degli Studi di Udine

This paper takes up the notion of ‘discourse capture’ as elaborated by Lewin (2021) in order to examine the linguistic mechanisms of resignifying, shifting, mimicking, and twisting employed by American Generation Z pro-life activists (Kingsberry 2022). As Lewin explains, “[d]iscourse capture involves the intentional resignification, shifting, mimicking, or twisting of existing concepts and terminologies, with the result that their dominant meaning and ideological underpinnings are altered, or replaced” (2021: 255). In the case of the so called pro-life feminism, the linguistic work of discursive capture can be performed, for example, through the resignification and the shifting of feminist discourses of empowerment and women’s rights. By analysing examples of pro-life rhetoric disseminated through dedicated digital channels (e.g., personal FB pages of individual Gen Z activists; the content tagged #prowoman #prolife #womensmarch #roevwade on TikTok and Instagram), I investigate the ways in which anti-choice actors exploit the affordances of these platforms to attack reproductive freedom. I am especially interested in the ways in which pro-life discourses interact with and feed off global anti-gender discourses (Borba 2022), operationalised as “a body of knowledge and worldview [reflecting] an ambitious plan to establish a new paradigm in social sciences, based on a religiously grounded set of fundamental truths about human nature, sexuality, family and society” (Graff & Korolczuk 2022: 61-62).

Compliment Response and Chinese Modesty Revisited: Evidence from Corpus-based Metapragmatics and Experimental Design Research

Panel contribution

*Dr. Mian Jia*¹

1. *The University of Texas at Austin*

Researchers have identified two conflicting constraints in compliment responses. Following the Agreement Maxim, complimentees are expected to agree with the complimenter; following the Modesty Maxim, on the other hand, they are expected to avoid self-praise (Leech, 1983; Pomerantz, 1978). Previous research has shown that English speakers tend to uphold the Agreement Maxim, whereas Chinese communicators favor the Modesty Maxim which is often represented by depreciating and devaluing self-achievement (Gu, 1990; Lee, 2009; Yu, 2003; Gao & Ting-Toomey, 1998; Zhou & Zhang, 2018). Recent studies, however, suggested an evolving pattern of preferring rejection (Chen, 1993) to preferring deflection/evasion (Ye, 1995; Yu, 2004; Yuan, 2002) to preferring acceptance (Chen & Yang, 2010; Tang & Zhang, 2009) and even self-praise (Ren & Guo, 2020), especially among college students. Given these mixed findings, this paper reports two studies that examine the metapragmatics of Chinese modesty and people's perception of various compliment response strategies.

Using corpus-based metapragmatics, study 1 explores layperson's understanding of the Chinese term 谦虚 "modesty" by examining its collocations in a large-scale web corpus with Sketch Engine (Kilgarriff et al., 2014). First, the Word Sketch function presents a concise summary of 27 possible lexico-grammatical relations of a search word. Second, the Distributional Thesaurus function can generate a list of words that share a significant number of common collocates with a search term. The corpus used in this study is zhTenTen17 which contains 16.6 billion tokens of Chinese words that were collected from the Internet in August and November of 2017. The results show that while modesty is typically associated with expressions such as *low-key*, *forbearance*, *humble*, and *yield*, they are also associated with negative evaluations such as *pretending*, *arrogant*, and *hypocritical*.

Using experimental design, study 2 investigates college students' evaluations of different responses to compliments. A 3 Strategy (accept, deflect, reject) X 3 Topic (English proficiency, public speaking, dressing) between subject experimental design was conducted. 518 college students from China's Mainland were randomly assigned to one of the nine conditions. After reading the material, they were asked to rate the compliment response message on its appropriateness, conceitedness, and impression of the speaker on five-point scales. The results showed that across scenarios, acceptance strategies were rated as more appropriate, less conceited, and leaving a better impression than rejection strategies. Moreover, while rejection strategies were predominantly rated as expressions of modesty, acceptance strategies were predominantly rated as not related to modesty.

Taken together, these two studies consistently show a split between Chinese people's metapragmatic evaluation of modesty and their evaluation of pragmatic behaviors in action. On the one hand, modesty is characteristically recognized as being humble and responding to compliments with rejections; on the other hand, invoking the modesty maxim may also yield negative communicative outcomes. This study seeks to contribute to this panel by demonstrating the utility of using a mixed methods approach to pragmatics research.

Gender-based variability in the prosodic realization of Italian compliments

Panel contribution

Prof. Patrizia Sorianello¹, **Dr. Glenda Gurrado**²

1. University of Bari (Dept DIRIUM), 2. University of Bari

To date, several studies have investigated the speech act of compliments and compliment responses (CRs) from a pragmatic and a communicative view (among all, Manes & Wolfson 1981; Sifianou 2001; Alfonzetti 2009; Castagneto & Ravetto 2015). From the wide literature on this subject, emerges that compliment response types differ across cultures and are affected by a certain degree of variability caused by sociolinguistic and interactional conditioning.

The main purpose of this study is to investigate the realization of Italian compliments from a prosodic perspective. The literature focused on compliments has paid little attention to the prosodic component so far (Voyer & Du 2016), without any consideration for Italian. Nevertheless, intonation and duration seem to play a crucial role in the production of compliments and in the distinction of CR types.

To this aim, a sample of compliments was analyzed with particular attention to the gender variable (Holmes 1988; Parisi & Wogan 2006; Castagneto 2016). 15 texts were designed to perform oral Discourse Completion Tasks (DCT): each scenario described a contextual situation that led the speaker to produce a compliment. Compliments were organized according to: 1) topics (physical appearance, owned object, abilities), 2) gender (males and females speakers), 3) participant roles; as compliments are more frequent in a relationship between equals, all compliments were specified as [+ knowledge] and [- social distance].

Ten young speakers of Bari Italian (5 M, 5 F) were asked to read the DCTs and to realize an utterance suitable for the situation described. The corpus was acoustically analyzed. According to the preliminary results, compliments are mostly realized by means of an exclamative act, although the degree of intensity and expression force vary considerably. Female and male speakers opted for different prosodic schemes but expressive and paralinguistic choices showed some differences too. These linguistic strategies modified the overall effect by suggesting the existence of a sort of illocutionary hierarchy of compliments.

How gender affects compliments in Italian

Panel contribution

***Prof. Giovanna Alfonzetti*¹, *Dr. Giulio Scivoletto*¹**

1. Department of Humanities (University of Catania)

The main aim of our research is to verify the impact on compliments in Italian exerted by gender, one of the macro-sociolinguistic factors that most influence communicative language use, and especially compliments. This is shown by many studies on this subject, but has largely been neglected in Italian (few exceptions being Castagneto 2016, Castagneto/Sidraschi 2020). The research adopts the perspective of variational pragmatics, mainly at actional, topic, and interactional levels (Schneider/Baron 2008), as the focus is on compliment realizations, functions, objects and responses.

Drawing on previous research (Alfonzetti 2009), this work is based on the analysis of spontaneous conversations recorded in Catania (Sicily) and Rome, showing that compliments are mainly conceived and treated as face-enhancing-acts. Italian is thus ascribable to the “American pattern” rather than to the hypothesized supra-national Northwestern European one, where compliments are less frequently used as social lubricants and often mitigated (Kasper 1990).

However, this conclusion assumes the idealization underlying much cross-cultural pragmatic research, i.e., speech communities are homogeneous wholes, dismissing sociolinguistic variability. On the contrary, the current stage of research (already started in Alfonzetti 2017) assumes that speech acts differ not only cross-culturally but also between regional and social varieties of the same language (Wierzbicka 1985).

In particular, we intend to test whether Italian compliments confirm the existence of some gender-based patterns, which according to many studies would overcome cultural differences (Rees-Miller 2011), i.e.:

- frequency – women seem to give and receive more compliments;
- function – compliments are used as positive politeness strategies by women, whereas men conceive them more referentially or as face-threatening acts;
- topic – women seem to receive more compliments on physical appearance, rather than possessions or performances;
- response – women tend to use different strategies;
- modulation – women tend to strengthen compliments more than men.

As to data collection, different techniques have been employed, integrating field and laboratory methods (Jucker 2009):

- naturally occurring compliments will be collected through the notebook method;
- a questionnaire will be submitted to a sample of university students balanced by gender; the questionnaire includes both open questions and DCT.

Multimodality and Speech Act Perceptions across Cultures: The Case of Compliments

Panel contribution

*Ms. Fang Xie*¹

1. *University of Zurich*

Compliments have received a lot of attention for years and are perhaps one of the most investigated speech acts. Various aspects of compliments have been studied, which include the structure of compliments, the demographics of complimenter and complimentee, the compliment responses, etc. Researchers have used a large range of different methods, from discourse completion tasks and role plays to corpus methods, to investigate these topics. However, few studies, so far, have focused on the evaluations or perceptions of compliments. As any other speech act, compliments contain multimodal information such as tone of voice, gestures and facial expressions in addition to verbal language and they can be carried out in written form and/or through emojis and memes. These multimodal aspects cannot be ignored because they may influence people's perceptions of compliments. Speech act perception is a recent and promising research interest in the field of speech act. Still, few existing studies mainly focus on the linguistic mode of the speech act itself, without considering the accompanying non-verbal information. This study, therefore, examines English, Swiss German and Chinese L1 speakers' perceptions of compliments in multimodal forms and compares them across the different language groups, age groups, gender groups, personality groups, etc.

The perception experiment is the most suitable method for this study because it can effectively investigate people's perceptions of multimodal compliments. Four modes of the same compliment are used in this study, including a monomodal text compliment, a bimodal text compliment with emojis and a meme, a monomodal audio compliment online through social media, and a multimodal video compliment including facial expressions and gestures. The data of this study are collected from 88 English L1 speakers, 137 Swiss German L1 speakers and 170 Chinese L1 speakers through online experiments and retrospective interviews. The compliment perceptions of various dimensions, such as sincerity, politeness, appropriateness, likeability, pleasantness, etc., and participants' rationales to warrant their evaluations are investigated in this study.

Through the quantitative analysis, the language groups are the most significant influential variable compared with other social variables. The text compliment with emojis and a meme shows the most significant perception differences among the three language groups, followed by the audio compliment and the multimodal video compliment, with no significant differences for the text compliment. Additionally, the qualitative analysis of the rationales shows that the Swiss participants have a wider range of rationales, and all three groups like to use the pattern "something good but something bad" to justify their neutral evaluations. In general, the perception experiment shows a new paradigm-shifting from production to reception and a multidimensional view of speech acts, which is a relatively new attempt in experimental pragmatics.

Rapport Management and Complimenting in Chinese

Panel contribution

***Ms. Yilin Chai*¹, *Prof. Fengguang Liu*¹, *Prof. Dániel Z. Kádár*², *Prof. Juliane House*³**

1. Dalian University of Foreign Languages, 2. Hungarian Research Centre for Linguistics, 3. University of Hamburg

In this talk, we examine how the speech act of complimenting tends to build rapport in Chinese workplaces, by devoting special attention to the role of complimenting in symmetrical and asymmetrical relationships. By so doing, we fill a knowledge gap because to date little research has been done on complimenting in Chinese in workplace settings. We believe that the study of this topic also contributes to research on performing compliments in a variationist perspective because in Chinese workplace settings complimenting is a key pragmatic behaviour through which power relationships are indicated. In our study, we analyse the speech act of complimenting through an interactional typology of speech acts (Edmondson & House 1981; Edmondson et al., 2022). Using this finite and interactional typology allows us to rigorously identify conventionalised manifestations of complimenting in a corpus of transcribed TV programmes. We use Rapport Management Theory (Spencer-Oatey 2000, 2005, 2008) to systematically interpret Chinese complimenting moves in varying relationships in our corpus.

Social Meanings of Congratulations: A Variationist Perspective

Panel contribution

*Ms. Anna-Marie Sprenger*¹

1. *University of Chicago*

Third wave sociolinguistics has theorized social meanings as attaching to variables through an indexical relationship (Eckert 2012), but larger units of discourse remain undertheorized as to their potential to accrue social meanings. Speech acts have been discussed in pragmatics with respect to their illocutionary force (Searle 1965, Austin 1975). This project treats speech acts as a sociolinguistic variable to ask: In addition to illocutionary force, do speech acts have social meanings, and how might these social meanings function differently from those attaching to other forms? Results from a matched-guise study reveal that congratulation speech acts can have different social meanings than non-congratulations and pattern differently across gender.

In a matched-guise design, participants read a written two-turn dialogue between two coworkers, in which the first speaker mentions a recent accomplishment, and the second speaker responds. The gender of each speaker, the scenario (competitive—where the first speaker receives a promotion both participants were considered for, or canonical—where the first speaker brings on a new client), and the response type of the second speaker (the congratulatory responses: “Congratulations!” “I’m proud of you”, or the non-congratulatory response: “When did you hear?”) were varied. In this between-subjects design, 1440 participants recruited from Prolific each viewed one dialogue and rated the second speaker for qualities like friendly or competent.

We find that non-congratulatory speakers are perceived as significantly less polite, friendly, professional, collegial, trustworthy, likable, easygoing, sincere, kind, emotionally expressive (at the $p < .001$ level), and hardworking, and competent (at the $p < .05$ level). These results suggest that the act of congratulating, though it can be performed through many different utterances, has various kinds of social meanings depending on the response type deployed in interaction.

We also find women addressing other women with the non-congratulatory response were perceived as less collegial ($p < .01$) than male counterparts. In competitive scenarios, women addressing other women with the non-congratulatory response are perceived as less polite ($p < .05$) and women addressing other women with I’m proud of you are viewed as less sincere ($p < .05$) than their counterparts. To explain these results, we highlight the expectations regarding women’s homosocial behavior and stereotypes of women as catty. Further, we argue that non-congratulatory responses are not linked to women due to frequency of use as for other sociolinguistic variables, but rather that the felicity conditions of congratulations and ideologies around who is an ideal congratulator contribute to the social meaning of the speech act.

The results suggest that speech acts can have fluid social meanings and indexical fields (Eckert 2008), and the person performing the speech act affects which areas of the field become salient in the moment. Furthermore, the nature of speech acts’ social meanings might begin with ideologies around the ideal conditions for the completion of the act, rather than emerging from a frequency-based origin by a particular demographic. Speech acts can be studied as sociolinguistic variables, but like morphosyntactic and semantic variables, they may need to be accounted for with different mechanisms than phonological variables.

The linguistic act of complimenting in foreign language Italian textbooks

Panel contribution

Ms. Giuliana Santoro¹

1. University of Basel

How to learn to compliment in Italian and "in the Italian way"? What to compliment for, in what situation and how to do it successfully according to the rules of pragmatics? Or how to react appropriately to a compliment when interacting in Italian?

Starting from the assumption that pragmatic competence does not seem to be intuitively learnable and therefore needs adequate instruction, the contribution investigates the didactics of the linguistic act of complimenting in Italian in a corpus of 6 foreign language Italian textbooks for German-speaking learners from level A1 to level C1 and a platform for the teaching of pragmatics, called LIRA (<http://lira.unistrapg.it/?q=node/1006>).

The 6 selected textbooks are among those most widely used in German-speaking areas (Switzerland, Germany and Austria) and are designed for three different audiences: adolescents, university students, adults. The choice of analysing textbooks is due to the fact that textbooks are still, in most cases, the main tool and first approach to learn pragmatics. The analysis will focus in particular on the variation of pragmatic input in compliments both in the transition from lower (A1-A2) to higher (B2/C1) levels and in the comparison between the manuals and the LIRA digital platform.

Since, however, the input in the manuals would seem to be limiting to the learning of such an extensive subject as the pragmatics of language acts, the "pars construens" of the paper will focus on the presentation of didactic strategies to deepen and broaden the learning of pragmatics, such as the use of native corpora and filmic speech.

Variational Pragmatics in Chinese compliment responses: The impacts of age and gender

Panel contribution

Dr. Yuqi Wang¹

1. *Beihang University*

Compliment responses (CRs) are defined as the hearer's replies to the speaker's positive comments (Zhang 2021). CRs are worthy of being investigated in the present study, since compared to other pragmatic features, CRs are prevalent but frequently problematic (Yu, 2003), especially for EFL learners (Golato, 2002). Among the macro-social factors investigated in variational pragmatics (VP), region has received the most attention in relation to CRs (Lin et al. 2012). To date, however, age-based differences have not been examined much in CRs studies within VP, with sometimes involving gendered nature (e.g., Cai 2012) among Chinese and American college students and both variables together among Iranian EFL learners (e.g., Allami and Montazeri 2012). Social status (SS) is frequently observed as a crucial internal factor affecting the pragmatic production of compliment responses, but few studies have explored the interaction between social status and macro-social factors, including age and gender, particularly among Chinese middle and high school learners. Therefore, this study investigates the effect of age, gender, and social status on CRs among Chinese learners based on two grouping variables, that is, different ages (50 younger vs. 50 older) and gender (50 male vs. 50 female). A total of 100 Chinese participants (50 middle school students vs. 50 high school students) were recruited in this study. The data were collected through a 4-item Chinese DCT (2 higher-SS scenarios vs. 2 lower-SS scenarios) to which Chinese learners were asked to provide short Chinese CRs, contributing 400 CRs in sum. CRs were classified and coded based on actual findings and previous literature (ref. Danziger 2018). Mann-Whitney U and Chi-square tests were employed for quantitative analyses. The collected data were analyzed by two researchers to establish inter-rater reliability. The similarities and differences in the two groups Chinese CRs with respect to age, gender as well as due to social status changes as a consequence of Chinese cultural norms, are discussed.

Variational pragmatics in the foreign language classroom: learning how to perform compliment responses in L2 Italian

Panel contribution

Prof. Borbala Samu¹

1. University for Foreigners of Perugia

In the field of interlanguage pragmatics L2 learners' compliment responses have been widely investigated from different theoretical perspectives (e.g. Cheng 2011, Samu & Wang 2020), mainly interested in analysing the effect of the L1 on the L2 and observing the way learners respond to compliments compared to target language norms. Since Wolfson's (1989) pioneer work several studies observed differences in the realization of the compliment responses of native and nonnative speakers according to the context and the speech situation. However, the representation of the target language ways of using language as a homogeneous whole is still dominant in language teaching practice and in teaching materials. The illusion of a homogeneous L2 speech community contrasts strongly with the experience of foreign learners coming to study Italian in Italy. Regarding compliment responses, previous studies (Castagneto & Sidraschi 2020) shed light on the geographic variation among Italian native speakers' performance and the different perception of politeness in Northern and Southern regions. This study offers some new insights about the great variation in the rules and patterns which constrain complimenting behaviour in Italian, through data obtained by administering a written Discourse Completion Test to 150 L1 Italian students at three Universities across the country. A variety of situations and roles with different degrees of social distance between the interlocutors were foreseen to explore whether strategies are activated in different ways depending on the context. Situations include compliments from a family member, teacher, team manager, colleague or classmate, friends and strangers. Compliments focus on achievements, appearance, possessions or ability. The data show that in the L1 macro-social factors combined with parameters relevant to intra-lingual pragmatic variation give a rather complex framework, very difficult to interpret for (non-specialist) language learners. In conclusion, the study highlights the need for a focus on macro-social factors and parameters relevant to intra-lingual pragmatic variation in teaching L2 Italian following the insights offered by Holmes & Brown (1987) and Rose (2001). On this basis, a learning path is proposed to include a variational perspective on conventions of language use.

Which politeness model for Italian compliments? An analysis in light of Variational Pragmatics

Panel contribution

***Prof. Marina Castagneto*¹, *Dr. Chiara Meluzzi*²**

1. University of Molise, 2. University of Milan

Compliments are complex pragmatic acts which require a great amount of *facework* from both the complimenter and the complimentee.

The present work aims at comparing different compliment management strategies in three compliment corpora collected in just as many Italian regions - namely in Eastern Piedmont (North-West of Italy), in Cancellod'Arnone (Caserta), and among the Sardinian community in Biella – and analyse them within the Variational Pragmatics framework.

Data have been collected in light of the methodology used in Castagneto & Ravetto (2015) and in the CoCorpus (www.cocor.eu).

The analysis of compliment responses highlighted the difficulty in using a fit all pragmatic theoretical model to describe the different *facework* dynamics for the compliment management within the different cultures. The Eastern Piedmont culture is more individualistic (Hofstede 2001) and oriented towards negative politeness. In this respect, the classical politeness model as proposed by Brown & Levinson (1978/1987) seems to better explain the social dynamics of compliment in this area: indeed, *face* belongs to speakers and *face-work* is oriented towards *face* protection. Conversely, Arundale's (2006) "Face Constituting Theory" seems to better explain the social dynamics of compliments in Cancellod'Arnone. This society is closer to the collectivistic pole, and the speakers are related to interdependent self-construal, as they tend to conceive themselves as a part in interpersonal relationship. Yet, Cancellod'Arnone's culture is not prototypically collectivistic as it is not shaped by power distance; moreover, the speakers do not accept unequal power distribution since their relations are symmetric, and therefore their *face-orientation* relies on their interactional performance. In Cancellod'Arnone, then, *face* has to be understood as a relational and an interactional phenomenon dynamically emerging in conversations, while compliments are oriented towards an interactive co-construction of a *connection face* which belongs to both the complimenter and the complimentee. Finally, in the Sardinian immigrant community in Biella, *face* dynamics are related to the respect of the *Social Contract of Values* (Mursy & Wilson 2001), especially with regard to the Maxim of Generosity according to which the act of compliment is to be meant as a social obligation, rather than an attempt at pleasing the interlocutor. Speakers' *face* is gained and preserved through the respect of social and conversational norms, which precede and support the verbal interaction itself. In light of this variability, the discussion will reflect upon the possible theoretical model behind the acts of compliment in Italian.

Connection and Disruption between Japanese Voice Actors and Anime Characters

Panel contribution

*Ms. Liu Yang*¹

1. *University of Tsukuba*

The phatic function of communication is generally known as the function that concerns the management of communicative channels/connections. Though often exemplified by speech acts such as greetings or turn-takings, phatic function is increasingly applied in explaining modern communication techniques and media culture consumption (e.g., Nozawa 2022). This research aims to analyze the labor of Japanese *seiyū* (voice actors/actresses) from a phatic perspective, and discuss how they pragmatically maintain and disrupt their self-established connections to the characters they perform.

It has been clarified that *seiyū* are technically connected to their characters. With an analysis on several subcultural metaphors for *seiyū* and *seiyū*'s own discourses, Nozawa (2016) examined how voice acting creates a layer between *seiyū* and their characters, and that the layer itself has become an object of desire. In my discussion, I would like to add how such a layer or connection is metapragmatically maintained and sometimes disrupted, as the connection already exists self-evidentially as part of *seiyū*'s stardom.

First, I will discuss how the *seiyū*-character connection is lingually and visually maintained with the notion of Hierarchy of Personal Presence (Du Bois 1986). The data include a widely used phrase observed in *seiyū*'s narratives (mainly during their self-introductions), along with an increasingly generated form of performance commonly known as *seiyū* concert, where *seiyū* appear on stage in the name of themselves and sing in the voice of characters. While voice acting as a speech act might be categorized as impersonation or trance that barely focuses on the proximate speakers' own intentions (Du Bois 1986: 329), these data show how *seiyū*'s egos are visualized and perceived in *seiyū* fandom.

Then, I move on to cases in which such a connection is disrupted. Here I focus on a specific *seiyū* concert originating from an anime that features male idols, which was held in November, 2022. Three months before the concert, one of the starring *seiyū* of the anime was reported in an affair scandal, whose performance in the concert later got canceled. Through an analysis of the *seiyū*'s narratives during the concert mainly focusing on how they mentioned themselves and their characters, I argue that *seiyū* lingually and performatively break apart the connection when their connecting to the characters is considered a threat.

To conclude, instead of providing a holistic view on Japanese *seiyū*, I hope that this research will add a new perspective in interpreting *seiyū*'s work as phatic labor, including but not limited to voice acting.

Extending the scope of phatic communion to political speech: Analyzing Redditors' comments on Japanese online reactions to Zelensky's speech to US Congress

Panel contribution

*Prof. Masataka Yamaguchi*¹

1. Kobe City University of Foreign Studies

The aim of this paper is to propose that the scope of the pragmatic research on “phatic communion” (Malinowski 1936; Senft 2009) be extended to broader discursive practices than “greeting formulae.” For this purpose, first, I analyze the speech of President Zelensky to US Congress on March 16 in 2022, in which he “poetically” makes an analogy between the Russian invasion of Ukraine and two historical events: Sept. 11 attacks and Pearl Harbor. Second, and more importantly, I examine the Redditors' comments on Japanese online reactions to his speech, by which I show different stances or “standings” to his analogy, both from Anglo-American and Japanese perspectives. In doing so, my point is to argue that we deconstruct the dichotomy of phatic communion as “a mode of action” as opposed to “an instrument of reflection,” given that Zelensky simultaneously “established bonds” with the members of the American Congress and further provoked “reflection” on the historical events of Pearl Harbor, Sept. 11, and the Russian invasion of Ukraine.

In my presentation, I first analyze the speech to US Congress by Zelensky on March 16, 2022, in which he “poetically” compares “Russia's ... onslaught in Ukraine to Japan's World War II air assault on Pearl Harbor” by saying “your sky was black from the planes attacking you” and to Sept. 11, when “innocent people were attacked, attacked from the air” (Edmonson and Shear 2022). Second, I examine comments on the online forum entitled “Some Japanese online felt offended when Zelensky mentioned about Pearl Harbor in his speech today” on the subreddit “r/Japan.” Using the “cultural standing analysis” (Strauss 2004) and other discourse analytic techniques, I focus on the ways in which the Japanese attack on Pearl Harbor is remembered from several perspectives of “cultural standings” both in English and Japanese. Specifically, I summarize the patterns of the cultural standing continuum of “highly controversial,” “debatable,” “common opinion” and “taken for granted” in my analyses of the Redditors' comments on the analogy of the Russian invasion to Pearl Harbor in English, while referring to the posts written in Japanese, and to Japanese Yahoo comments.

In the end, I discuss implications of the analyses in which I argue that in addressing the question of “poetics of phaticity,” we can extend the scope of the pragmatics of phatic communion to the discursive practices of political speech and online comments as empirical sites for analysis. In sum, I suggest that to understand the phaticity of political speech, we need to conceptualize phatic communion both as “a mode of action” and “a mode of reflection.”

Fractal meanings and cultural logics: Metapragmatics of “jiko-sekinin (self-responsibility)” in Japan

Panel contribution

*Mr. Toshiyuki Aoyama*¹

1. *University of Tsukuba*

This paper analyzes the semiotic ideology of *jiko-sekinin* (自己責任: self-responsibility), which is one of the most symbolic political arguments in late modern Japan. Political economic workers and activists have urged Japanese citizens to be autonomous individuals and also to control risks under the conditions of socio-economic anxiety since the 1990s. Accordingly, previous researchers have regarded *jiko-sekinin* as a political ideology and criticized it through that lens. However, I argue that *jiko-sekinin*, as exemplified by the 2004 Iraq-Japanese hostage incident during which the term gained widespread attention in Japanese society, should be understood from the perspective of cultural norms related to phaticity.

In this incident, the criminals responsible requested the Japanese government to remove the Self-Defense Force (SDF) from Iraq in exchange for the hostages, who were Japanese citizens visiting Iraq as volunteers and journalists. This incident provoked a rupture in public discussion, centered on whether the Japanese government should submit to the threat or not. Initially, the hostages' families proactively requested the government save the hostages by ordering the SDF to retreat from Iraq. This generated severe public criticism towards the hostages and their families for causing *meiwaku* (迷惑: nuisance, annoyance, troubling) towards other Japanese people, on the basis that their deeds were their responsibility.

This paper regards the semiotic process of the terms *jiko-sekinin* and *meiwaku* as discursive practices and discusses how *jiko-sekinin* has been rationalized by the metapragmatics of *meiwaku*. Using newspaper articles regarding the East-Asian Japanese hostage incident as data, this paper analyzes how the texts mix similar and different perspectives towards the term *jiko-sekinin* mainly based on the “semiotics of differentiation” (Gal & Irvine 2019). In particular, I focus on how the concept of *meiwaku* differs from the European and American notion of “rights” (Azuma 2022). The term *meiwaku* means the subjective order, i.e. “don’t make a nuisance to others,” and also implies the objective order “don’t break the rules.”

In conclusion, this paper analyzes the semiotic process of *jiko-sekinin* from the perspective of linguistic anthropology and describes the ideological connection between *jiko-sekinin* and *meiwaku*. To take an example, the subjective order of *meiwaku* combines *jiko-sekinin* with norms of social roles and ties, even though the term *jiko-sekinin* implies autonomous individuals. As a result, I argue that discourses of *jiko-sekinin* and *meiwaku* endlessly trigger subsequent arguments in Japanese society.

Phatic and poetic simulacra in Japanese political argument

Panel contribution

Dr. Kuniyoshi Kataoka¹

1. Aichi University

Focusing on verbal exchanges in the Diet and press conferences, this presentation will examine how the formal validity of talk nullifies the argument itself (i.e., semantic content), turning it into an occasion for phatic communion. As Malinowski defined it nearly a century ago, phatic talk aims to “establish bonds of personal union” (Malinowski 1936: 316), and what matters there resides in “the fact that one says it at all” (Leech 1981, see also Rampton 2015). Under this circumstance, the act of utterance (locution) induces the maintenance of the communicative channel and creation of a bond. In other words, the semantic content transmitted by exchanging information serves a secondary function, and instead, keeping in touch and building rapport becomes primary, the distinctions of which are respectively identified as “contact” and “communion” phaticity (Zuckerman 2021). Similarly, poesis concerns something more than the sum of effects inherent in semantic content (referential/non-referential) and formal features such as repetition and parallelism: it is rather a consequence that emerges when sound, tone, meaning, and form(ation) are homologously and equivalently mobilized through paradigm and syntagm. What follows from these phenomena is a presupposition that both phaticity and poesis fundamentally represent the consequences (the perlocution, or the indexical) caused by the locutionary and illocutionary force beyond the referential, as well as poses a possibility that those consequential effects are not necessarily invoked by linguistic means.

One such type of talk is the one used by politicians and statesmen, which sometimes has no function other than to keep the audience’s and supporters’ attention, simply staging a make-believe performance as an interaction ritual. Currently, the media does not seem to regard it as a problem either, embracing it as a mere occasion for phatic acts. In such a circumstance, what counts is to simply achieve an interactive configuration (such as Q-A exchanges and turn-taking)—or pretense-turned-reality, as long as the skeletal schema is ensured. Such indifference (or insensitivity) to the semantic content has often been criticized for demonstrating *yatteru-kan* “pretended image.”

This presentation will investigate the factors that ratify and encourage such exchanges in the Diet and press conferences, arguing that the process is achieved through not only the politicians’ conciliation but also the media’s complicit cooperation. In this respect, the current political situation in Japan represents a transition from “pretense of reality” to “hyperreality” (blending of the real and the fiction: Baudrillard 1981).

Poetic performance in tourist city's identity construction

Panel contribution

Dr. Hiroko Takanashi¹

1. Japan Women's University

This study examines tourism discourse from an English-guided tour in Bologna, Italy, and demonstrates how poetic performance shapes the city's identity in intercultural tourism communication. Tourism discourse reveals a “global semioscape” (Thurlow & Aiello 2007) saturated in sociocultural meanings, including place identity, and tourists experience “the cultural Other” by referring to how it differs from the culture of “the Self” (Gao 2022, Molz 2007).

The analysis employs *parallelism*, aided by its deeply related notion of *dialogic resonance*. The poetic function of parallelism (Jakobson 1968) constitutes language structure by combining selected linguistic elements from a juxtaposed text. The parallel structure becomes visible in the light of dialogic syntax (Du Bois 2014), which maintains that language is shaped in the dialogic environment with other utterances. Moreover, dialogic syntax gives rise to dialogic resonance, which refers to affinities based on similarities and contrasts across utterances. In the example below, the guide explains the local patriotism (*campanilismo* in Italian) by enacting an imagined local with direct speech (as indicated by *my*) addressed to an imagined competing neighbor city's resident (as indicated by *your*) across the four lines (lines 4, 6, 8, 11). These utterances show resonance in the comparative **syntactic structure** (*my ~ + is better than + your ~*) except line 11, **lexemes** (*my, your, better*), **gesture** (the palm of his left hand is placed on the chest when uttering *my ~*, and then it folds out at *your ~*), and the **interactional pattern** (tourists' reaction, especially laughter, follows each utterance). Additionally, we can see **pragmatic resonance** as the meaning expands from ‘bell tower’ (*campanile* in Italian, line 4), the word from which *campanilismo* derives, to ‘village’ (line 6), to ‘city’ (line 8), where the emphasis is also indexed by the intensifying adverb *much* in conjunction with loud voice (as indicated by <F>), and finally, to the humor employing the stereotypical image of Italian people enthusiastic about their local soccer team (line 11). Of the four, the last utterance marks the deviation not only in such witty pragmatic meaning but also in syntactic elements—it employs a comparison implying idiom (*kick ~'s ass*) instead of the comparative structure. That it is slang also makes this utterance impressive as a climax, which receives the hardest laughs.

1 Guide: .. Now the concept is called *campanilismo*,

2 .. which comes from the word *campanile*,

3 .. which means bell tower.

4 .. So basically it comes down to **my bell tower is better than your bell tower**.

5 Tourists: @@@@

6 Guide: **My little hilltop village is better than your little hilltop village**.

7 Tourist: @@

8 Guide: <F> **My city is much better than your city** </F>.

9 @@

10 Tourist: <P> Yep </P>.

11 Guide: .. And now obviously it's **my soccer team can kick yours' ass**.

12 Okay.

13 Tourist: <@> Mm-hum </@> @@@@

The analysis suggests that the poetic performance in language and body formulates recurrent patterns at both local and discourse levels, reproducing a multi-faceted tourist city identity.

Poetics of Cheering: Multimodal Achievement of Phaticity in a Japanese Junior-High School Pep Rally

Panel contribution

Mr. Takeshi Enomoto¹

1. Osaka University

As early as 1923, Bronislaw Malinowski discovered a type of linguistic use called “phatic communion”. It is an act in which “ties of union” are created, “serving the direct aim of binding hearer to speaker by a tie of some social sentiment or other”. Expanding on this idea, and drawing on the perspectives of poetics, performance, and metapragmatics (Jakobson 1960, Bauman & Briggs 1990, Silverstein 1993), this study explores how “ties of union” are created poetically and multimodally (Kataoka, Takekuro & Enomoto 2022) in a Japanese junior-high school *gekirei kai* (pep rally).

The data are from my one-year long fieldwork at a junior high school in Kanazawa City, Ishikawa, Japan. Although I was able to record the rally only in the form of fieldnotes, photo images, and an audio recording, these field data still provide rich ethnographic information.

The analysis consists of two parts. First, the study reveals the cohesiveness of the rally by identifying its solid metrical structure. The beginning of the rally is marked by student athletes’ (SA) marching into the hall accompanied by clapping from students who do not participate in the tournaments (SS). Following the singing of the school song, the rally proceeds to a part where each club takes turns to show their enthusiasm and to plead for cheering. Their enthusiasm and pleading are then answered by a sequence of yells and cheering from SS, followed by an encouraging address from the vice-principal. To these, one of the SA responds with a message expressing their gratitude for cheering as well as their determination to do their best. After such a reciprocal series of affirming social and sentimental ties of union, the end of the rally is marked again by SA’s marching out of the hall and clapping from SS.

Second, the analysis takes a closer look at the yells and cheering. In so doing, I pay special attention to signs in different modalities that point to different socio-spacio-temporal meanings (Harkness 2014). Singing the school song is certainly a salient act of evoking the school’s tradition. In addition to that, the yells are saturated with cultural semiosis. Stylized use of old expressions and its prosodic characteristics metapragmatically frame them as performance. In such heightened delivery, the local natural environment is poetically invoked, positioning the school in the midst of it. Then, deictically placing where the rally is held as “here”, the yells locate the games or matches as “there” of fighting. In the subsequent cheering, not only the yells, but also pulses with drumming and clapping play a vital role. Most significantly, one, two, and three pulses are indexically associated with praying for good strenuous fighting, victory, and glory respectively.

Thus, a Japanese junior-high school pep rally is an exemplary site where ties of union and social sentiment, or phaticity, are created poetically and multimodally. Though it is one semiotically rich manifestation of “phatic communion”, it should be noted that it also involves institutional and educational processes of standardization and differentiation based on collective ideologies.

Secrets of Phaticity: Weak Bonds in Rural Japan

Panel contribution

Dr. Makiko Takekuro¹

1. *Waseda University*

Malinowski (1923) introduces the concept of “phatic communion” into linguistics, regarding language as a mode of action. Greeting formulae, as well as quick exchanges about health or weather, are part of a “free, aimless social intercourse” that does not serve to communicate ideas but to establish ties of personal union. This “bonding function” (Senft 1987) of language has received much attention in pragmatics. Numerous studies have examined ways in which bonding is achieved or emerges in the course of interaction. For the most part they claim that, whether explicit or not, the effects of bonding, such as creating a sense of security among individuals and enhancing interpersonal relations, are positive ones. However, many fundamental research questions remain largely unexplored. To what degree is bonding effective? How and when does bonding become burdensome and troubling instead of comforting?

In contemporary Japan, the pervasive use of idioms relating to “contact” or “phaticity,” such as *kizuna* (‘bonds/bonding’) and *fureai* (‘touching-together’), imbues “an emergent fantasy of sociality” (Nozawa 2015: 373). These idioms emphasize an implicit ideology of phaticity in interpersonal communication, but at the same time, paradoxically, they bring up feelings of anxiety about loosening or losing bonds in society. In this study, I explore both aspirations and anxiety about bonding, based on ethnographic research in rural communities in different parts of Japan. My purpose is to point out the considerable importance of weak bonds for wellbeing and comfortable living in these communities (cf. Granovetter 1973).

First, I draw on research conducted in towns with remarkably low suicide rates (Oka 2011, 2012, 2020; Morikawa 2016). Kaifu-cho (known as Kaiyo-cho today after large-scale municipal amalgamations of the Heisei era) in Tokushima Prefecture, for instance, has been listed as one of the top ten towns with the lowest suicide rates, even though it is surrounded by towns with high suicide rates. In Kaifu-cho, houses are built closely together, resulting in a high physical density. Some people may even overhear their neighbors’ phone conversations, which inevitably increases the frequency of contacts between residents. Nevertheless, interviews and survey results show that socializing among residents is typically limited to short chats or greetings (Oka 2016). In other words, they intentionally avoid close interpersonal contacts. Moreover, peer pressure is known to be rather soft, as evidenced by low voting turnout and meager fundraising numbers for the Red Feather Community Chest. Residents do have mutual support systems, but in principle, they choose to keep personal ties weak and they do not fantasize phaticity.

I then examine naturally-occurring conversations and narratives among residents of Ishigaki Island in Okinawa Prefecture based on my own fieldwork. While pervasive “dialogicality” (Bakhtin 1981[1935]) and linguistic resonance hint at bonds that seem to have been cultivated among participants, their post-interaction comments reveal that such bonds are only short-lived. Their preference for temporary bonding illustrates their hidden anxiety regarding phaticity. A possibility will be discussed that loose bonding is a coping strategy for people of diverse backgrounds who live in a small community.

The embodied poetics of yoga: Parallelism and communion within a military veterans' yoga program

Panel contribution

Dr. Robin Riner¹

1. Marshall University

Based on video ethnography of a yoga program for military veterans, this paper argues that the poetic features of participants' embodied interactions, including parallelism, equation and contrast (Jakobson 1960), and rhythmic and prosodic contours, enable both shared and discordant affective stances (Goodwin et al. 2012) among participants. Multimodal interactional analysis of video recordings of yoga sessions reveals patterns of parallelism across participants' bodily actions, verbal directives of the instructor, and the organization of bodies and objects in space. Drawing from the concept of phatic communication, which asserts that language serves not simply to convey referential information, but also to create and maintain social "ties of union" (Malinowski 1923), the paper explores the forms of contact, communion, and division that multimodal poetic structures afford within and are emergent from yoga sessions. The analysis focuses specifically on two structures of parallelism in the yoga sessions: first is the organization of the yoga mats in space and the orientation of bodies on the mats and second is movement (layered with verbal directives) initiated by the instructor that is mirrored (or not) by the veteran participants. Through an analysis of these unfolding structures of parallelism, I argue that the emergent poetics of the interaction construct a sense of collectivity among participants. By engaging in synchronous embodied actions – layered with the prosodic contours of the instructor's utterances and patterns of breathing and the parallel positioning of yoga mats and bodies – veterans build "kinesthetic empathy" (Fisher 2019) through which they are "thrust into the living experience of another human being" (Goodwin et al. 2012:23), fostering a sense of community and emotional and social integration of the individual (Fisher 2019). At the same time, these parallelisms are not exact. Individual variations and asynchronies within the overarching parallel structures (such as when a veteran opts out of the guided movement) allow for moments of disalignment and assertions of varied forms of agency. The yoga mats, moreover, while providing a form of common ground among participants, also outline individually isolated spaces, thus potentially fostering a bounded sense of self and divisions between participants. These dualities of individual/collective, contact/division, communality/isolation are afforded by the embodied poetics of interaction, creating an interactional space that is therapeutically beneficial (Briggs 1994). Participants are at once integrated into a collective and given space within this collective to forge senses of individual and intersubjective agency and empowerment (Persson 2007).

The Phatic Function and the Liberal Imaginary of Communication

Panel contribution

Dr. Shunsuke Nozawa¹

1. Hokkaido University

While the expression *harassment* has been part of the Japanese public vocabulary since the 1980s, the last decade or so has witnessed a flourishing of various neologistic terms pivoting on the shortened form of this loan word, viz., *hara-*, as a word stem (see e.g. *Gendai Shisō* 2013). Some of these terms are relatively longstanding (and even semi-codified, like “power harassment”; Ministry of Health, Labour, and Welfare 2020), while others are yet to catch on as widely (e.g. “smell harassment”), and some are apparently coined for the nonce. As these *hara-* idioms conjure up ever more diversifying scenes of impropriety, what might the seeming ease with which people invoke them in public and private discourse reveal about the contemporary significance of communicative contact: what it means to be ‘in touch’ with others? Building on this initial observation, I explore the “phatic function” — the capacity of signs to index their channel, or conditions and effects of contact (Jakobson 1960) — as a metapragmatic concern in the contemporary sociohistorical context by situating phatic impropriety in institutional processes. Concerns about improper contact have compelled universities, corporations, local communities, state organizations, and other institutions to craft anticipatory, regulatory language about how to avoid such contact and what to do should it happen within and beyond particular parameters of institutional life. How do institutions generate and perform “phatic expertise” (Lemon 2018), a metalanguage of harm through which they define, classify, anticipate, and warn about events of harmful contact? In claiming to have such language, I argue, institutions seek to present themselves as a ‘proper’ liberal social space and manage risks involved in their own institutional wellbeing. I approach the phatic function as a relatively undertheorized dimension of liberal conceptions of communication, and discuss how institutional processes and participants imagine and inhabit channels of contact deemed proper to liberal democratic sociality (Slotka 2015, Candea et al 2021). My discussion focuses on higher education, examining various reflexive discourses performed by and for universities and other institutions, and provides a brief comparative framework to highlight transnational contemporaneity in the metalanguage of harm by drawing on the issue of so-called “triggers” and “trigger warnings” in the 2010s North American context.

(C)overt self-praise strategies in Press Releases by French companies. What does it mean to be polite for a company?

Panel contribution

Prof. Els Tobback¹

1. Universiteit Antwerpen

Within Politeness theory, self-praise has, traditionally, been described as a problematic speech act, since it infringes the “maxim of modesty” (Leech 1983) and it does not take into account the hearer’s feelings. However, it has also been shown that specific contexts, such as job interviews (e.g. Stevens and Kristof 1995) or social media (e.g. Dayter 2018) tend to impose fewer restrictions on self-praise.

In this paper, the focus shifts from interactions between ‘natural persons’ to self-praise strategies used by ‘legal persons’, more specifically French companies, in press releases published on their corporate websites. On a theoretical level, this specific institutional context raises several questions, such as to what extent the use of specific self-praise strategies is a matter of ‘politeness’. Companies being (normally) well aware of the fact that their communication should by no means be too promotional if it wants to make a chance to be used by journalists (e.g. Pander Maat 2007, Catenaccio 2008), self-praise in press releases appears to be at least a delicate speech act. It will be argued then that press releases both involve the positive image of companies or their “want to be appreciated and approved of” (hence, their ‘positive face’, Brown & Levinson 1987: 61) and the ‘negative face’ of journalists.

At a textual level, the paper focuses on the pragmatic strategies of ‘self-praise’ used in 50 online published press releases by French companies in 3 economic sectors: retail, banking and (public) transport. Based on previous research on promotional language in press releases (Jacobs 1999, Pander Maat 2007, Catenaccio 2008) and on self-praise (Dayter 2014, Tobback 2019), it will be shown that companies do not always refrain from using overt, direct strategies and more or less strong qualitative upgraders, but that they also frequently make use of more indirect strategies (e.g. praising other instances), or quantitative upgraders, which have a certain objectivising effect on the self-praise for being (normally) objectively verifiable.

A comparative analysis of politeness and impoliteness in French and Korean

Panel contribution

*Ms. Ha Nah Kim*¹, *Ms. Georgeta Cislaru*²

1. *Université Sorbonne Nouvelle*, 2. *Université Paris Nanterre*

Our work aims to focus on a comparison of conventional indirect realizations in which cultural characteristics are prominent among various expressions and strategies of (im)politeness in French and Korean. Linguistic politeness can be defined as a coded communicative system working in social interaction situations to initiate or maintain relationships “by minimizing the potential for conflict and confrontation inherent” (Lakoff 1990: 34). The *face* and *face-work*, terms proposed by Goffman (1967) and developed by Brown & Levinson (1987), are key concepts underlying the politeness theory. According to them, the face is the public self-image that all members of society have equally, and the face-work refers to all processes for achieving the purpose of realizing politeness. The Korean word for this term is *Chaemyeon*. Nonetheless, the two words are not equivalent because *chaemyeon* can be analyzed more complexly than the former (Lim 1994): 1) it is combined with all constituents related to one’s self-concept, such as honor, status, authority, and self-esteem 2) the ‘weight’ of the faces of interlocutors may be different depending on the situation and relationship 3) when someone tries to save face in a very close relationship, it can cause a sense of distance (Choi & Yoo 1992). For example, as mentioned in Kerbrat-Orecchioni (2009: 286), unlike the French, Koreans may feel distant when they are told “merci” (or “c’est gentil” in an indirect way) by their parents or close friends. To Koreans, losing face means losing one or more of the factors simultaneously related to this self-concept, making face-work more complicated for Koreans than for French. Nevertheless, little research has been conducted under the premise that native speakers do not perceive these two terms identically. The indirect speech act is one of the strategies related to face-work. Furthermore, the preference for indirectness, characterized “in terms of the gap between speaker intention and literal content” (Grainger & Mills 2016: 35), is one of the representative characteristics attributed to Korean (Byon 2006). The indirect realizations of speech acts can be divided into conventional and non-conventional indirect realizations (Blum-Kulka & Olshtain 1984, Kerbrat-Orecchioni 1994), and the character of a linguistic community appears more clearly in the former group. Traverso (1996) stated that some conventional indirect realizations belong to routines that are “socially canalized according to successful solutions of recurring verbal tasks, fixed by functional appropriateness and tradition” (Coulmas 1981, cited from Traverso *ibid.*: 40). The data to be applied for the analysis are recordings of daily conversations by French and Korean native speakers – a total of four recordings of two pairs of males and two pairs of females for each language. This comparison could also create an opportunity to discuss the scope of certain pragmatic concepts and their validities in different cultural frameworks.

Espèce de linguiste! – An impoliteness construction in French?

Panel contribution

*Dr. Daniel Van Olmen*¹, *Dr. Delphine Grass*¹

1. Lancaster University

This paper seeks to argue against the widespread view in (im)politeness research, especially since the “discursive” approach’s advent (e.g. Locher 2006), that (im)politeness is not intrinsic to linguistic form but just a situational judgment. With Culpeper (2011) (see Terkourafi 2005 too), we aim to show that there do exist constructions in language conventionalized for impoliteness, with a study of French parenthetical/free-standing *espèce de* ‘kind of’ + NP!.

We first analyze a random sample of 200 cases of the pattern from the frTenTen20 corpus (more specifically, instances followed by a noun optionally modified by one adjective and occurring between punctuation marks). An initial look at the data shows that most NPs after *espèce de* contain negatively evaluative nouns (e.g. *crétin* ‘dumbass’) and/or adjectives (e.g. *sale* ‘dirty’). Considering more general research into *espèce* (e.g. Chauveau-Thoumelin 2020), this bias is argued to be distinctive of its parenthetical/free-standing use. An in-depth investigation of each example in its co-text (see Culpeper 2011: 11-12) reveals that *espèce de* + NP! is also nearly always intended and/or perceived to have negative emotional consequences for the addressee (e.g. ironic *espèce de génie!* ‘you genius!’). Most exceptions are cases where the pattern is used jokingly or as a solidarity marker between friends/relatives (e.g. *espèce de petit con!* ‘you little shithead!’). With Leech (1983), however, we regard such instances as secondary since they depend on the potential of impoliteness. Together, these facts are taken as pointing toward the existence of a construction/frame conventionalized –“as a correlate of the (statistical) frequency with which an expression is used in one’s experience of a particular context” (Terkourafi 2005: 231)– for impoliteness.

This claim is tested in two more ways. We examine the first 50 examples of *espèce de* in frTenTen20 where the NP contains no overtly negative-evaluative noun or adjective (e.g. *espèce de femme!* ‘you woman!’). The analysis of their co-text shows that they too are almost always meant and/or understood as offensive. We argue here that the construction coerces such NPs into this interpretation. We will also conduct a questionnaire (to be developed) in which native speakers of French are asked to assess the well-formedness of *espèce de* with different NPs, in and outside context, and express their perceptions of them (the latter part will also include stimuli with pseudowords, e.g. *espèce de garlon!*). Our hypothesis is that negatively evaluative NPs will be considered more well-formed but that, irrespective of the actual NP, *espèce de* will be deemed impolite.

Expression and perception of (im)politeness of formal and informal requests in Spanish L1, French L1 and Spanish L2

Panel contribution

*Mrs. Aurélie Marsily*¹

1. *Université catholique de Louvain*

Politeness is a universal concept, but the ways in which it is applied varies from culture to culture (Kerbrat-Orecchioni, 2004). The languages of our study, French and Spanish, share many linguistic features, yet there are some notable differences between them. Several studies show that Spanish is a rather direct language (Bataller, 2013) and that the conditional mode is used in more formal requests than in French (Dewaele & Planchenault, 2006). Other studies highlight an increase in the use of *tú* vs. *usted*, especially among the younger generation in Spain and also that the Spanish culture is oriented towards positive politeness (Bataller, 2013).

In this study, I analyse the expression and perception of (im)politeness in a comparative perspective: the corpus COPINE comprises DCT, Naturalized Interactions (NIs, Marsily, 2022) and perception questionnaires. The DCT contains three situations of student-professor requests. The NIs incorporates five situations where a student performs requests towards professors in naturalized settings. The corpus includes Spanish native university students and French-speaking Belgian students of Spanish in different Walloon universities. The DCT and NIs are analysed quantitatively to retrieve (im)politeness strategies in requests. The perception questionnaires offer feedback on the participants' productions and highlight different conceptions of (im)politeness. The data are also compared with (Belgian) French L1 requests from a written DCT, to calculate the possible influence of the mother tongue among the Spanish non-native group.

The first hypothesis is that NN speakers of Spanish tend to overuse features identified in their mother tongue, such as the conditional mode, *usted* and indirect strategies. Another explanation might be that they find it more convenient and more in line with the norms they already know in their mother tongue or because of lack of knowledge of the politeness conventions operating the target language and culture. Secondly, I postulate that Spanish native speakers use more direct requests and that this reflects their culture of *acercamiento* (Briz & Albelda, 2013).

The results offer interesting insights on the production and perception of politeness in different N/NN academic situations.

How to express embarrassment in Persian, Japanese and French

Panel contribution

***Dr. Shima Moallemi*¹, *Prof. Chantal Claudel*²**

1. Utrecht University, 2. Université Paris Nanterre

The basis of ideal interpersonal encounters is that they should run smoothly. All sorts of polite behaviors are therefore used to avoid misunderstandings, conflicts or inconveniences that may lead to embarrassment.

Closely related to im/politeness, this feeling is therefore central to social relations. However, the situations associated with it seem to differ from one community to another. The same is true of the linguistic behaviours associated with it.

In studies about Japan, while embarrassment has been linked to guilt and/or shame (Benedict; Lebra Sugiyama 1983; Mead 2003; Kaufman 2011; Sakura et al. 1986), the existence of a continuum between embarrassment and shame now seems to be established (Lebra Sugiyama 1983: 194; McNamee 2015: 197), as the word *haji* refers to both (Lebra Sugiyama *ibid.*). The same is true in Persian where the term *sharmandegi* refers to both meanings (shame/embarrassment). The realisation of such a feeling can be linked to speech acts such as: “expressing gratitude, offering goods and services, requesting goods and services, apology, refusal, and accepting offers” (Sharifian and Jamarani 2011: 227). For example, in Persian and Japanese, ritualized expressions are used to express embarrassment. This is a linguistic strategy to achieve a form of politeness (positive or negative). However, it would seem that in French, embarrassment and shame are not as closely linked to the expression of politeness, particularly in the case of shame, which is generally directed towards another person (*T’as pas honte?*) or a particular situation (*Quelle honte! C’est la honte!*).

In a cross-cultural approach, we will try to understand the cultural conceptualisation (Sharifian, 2011) of embarrassment in Persian (*sharmandegi*), Japanese (*haji*) and French (*embarras*) and the place occupied by this feeling in the construction of interpersonal relationships and politeness in these languages. The question will therefore be asked to what extent this term can be linked to entries such as guilt, embarrassment and/or shame? Furthermore, are the behaviors that cause embarrassment comparable from one cultural community to another? Furthermore, which linguistic formulas refer to the expression of embarrassment? Which speech acts do they refer to? Apology? Other acts?

Polite requests with “*falloir*” in the language of service encounters in Côte d’Ivoire

Panel contribution

Ms. Linnéa Koré¹

1. university of Gothenburg

Extremely rare in service encounters in France (e.g. Hmed 2008), requests constructed with the verb *falloir*, for instance *faut donner deux cent mille* (electronics market), account for 21,5% of all requests in a corpus of 200 video-recorded interactions in French taking place at a supermarket, a pharmacy, an electronics market and an open-air market in Abidjan, Côte d’Ivoire. This makes them the second most important request strategy in the data of the current study: only the elliptical form is more frequent. In order to fill a research gap, the present study combines a frame-based and a discursive approach to politeness to answer the question: what effects relating to (im)politeness do participants in service encounters in Abidjan achieve when using the verb *falloir* to realise requests?

Firstly, I argue that the construction *faut/faudrait* followed by an infinitive verb, expressing the act that the speaker wants the hearer to perform, functions as a generalised implicature (Terkourafi 2005), flouting Grice’s maxim of quantity, in the service interactions of Abidjan. Indeed, this is generally how politeness is achieved when a speaker is uttering a request with *falloir* in this type of context, typically the kind of politeness that goes unnoticed. The construction *faut/faudrait* + verb has derived from the expression *il faut (que)...*, which is on the surface nothing more than an assertion about the necessity that something be done, as if imposed by an outer force. Therefore, the directive nature of this construction from the speaker to the hearer, is only implied. Moreover, the most preferred frame of the implicature in question is the following: electronics market, male speaker to male hearer, both speaker and hearer between 20 and 39 years old, close interpersonal relationship considering the context (such as regular customer or colleague) and independent request (as opposed to solicited or co-constructed).

Secondly, the results cannot show any clear-cut occurrences of impoliteness as an effect of requests with *falloir*. However, two interesting uses of requests with *faut* in the data challenge the definition of the term *impoliteness*. In one case, a participant qualifies her interlocutor, who utters several requests with *faut*, as “not polite”, even though she asserts that she finds him “very nice” and that she likes his way of speaking. In another case, a participant clearly finds her interlocutor impolite; nevertheless, it is probably the lack of initial greeting that damages the politeness of the interaction as a whole, not the interlocutor’s request with *faut*. These examples furthermore highlight that (im)politeness are discursive concepts.

Politeness in multilingual medical consultations

Panel contribution

***Prof. Véronique Traverso*¹, *Dr. Vanessa Piccoli*²**

1. CNRS, France, 2. Université de Nanterre

This contribution focuses on how people with limited language resources manage the relational aspect of interaction in the context of medical consultations.

It echoes the work on linguistic politeness and the management of interpersonal relations developed in Lyon in continuity with Kerbrat-Orecchioni 1992, while within a multimodal conversational analysis approach.

The analysis is based on a corpus of medical consultations with migrants in France. It focuses on the resources that the participants (patients and doctors) use to show their attention to the relationship when carrying out interactional activities linked to the situation (such as history taking, request for description of symptoms, explanation of the prescription by the doctor, request for prescription, change of medication by the patient). These situations are also interesting because they sometimes reverse the asymmetrical positions specific to medical consultations, when the exchanges are held in English, a language that the patient sometimes masters better than the doctor.

Processing pronouns of address during an online job interview in German

Panel contribution

Ms. Maria den Hartog¹, Ms. Patricia Sanchez Carrasco¹, Dr. Gert-Jan Schoenmakers¹, Prof. Helen de Hoop¹, Dr. Lotte Hogeweg¹

1. Radboud University Nijmegen

In many languages, speakers have to choose between informal or T (from the Latin *tu* 'you') and formal or V (from the Latin *vos* 'you') pronouns of address. Previous studies have determined that factors influencing T/V-use differ between languages and contexts (e.g. Kretzenbacher et al., 2006). Germans are known to prefer V-address for public communications, including interactions in the workplace. Being addressed with an unexpected T or V can lead to negative feelings on the side of the addressee, and to embarrassment for the speaker. However, the effects of T/V pronouns on the addressee remain understudied.

In our experimental study, participants ($n = 198$) took part in an online job interview for an unknown company. Participants were addressed by a recruiter with either T or V in a video recording. We asked the participants questions on a scale from 0 (full disagreement) to 100 (full agreement) to measure the effect of pronoun of address. We investigated the following domains: interpersonal relations (e.g. "The recruiter acts like they know me well."), attitude towards the recruiter (e.g. "This person is friendly."), job motivation and identification (e.g. "I would "fit in" in this work environment."), attitude towards the company (e.g. "I would describe the organization as friendly."), and salary expectations ("My estimate of the salary that the company may offer is: lower/higher than average.").

We constructed a linear model for salary expectations and linear mixed effects models for the other domains. We found no effect of pronoun of address on interpersonal relations. We found main effects of T/V on attitude towards the recruiter, job motivation and identification, attitude towards the company and salary expectations (see Table 1), with interviewees reacting more positively and giving higher scores when V-address was used. We found interactions between participant gender and pronoun of address for job motivation and identification and for salary expectations (see Table 1). In these domains, men showed a stronger sensitivity to pronoun of address than women, reacting more positively and expecting higher salaries when addressed with V. These results show that pronouns can indeed have an effect on the addressee, and the effect that pronouns of address have can be different for different genders. Our finding that attitudes are generally more positive when V is used reflects previous findings that V-address is seen as the appropriate choice with strangers. In this study, we have experimentally demonstrated for the first time that a violation of this norm negatively affects how German-speakers see their interlocutor and the organization that their interlocutor belongs to.

Processing pronouns of address: a job interview in French

Panel contribution

*Ms. Patricia Sanchez Carrasco*¹, *Ms. Maria den Hartog*¹, *Dr. Gert-Jan Schoenmakers*¹, *Prof. Helen de Hoop*¹, *Dr. Lotte Hogeweg*¹

1. Radboud University Nijmegen

French speakers have a choice of pronoun of address, either *tu* (often referred to as informal or T-pronoun of address) or *vous* (polite or V). This choice depends on factors like relative social distance, age of the addressee, sameness (Havu, 2009; Warren, 2009) and communicative situation (Clyne et al., 2009). French speakers are known to prefer V-address for public communications, including workplace interactions. However, over the last two decades, some studies observed an increase in T-use in workplaces and service encounters. As a case in point, a predominantly negative reaction was observed when several companies in France enforced informal address policies, as in the well-known case of IKEA. We aim to experimentally investigate the potential effects of T/V on the addressee in a work-related context.

In our study, 182 participants took part in an online job interview for an unknown company. Participants were addressed by a recruiter with either T/V in a video recording. We asked participants questions on a scale from 0 (full disagreement) to 100 (full agreement) to measure the effect of pronoun of address. We investigated the following domains: interpersonal relations (e.g. “The recruiter acts like they know me well.”), attitude towards the recruiter (e.g. “This person is friendly.”), job motivation and identification (e.g. “I would enjoy working in this company.”), attitude towards the company (e.g. “I would describe the organization as friendly.”), and salary expectations (“My estimate of the salary offered is: lower/higher than average.”).

We found a main effect of T/V (T vs. V; $\beta = -6.63$, $SE = 1.98$, $p < 0.001$) on the construct **attitude towards the recruiter**. Participants had more positive attitudes towards the recruiter when addressed with V, in line with previous findings that speakers expect to receive V-address in the workplace.

A marginally significant effect of the interaction between pronoun and gender was found ($\beta = -10.96$, $SE = 5.71$, $p = 0.057$). Women scores for **identification and motivation** were lower than men’s when addressed with T. This trend seems in line with previous findings that women use T less often than males in the workplace (Alber, 2019: 17), and might thus feel more motivated to pursue jobs where professional distance prevails through the V-use. V-address could be able to provide women with a stronger sense of belongingness in certain contexts, compared to men, although these results are not conclusive and further research into differential T/V effects for gender groups is needed.

We did not find any effects on the other constructs, suggesting that the scope of T/V effects is limited to the speaker, and a connection might not be made with a broader context (opinion about the company, salary expectations). Our study shows that V-address is strongly seen as the appropriate choice with strangers and that a violation of this norm negatively affects how French speakers perceive their interlocutor.

Requesting behavior and personality – An experimental study of French requests

Panel contribution

Dr. Nicolas Ruytenbeek¹

1. KU Leuven

The realization of speech acts is shaped by a variety of (socio-)contextual variables, as is the interpretation of utterances (Gibbs & Colston 2012). To this day, some attention has been paid to the role played by personality on the interpretation of utterances (Demeure et al. 2007) and on the language used in SMS (Holtgraves 2011). However, the role of personality on (email) requesting behavior remains unknown. This research seeks to fill this gap by addressing the combined influence of writer empathy and addressee personality on the use of politeness strategies in French email requests, a speech act often performed using this channel. I predict request forms to be more direct and include less mitigation in the case of writers who are low on empathy compared to those who are high on empathy. Assuming that requests targeted at rigid individuals entail a higher degree of threat for the negative face of the recipient of the email, I predicted a higher use of negative politeness strategies with rigid recipients in comparison with requests addressed to flexible individuals. By contrast, I expected positive politeness strategies to be more frequent for flexible recipients. In the current state of knowledge, it remains unclear how the interaction between writer empathy and recipient personality should influence the form of requests. However, a plausible prediction is that writers who are high on empathy will be more responsive to the manipulation of the recipient's flexibility with, as a result, greater variation in request formulation compared to writers who are low on empathy.

In Step 1, an empathy questionnaire including items about relation to authority and requesting behavior will be administered, via the testing platform Prolific, to a target number of 200 male participants with French as mother tongue and aged 30-50. Only the 25 respondents who scored lowest and the 25 who scores highest on the empathy questionnaire in Step 1 will be selected for Step 2.

In Step 2 (email writing task), these participants will be provided with contextual information and asked to produce an email request. The personality of the recipient will be manipulated (flexible vs. rigid recipient); 2 different types of requests will be involved (a: request to reschedule a meeting; b: request to answer an email on writer's behalf).

In Step 3 (exit interview), participants in Step 2 will be asked a few questions intended to shed light on the extent to which they adapted their requesting behavior to the personality of the addressee of their email.

« On remercie une fois encore » : Requests and anticipatory thanks in formal letters in L2 French

Panel contribution

*Ms. Sulun Aykurt-Buchwalter*¹, *Dr. Tatiana Aleksandrova*¹

1. LIDILEM, Université Grenoble-Alpes

Non-native speakers, in authentic and didactic settings, may be required to write formal letters. According to the CEFRL, advanced learners of L2 French are required to write argumentative essays and to adapt their speech to the appropriate register. This requires pragmatic skills, especially in accomplishing complex communicative goals related to politeness, such as formulating requests and thanks. This study, located at the interface between L2 acquisition and interlanguage pragmatics, seeks to observe and explain how L2 French learners express written politeness a situation characterized by formality and when addressing a hierarchically superior interlocutor.

Requests are a well studied speech act from an interlanguage perspective (Bardovi-Harlig, 1999 ; Warga, 2005). A wide range of linguistic tools serve as mitigators in requests and thus contribute to politeness. Thanking is defined as “an act by which the speaker acknowledges receipt of any ‘gift’ and expresses their gratitude to the person responsible for this gift” (Kerbrat-Orecchioni 1997 : 132). In an epistolary context, thanks are generally anticipatory, since the receipt of the gift is hypothetical, and are therefore considered to be a form of indirect request (Kerbrat-Orecchioni, 1997).

In this study, we analyse a corpus of 75 argumentative essays produced on the one hand by native French speakers, and on the other hand by four groups of L1 Chinese, Indonesian, Russian and Turkish learners. The texts were written based on a common prompt, namely, to write a formal letter addressed to the mayor of the city to persuade them not to cancel a cultural event. We compare the number of occurrences of explicit requests and thanks in the essays, as well as their place in the text structure. Then, we analyse the linguistic forms used to express these objectives, namely markers of deontic modality, lexical variety as well as formulaic language. Results indicate that the “explicit request without anticipatory thanks” pattern is the most frequent among native writers. Learners, on the other hand, overuse requests and thanks, as well as the politeness marker “*s’il vous plait*”, which mitigates the use of imperative mode. Regarding the linguistic forms, native writers differ from learners in their use of formulaic language, which confirms existing research on this subject. Variations also appear among the learners in terms of politeness markers. The contrasts suggest possible influences of the L1 and the effects of teaching, but also learner strategies in the expression of politeness in L2 writing. This study could be supplemented by an analysis of the corpora available in the learners’ L1s.

«Évitez les impératifs». Rules and formulae for master-servant directives in French nineteenth-century etiquette and conduct books

Panel contribution

Dr. Annick Paternoster¹

1. *Università della Svizzera Italiana (USI)*

The third wave in (im)politeness studies represents a middle ground between research into more stable meanings of politeness and into meanings emerging in interaction (Haugh and Culpeper 2018 on integrative pragmatics). One way of tapping into more stable meanings is to harvest politeness rules and formulae in conduct and etiquette books, which form a prescriptive politeness metadiscourse. Rules and formulae are presented within minimal contexts: how to formulate an invitation, offer food, disagree, apologise, formulate advice, make requests. With Terkourafi (2011) I take the view that conduct and etiquette writers reproduce exemplary usage, which they prescribe authoritatively. Aided by their higher social standing, they legitimise and restrict existing usage.

This historical proposal uses French etiquette books, *manuels de savoir-vivre*, and conduct books, *civilités*, two genres that were very successful in the second half of the nineteenth century, with hundreds of publications. My (small) self-built corpus is composed of public domain text drawn from Gallica.fr, the digital library of the Bibliothèque Nationale de France, <https://gallica.bnf.fr/> (23 etiquette books and 8 conduct books, see Fisher 1992; Paternoster 2022; Rouvillois 2008²). Both genres address the middle classes, which are defined by having at least one living-in servant (Guiral and Thuillier 1978). The proposal zooms in on the master-servant relationship, given that the superior-subordinate dynamic is what mainly characterises Discernment politeness (Hill et al. 1986; Ridealgh and Jucker 2019).

For the minimal context (Terkourafi 2001, 2002) of masters' directives towards servants, this proposal uses close reading and qualitative, manual analysis to make an inventory of linguistic politeness rules –«Évitez les impératifs » – and formulae – «Portez ceci à monsieur le comte», together with any metadiscourse justifying their usage.

Like Culpeper and Demmen 2011, who find that mitigating *can/could* for English requests is slow to take off in the nineteenth century, I find many impositives (which may even be commands, i.e. leaving no to refuse). The bald-on-record imperative demonstrates the presence of a Discernment paradigm, whereby masters use unmitigated impositives to express an order, which is not seen as impolite given the hierarchical difference (Ridealgh and Unceta Gómez 2020). However, a minority of sources recommend mitigating features such as the modal verb *vouloir*, the verbs *prier* and *plaire*, the nouns *prière* and *bonté*, the conditional, and the use of questions, which are explicitly evaluated as polite. I will closely look into a diachrony of rules/formulae in an effort to link the rise of mitigating formulae to ideological discussions about the master-servant relationship within the sources, which are of a political, religious, and commercial nature: sources increasingly warn that the servant is an individual in his/her own right.

(Digital) Grief Counselling: Helping Interaction in Grief Work

Panel contribution

Dr. Christina Siever¹

1. Universität Zürich

Dealing with grief – triggered by the death of a loved one or also a loss in general – is usually referred to as “grief work” (Schwarz-Friesel 2013: 278). The linguistic (and multimodal) practices of grief work are strongly guided by socio-cultural and historical norms (cf. Linke 2001 and Jakoby/Haslinger/Gross 2013). According to Hochschild (1979) compliance with these norms is a major task of the so-called “emotion work” but they often do not (any longer) meet the needs of the mourners. People who are grieving therefore often experience loneliness and they feel abandoned. As a result, they may seek help in form of the so called “grief counselling” in order to find a way to adequately cope with their grief or conduct “grief work”.

Historically, grief counselling was mainly a task of pastoral care, but in the course of increasing secularisation, people also started to seek help outside the church. In the course of this, different institutions for grief counselling as have been established in the western modern world (cf. Winkel 2004: 182-183). In addition, many (professional) individuals offer similar services with respect to this form of helping interaction for which they also make use of digital tools (cf. Graf/Spranz-Fogasy 2018: 422); one frequently observable example is the use of Instagram accounts to disseminate their knowledge and, of course, to draw attention to their work.

In the planned qualitative study, interviews with 10 grief counsellors who are using digital tools are conducted. The focus of the evaluation of the interviews is on the question of how the expert knowledge of the helpers and the experiential knowledge of the mourners can be meaningfully used in grief counselling or grief work. On the other hand, I am interested in the extent to which digital tools support and change grief counselling.

Diagnosis in Telemedical Consiles. Recipient Design in a Triatic Consultation.

Panel contribution

Prof. Karin Birkner¹

1. University of Bayreuth

Over the past years, the importance of telemedicine has increased considerably, especially for acute conditions. In Bavaria, patients with neurological symptoms of a suspected stroke are presented to expert neurologists in medical centres by doctors from rural clinics in order to shorten the “door-to-needle time”. The telemedical consultations consist of the clinic doctor and the patient on one side of a video conferences and the neurologist on the other. By taking the patient’s history, performing neurological tests (assisted by the clinic doctor) and consulting CT-images, the neurologist arrives at a diagnosis and a treatment decision.

Due to the medial constellation, diagnostic utterances as well as prediagnostic statements (Spranz-Fogasy 2014) are “heard” by all participants, nevertheless, they get addressed either to the patient, the clinic doctor or to both of them. The paper will analyse the linguistic practices of adjusting the transfer of knowledge – viz. the diagnosis – to the respective addressee, using different recipient designs that take into account the medial constellation as well as the diverging relevancies of the diagnosis for an affected person or an institutional agent. This way, intra- and inter-professional communication in the same encounter can be scrutinized. Using conversation analytic methods, we examine the interactional work and the multimodal and multimedial practices used by the participants in the delivery of a diagnosis in a triadic face-to-screen and face-to-face constellation.

The study is based on 34 telemedical consultations, recorded between 12/2014 to 5/2015, in the Munich Clinic Harlaching, lasting between ten and twenty minutes. Only considered oriented patients capable of giving their consent were included. The conversations were transcribed in accordance with the GAT2 conventions (Selting et al., 2009). In the analytical process, the selected sequences were gradually refined in a multimodal manner (Mondada 2018).

Explicit and implicit discursive practices of managing coaching-relevant knowledge in agenda setting

Panel contribution

***Dr. Sabine Jautz*¹, *Prof. Eva-Maria Graf*²**

1. University of Siegen, 2. University of Klagenfurt

Client: *Do you actually have to be well informed as much as possible...*

Coach: *That's an issue where I am maybe not in a position to be able to say so much about it*

The helping profession coaching is defined as a “process of equipping people with the tools, knowledge, and opportunities they need to develop themselves and become more effective” (Peterson/Hicks 1995: 41). As argued by Sator/Graf (2014: 92), “(t)he discursive management of knowledge, i.e. (re-)constructing clients’ experiential and/or epistemic knowledge as regards the solution of their problems (...) is a central element of coaching discourse”.

This core element of coaching discourse transpires in negotiating and managing differences in participants’ epistemic status, i.e., who has primary access to a targeted element of coaching-relevant knowledge or information and in participants’ epistemic responsibility, i.e., who is held accountable for having what type of knowledge and information (Stivers/Rossano 2010; Stivers et al. 2011) as well as their deontic status (Stevanovic/Peräkylä 2014). Coaching practice literature claims that coaches are responsible for the coaching process, i.e., bring the relevant professional expertise to best guide clients through the process and thereby allow for clients’ learning and development, while clients are responsible for content, i.e., bring their experiential and subjective expertise as regards their life and their concern(s). Concurrently, the discursive management of coaching-relevant knowledge is framed by and at the same time frames the working relationship between coach and client (Jautz 2017; Graf/Spranz-Fogasy 2018) as interactants treat knowledge as a moral domain with clear implications for their relationships with co-interactants (Stivers et al. 2011). All of this locally emerges in the use of different “interactional practices” which “both reflect and embody differential access to resources and to power” (Heritage/Clayman 2010: 50). While all clients bring work-related concerns, they have differing expectations as regards how possible solutions for their concerns in the form of new knowledge should be generated. Moreover, clients bring varying experience with coaching and their epistemic status with regard to coaching methods and procedures must be assessed in order to guarantee epistemic congruency regarding the coaching process.

We document how the interactants locally co-construct – in more or less aligning and/or affiliative ways – coaching-relevant knowledge in concert with their working relationship (Graf/Jautz 2022) by particularly focusing on agenda setting as part of the basic activities ‘Defining the Situation’, ‘Building a Relationship’ and as part of the basic activity ‘Co-constructing Concern’ (Graf 2019).

To this end, we analyse first sessions from systemic-solution oriented business coaching (<https://questions-in-coaching.aau.at/>). The data will be analyzed applying CA-based concepts such as sequentiality (Schegloff 2007), alignment and affiliation (Stivers et al. 2011), epistemics (Heritage 2010, 2011) and deontics (Stevanovic/Peräkylä 2014).

Helping. Managing knowledge in interaction.

Panel contribution

***Dr. Ina Pick*¹, *Prof. Claudio Scarvaglieri*²**

1. University of Basel, 2. Lausanne University

Outline and Results

In this contribution we present a concept of helping with language (Pick & Scarvaglieri 2019; 2022) as a basic means of helping that is gaining importance (Miller&Considine 2009, Graf & Spranz-Fogasy 2018) in the helping professions. We aim to develop an understanding of helping with language from an interaction-analytic perspective.

We suggest to conceive of helping with language as an interactive process in which the helper takes on (parts of) actions in place of the helped. Helping with language thus proceeds as a communicative pre-structuring of alternatives of thinking and/or acting in pursuit of a goal, and thus as management of help-seekers' knowledge. Such a pre-structuring of actions can be performed in weak (formulating or activating of knowledge), intermediate (formulating knowledge and evaluating alternatives) or strong (formulating knowledge and explicitly weighting of alternatives) ways. Our analyses show that in general the 'action complex' (Pick 2017) of helping with language can be performed in different institutional constellations and helping professions (Graf et al. 2014). However, depending on the overarching institutional constellation or the helping profession in which the action complex is embedded, we find varying *degrees of pre-structuring* alternatives (from weak to strong) as well as differences regarding the pre-structuring of alternatives of *thinking* versus alternatives of *acting* in relation to the different settings. We thus find that knowledge is managed differently in different helping professions. We will illustrate these differences in our presentation.

Data

We analyze authentic conversations in the helping professions (incl. psychotherapy and legal counselling). We rely on data gathered by us (Scarvaglieri 2013, Pick 2015) and on previously published material.

Methods

We follow an action-analytical approach (cf. Levinson 1979, Redder 2008) that allows us to reconstruct the action complex that shapes linguistic helping as well as the interactional processes that precede and follow the helping interaction.

Knowledge management in counselling on dementia risk prediction

Panel contribution

Dr. Carolin Schwegler¹

1. University of Cologne

Counselling on Alzheimer's disease (AD) detection and dementia risk prediction is a complex process and a relatively new medical task without proper guidelines (Rostamzadeh & Jessen 2020). From a medical, ethical, and legal point of view, it is desirable that the decision for or against a risk prediction – which is required after the counselling – is ideally a step-wise shared decision-making process as an ensemble of health care professional, patient, and close others (Alpinar-Sencan & Schicktanz 2020; Prvulovic & Hampel 2011). From a linguistic point of view, predictive counselling meets central elements of helping interactions (Graf & Spranz-Fogasy 2018) and offers interesting insights into the co-construction and management of knowledge in a biomedical and probabilistic context (Lehtinen 2013; Schwegler 2021).

The aim of this contribution is to examine selected relevant discursive practices and their sequential organization such as knowledge inquiring questions and “exploring (knowledge) by fishing” (Bergmann 1992) as well as the procedural realization of (AD and prediction-) specific terminology – with a focus on explanatory synonyms, repetitions, and reformulations.

Knowledge management through formulation offers - the example of Messenger-supported group psychotherapy

Panel contribution

Dr. Susanne Kabatnik¹

1. Greifswald

The balancing of knowledge asymmetries and the establishment of intersubjectivity is a central component of eSA group psychotherapy ('electronic Situation Analysis) as a genuine helping format (Pick & Scarvaglieri 2019). The therapy format aims to treat persistent depressive symptomatology, which is often accompanied by interpersonal conflicts (Schramm et al. 2011). The eSA format was developed to improve the communicative behaviour of patients with depression (Grosse-Wentrup et al. 2020). Smartphones are used to analyse the messenger-based communication of patients and their conflicts with familiars and relatives. Based on this, the group formulates a message collaboratively. Different epistemata of the interactants play a role here, i.e. both the professional knowledge of the therapists and the biographical, emotional and/or problem- or illness-related knowledge of the patients as well as the communicative knowledge of the interactants. These manifest themselves in particular in the formulation phase of the conversation, specifically in the formulation offers of the interactants. The establishment of a common ground (Clark 1992; Deppermann 2018) forms the basis for the joint project, namely the formulation of the message. In the formulation offers of the group, in which the knowledge and experience fields of the patients are manifested, there are, for example, evaluative elements or modal particles to indicate the epistemic status in the conversation (Heritage 2012; 2013). Using interactional linguistics (Imo/Lanwer 2019), I focus on practices of knowledge management through formulation offers in eSA group psychotherapy as a helping interaction format. The data basis for the investigation is an extensive corpus of 14 group psychotherapy sessions recorded at the LMU Munich in the Department of Psychiatry and Psychotherapy and transcribed in GAT 2.

Negative epistemic construction ‘I don’t know’ in German and Bosnian medical interaction. A cross-linguistic study

Panel contribution

Dr. Minka Dzanko¹

1. *University of Sarajevo*

Following Beach and Metzger’s (1997) work on insufficient knowledge, studies on negative epistemic construction ‘I don’t know’ in informal, institutional, and telephone conversations in various languages emerged. So far, very little research has focused on its use in medical interaction. Drawing from research in Conversation Analysis and pursuing a cross-linguistic pragmatic approach, I analyze two corpora of doctor-patient interaction to explore semantic, sequential, epistemic, and pragmatic aspects of ICH WEIß NICHT and NE ZNAM in German and Bosnian medical interaction. I argue that both phrases are being used as interactional practices to transfer a certain degree of knowledge between patients and doctors. Data come from 29 German and 28 Bosnian medical encounters. Analysis reveals similarities regarding (1) complementation patterns, turn-position, and a temporal scope (2) as well as their function to display either partial or related knowledge that might contribute to the topic at issue. However, as of their sequential context, the findings show differences which can be correlated with cross-cultural factors that influence medical interaction in German and Bosnian. While Bosnian patients produce NE ZNAM predominantly in question-answer sequences on their subjective symptoms and experiences of their illness, German patients use ICH WEIß NICHT in statements conveying patient initiatives and self-diagnosis.

Keywords: *conversational analysis, German, Bosnian, medical interaction, negative epistemics*

Patients' interpretations and knowledge management in medical interactions

Panel contribution

Ms. Moa Hagafors¹

1. ICAR Lab

With recent years' patient-centred approach, patients have been shown to take a more active role in medical consultations, and the notion of patient agency is central to conversational medical research. However, the participation of patients seems to depend on the phase of the consultation, and Stivers (2005) shows how patients are typically more active in treatment decisions than in the diagnosis. Peräkylä (2002) indeed demonstrates how in Finnish primary care, patients rarely produce something more than a minimal acknowledgement token after the announcement of a diagnosis, and that when they do produce an extended turn, it is rarely to participate in the interpretation of evidence but rather to react to the diagnosis proper. This may be explained by the importance of the professional vision (Goodwin, 2018) in this phase, where the expert knowledge of the physician contributes to the exact understanding of their observations. It is well established that the epistemic asymmetry in medical consultations not only depends on the participants' inherent roles but also on the sequential unfolding of the interaction. Patients' participation and claim of epistemic authority in the diagnostic step of the consultation can thus typically help balance this asymmetry. In this presentation, the focus will be on cases where patients participate in the interpretation of evidence, either when it comes to the evaluation of the examination, or the interpretation of symptoms and its possible link to various treatments. Departing from a Swedish corpus of nine video-recorded consultations in specialized care, we will look at examples of patients unsolicitedly offering their interpretations and thus claiming epistemic authority. As will be shown, this is being done in different ways: patients may express themselves freely before hearing the doctor's interpretation, or react as a response to it. The patient's interpretation may furthermore be in line with that of the professional, or contrast with it and bring up elements that the latter have failed to take into account. The sequential unfolding of the knowledge negotiation in these examples will be analysed, showing how the doctor treats this kind of participation. We will see how their responses range from non-response or minimal acknowledgement tokens to an alignment with the patient's production, taking their interpretation into consideration in the following decisions.

Practices of knowledge management in interpreter-mediated women's healthcare interactions

Panel contribution

***Prof. Laura Gavioli*¹, *Prof. Claudio Baraldi*¹**

1. University of Modena and Reggio Emilia

Due to a growing presence of migrant residents, consequent to movements toward the Western world, institutional-help interactions, such as interactions in healthcare, increasingly include a further form of verbal help that is translation between the language spoken by the institutional representative and that of the help seeker. Thus so called “interpreter-mediated interaction” has caught the attention of interaction studies for a while (e.g. Raymond 2014; Bolden 2018), highlighting the ways in which interactional forms of coordination (Wadensjö 1998) help establish intersubjectivity. In this presentation we look at interactions in women's health care in Italy, which we have collected over the last 15 years, now making up a set of more than 500 encounters (about 100 hours recording, see e.g. Baraldi/Gavioli 2021 for a recent development of the project). The patients in our data are migrant women speaking little or no Italian, who are helped by language mediators providing interpreting service. We focus on what is defined by Wadensjö (1998) as “expanded renditions” of the clinicians' talk for the patients. In their expansions, the language mediators make their understanding explicit of what the clinicians are referring to, thus supplying knowledge for the benefit of the migrant women's understanding and participation. Such is the case for instance of medical items (illnesses, tests or therapies), clinical procedures like check-ups, or recommendations about healthy behaviour (e.g. dietary choices), which are all rendered explicatively by rephrasing the items (Weiste/Peräkylä 2015), in more easily recognisable and understandable formulations. Expanded renditions then modify and re-present the clinicians' utterances so as to invite understanding (and participation) from the patient, a function of talk which is referred to in Heritage/Clayman (2010: 209) as transformative relaying. Thus, the way in which the interpreter's epistemic status (Heritage 2012) is related to the other participants' epistemic status consists in filling a gap of knowledge based on different practices of use of language in producing meaning in healthcare services on the one hand, and in the migrants' social contexts on the other. As a result, the interpreter's epistemic stance in the interaction is designed as that of a knowing speaker re-formulating talk with an orientation to enhance the migrants' epistemic status.

‘Benefactor’ recipient design in calls for help to the stasi

Panel contribution

*Dr. Olga Galanova*¹

1. Ruhr-University Bochum

Citizens outside and from the former GDR could find the telephone number of the Ministry for State Security (stasi) in any telephone book and contact the authority verbally. All calls were secretly recorded by the stasi and can be listened today in the Federal Archive for research purposes. My entire corpus consists of 800 calls that were made available to me by the archive in the form of digitised and anonymised audio recordings.

The calls to the Stasi were not just enquiries, complaints and denunciations. Some of them were requests for help, which, unlike denunciations and complaints, had not even been investigated. Therefore, the first challenge for both the Stasi and the researchers was to distinguish the calls for help from the other formats, especially those masquerading as calls for help. This leads to the following question, what characteristics indicate a help format, what specificity do they exhibit in the institutional context studied, and how is the organisation and distribution of help coordinated through the machinery of requests and offers in the setting studied (Clayman and Heritage, 2014; Schegloff, 2007)?

In 1989, citizens complained about unfriendly behaviour by the officer on duty to whom callers were connected and who attended to their concerns. This led to officers being instructed to greet callers with the “friendlier” salutation “Can I help you?” and to introduce themselves on the phone with an alias. While the main aim of the Stasi was not to provide a help service, but rather to keep records of callers’ personal circumstances, a help-oriented practical epistemologies of trouble-telling prevailed and became accountable.

In this context, the following research questions became relevant, what relational constellation emerged from such a self-initiated offer of help through this institutionally prepared greeting? How was a self-initiated recipient design of a “benefactor” (Raymond/Zimmerman, 2016: ff218) carried through the interactive process and what discrepancies resulted from such an opening sequence between “structural provisions” and “participants work design” (Jefferson (1972, p. 315)? These questions will be explored in my talk by means of concrete examples played in German and presented in the form of translated transcripts.

“What you have discovered here for yourself so far, maybe represents a learning regarding the topic and about yourself. Could one see it as such?” – (Epistemically) Pre-Structuring Alternative Thoughts and Behaviours via Questions for Solution Generation

Panel contribution

Ms. Frédérick Dionne¹, Ms. Melanie Fleischhacker¹

1. University of Klagenfurt

Institutionalized helping transpires between a help-seeking client and a helping professional and is mainly realized *in* and *through* (talk-in-)interaction. Its primary goals are to nurture personal growth and learning by addressing help-seekers' physical, psychological, intellectual and/or emotional constitution and problems related with it in a series of helping conversations (Graf et al. 2014: 1). Pick and Scarvaglieri (2019: 28; see also 2022) conceptualize such verbal helping as the “helping professionals' tackling of activities and/or stages of an activity in a goal-oriented process, which their help-seeking clients cannot carry out themselves (in the same quality, speed etc.) at this particular point in time.” This (partially) taking over of activities for the help seekers' benefit involves the professionals' pre-structuring of (action) plans, solutions, or problem-solving interventions. This is done via (epistemic) practices such as i) transmitting new or activating pre-existing knowledge, ii) introducing alternative patterns of thinking or behaviour, iii) providing assessment criteria for the help seeker to evaluate such alternatives; and/or iv) the professional's weighing of alternatives in respect to their potential for goal attainment. As such, at the core of (professional) helping reside endemic epistemic asymmetries: the helping professionals' expert knowledge in tackling and addressing potentially problematic aspects of solution generation, and the help seekers' experiential knowledge regarding their concern and, indeed, what constitutes an adequate goal and solution for their own needs (Graf & Spranz-Fogasy 2018: 427f).

Verbal helping presents structural similarities across a variety of counselling formats (Pick 2017; Pick & Scarvaglieri 2019/2022). Yet it differs in form and dimension, particularly on the level of pre-structuring which is undertaken by the helping professional, i.e., expert-oriented interactions include more pre-structuring than process-oriented helping does (Miller & Considine 2009). In work-related coaching, a process-oriented and client-centered format (Graf 2019: 2, 59), coaches are generally conceptualized as “change-process facilitators” (ibid.: 2), who, within a goal-oriented dialogue among equals (Jautz 2017), accompany and guide their clients on their path to finding individual solutions. In this talk, we investigate how a coach's verbal helping is realized in solution-generating questions and to what degree coaches pre-structure clients' solutions, i.e., alternative ways of thinking or acting therein. To do so, we analyze how coaches' (epistemic) practices (pre-)structure the formulation of ideal solutions, the topicalization of resources, the development of concrete strategies, and the evaluation of (interim) changes. We focus on 2 authentic systemic/solution-oriented business coaching processes, which have been video-and audio-recorded and linguistically transcribed following cGAt conventions (Schmidt et al. 2016).

From “Good for her” to “You in danger, girl”: making multimodal moral judgements on Twitter’s ‘Am I the Asshole’ posts

Panel contribution

*Dr. Elizabeth Marsden*¹, *Dr. Alba Milà-Garcia*²

1. Åbo Akademi University, 2. Universitat Pompeu Fabra

This paper describes the multimodal posting practices in the community of Twitter users who follow the account @AITA_Online. @AITA_Online reposts submissions from the sub-Reddit “Am I the Asshole?” in which users put forward morally questionable situations in which they, or another person, may have been acting reprehensibly, and ask the wider community for their judgment. Our data comprises 50 multimodal Twitter replies made by users to nine reposts by @AITA_Online from May 2019 to August 2020 which received over 100 likes. Visual elements may accompany a text comment added by the tweet author, they may have text embedded or they may appear as a standalone image.

In the data, GIFs and images are used predominantly as reactions to previous posts (Herring & Dainas, 2017: 2186); more specifically, and as noted by Dynel (2020: 524), often offering a metaphorical or literal visualization of a word used in the post, or the poster’s reaction/sentiment to the text. This embodiment of action or emotion is an example of the ‘affective capacity’ of the GIF (Miltner and Highfield, 2017) format. Not all of our GIFs and images fulfill this function however, with some, for example, serving to animate aspects of the original post.

Given the communicative goal of the dataset, which focuses on passing judgment on the actions of strangers, this affective capacity is notably relevant, since these multimodal posts may illuminate a particular understanding of the moral order (Kádár, 2017) or convey an (im)polite attitude towards the original poster or someone else mentioned in their story. This presentation will look at a small number of multimodal posts in detail, exploring their relationship to the surrounding context and potential communicative effects.

GIFs as Speech Acts

Panel contribution

Ms. Ashley Dainas¹

1. Indiana University

A picture is a worth a thousand words, but what about a picture that moves? Emoji and emoticons, the most studied multimodal communication devices, have been shown to convey complex pragmatic and semantic information and to perform speech acts in text conversations (e.g., Ge & Herring, 2018; Herring & Ge, under review). This raises the question of how GIFs, one of the more under-studied types of graphicons in computer-mediated discourse (CMD), are used in conversation. The present study addresses this question.

As part of a larger study on the uses and interpretations of GIFs, 20 self-selected dyads submitted four GIF-containing one-on-one personal text conversations. Two coders independently applied an adapted version of the CMC act taxonomy (Herring, et al., 2005) consisting of 19 speech acts (e.g., elaborate, react, claim, desire) to analyze the pragmatic meaning of each of the 80 GIFs in context. Interrater reliability never rose above 35%, and so the coders discussed each item until agreement was reached. This discussion often resulted in both coders changing their initial code.

Despite the lack interrater agreement, the results show that all the submitted GIFs could be seen as performing at least one primary speech act. GIFs were used most often to comment on, explain, or literally or metaphorically illustrate some aspect of a previous utterance. This was followed closely by being used to show listenership or engagement as well as to approve or reject a previous utterance. GIFs could also make objective and subjective assertions; communicate desire, encouragement, or speculation; or promise future action. GIFs sometimes performed other speech acts (e.g., requests, greetings, and apologies), but such uses were rare in the data. The presentation will conclude by discussing the difficulty of applying speech act categories to complex and ambiguous multimodal graphicons. The relationship between speech acts and other pragmatic functions (e.g., Herring & Dainas, 2017) will also be considered.

Graphical elements in online relationship maintenance: Age as a decisive factor

Panel contribution

Dr. Carmen Pérez-Sabater¹

1. *Universitat Politècnica de València*

This presentation proposal forms part of an ongoing study on how interactants exploit the technological affordances at their disposal to create and maintain relationships in cases where online interaction is seen as an extension of offline contact. Tong and Walther (2011) point out that the maintenance of interpersonal relationships online is expressed through the frequent use of specific markers of bonding or bonding symbols, referred to as “tie signs”, which serve to show the existence of a relationship between members of a given group or couple. The present study focuses on the role of graphics, that is, emojis, emoticons, stickers, images, GIFs, and video clips (Dainas & Herring, 2017), for the collective creativity of tie signs.

The corpus studied comprises 2 groups of interactions on WhatsApp during 2022: (1) those established among the members of 5 WhatsApp groups and 5 dyads of adult users aged 18-70, and (2) those exchanged in 5 groups and 5 dyads of teenagers aged 13-17 (total number of words 353 128/ 69 646 text messages). Langdetect and its library demoji on Python drew the quantitative results on the number of texts with multimedia elements, stickers, GIFs, emojis, emojis and text, and text. After the quantitative study, the discursive and pragmatic functions of the graphic elements were studied following Pérez-Sabater (2019), Sampietro (2019), and Yus (2021), centring on whether they offered propositional content or whether they simply enhanced group membership by creating a kind of “proximity in the virtual”.

The analysis shows that most conversations are triggered by the exchange of a multimodal element in the adults’ exchanges. In contrast, in the teenagers’ texts, a personalized GIF or sticker usually starts this performance of social connection. Another interesting outcome is that graphical elements work differently in adult user group chats and dyads. Co-presence and connection is enhanced by sending an emoji to these groups of adult users, whereas the exclusive exchange of pictograms is rare in the dyads studied. It seems that emojis need to be accompanied by text (62% of the messages) to express the required propositional meaning, mainly to signal that there is a relationship between the pair of interlocutors whose main reason for communication is to keep that bonding alive; emojis do not appear to be pragmatically marked elements but are merely being used as decoration. However, conventional emojis are rarely employed in teenagers’ texting to signal mutual affinity. These young texters, probably in their need to stand out visually, base their dyadic interactions on messages formed exclusively by personalized GIFs and stickers (67% of the messages).

How emojis interface with grammatical structures on WhatsApp and Instagram

Panel contribution

Dr. Brenda Corchado¹

1. Inter American University of Puerto Rico

This work in progress is founded on the premise that emojis are mainly born from the need to compensate for the lack of face-to-face communication that occurs in virtual environments. This compensation does not occur in a vacuum, but is combined, usually in communicative interactions with syntactic structures that produce semantic content (Yus, 2021). These combinations can produce multimodal metaphorical constructions (Forceville, 2009) whose meanings are elaborated with a social purpose; their understanding depends on the shared cultural knowledge that the exchange participants may have. We are not only interested in knowing how the modes were structured for the metaphorical creations, but we also intend to analyze syntactic aspects in order to see to what extent this compensation is becoming a substitution, what types of syntactic structures (verbs, nouns, adjectives...) are easier for the elaboration in emojis, and what tropes are more productives in creating metaforical constructions (metaphors, methonymy, rebus...)

The corpus comprises messages from young Puerto Rican university students between the ages of 18-25, provided voluntarily. Their participation was anonymous and they received no compensation for that. The WhatsApp and/or Instagram messages had to contain some pictogram and, although, after the evaluation of the sample, the communicative contexts of requests or rejections were preferred, they were not limited to these contexts. After establishing the communicative purpose, we proceeded to identify the textual cohesion of the message to recognize, through the same exchange, its understanding; that is, the same exchange evidenced whether or not the communicative purpose was achieved.

The novelty and speed of changes in this context make it difficult to use a single theoretical framework to investigate them, so we took some aspects of the Cyberpragmatics proposed by Yus (2011) and for the analysis of the multimodal metaphor (Forceville (2009, 1996) and Jewit et al (2016); for the textual cohesion of the metaphor (Martinec and Salway, 2005).

The work is in process, so there could be modifications at the time of its presentation.

Illocutionary context and management allocation of emoji and other graphicons in Mexican parent school WhatsApp communities.

Panel contribution

Dr. Elizabeth Flores-Salgado¹, Dr. Michael Witten¹

1. Benemérita Universidad Autónoma de Puebla

Today emoji and graphicons are commonly used in WhatsApp interactions. WhatsApp is an instant medium of communication that enables to use graphical forms such as emoji, photos, stickers or memes. Herring and Dainas (2017) introduced the term graphicon to refer to these semiotic systems. The purpose of this study is to analyze the interactional achievement of emoji and other graphicons in WhatsApp communities created by and for school parents. It also aims to describe how they are used to signal the illocutionary force of the utterance they accompany, their sequential position, and the management of turn allocation both before and after the message in which they are used. Using a conversation analytic approach, 4824 messages written by 161 Mexican Spanish users, members of six different WhatsApp communities were examined in this study. The results show that task-oriented speech acts were the most common in this community of practice. Speech acts such as requests and responses to requests were mainly accompanied by emoji and graphicons. It was also observed that these speech acts formed adjacency pairs in which requests most often formed the first part of the sequence. It was also found that depending on the communicative purpose of the message and the type of speech act used, the emoji functioned as either upgraders or mitigators. Emoji and graphicons also have the function of managing WhatsApp conversations by signalling conversational turns. Another finding revealed that stand-alone graphicons formed part of an adjacency system, replacing the verbal part of the message. Drawing on Locher and Watts' (2005) relational work model, the analysis revealed that the interactional use of emoji and graphicons was influenced by the politeness rules of this community of practice.

Kisses, peaches and fire: how emojis are used by online child sexual groomers

Panel contribution

Ms. Andrea García-Montes¹

1. *Universitat Politècnica de València*

The presence of emojis has been mentioned in online child sexual grooming (OCSG) studies as one of the elements present in these interactions (Lorenzo-Dus, Izura & Pérez-Tattam, 2016; Chiang & Grant, 2019; Seymour-Smith & Kloess, 2021). This is not surprising, since one of the main characteristics of digital communication is the use of emojis (Pérez-Sabater, 2019; Sampietro, 2019; Vela, 2020; Yus, 2022). However, the research on these graphicons (Herring & Dainas, 2017) in OCSG is reduced to McMahon and Kirley's (2019) study. Their findings show that emojis were recognised as evidence in diverse jurisdictions. Hence the importance of exploring the pragmatic functions of emojis in OCSG discourse.

Following Lorenzo-Dus, Kinzel and Di Cristofaro, we understand OCSG as “an internet-enabled *communicative* process of entrapment in which an adult uses language and other semiotic modes (e. g. images) to lure a minor into taking part in sexual activities online and, at times, also offline” (2020: 15-16). One of the strategies used by groomers to entrap their victims is by developing a deceptive trust relationship. Therefore, we can expect groomers using emojis to accomplish rapport management (Pérez-Sabater, 2019; Sampietro, 2019; Zappavigna & Logi, 2021). In this sense, emojis like *face throwing a kiss* or *face with tears of joy*—two of the most frequent emojis in Cantamutto and Vela (2019) and Sampietro (2019)—are involved in this deceptive relationship. Moreover, if the main reason for groomers to talk with minors is to get sexual gratification, these adults might be using emojis related to sexual terms; for instance, emojis such as peaches, aubergines or flames convey sexual meaning (Méndez Santos & Linares Bernabéu, 2022).

In this investigation, we report the findings of the first linguistic analysis of emojis in OCSG discourse. This presentation attempts to answer which emojis are the most frequent in our OCSG corpus. The data comprise 70 chat logs (103 475 words, 4669 emojis) exchanged among arrested offenders and real minors provided by the Spanish Secretary of State for Security. Our analysis, based on CADS, shows that groomers predominantly use rapport management oriented emojis rather than sexually marked pictograms. This suggests that offenders put all their efforts into creating a false love relationship/friendship with their victims, which reveals their clear manipulation tactics. With a similar aim, groomers use some emojis, especially the ones with anthropomorphic facial expressions, strategically, since they mitigate sexual content, present it implicitly or, even, introduce it in a playful way.

Pictures vs texting, texting about pictures. Conversational functions of everyday images on WhatsApp

Panel contribution

Dr. Agnese Sampietro¹

1. University Jaume I

Taking pictures is a common practice for many smartphone users. Nowadays, anyone with a smartphone can take a photo or a screenshot and share it with other users both publicly and privately.

Research on photo-sharing practices has mainly focused on pictures featuring human participants (see, for example, Venema & Lobinger, 2020; Katz & Crocker, 2015). In these situations, the phatic component is prominent: users send pictures to share moments, emotions, and feelings with other people. Yus (2021), in effect, acknowledges that the primary purpose of sharing pictures is the non-stop connection with other people. However, seeking connection is not the reason for many photo-sharing practices. Indeed, the representation of everyday objects or situations, especially when sent “on the go”, i.e., without embellishments, is largely unexplored. This study aims to analyse how ordinary images (pictures of objects, screenshots, etc.), often with unesthetic qualities, are introduced and commented upon in a conversation.

Data from this paper comes from a large (text-only) open-access corpus and a smaller multimodal (i.e., including pictures) private collection of WhatsApp chats. Methods draw on computer-mediated discourse analysis (see Herring, 2004) and digital conversation analysis (Giles et al., 2015). The analysis focuses on how pictures and screenshots are included in conversations occurring in instant-messaging interactions.

Results suggest that WhatsApp users share pictures of objects and screenshots to discuss the object represented or with phatic purposes. These images often appear in task-oriented exchanges, so they do not usually serve as a prompt for storytelling. Nevertheless, images often open a conversation, setting the topic for the subsequent discussion. Another function of pictures and screenshots is to sustain arguments with visual evidence. The discussion also considers how using pictures in conversation demonstrates users’ semiotic ideologies about the properties of photographic images.

Stickers and gifs to create identities: the case of Cameroonians' multilingual conversations on WhatsApp

Panel contribution

Dr. Ginette Maguelouk Moffo¹

1. University of Douala

This paper explores contextualized conversations of participants who use stickers and gifs in Cameroon WhatsApp groups. Online multilingualism considers different linguistic resources in user interaction (Danet & Herring, 2007, Pérez-Sabater & Maguelouk-Moffo, 2020). Therefore, this study examines the role of the languages used in stickers and gifs in two groups of participants on WhatsApp in Cameroon. The groups go beyond the dominant French-speaking official language to include other local and national languages of Cameroon and a growing number of hybrid languages, created mainly by the digital generation. The groups construct an identity on official and Cameroonian languages to show their link to the native home, and their interest in hybrid communities (Anchimbe, 2011).

The data comes from two WhatsApp groups of participants from Cameroon who recently joined the university in 2021. Data collection from these groups was not limited to the two official languages, English and French, it also includes native Cameroonian languages.

The analysis centres, following Androutsopoulos (2007), on (1) the relationship between linguistic diversity and ethnic identity online by examining the number of participants, their age and gender, and the dominant language used in each group. Following Garde-Hansen and Gorton (2013), this presentation analyses (2) how stickers intervene in the construction of online happiness and how they seek to eradicate cultural, social, political, historical, geographical and religious differences. Finally, (3) a statistical analysis of the languages involved in gifs and stickers is carried out.

The results show differences between the language practices of these groups. The quantitative analysis shows that age is crucial in identifying the types of messages used, likely because age influences in the degree of orality represented in different written stickers or Gifs and non-standardized languages.

Our research has established that this highly multilingual group of WhatsApp participants in the country adapt their language to the written or spoken context in which they are involved. Gifs and stickers include text to manifest the culture and achieve a particular goal in interaction.

Finally, the analysis of graphical elements shows that participants in post-colonial societies online prefer those that mix languages, basically very colloquial French and some English. Indigenous and Cameroonian languages are sometimes included to emphasise the solidarity among the participants by constructing the group online happiness.

Uses and functions of emoji in Spanish MPs' Twitter profiles: the influence of political ascription and gender

Panel contribution

Dr. Carmen Maíz-Arévalo¹

1. Complutense University of Madrid

From its first appearance on Twitter in 2007, hashtags have become ubiquitous in digital discourse, present not only on Twitter but also on Instagram or Facebook. Hashtags are multifunctional, as they have evolved from their original role as content and topic organisers to promoting social movements worldwide such as #MeToo or #blacklivesmatter (Bisiada 2021; Zeifer 2020). Scholarly interest in hashtags, with a focus on its communicative functions, goes back to the beginning of the 2010s (Page 2012; Wikström 2014; Zappavigna 2015). In the case of Spanish political discourse, hashtags have been proven to boost persuasion and to present speakers' communicative intentions in a concise and "easy to process" messages, which allows politicians to get closer to their (potential) voters (Casañ Pitarch 2020; Pano Alamán 2020) while "branding" both their own persona and the political party they represent (Mas Manchón and Guerrero-Solé 2019). However, most of these studies centre on political tweets while politicians' self-presentation on Twitter bios has not been studied. The present study aims to redress this imbalance by zeroing in on the diachronic analysis of hashtags (and their functions) by the Spanish members of parliaments (MPs) belonging to the consecutive terms 2016-2019 and 2019-2023. More specifically, the study aims to contrast the function(s) of hashtags in the Twitter profiles of the 350 MPs of the past term with the use of the same element by the 350 MPs of the current term. Adopting a mixed-method approach, hashtags were thematically coded by means of NVivo. Results show a significant increase in the use of hashtags by the politicians in the second group, with specific functions such as stressing the region or county they represent, repeating their party electoral slogans or social movements. Furthermore, although hashtags seem to point to the same themes, there are important quantitative differences when considering the politicians' political ascription (left vs. right-wing).

What is really at stake when we talk about “a pragmatics of emoji”?

Panel contribution

Prof. Francisco Yus Ramos¹

1. University of Alicante

Inferring entails a gap-filling inferential activity performed to turn what is coded into what is meant. This basic inference is also at work in internet-mediated communication (Yus 2011). In one of these internet-mediated interactions, namely messaging apps, texts are mainly typed, but the user is aided by a number of additional discourses (emojis, GIFs, stickers, audios...) and text-altering strategies (letter repetition, connoted use of punctuation...) in the accomplishment of their communicative intentions. These discourses and/or strategies make it easier to convey the intended interpretation within an otherwise cues-filtered environment. In this paper, I will focus on one of these discourses on messaging apps: *emojis* (specifically on WhatsApp). From a cyberpragmatic approach, typing an emoji on its own or attached to a text invariably has communicative value, that is, their presence in the messaging conversation alters, modifies or complements the way specific texts are interpreted and impacts how the overall interaction proceeds. A pragmatics of emoji normally aims at isolating their functions, as I did with my three-fold distinction of categories: *emoji within* (the text), *emoji without* (the text) and *emoji beyond* (the text) with a number of sub-functions (Yus 2021). In this paper, though, I acknowledge the usefulness of this pragmatic approach but intend to move beyond this analysis of emoji and show how interpreting emojis entails inferential strategies that so far have only been isolated for verbal content. In short, I intend to move beyond current semiotic analyses of emojis and, instead, picture them as genuine objects of pragmatic analysis on their own, and whose interpretation also demands those inferential strategies that have previously been supposed to be only at work in the comprehension of verbal content.

A pranzo is (not?) a dinner party. Observing words for mealtimes in a corpus of Italian and translated fictional prose in Italian (XIX-XX century)

Panel contribution

Dr. Floriana Sciumbata¹

1. *University of Trieste*

In his essay *A che ora si mangia?* (2017), the Italian historian Alessandro Barbero observes how times of meals and their names have changed since the XVIII century: they do so from country to country, they become a status symbol for social classes and shift through time, mostly owing to customs imported from abroad.

This study starts from Barbero's observations and explores how words related to meals in Italian, especially *colazione* and *pranzo*, as well as the related verb *pranzare*, changed their meaning diachronically throughout the past two centuries. *Colazione* and *pranzo* are indeed interesting cases, with the former previously used to indicate lunch and the latter dinner, or the most important meal of the day or a formal one, although today they are commonly used for breakfast and lunch. Furthermore, the analysis seeks to understand whether there are differences between their use and meaning in prose originally written in Italian and translated works.

The study is based on a corpus of fictional prose in Italian published between 1800 and 2005 and consisting of two subcorpora (works originally written in Italian and translations into Italian, ~8,000,000 words). The corpus is divided into four periods (1800-1899, 1900-1945, 1946-1975, and 1976-2005) on the basis of historical, social, and cultural factors in Italy, which will be useful to compare meal names over time.

To find differences between Italian and translated prose and in different periods, *colazione*, *pranzo* and *pranzare* were located in the corpus and considered if they specify the time of the day by mentioning the hour in which they take place or through other lexical strategies ("in the morning", "after waking up" etc.).

Results show that Italian writers consistently use *colazione* to indicate lunch and *pranzo* for dinner, while trends are different in translations: the use of *colazione* and *pranzo* is innovative at first (indicating breakfast and lunch respectively), and later more conservative (lunch and dinner respectively). Generally speaking, the cultural aspect ought to be taken into consideration, given that translators have the task of conveying different cultural systems using a different language. The influence of other languages, mainly French, may explain the innovative use of *colazione* in translations in the first periods, considering its two *déjeuners* indicating either breakfast (without specifications) or lunch (when *à la fourchette*). In contrast, the more archaic use of the last period can be ascribed to one of the translation universals, known as normalization (Laviosa-Braithwaite, 2001: 289-290; Ondelli, 2020: 35, 65), which explains the translators' tendency to choose more formal and standardized solutions. In this specific case, the translators' choice to use *colazione* for lunch and *pranzo* for dinner in recent years may have also been an attempt to emulate a more bookish and formal language. Regarding *pranzo*, referring to one meaning or the other not only depends on whether it is used in a translation or when writing formally but also on the formality of the social event itself.

Animating food and drink: How cartoons create fantasies, stereotypes and expectations about food

Panel contribution

Prof. Anthony Baldry¹

1. University of Messina

“The poulterers’ shops were still half open, and the fruiterers’ were radiant in their glory. There were great, round, pot-bellied baskets of chestnuts, shaped like the waistcoats of jolly old gentlemen, lolling at the doors, and tumbling out into the street in their apoplectic opulence. There were ruddy brown-faced, broad-girthed Spanish Onions, shining in the fatness of their growth like Spanish Friars, and winking from their shelves in wanton slyness at the girls as they went by. [...] The very gold and silver fish, set forth among these choice fruits in a bowl, [...] appeared to know that there was something going on; and, to a fish, went gasping round and round their little world in slow and passionless excitement”.

A Christmas Carol, Charles Dickens, 1843

In the pre-animated cartoon era only brilliant novelists like Dickens could use language to create *ante litteram* multimodal animations that encourage critical reflection on human nature. How much easier it is today to use the affordances of the animated cartoon to turn inanimate foods into animated human beings and use body movements such as lolling, tumbling, winking to poke fun at people’s fantasies, stereotypes, expectations and disappointments. Yet when, in today’s animated cartoons, human identities are merged with food and drink and their packaging, unanswered questions are raised about young people’s critical skills when exploring the relationships between caricature-creating semiotic resources (Baldry & Thibault 2006) and their awareness and empowerment *vis-à-vis* texts’ potential to manipulate and even to deceive (Vasta 2020, forthcoming).

Would animated cartoons, by their very nature, help with this empowerment? Could students find examples, satirical or otherwise, that encouraged their critical reflection on human identities and membership of communities? Using the affordances of the OpenMWS platform (Taibi 2021; <http://mws.pa.itd.cnr.it/>) for multimodal corpus construction, a group of university students constructed a searchable corpus of animated cartoon excerpts satirizing human behaviour through association with food and drink, focusing on the consequences from the standpoint of pragmatics (O’Halloran et al., 2014) of merging human beings with food and drink in often stereotypical but unexpected ways. The paper reflects on the students’ findings, that led them to widen their field of investigation and undertake related experiments, in relation to the students’ capacity to undertake and benefit from critical multimodal discourse analysis.

Kids and nutrition– the new frontier in the discourse about food

Panel contribution

***Prof. Viviana Gaballo*¹, *Prof. Sara Gesuato*²**

1. Sapienza University of Rome, 2. University of Padua

Printed products and digital communicative events on food preparation, assessment and consumption have been enjoying increasing social success. This phenomenon also applies to children, considering the number of cookbooks and cooking shows catering to young chefs. Since Cutter's (1994) research on the recipe genre, scholars have been paying attention to the discourse about food (Bergman et al. 2022). Yet, to our knowledge, no linguistic studies have been conducted on the discourse of food addressing children. Our study aims to contribute to filling this gap.

We consider 91 kids' recipes (about 30,000 words) available on the BBC Good Food website, 39 recipes from a young chef cookbook (about 6,000 words) and nutritional advice for kids (about 15,000 words) accessible on the Kids' Health website. We address these questions: A) how are kids' recipes and health information instructions for kids organised? B) What relationship do recipe authors vs health advisers establish with their addressees? Our approach combines a top-down and a bottom-up approach – i.e. familiarisation with the content and structure of the texts through repeated readings, and examination of collocational patterns of recurrent terms and phrases.

The online recipes comprise more moves than the printed ones: both compulsory (Title; Mini-introduction; Nutritional facts; Ingredients; Method; Questions/comments vs Title; Level of difficulty; Ingredients; Tools; Instructions, respectively) and optional ones (Cooking implements; Recipe tips vs Tip, respectively), recognisable from their headings and arrangement on the page. The most prominent in both sets is the Method, although more detailed in the online recipes. Divided into numbered Steps, it guides the reader through the stages of food preparation: it comprises instructions ("Peel X"; "Add Y"), indications on procedures ("then"; "with your hands"), clarifications on procedures ("if using X"; "use X to do Y"), and warnings ("so they don't X"; "be sure to Y"). The focus is thus on the conative function of language.

The nutritional advice texts are divided into short (one-to-four paragraph-long) titled Sections, which contain a combination of: attention-getting utterances ("Do you like putting on an apron and making a delicious snack for your family?"); explicit "sensible" tips ("Also be sure to wash your hands before and after handling raw meat"), and instructive information ("Stimulants make us feel more awake and alert."). The focus is on the conative, referential and phatic functions of language. In both datasets, the wording suggests a relationship between experts and non-experts.

The findings suggest that recipe authors take their readers' interest for granted, assuming no prior familiarity with cooking, whereas nutrition experts appeal to kids both rationally and emotionally, aiming to sensitise them to food health issues.

Polite and politic work in Greek food blogs: The case of praise

Panel contribution

Prof. Angeliki Tzanne¹

1. National and Kapodistrian University of Athens

Food blogging, “the practice of publishing food-related posts on a blog” (Lee et al. 2014: 228), is a way for people to exchange information about food. In addition, bloggers and visitors to blogs have the chance to create and maintain a network of relationships. In the case of Greek food blogs, in particular, participants have been found to cultivate relationships of closeness and solidarity, mainly through the positive politeness strategies they use (Tzanne 2019; 2022).

This paper is concerned with praise, a positive politeness strategy that occurs frequently in the comments section of 10 Greek food blogs run by amateur cooks. Drawing on Brown and Levinson’s ([1978]1987) theory of politeness, and relational work, the discursive approach to politeness put forth by Locher and Watts (2005), the paper examines the main forms of visitors’ praise, the ways it is received by food bloggers and the types of relational work it performs.

It will be argued that, although praise could be seen as a clear example of Brown and Levinson’s ([1978]1987) positive politeness strategies, in particular an output of “Notice, attend to H (his interests, wants, needs, goods)” and “Give gifts to H (goods, sympathy, understanding, cooperation” (Brown and Levinson, [1978]1987: 103, 129), in the case of Greek food blogs, praise, especially ‘simple praise’, may constitute politic relational work (Locher and Watts 2005), that is, *unmarked* relational work which is merely adequate and appropriate for the specific context. This can be justified by the fact that most of the instances of simple praise go largely *unnoticed* (Locher and Watts 2005; Watts 2003) by bloggers and, thus, remain unacknowledged in the specific context of digital communication.

In the light of the above, it will be suggested that, in the discourse of Greek food blogs, many instances of praise may function as greetings or preface to other speech events like requests for information. Finally, it will be argued that, since there is no evidence that not responding to praise is perceived as impolite, leaving praise unacknowledged also constitutes politic behaviour in the particular context.

The Road to Well-Being: Illy's CSR campaigns as a best practice for local community engagement

Panel contribution

Prof. Nicoletta Vasta¹

1. University of Udine

In keeping with a major Conference strand – i.e. “how human interaction forges atypical solidarity ethnic, social, linguistic and political divides” –, and with the Panel’s focus on “how communication about food and nutrition is shaped, both verbally and visually”, this paper analyses Illy’s recent advertising campaigns on coffee growing and consumption rituals.

The analysis shows that, while *Illydreamers* (2015) and *Live HAPPIlly* (2017) promote the brand as a lovemark (Roberts 2005) – creating an intimate, long-lasting company/consumer relationship –, subsequent campaigns are CSR-oriented, with Corporate Social Responsibility covering multiple topics “from safety and diversity to ethics, the environment, and community involvement” (Evangelisti/Garzone 2011: 122) and incorporating Illy’s commitment to sustainability and local communities’ engagement. Incidentally, Illy has established an award-winning coffee procurement certification protocol to meet CSR standards (<https://www.illy.com/en-ww/live-happilly/stories-of-sustainability>).

While the *Thanks4thecoffee* (2016-2019) campaign is one of the ways in which the company publicises its work in establishing the above-mentioned certification protocol, its major focus is on celebrating International Coffee Day by atypically showing the delivery to coffee growers of the thank-you-for-the-coffee messages collected on its website and in Illy coffee bars worldwide. The campaign thus rather unusually focuses on creating a social bond with coffee growers, rather than with the company or brand, and on promoting collective well-being resulting from their work. To underscore the message of collective well-being, the thank-you messages are read aloud to coffee growers by their children in the 2017 version of this campaign. The 2018 *Half a Cup* commercial for this campaign pays tribute to women’s work in coffee production by multimodally underscoring the fact that, since women represent almost half of the workers in the supply chain, their absence would result in half a cup of coffee. Finally, in 2019, the campaign is based on plant-to-cup coffee sounds and on the thanks from people worldwide to coffee growers, thus exploiting the synergic interplay of different semiotic resources. *Welcome on the Road to Happiness* (2021) and *Cupsid Down* (2022) complete Illy’s innovative journey to solidarity and community well-being.

Starting from a brief overview of how coffee consumption differs as a result of the development of specific cultural habits, the paper ultimately aims to investigate, in a CMDA perspective (Vasta 2005, 2010, 2012, 2020), how the above-mentioned campaigns manage to instantiate narratives of social bonding and CSR which represent an innovation, in pragmatic and strategic terms, with respect to more traditional fair trade policies and discourse strategies enacted by other coffee companies.

With a ‘Beat’ of Salt. The Evolution of Recipes in the TikTok Era

Panel contribution

Dr. Ilaria Moschini¹

1. Università degli Studi di Firenze

Cooking recipes belong to a well-defined procedural genre, with the clear writing purpose of providing instructions on how to prepare dishes, which has remained remarkably constant over the years (Taavitsainen 2001). For several centuries, the main formula of cooking recipes consisted of a title and a body of the text with the instructions. At least since Medieval times, layout and coloring have assisted this division into text parts with a typical two-part visual structure helping in “scanning by title and then reading a single recipe” (Carroll 2010, 64).

The emergence of channels of communication such as television and digital media has favored some transformations in the scenarios where cooking recipes are produced and shared. Emblematic artefacts that have emerged are television shows which – from the early informative programs led by home economists and nutritionists – have turned into entertainment, personalized, and gamified shows (Collins 2009). Other artefacts are food blogs, where communication can potentially take place between experts and non-experts (Cesiri 2020). However, as Garzone highlights (2017, 47-48), the genre of cooking recipes appears to have remained quite unaltered since culinary instructions tend to be embedded into such textual spaces through many examples of intertextuality.

TikTok, a video-sharing social app that has exploded worldwide since 2018, has changed the global communicative landscape by providing an influential hub for entertaining content, especially for the demographic group of people between the ages of 18 and 24 years. “Cooking/recipes” is one of the most popular content categories on this platform, featuring around 18 billion hashtag views at a global level (Statista 2022).

Through the multimodal analysis of a qualitatively selected corpus of *TikTok* cooking recipes, the paper will explore the ways in which the genre has been affected by this new kind of digital mediation. It will investigate how the semiotic work is distributed among the different resources offered by the digital platform in terms of affordances and constraints. It will also examine whether the “semantic regime” that sets the ideational goals of the media environment influences the ultimate communicative scope of this procedural genre.

“Eat, Play, Love”: An Interlinguistic Perspective on Montalbano’s Pragmatics and Aesthetics of Food

Panel contribution

*Dr. Carla Quinci*¹

1. University of Padua

Much ink has flown on the hurdles of translating the crime stories of Camilleri’s extravagant detective Montalbano either on paper or screen. The strong Sicilian identity pervading the setting and the characters’ language (e.g. Fodde, 2019; De Meo, 2020), habits, humour, and mindset represent the main translation challenges in Camilleri’s work, making the translator walk the tightrope between preserving authenticity and ensuring understanding. Besides shaping and depicting the Sicilian cultural identity, food may be considered a fictional character in itself, one that holds a privileged relationship with Montalbano and overshadows those with love and work. In an attempt to expand Dore’s (2015) work on the English subtitles of the first 13 episodes of Montalbano’s TV series and provide an additional, pragmatic perspective on the translation of food discourse, this paper analyses all 36 episodes with English subtitles of Inspector Montalbano aired by the BBC in the UK. All the food-related instances of verbal and non-verbal communication were retrieved and analysed intra- and interlinguistically. The intralinguistic analysis considers the instances in the original Italian version and explores how food is conceived, and how it shapes cultural and individual identities and affects interpersonal relationships. Interlinguistically, the paper investigates whether and how these pragmatic aspects are conveyed in Inspector Montalbano by drawing on Dore’s (2015) analysis of translation strategies, with a focus on authenticity (Adami 2017). Some recurrent food-related references, including both food terms and culinary habits, can be classified as expressing Montalbano’s national, regional, and individual culture. These contribute to shaping his identity on multiple levels, thus increasing the character’s authenticity. As for the relationship with food, some clear tendencies emerged. Food is often prioritized over work and personal issues; it is celebrated – as are those able to prepare good food – and considered a form of art; it influences people’s moods, and is offered and shared to welcome others. Contrary to contemporary views, overeating is not condemned but is rather depicted as a way to celebrate food. Finally, food also carries an allegorical value, as good food is associated with those who appreciate it or know the secrets and art of its preparation, and bad food is associated with allegedly unworthy people, e.g., the Forensics. From an interlinguistic perspective, national-level food-related cultural references (e.g. coffee) are often translated through direct equivalents, while regional references are predominantly foreignised through borrowings (e.g. *pasta ‘ncasciata*), which preserve their authenticity. Adaptation through generalisation also occurred, causing a partial loss of the pragmatic nuances of food-related references.

“Five Foods to eat if you have Covid-19”. Discursive strategies in health claims of food-related communication

Panel contribution

Prof. Stefania Maci¹

1. University of Bergamo

The amount of popular literature, television and radio shows, online forums, and blogs on the reparative and restorative properties of food and drink, has increased dramatically during the past 20 years. However, as the public has become more educated about the irrefutable link between nutrition and health, it has also been much more perplexed about what to consume. Due to the marketization of a variety of very diverse diets, each claiming to be the safest and healthiest (the macrobiotic, vegetarian, pescatarian, ketogenic, and paleo, to quote some of them), uncertainty about what we should be eating has created a sense of rising uneasiness. Those who have survived an illness, particularly in the case of the pandemic, tend to feel this unease far more strongly, worrying that specific drugs may be the cause of eventual death and that this can be overcome with the right dieting.

This talk aims at providing an overview of the process and discursive strategies involved in formulizing and disseminating health claims in food-related communication from science to laypeople in times of crisis (Covid-19) across cultures (the UK and Italy), how these are decoded by laypeople and what information laypeople process and retain.

In the first phase of our corpus-based investigation, we will gather information through official documentation in English provided by the health ministries of the interested countries in relation to food consumption and Covid-19 treatment. Parallel to this, we will explore through social media (namely Twitter) how laypeople interpret, understand and re-encode such food-related messages conveying health claims. The aim is to identify linguistic and/or visual attributes that play a key role in the understanding of food-related information in relation to Covid-19 treatment across cultures and linguistic contexts.

The identification of the core discursual and rhetorical features about food shared by health communities and professional stakeholders from different language backgrounds (i.e. English and English as a Lingua Franca when communicating to speakers of other languages), will allow the detection of those features that single out the laypeople's difficulties in decoding the textual output of such communities and thus in misunderstanding the pragmatic intentions existing beyond the text. These findings will lead to the identification of the best (and worst) communication practices about food by health professionals and stakeholders, which will help to elaborate effective ways to

- formulate and disseminate proper food-related information in scientific health claims;
- develop recommendations and guidelines for Health Policy Makers, Regulators, and any interested stakeholders on how to better construct food claims in relation to Covid-19 and any other serious disease that can be understood by the intended consumer, taking into account cross-cultural and cross-linguistic factors.

A turning point in metaphor development: Significant improvements and shift in cognitive scaffolding during school-age

Panel contribution

***Mr. Nicolas Petit*¹, *Prof. Valentina Bambini*², *Dr. Luca Bischetti*³, *Dr. Ira Noveck*⁴**

1. Hospital Le Vinatier, 2. iuss, 3. University School for Advanced Studies IUSS Pavia, 4. Université Paris Diderot-Paris 7

Metaphors are a powerful and ubiquitous tool for verbal communication (Gao et al., 2017; Glucksberg, 1989; Sopyry & Dillard, 2002), but this process appears to be fully mastered only late in children's development (Winner et al., 1976). Although emerging early (Pouscoulous & Tomasello, 2020), metaphor comprehension remains task-dependent until late, with a particular development window between 8 and 11 years old (Deckert et al., 2019). The autism literature postulated two important cognitive bases for metaphors comprehension, namely theory of mind and formal language skills (Kalandadze et al., 2019), the former because understanding metaphors arguably requires reconstructing the speaker's intention, the latter because refined and stable linguistic representations might be necessary to derive a figurative interpretation. Yet, these two factors have only been investigated more recently in typical development (e.g. Lecce et al., 2019 for theory of mind), but not in a joint perspective. To fill this gap, we recruited 249 children between 6 and 11 years old, who were native French speakers and whose parents did not report any neurodevelopmental disorder. Children were assessed for receptive grammar (BILO-2C CO, Khomsi et al., 2007) and theory of mind (PST, Langdon & Coltheart, 1999), as well as for metaphor comprehension via a referential metaphors task (as Noveck et al., 2001) as implemented in the TIPi (Test des Inférences Pragmatiques informatisé, Petit et al., in progress), a new tablet-based assessment tool for pragmatic comprehension. Results showed a non-linear developmental trend in metaphor comprehension, with a focused improvement between 7 and 9 years old. Mixed-effects models explaining children's accuracy and response times showed that the cognitive predictors of metaphor comprehension changed with age: theory of mind was a reliable predictor in younger children (6 to 8 years old) but faded away in favor of receptive grammar in older children (8 to 11 years old). These results confirm that school age is a key period for the development of metaphor comprehension and suggest that the underlying strategies or cognitive scaffolding of this ability might be evolving in this window.

Acquisition of manner implicatures and sense of conventionality in children

Panel contribution

*Dr. Ingrid Lossius Falkum*¹, *Dr. Elspeth Wilson*², *Dr. Camilo Rodriguez Ronderos*¹,
*Mr. Henrik Torgersen*¹

1. University of Oslo, 2. University of Cambridge

Grice's Maxim of Manner entreats speakers to 'avoid obscurity of expression', 'avoid ambiguity', 'be brief' and 'be orderly' (Grice, 1975; but see later reformulations in Horn 1948 and Levinson 2000). If a speaker says 'that idea is not impossible', she implies that it is not straightforwardly possible, otherwise she would have used the synonymous but briefer alternative, 'possible'. To date, manner implicatures have only been tested in children with the lexical-periphrastic causative alternation (e.g. 'he made the door close' vs. 'he closed the door'), which, however, is possibly lexical rather than pragmatic (Antoniou & Katsos, 2017).

Manner implicatures present an interesting case in revealing how children's cognitive development interact with their pragmatic competence. In particular, a rich literature documents children's development of conventionality, both linguistically and across a range of nonlinguistic domains. This may include a stage of heightened sensitivity to convention (Falkum, 2022).

We investigate the acquisition of manner implicatures in children by looking at lexical alternations within DPs. Using the relation between a lexical item and a hyperonym (e.g. 'chocolate cake' vs. 'round chocolatey thing'), we investigate how children comprehend manner implicature used to reference an untypical variant of the base form. In terms of acquisition, we investigate two hypotheses:

(H1) Children follow an inverted u-shape in rates of manner inferences

(H2) Children reach adult-like rates of manner inferences relatively late

Method: We use a picture-selection task with 3-, 5- and 7-year-olds and adults (total N = 96). Participants hear a context sentence, which either establishes a supportive context (e.g., It was Tom's birthday so Sasha tried some baking) for the marked meaning or a neutral context (e.g., It was Tom's birthday so Sasha did some baking), followed by either a marked implicature-triggering sentence (e.g., She made a round chocolatey spongy thing) or an unmarked literal sentence (e.g., She made a chocolate cake). Supportive/neutral contexts are crossed with critical/control sentences to yield four conditions. Participants are presented with two images on a screen, one matching the marked meaning of the utterance, and one with the unmarked meaning, and listen to the short story (context sentence + critical/control sentence). After each story, participants are asked to point to the picture which matches the utterance.

In favour of (H1), children's heightened sense of conventionality could mean that they acquire implicatures as soon as other implicatures, and may even be more sensitive to them than adults. This would predict an inverted U-shaped development, where children begin to derive manner implicatures, and then with heightened sense conventions do so increasingly, before decreasing to adult-like levels.

On the other hand, pro (H2), although manner and quantity implicatures share similarities, manner implicatures are plausibly more complex, and therefore more challenging for children, in that they involve negation of the inference to the stereotypical of the unmarked alternative (i.e. 'a normal chocolate cake') rather than negation of the alternative's meaning itself (following Levinson).

Class innovation and sense conventions at the syntax/pragmatics interface

Panel contribution

*Mx. Biu Rainey*¹, *Dr. Ingrid Lossius Falkum*¹

¹. *University of Oslo*

Children as young as 2 years old are well-documented in their capacity for lexical innovation, including extending words across class boundaries (e.g. “I’m talling” for getting taller, Clark 1993). However, experimental evidence suggests children struggle with class derivation before 3 (e.g. Lippeveld & Oshima-Takane 2015, 2020). Why the disparity?

Almost all of this experimental literature holds the common assumption that roots are marked for class in the lexicon, and that class derivation is therefore reliant on the acquisition or activation of transformational rules. We propose instead that **class is not lexically marked**. Morphosyntax instructs the parser to retrieve and construe an unmarked concept *X* in the **manner that the speaker intends - that is, the optimally relevant manner**. As a consequence, we hypothesize that as long as the communicative task at hand is not beyond their developmental level in terms of pragmatics, even the youngest children should be able to process innovative uses of class.

If the above holds, then **class innovation should be impacted by sensitivity to convention**. Encounters with words act as convention-shaping mechanisms, with each encounter further entrenching a given interpretive process as the conventional method of construing the associated concept - similarly to how sense convention interference might occur in instances of metonymy or other modulation (Falkum, Recasens & Clark 2019). We created an experimental setting to investigate this, testing children’s understanding of innovative uses of class in both ‘familiar’ and ‘novel’ conditions. In the familiar condition, the children will have acquired both the target item and at least some associated class conventions through usage. In the novel condition, the children will have no pre-existing class conventions associated with the term, and will thus be relying entirely on pragmatic capacity to grasp the speaker’s intended meaning (Carston 2016).

In the experimental design, children from 2 to 5 years old engage in a picture selection task. They first encounter an animated character, who performs either a novel or a familiar action, accompanied by a verbal prompt (e.g. “Look! It’s *waving/plikking!*”). They then see two new characters, one of whom will be performing the taught action while the other performs a novel distractor. Children are asked to identify the target, this time in a nominal frame (e.g. “Can you show me the *waver/plikker?*”). Both picture selection and reaction time are recorded and analysed. This process is repeated for 10 items (not including control items), 5 familiar and 5 novel, with encounter order randomized, resulting in a within-subject design. Following the above account, our prediction is that in both the novel and familiar conditions a high success rate in target selection will be seen at the youngest age. However, this success rate will fall off with age in the familiar condition, due to an increasing sensitivity to class convention in the older children.

Literalism in Autistic Individuals: Relation with Predictive Processing Accounts

Panel contribution

***Dr. Valentina Petrolini*¹, *Mr. Christian Michel*², *Prof. Agustin Vicente*³**

1. University of the Basque Country, 2. University of Edinburgh, 3. Ikerbasque Foundation for Science/University of the Basque Country

1. Autistic individuals have a stronger tendency than neurotypicals to understand non-literal uses of language literally (Chahboun et al., 2017), as well as to experience difficulties in understanding implicit meanings (Wilson & Bishop, 2020). Vicente & Falkum (2021) criticize existing accounts of such phenomena. In this contribution, we propose to relate literalism to predictive processing accounts of autism.

2. Predictive processing (PP) holds that the brain, in its effort at building a model of the environment, is constantly making predictions about what the subject is going to experience, updating the model according to the input received. Predictions are then assigned prior probabilities according to how reliable the model is taken to have been in the past. According to PP approaches to autism, a core difference between neurotypical and autistic brains is the weight assigned to sensory information. While the neurotypical brain assigns more confidence to its higher level priors, the autistic brain assigns more weight to sensory data at the expense of such priors (Pellicano & Burr, 2012). PP accounts have offered explanations of most autistic symptoms, from insistence on sameness to social difficulties (Palmer et al., 2017).

3. Predictions also play an important role in linguistic comprehension. Pickering and collaborators (Pickering and Garrod, 2021) have proposed a model of language understanding where hearers are constantly issuing predictions about prosody, syntax, content, and intentions of the speaker. Predictions at these different levels are constantly and dynamically updated depending on what the speaker is actually producing.

4. Concerning non-literal uses of language, or implicit meanings in general, hearers have to guess what speakers try to convey. Take an implicature that includes the question (Wilson & Bishop, 2020): “Did you hear what the police said?” and instead of the predicted answers – i.e., ‘yes’ or ‘no’ – the hearer gets the following answer: “There were many trains passing by”. In order to get the implicated meaning ‘no’, the hearer has to be confident that, no matter what the speaker actually says, the answer has to be ‘yes’ or ‘no’.

Regarding figurative language - especially metaphorical language - hearers have to find the right analogy after an unexpected semantic clash (E.g. Juliet is the sun - but in what way?). The hearer expects certain features in the predicate (e.g., features that apply to persons), and is surprised by a predicate whose salient features are not the expected ones. High confidence in one’s prediction about the overall speaker’s meaning may make it easier to select features that are applicable to the subject of the utterance while suppressing the rest. By contrast, low confidence in one’s prediction may make it harder to suppress features of the literal meaning, and make the hearer get stuck as a consequence, trying to make sense of how to apply literal predication.

5. A PP account can successfully explain literalism in autism, as well as the observed asymmetry between, *inter alia*, metaphor comprehension and metaphor production (Kasirer & Mashal 2014), where individuals arguably experience a lower degree of uncertainty.

Losing the thread: How 3- and 5-year-olds predict the outcome of a story when non-literal language is used to update events.

Panel contribution

Dr. Claire Prendergast¹

1. University of Oslo

How do young children make sense of non-literal language in context? In a picture selection task testing 3- and 5-year-old's capability to predict the outcome of a story when an idiom is used to update events, we investigated the cognitive strategies preschool children adopt in event prediction and how much weight they assign to different contextual cues in doing so. In the main study, Norwegian-speaking children (N=122) were asked to predict the ending of story from a polynomial display of four options onscreen relating to event prediction heuristics: *anchoring* (outcome event not updated by the idiom), *representativeness* (correct outcome), *availability* (a literal interpretation of the idiom) and *nominal matching* (distractor). A follow-up study (N=40) alternated onscreen options to further investigate differences in performance on the task for each age group. In the main study we found that 5-year-olds chose the *literal* option at a significantly higher rate than 3-year-olds. However, 3-year-olds also chose the *literal* option more than any other option and were more likely than 5-year-olds to choose the *anchoring* and *nominal matching* options. Neither group were more likely to choose the *correct* option. In the follow-up study, when no *literal* option was available, 5-year-olds chose the *correct* option significantly more than in the main study. By increasing sensitivity to several contextual aspects of the experiment, we managed to further contextualize results from previous studies explaining differences in how 3 and 5-year-olds handle non-literal language in an otherwise predictable context. We propose that this hinges in part on differences in how social others are held accountable for their language use.

That child is a grasshopper (because he jumps a lot): children's development of novel metaphor comprehension

Panel contribution

*Ms. Isabel Martín-González*¹, *Dr. Kristen Schroeder*², *Dr. Camilo Ronderos*², *Dr. Elena Castroviejo*¹,
*Dr. Ingrid Lossius Falkum*², *Prof. Agustín Vicente*³

1. University of the Basque Country, 2. University of Oslo, 3. Ikerbasque Foundation for Science/University of the Basque Country

- The literature on metaphor comprehension has produced two major views on when children are able to understand novel metaphors (Falkum, 2022): the “literal-stage hypothesis” posits that this occurs at 10-12 years of age. In contrast, the “early-bird” view holds that even children as young as 3 are able to make sense of novel metaphoric language when the task is age-appropriate (Pouscoulous & Tomasello, 2020). Evidence for the “early-bird” view comes from referential, perceptually-based metaphors (e.g., “the tower with the hat” referring to a roof). The goal of the current work is to examine the development of metaphor comprehension using nominal metaphors akin to those used by the “literal-stage hypothesis” tradition (e.g., “the prison guard was a hard rock”), albeit using child-appropriate methods.
- We deployed an eye-tracking, visual world paradigm in which children (ages 3-9) heard 10 metaphoric (normed for novelty) or literal sentences while examining four pictures (a metaphoric, a literal and two distractors). The metaphoric condition included a context sentence and a metaphor, e.g., “Grasshoppers jump a lot [context sentence] That child is a grasshopper [metaphor]”. The literal condition was the same but substituted “child” with “animal”. Participants had to select the picture they thought best described the referent at the end of each trial.
- The experiment included the predictors SENTENCE TYPE (two levels, ‘metaphoric’ vs. ‘literal’), AGE (continuous, measured in days) and their interaction as fixed effects. Eye-tracking data was analyzed fitting a linear, mixed-effects model to the log-probabilities of looks to metaphoric picture divided by looks to the literal picture. Forced choice data was analyzed by fitting a logistic regression model to the type of picture selected at the end of the trial (1= metaphoric picture, 0= literal picture). Both models included a ‘maximal’ random effects structure, with random intercepts and slopes (for both factors and their interaction) by items and by participants.
There was a significant effect of AGE ($p < 0.01$) on picture selection and on log-gaze probabilities for the metaphoric condition, but not for the literal condition, which resulted in a significant interaction between both factors ($p < 0.01$) for both types of data.
- The results suggest that children get better with age at understanding metaphors (they look progressively more at the metaphoric picture and select the metaphoric picture at the end of the trial more often as they get older in the metaphoric condition), but not at understanding their literal equivalents. The youngest participants (3-4-year-olds) did not seem to understand the metaphors used in the experiment. Our study thus stands in contrast with both the ‘early-bird’ and ‘literal-stage’ views. We posit a continuous, linear improvement in metaphor comprehension, with 5-year-olds being the youngest to understand the nominal metaphors in our task. We discuss our results in the light of other work on the development of figurative language comprehension.

The Emergence of Second-Order Epistemic Vigilance and its Developmental Trajectory

Panel contribution

Dr. Marie Aguirre¹, Dr. Thomas Castelain², Prof. Nausicaa Pouscoulous³, Prof. Diana Mazzarella¹

1. University of Neuchâtel, 2. Universitat de Girona, 3. University College London

Humans are endowed with a suite of cognitive mechanisms that allows them to face the risk of misinformation and underlies their ‘epistemic vigilance’ towards the trustworthiness of the source of the information and the believability of its content (Sperber et al., 2010). Epistemic vigilance plays a role in the understanding of deceptive uses of language, such as blunt lies (Mascaro & Sperber, 2009). Previous work in pragmatics put forth the hypothesis that epistemic vigilance may also contribute to the understanding of figurative uses of language, such as irony (Wilson, 2009). Mazzarella and Pouscoulous (2021) have proposed that irony comprehension requires the exercise of so-called ‘second-order epistemic vigilance’: the ability to assess *others’ epistemic vigilance*. This capacity would allow interpreters to recognize that the ironical speaker is dissociating from a source that she judges untrustworthy and/or content that she judges false or irrelevant. This opens up new research avenues for developmental pragmatics: Is the development of irony comprehension buttressed by the child’s epistemic vigilance? To answer this question, it is crucial to examine the co-development of epistemic vigilance and pragmatic skills. Little is known, though, of when second-order epistemic vigilance emerges and how it develops during childhood.

The present study investigates the emergence of first- and second-order vigilance towards deception in early and middle childhood. To assess second-order vigilance, we devised a new ‘false communication task’ (adapted from Mascaro & Sperber, 2009). Children were first exposed to the behaviour of a partner who faces multiple trust choices between a benevolent and a malevolent informant. We thus manipulated the vigilance of the partner: in the Vigilant condition, the partner systematically trusts the benevolent informant, while in the Gullible condition, the partner systematically trusts the malevolent informant. In a subsequent phase, we tested children’s propensity to accept a piece of information from the same partner, as a measure of their second-order epistemic vigilance (their ability to keep track of the vigilance of their partner and act accordingly)

We tested four- to seven-year-olds ($N = 225$) and adults ($N = 60$) as a control group. Children were tested in four sessions (one control and three experimental sessions). Each experimental session involved a different manipulation of the benevolence/malevolence of the informants in both first- and second-order epistemic vigilance tasks: a moral characterization (“mean” vs. “nice”), an epistemic characterization (“always tells lies” vs. “always tells the truth”), and an intentional one (“wants to help” vs. “does not want to help”). Participants were tested on their first-order epistemic vigilance when evaluating the trustworthiness of the two informants, and on their second-order epistemic vigilance when evaluating the trustworthiness of the vigilant/gullible partner. Our findings on first-order epistemic vigilance are in line with previous literature. Results on second-order epistemic vigilance revealed that children are sensitive to the distinction between a vigilant and a gullible partner starting from the age of 5. However, across all the age groups tested, children appear to display a strong tendency to trust their partner, in both the Vigilance and the Gullible conditions.

Uncoupling children's literal bias from their metaphor comprehension abilities

Panel contribution

Ms. Mary Beth Neff¹, Dr. Ingrid Lossius Falkum¹

1. University of Oslo

If you were to stub your toe and say, “Ah - my toe is on fire!”, there are two possible interpretations to take—that your toe is literally on fire or that your toe is in a lot of pain. Depending on the context, adults may interpret this statement metaphorically. Children, however, often interpret these metaphorical utterances literally and do so even if the context is infelicitous (Vosniadou, 1987,1989). We investigate why, between these two alternatives, children privilege the literal interpretations of novel metaphorical statements.

In efforts to tease apart children's treatment of literal versus metaphorical meaning, metaphor comprehension tasks often require children to disambiguate between the two interpretations (e.g., Long et al., 2021). For example, after hearing “Lucy is a parrot”, children were asked to choose which of three images the experimenter wanted: the parrot, the girl resembling a parrot, or a different girl (Long et al., 2021). Like in other studies, children's responses were literally biased, which has often been suggested to indicate a difficulty with metaphor. However, because both literal and metaphorical interpretations are visually depicted in these tasks, and thus equally available as referents, choosing literal alternatives does not provide clear evidence against metaphor comprehension. Instead, these findings could suggest that children privilege literal information when available. If the aim of metaphor comprehension tasks is for children to pick metaphorical interpretations, then providing evidence that the literal interpretation is also afforded could confuse that goal. Therefore, removing these literal options may provide a better test of children's metaphor comprehension. In a recent study, Pouscoulous and Tomasello (2020) replaced literal alternatives with distractors and found that 3-year-olds could comprehend novel metaphors. For example, children were given two toy cars—one with a large sack on its roof (metaphorical) and one with a similar sack inside (distractor)—and asked to “Pick the car with the backpack.” Children chose metaphorical depictions over distractors, demonstrating that even 3-year-olds can access metaphorical meaning. However, given this is a single study it is unclear whether these findings are specific to the task or the type of metaphor tested. It also does not show whether reintroducing literal options would impede this understanding.

Adapting Pouscoulous and Tomasello (2020), we investigate whether 3- to 7-year-old children can understand a variety of novel attributional, functional, and psychological metaphors and whether this understanding is impeded by literal competitors. Children will hear a metaphoric utterance and be asked to choose which of two images the utterance refers to. In the first experiment, children will be presented with metaphorical and distractor images. In the second experiment, the distractor will be replaced by a literal depiction.

We predict that children will privilege metaphorical images over distractors (Exp1) but not literal images (Exp2). If this were the case, it would suggest that literalism could be attributed to broader communicative expectations rather than a deficit in metaphor comprehension. If literalism is distinct from figurative comprehension, then this would also suggest that previous tasks that included literal competitors may have underestimated children's ability with metaphor.

When children are more pragmatic than adults: Norwegian children's comprehension of precise and imprecise absolute adjectives

Panel contribution

*Dr. Camilo Ronderos*¹, *Ms. Emma Mathisen*¹, *Dr. Ira Noveck*², *Dr. Ingrid Lossius Falkum*¹

1. University of Oslo, 2. Université Paris Diderot-Paris 7

Traditionally, studies in developmental pragmatics have shown that children struggle with deriving non-literal meaning and prefer to derive semantic (or 'literal') interpretations of phenomena such as metaphor, irony, hyperbole or scalar implicatures (Demorest et al, 1983; Noveck, 2001, i.a.). With age, they learn to interpret the intended non-literal meaning of such expressions. However, does this developmental tendency mean that children always go from first grasping the semantic meaning to later learning the intended (pragmatic) meaning of an utterance?

The current work attempts to answer this question by investigating the development of comprehending **maximum standard absolute gradable adjectives** such as *straight*. These adjectives can have both a precise ("literal") (*perfectly straight*) and an imprecise ("non-literal") (*straight enough*) interpretation. Their precise interpretation is generally believed to be part of the adjective's semantic meaning, whereas the imprecise interpretation is seen as a pragmatic adjustment (see Kennedy, 2007, i.a.).

We tested 100 native speakers of Norwegian ages 3-8, and 33 adults. Participants saw 12 critical items and 12 fillers on a tablet screen. In each trial, participants heard an instruction to select a picture. They saw three pictures including a distractor referent, a target referent (precise, imprecise or incorrect control picture) and a red X, signifying that neither of the two pictures was the correct referent (See Figure 1). The Experiment had CONDITION (three levels: precise, imprecise, control), AGE (continuous predictor measured in days) and their interaction as fixed effects. The dependent variable was whether participants selected the target picture (coded as 1) or the red X (coded as 0). Instances of selecting the distractor image (less than 2% of the data) were discarded.

We fitted a mixed-effects, 'maximal' logistic regression model to the data. We found an interaction between CONDITION (precise vs. imprecise levels) and AGE (z-value= 2.4, p<0.05), suggesting that, with age, children were less likely to tolerate imprecise interpretations and increasingly preferred precise ones (see Figure 2). Adults were significantly less likely to tolerate imprecision relative to the youngest age group (3- to 4-year-olds), whereas there was no significant difference in their acceptance for precise referents.

Overall, our findings suggest that children behave more pragmatically than adults when understanding imprecision, and that only with age do they become less tolerant of imprecise interpretations of absolute adjectives. This speaks against a general 'semantics-first' developmental trajectory. We discuss whether children's increased knowledge of and sensitivity to conventional senses of absolute adjectives (assuming that the precise senses are perceived as "more correct" than imprecise ones) makes them less accepting of imprecise uses with age.

When do children (really) start understanding irony?

Panel contribution

*Ms. Ana Milosavljevic*¹, *Prof. Nausicaa Pouscoulous*², *Dr. Thomas Castelain*³, *Prof. Diana Mazzarella*¹

1. University of Neuchâtel, 2. University College London, 3. Universitat de Girona

Research on the development of irony comprehension does not show a consistent acquisition pattern. While several studies point to a relatively late development during late childhood or even adolescence (see, e.g., Demorest et al., 1984), others suggest that children may be sensitive to irony much earlier (around the age of 6, see Köder & Falkum, 2021).

First, these mixed results raise some methodological issues. Such variability could be explained by the variety of tasks used, requiring different levels of metalinguistic and linguistic abilities. Furthermore, it is an open question whether the measures of irony comprehension employed in the studies with younger children can effectively capture a full-fledged understanding of irony, or merely detect their sensitivity to the existence of a mismatch between the speaker's expectations and the actual context.

Second, this complex picture calls for a better understanding of the socio-cognitive repertoire that supports irony acquisition. Mazzarella and Pouscoulous (2021) proposed that irony comprehension requires the exercise of advanced forms of epistemic vigilance, which allow hearers to grasp the speaker's ironical attitude and recognize that the speaker is distancing herself from a source deemed unreliable and/or content considered false or irrelevant.

The present study aims to (1) examine the emergence of irony comprehension by assessing whether young children's successful performance in irony comprehension is reducible to sensitivity to the presence of a mismatch between expectations and context; (2) test the role of epistemic vigilance in buttressing irony comprehension. We assessed irony comprehension in 6- year-olds (N=56) and 7- year-olds (N=43) and a control adult group (N=21) by adapting the offline picture selection task of Köder and Falkum (2021). Participants were presented with short pre-recorded stories accompanied by pictures, each involving an interaction between a mother and two siblings. In the induction phase, the reliability of the two siblings was established: they were each presented as consistently reliable, or unreliable, in their report of past events. In the test phase, the mother requested one of the two children to act in a certain way. As the child meets/fails to satisfy her expectation, the mother utters either an ironical (criticism) or a literal comment (literal praise, literal criticism, control). Participants judged which emoticon (happy vs. angry face) best reflected the mothers' inner feelings. Importantly, in the literal control condition, the mother responded positively even though the visual context did not meet her expectations, so that participants were supposed to choose a positive emoticon as a correct interpretation of the target utterance. The choice of the negative emoticon in the control would thus suggest their failure to consider both the context and the utterance when making such judgements.

Preliminary analyses reveal a clear improvement of irony understanding with age, with 7-year-olds displaying better performance than 6-year-olds, but no effect of our reliability manipulation. Crucially, when excluding children who failed the control, both age groups reported lower irony scores, and 6-year-olds are at chance level. These results support the relevance of rethinking the import of established measures of irony in the developmental pragmatics literature.

‘They are wellies, not shoes’: Do children’s sensitivity to language norms grow stronger with age?

Panel contribution

Dr. Rebecca Iversen¹, Dr. Camilo Rodriguez Ronderos¹, Dr. Ingrid Lossius Falkum¹

1. University of Oslo

In early childhood, children gradually develop abilities to learn meanings of words (Clark, 2007), categorise and identify functions for objects (Kalish, 2007), and take part in games that require a shared goal structure (Rakoczy, 2007). Around the same time, children also realise that there is a preferred, or conventional, way to do so (Kalish & Sabbagh, 2007). Children have a strong disposition for attending to these conventions across domains, including language (Clark, 2007a), artefact use (German, Truxaw, and Defeyter, 2007), categorization social behaviour (Schmidt, Butler, Heintz, and Tomasello, 2016) and pretence games (Rakoczy, 2007), to the extent that they have been hypothesized to share a common structure (Kalish & Sabbagh, 2007). This study aims to examine how children’s sensitivity to conventionality develops with age, and if their performance is similar across the different domains.

Conventions are regularities in social behaviour which allow us to coordinate our actions (Lewis, 1969). A child’s appreciation of conventions aids language acquisition. For example, conventionality creates assumptions that newly acquired words have a meaning distinct from words they have already learned (Clark, 1993), and that word meanings are shared with other people in their community (Koenig, Clément & Harris, 2004). But a strong tendency to follow conventions can cause difficulties in situations where a familiar word requires a non-conventional interpretation (e.g., metonymy: Köder & Falkum, 2020, Falkum, Recasens & Clark, 2017, metaphor: Di Paola, Domaneschi, Pouscoulous, 2019; Long, Shukla Rubio-Fernandez, 2021). This has led to the proposal that during the pre-school years a child’s growing sensitivity to conventional meanings might impede their pragmatic reasoning (Vicente & Falkum, 2021), before they become more flexible and learn that conventions are human-made and alterable.

In this study, we examine 3-5-year-old children’s (N=119) sensitivity to conventions in three different conditions: (1) conventional vs. unconventional targets, (2) conventional vs. incorrect targets and (3) unconventional vs. incorrect targets. Each condition consists of eight test questions, and a child can obtain a score of 0-16 points. Test items belong to one of four categories: word learning, categorization, artifact function and rule-based games/pretend play. We measure picture choice and reaction times to examine any differences between their responses on the conventional and unconventional options.

We predict two possible outcomes: Either we find a progressive development where 3-5-year-old show a strong adherence to sense conventions but that they become more flexible with age (cf. pretence games: Rakoczy, Warneken, & Tomasello, 2008, artifact use: Schillaci & Kelemen, 2014). Or we find that 5-year-olds are more susceptible to choosing conventional options than 3-year-olds, due to a particular attention to conventions during this developmental period (cf. Falkum et al. 2017; Vicente & Falkum, 2021). In both cases, the more convention adherence, the less pragmatic/unconventional answers and vice versa. Finally, following Kalish and Sabbagh (2007), we explore whether we find a similar developmental trajectory across the four domains (word learning, categorization, artifact function and rule-based games/pretend play).

**Pragmatic variation in
pluricentric languages

Felix-Brasdefer, Klaus
Schneider)**

An ethnographic multimethod investigation of speech actions in Namibian English and English English: A focus on offers and responses to thanks

Panel contribution

***Prof. Klaus Schneider*¹, *Prof. Anne Schröder*², *Dr. Pawel Sickinger*², *Dr. Selma Ashikuti*³, *Dr. Nelson Mlambo*³**

1. University of Bonn, 2. Bielefeld University, 3. University of Namibia

English is one of the pluricentric languages par excellence and hence well-studied in the framework of Variational Pragmatics (VP) (e.g. Schneider & Félix-Brasdefer 2022). However, L2 varieties and more specifically African varieties of English are relatively underexplored in this paradigm. In the present paper, we contrast English English (EngE) to Namibian English (NamE), the latter representing a particularly unique research object, as the country in which it is spoken is shaped by an unusual colonial history leaving behind two former colonial languages (German and Afrikaans) in addition to English. The country also hosts 20-30 indigenous languages and therefore is an ideal test case for investigating the interplay of multilingualism, complex facework, and diverging cultural norms influencing pragmatic behaviour. This linguistic diversity shapes the linguistic ecology and thereby the variation of English at various levels (see Schröder 2021). In this, NamE noticeably differs from EngE, to which NamE data is systematically compared in our research.

In this paper, we describe the development of ethnographically informed research tools on the basis of a series of explorative qualitative interviews and ethnographic field notes as well as close collaboration with local experts, shedding light on culture- and language-dependent concepts of politeness as well as the conceptualisation and contextualisation of a range of speech acts, namely APOLOGIES, OFFERS, REQUESTS, and RESPONSES TO THANKS. By triangulating these qualitative data with elicited quantifiable oral (100 recorded questionnaires) and written (800 questionnaires) DCT data, we will show how communicative behaviour is influenced by the macrosocial background of members of the respective Community of Practice, i.e. students at the University of Namibia and at three universities in England (Lancaster, Norwich, Sheffield). In our presentation, we will specifically focus on two of the speech acts, namely OFFERS and RESPONSES TO THANKS. Our data suggests that realisation strategies for these two speech acts differ notably e.g. in terms of directness depending on ethno-social group, language background and participant constellation, as well as national variety.

In this, the present paper answers Anchimbe & Janney's (2017:117) call for community-based and emic approaches to pragmatic practices in postcolonial speech communities, in that the data collection includes "perspectives that prioritise the local, situated, emic and hybridised forms rooted in these societies" (Anchimbe 2018:43), while allowing these insights to inform stringently controlled, quantifiable research in the tradition of VP, suitable for immediate comparison with other national varieties of English.

Complaints and regional variation in French: Examples from Cameroon and France

Panel contribution

Dr. Bernard Mulo Farenkia¹

1. Cape Breton University

The focus of this paper is on complaint strategies across regional varieties of French. Using DCT questionnaire data collected in Cameroon and France, the study examines the strategies used by French speakers in Cameroon and France to complain in three different situations (to a friend, to a stranger, and to a professor). While the findings reveal some parallels in both varieties of French, the analysis highlights many differences with respect to the types and realization patterns of complaint (head act) strategies, external modifications, and internal modifications). Overall, the study adds to the research on intra-lingual regional pragmatic variation in French, which has so far dealt with speech acts such as apologies, compliments, requests, and refusals.

Does space matter? Pragmatic variation in Finland Swedish and Sweden Swedish

Panel contribution

***Prof. Jenny Nilsson*¹, *Prof. Jan Lindström*², *Dr. Love Bohman*³, *Prof. Catrin Norrby*⁴, *Dr. Klara Skogmyr Marian*⁴, *Prof. Camilla Wide*⁵**

A large-scale investigation of pragmatic behavior in Swedish-speaking Finland and Sweden found that there are some differences in the communicative patterns between the two nations (Norrby 2021, Norrby et al. 2020). However, to what extent does geographical space really affect pragmatic variation? Could such variation rather be caused by other social-spatial factors? In this presentation, we wish to problematize the notion of space and examine how pragmatic variation interfaces with several dimensions of space, not only geographical but also social space (see also Jucker & Hausendorf 2022).

We approach space from a variational pragmatics perspective (Schneider & Barron 2008, Schneider 2010) and present an empirical study of greeting behavior in 1000 video-recorded Swedish service encounters to illustrate how different layers of space interact and are relevant for pragmatic variation (see also Nilsson et al. 2020, 2022). We combine qualitative observations of greeting routines with statistical analyses of several co-variables in order to find connections between the choice of a certain greeting form and geographical and social-spatial factors.

In the presentation, we will illustrate how the geographical-spatial levels of nation and region (i.e., data from a certain nation and town) can partly account for variation in the choice of greeting forms, but that more local levels of geographical space (i.e., interactions in specific venues) as well as social variables such as the age and gender of a speaker also play an important part. We will also discuss how spaces can carry recognizable cultural meanings, and may trigger certain parts of a speaker's pragmatic repertoire.

Expressing gratitude in Nigerian and British English

Panel contribution

***Dr. Foluke Unuabonah*¹, *Prof. Ulrike Gut*²**

1. Department of English, Redeemer's University, Ede, Nigeria, 2. Englisch Seminar, Westfälische Wilhelms-Universität Münster, Germany

With the speech act of thanking, a speaker acknowledges 'having benefited from the actions of another person' (Norrick 1978: 285). The linguistic form chosen for this speech act has been shown to vary systematically across some varieties of English (e.g. Funke 2022, Cheng 2010, Schauer & Adolphs 2006). For example, New Zealand English speakers use fewer and a smaller inventory of thanking expressions than British English speakers (Jautz 2013). Likewise, Hong Kong English speakers use a restricted repertoire and very brief expressions of thanking, probably reflecting Chinese cultural norms (Wong 2010). Expressions of gratitude have not been studied systematically yet in African varieties of English, where an influence of cultural norms can also be expected. It is the aim of the present study to contribute, within the paradigm of variational pragmatics (Schneider & Barron 2008), to our growing knowledge of variation in expressions of gratitude in varieties of English by investigating the use of thanking expressions in Nigerian English and British English.

We analysed questionnaires with 18 discourse completion tasks (DCTs) prompting expressions of gratitude filled in by 452 educated speakers of Nigerian English. The responses were analysed according to the type of thanking strategy (Aijmer 1996) and their linguistic form (naming a benefactor, naming the reason, intensification). In addition, expressions of gratitude in the spoken part, the social and business letters in ICE-GB and ICE-Nigeria were analysed in the same way.

The results show that, in both varieties, *thanking explicitly* was the most frequent thanking strategy followed by the *stress gratitude* strategy. Differences between the two varieties exist in terms of British English users employing more *express emotion* strategy, while Nigerian English users employ more *thank a supernatural being* strategy. The study further revealed that DCTs elicited a wider range of different expressions of gratitude and that their linguistic forms differed across DCTs and the corpus data. The study thus shows that Nigerian English thanking strategies are influenced by the religious and socio-cultural practices of Nigerian English users and highlights the constraints of data collection methods in cross-varietal pragmatic research.

Morphopragmatics of mitigation in German as a pluricentric language: subjunctive II and diminutive in formal and informal conversations from Austria and Germany

Panel contribution

Dr. Katharina Korecky-Kröll¹, Mrs. Maria Luisa Krapp², Dr. Georg Oberdorfer², Mrs. Anja Wittibschlager¹

1. University of Vienna, 2. University of Marburg

The subjunctive II and the diminutive are two grammatical phenomena that are widely used for the pragmatic purpose of mitigation in the world's languages (e.g., Dressler & Merlini Barbaresi 1994; Caffi 1999; Schneider 2003; Félix-Brasdefer 2008). In German as a pluricentric language, they have been identified to exhibit considerable regional variation, not only in terms of different forms but also in terms of different frequencies of usage. Therefore, they are expected to be an adequate testing ground to investigate pragmatic differences in two different national centers of German, namely Austria and Germany.

Early 20th century research in German dialectology (e.g., Wrede 1908 based on the “Wenker” questionnaires) highlighted regional frequency differences of diminutives between Northern and Southern regions of the German-speaking area, which were often attributed to the inhabitants' personality traits (e.g., “reserved northerners” vs. “jovial southerners”, see Elemental 2013 for a critical review). However, later questionnaire surveys conducted in the 1990s (Muhr 2008; Warga 2008) also showed that mitigation using subjunctive II forms was more frequent in Austrian than in German speakers.

We investigate whether these older questionnaire-based observations on frequency differences of diminutive and subjunctive II can be confirmed based on recent free conversation data from Austria and Germany collected from 2008 to 2019.

Our data were sampled from 48 autochthonous male adult native speakers of German (24 speakers per country) living in 24 smaller locations (12 locations per country, evenly distributed across territories). The two speakers from each location were part of two different sociodemographic groups, i.e., one “nonmobile older rural male” (NORM, see Chambers & Trudgill 1998) aged 60+ with low formal education and one young man with (at least) high school diploma aged 18-35.

To analyze intraindividual variation, we investigated two conversational settings per participant:

- 1) a formal interview with a researcher unfamiliar to the participant conducted in the respective national variant of Standard German,
- 2) an informal conversation with a close friend from the same location conducted in the respective dialect or regiolect.

All conversations were transcribed following the GAT2 conventions (Selting et al. 2009). From each transcript, we sampled 1000 word tokens of participants (i.e., 96,000 tokens in total) and tagged these samples for diminutive and subjunctive II forms. We then used linear mixed-effects regression models (Bates et al. 2015) in R (R Core Team 2018) to investigate effects of various independent variables (e.g., national variety, regional variety, location, sociodemographic group, setting) on token frequencies of diminutive and subjunctive II forms.

Results show larger effects of the setting than of the national or regional variety or the sociodemographic group, but also differences between subjunctive II and diminutive forms: While subjunctive II is more frequently used in formal language of distance and has a stronger politeness focus, diminutives are more common in informal conversations to express mitigation (Caffi 1999) and linguistic insecurity (Labov 1972).

We discuss aspects of pluricentricity vs. pluriareality and give an outlook on future research which should include female and diverse gender data as well as data from Switzerland.

Pragmatic Variation During the Negotiation of Service Across Varieties of Spanish

Panel contribution

Prof. Cesar Felix-Brasdefer¹

1. Indiana University

Research on linguistic pluricentrism has received considerable attention among national varieties of a language, as well as among dominant and non-dominant varieties (Nilsson et al 2022; Schneider & Félix-Brasdefer 2022). Pluricentric languages, such as Arabic, French, Chinese, or Arabic, have been generally defined as languages having different national varieties, each with a standard codified register and with “several interacting centers, each providing a national variety with at least some of its own (codified) norms” (Clyne 1992: 1). This presentation examines pragmatic variation across three national varieties of Spanish during the negotiation of service in small shops across three varieties, namely, Spanish from Buenos Aires, Mexico City, and Seville, Spain. The framework adopted is ‘variational pragmatics,’ which is an approach concerned with pragmatic variation within a single language and focused on the impact of macrosocial factors on language use in (mostly spoken) interaction (for a recent summary of the field (Schneider & Barron, 2008; Schneider 2020 [also Félix-Brasdefer 2015])). Three levels of pragmatics are analyzed: actional (variation of the request for service and presence/absence of mitigation), openings and closings (interactive), and the selection of forms of address (T vs V [tú/vos vs usted]) and vocatives. The data were collected from 300 audio-recorded service encounter interactions in each location: 100 in each region. Data are analyzed with regard to degrees of directness and indirectness, pronominal variation T/V, and presence or absence of internal modification. Results show regional differences in the preference for request forms, most frequent in each region (assertion [Mexico]; imperative [Seville]; elliptical request [Argentina]). Regarding T/V, Mexico shows an orientation towards respect and formality (V) over equality (Buenos Aires & Seville). This presentation ends with methodological issues and new directions for analyzing pluricentrism in other varieties of Spanish that have not received sufficient attention.

Regional Varieties of Arabic as a Pluricentric Language: A Speech Act Perspective

Panel contribution

Dr. Dina El-Dakhs¹

1. Prince Sultan University

Traditionally, language variation was studied through dialectology which focused on regional variations within a single country (Schneider & Placencia, 2017) and on the central levels of the language system; namely, pronunciation, vocabulary and grammar. More recently, variational pragmatics (VP) emerged to encourage the examination of linguistic pluricentricism; that is, language varieties that are spoken natively within (e.g., Alexandrian Arabic, Caireen Arabic and Upper Egyptian Arabic in Egypt) and across (e.g., Alexandrian Arabic in Egypt, Najdi Arabic in Saudi Arabia and Marrakesh Arabic in Morocco) nations from a pragmatic perspective (Schneider, 2010; Schneider & Barron 2008). The current talk adopts a VP approach to the study of the Arabic language which represents an ideal example of linguistic pluricentricism because it is spoken throughout the Arab World which extends over 5,070,420 square miles in 22 countries. This huge space has created a diverse society in terms of geography, dialects, customs and historic experiences (Sidani & Thorburry, 2010).

The current talk will summarize the results of earlier studies that the speaker conducted on variational pragmatics in the Arabic language, particularly between the Alexandrian dialect, which is spoken in the northwest of Egypt, and the Najdi dialect, which is the dialect spoken in central Saudi Arabia including its capital city of Riyadh. I chose these dialects because Saudi Arabia and Egypt are geographic neighbours, and that there is a constant language contact between Egyptians and Saudis due to work and tourism relations. Hence, if pragmatic differences emerge within this context, the differences will constitute a strong indication of the significant role place plays in pragmatic variation in pluricentric languages. The talk will adopt a speech act perspective because it will compare the realization of specific speech acts across these two regional varieties of Arabic (e.g., complaining and complementing) while considering important macro- and micro-social factors, including gender, age, social distance and social power. Additionally, the talk will shed light on the methodological choices the speaker made with respect to data collection (i.e., the use of discourse completion tasks and role-plays) and coding (i.e., the use of adapted models from earlier studies).

The impact of the factors ‘nation’ and ‘region’ on pragmatic variation in pluricentric German. First results

Panel contribution

Dr. Tanja Ackermann¹, Mr. Henrik Discher¹

1. Freie Universität Berlin

While there is an ever-growing body of literature on the divergent phonology, lexicon and grammar of German as spoken/written in Germany, Austria and in German-speaking Switzerland (cf., e.g., Ammon et al. 2016; Dürscheid et al. 2018), the pragmatic dimension of pluricentric German has been studied to a much lesser degree (cf. Norrby & Kretzenbacher 2013: 243–244) – especially in comparison with English or Spanish. For German, only few studies exist that address selected pragmatic aspects and focus on a comparison between German German and Austrian German or German German and German spoken in Switzerland (for an overview see Ackermann 2021).

In our talk, we want to investigate Austria, Germany, and German-speaking Switzerland by examining the formal and the actional pragmatic levels – specifically, differences in the use of (pro)nominal address terms and the expression of requests. The data come from an online-survey with production and rating tasks, in which 577 participants took part (as well as from focus-group interviews and the *Atlas zur deutschen Alltagssprache* [‘Atlas of Colloquial German’]). Using multifactorial modelling, we will show that the macro-social variable *region* has an impact on the use of vocatives and the realization strategies of requestive head acts (as well as other social variables such as *age* or *gender*). However, we will argue that the level of *national* varieties plays a rather minor role for language use: the production data yield interesting spatial patterns that typically do not correspond to national borders. Nonetheless, the concept of national varieties does play an important role, namely from a sociolinguistic perspective as data from our focus-group interviews and other meta-pragmatic studies suggest (cf., e.g., Locher & Luginbühl 2019). Accordingly, a distinction should be made between the actual occurrence of language variants in the respective language uses on the one hand and the perception (or construction) of such diatopic variation on a meta-level on the other hand.

As an outlook, we will present our recently launched trinational project *Variational Pragmatics of German. Comparing Communicative Patterns*, which is dedicated to the variation of formal and actional pragmatic phenomena in the German-speaking area on a larger scale, building on the pilot studies mentioned above. Primarily, we will put our methodological choices up for discussion.

Variational pragmatics study on impoliteness strategies in Chinese negative online consumer reviews

Panel contribution

Prof. Wei Ren¹

1. Beihang University

Variational pragmatics (VP) studies mostly examine intralingual variation in oral communication, although often through written discourse complete tasks. In contrast, online communication deserves more attention in VP research. This study investigates the impoliteness strategies employed by Mainland Chinese and Taiwan Chinese in negative online consumer reviews. The data were composed of 400 negative online reviews from *TripAdvisor*, 200 of which were written by Mainland Chinese and 200 of which were written by Taiwan Chinese. The findings suggest that in the context of online consumer reviews, both Mainland Chinese and Taiwan Chinese tend to employ the following impoliteness strategies: positive impoliteness (including pointed complaints, dissociation from the other, unfavorable comparison, taboo words, and meta-comments), negative impoliteness (including explicit emotional displays, unpalatable questions, suggestions to hotels and threats), implicated impoliteness (including suggestions/warnings to customers, indirect blame), and sarcasm. Moreover, both groups tend to use on-record impoliteness strategies more frequently than off-record impoliteness. Despite the similarities, some differences were also found. For example, Mainland Chinese people tend to employ positive impoliteness more frequently, while Taiwan Chinese people show a greater preference for negative impoliteness. In addition, Taiwan Chinese employed significantly more off-record impoliteness than Mainland Chinese, which demonstrates that in the context of online consumer reviews, Mainland Chinese tend to express their negative feelings more directly and explicitly, while their counterpart Taiwan Chinese employ impoliteness strategies more implicitly and tend to use more mitigation strategies. The findings indicate that the macro factor region has impacts on the employment of impoliteness strategies in Chinese online consumer reviews.

Atypicality in copular predications in Mano (Mande)

Panel contribution

*Dr. Maria Khachaturyan*¹

1. *University of Helsinki*

This talk focuses on some properties of predication in Mano and its deviation from a canonical clause. It discusses copular predication and a) its frequency in spoken discourse, b) its role in interaction.

Mano has four copulas: *lē*, *lé*, *wó* and *gè*. In Mano copular predications, the copula is the predicative center which takes only one argument – a subject, the word order being S - COP (as in 1, where the subject is the 3pl pronoun *ō*). A prominent type of function expressed by copular predications is ostensive demonstration, where the copula is usually *wó* or *gè*. Depending on the interaction context, such predications may take a substantial proportion among all predications uttered, as was the case in a 30-min recording where siblings were conversing while passing through an unfamiliar town by car and discussing objects around them and where presentatives took more than 10% of all predications.

(1) *ō wó dìŋ ā*

3pl.emph cop there dem

‘There they are.’ [sortie_abidjan_aller.008]

Crucially, two out of the four copulas, *lé* and *wó*, do not function independently, but always as part of a construction: usually, NP – Copula – [...] – Demonstrative (the final element may vary). The material between the copula and the demonstrative is optional; it helps specifying the relationship of the subject to discourse and to the context of interaction, as in 1, where the copula is followed by the demonstrative adverb *dìŋ* ‘there’. The material to the right can also be a clause, as in (2).

(2) *sálámá wó ē kē à là ā*

luck cop 3sg.pst be 3sg on dem

‘Lucky she was (lit.: luck was on her).’ [bavardage_tilepulou.057]

The copula serves to support the NP as a separate discourse move whose function is to orient the interlocutors’ attention to a referent. In the cases of ostension, joint attention is really the goal: the point of the utterance in (1), uttered by a child from a group of siblings, is to orient other siblings to a car carrying the children’s parents. The role of the NP, supported by the copula and the ensuing predication, can also be to assert updating information, where the main update is concentrated on the NP itself and the predication provides an additional update: In (2) the point of the utterance is to assert that a woman (referent of the 3sg pronoun *à* ‘her’) was lucky when she almost lost her child (on NPs as separate discourse moves, see Ozerov 2021). As for the final element of the construction, the demonstrative, its function is to serve as a boundary of the noun phrasal component, which can occur between turns or inside a turn, depending on the intonation (final or non-final, on NPs as turn-internal subunits and turn-internal boundaries, see Iwasaki 2009).

Thus, functions of copulas cannot be reduced to predication alone and predication, which is arguably a central function of the clause in the traditional grammar, turns out to be a component of a more complex interactive event.

Clausal Constituents and Repair-related Actions in Augmentative and Alternative Communication

Panel contribution

Prof. Patricia Mayes¹

1. University of Wisconsin - Milwaukee

Augmentative and Alternative Communication (AAC) enables people with communication disabilities to interact with others. The focus here is on high-tech AAC, in which an electronic device, equipped with a keyboard and speech-generating software, vocalizes an utterance typed by the participant. AAC-mediated interaction is atypical for many reasons such as the presence of typing errors and delays, and the absence of prosodic cues. These factors lead to frequent trouble and repair, but unlike typical interaction, self-repair is rare; and recipients are quite active, making repair a collaborative process (Mayes 2020; Müller & Soto 2002). Still, the lack of interactional resources makes the recipient's task of projecting the speaker's utterance more difficult, and repair is a step-by-step process that depends critically on already produced syntactic forms. In repairing noun phrases, the recipient focuses on the head of the NP, and apparently, targets NP constituents of a clause (Mayes 2020), suggesting additional questions about the relation between the syntactic form of the trouble source (TS) and the form(s) targeted by recipients' repair-related actions. More specifically, what is the projected grammatical form of the TS when recipients target NPs in their repair-related actions, and what other types of clausal constituents (if any) are also targeted?

Nouns and noun phrases are the TSs 62% of the time in my data, with other forms causing trouble less frequently. However, even when the TS is a predicate, recipients may focus most of their repair-related actions on determining other NP constituents. The example below illustrates this point. (FD=voiced by F's AAC device; F=vocalizations; M and L=recipients)

01 FD: but the person (2.6) who (1.5) has C-H-R-G-E

02 M: ((gesturing, as if spelling))

03 L: char- who has charge of wha:t.

04 M: oh, charge.=

05 F: =thethe ((glottalized))

06 M: of the (.7) [pops?]

07 F: [groug]rougrou (home).

08 M: oh, the group ho[me.]

09 F: [>yeah.<]

The initial TS is part of the predicate, voiced as five letters in line 1. L quickly completes the repair with *charge*, while simultaneously initiating another repair (line 3). Her question might be interpreted as targeting both the subject and the prepositional object, but the emphasis on *what* suggests the latter. M follows up with a candidate repair, also targeting that PP (line 6). This example illustrates how recipients use available syntactic forms, building from the bottom-up, so to speak. In this case, once the predicate is understood, they focus on other constituents of the verb phrase.

Essentially, when the trouble source is a predicate or part of a predicate, recipients' repair-related actions target NPs that function as constituents in the VP or clause. One reason may be that AAC interaction does not differ from typical English conversation with respect to the fact that most clauses are low in transitivity. (See Thompson & Hopper 2001.) That is, mostly copular clauses or two-participant clauses with low-content predicates. In such clauses, much of the content is expressed through NP constituents, making them a likely target for recipients' repair attempts.

Clause structure in Upper Kuskokwim conversational discourse

Panel contribution

Dr. Andrej Kibrik¹

1. Institute of Linguistics RAS

Upper Kuskokwim is a moribund language of interior Alaska, it belongs to the Athabaskan (Dene) language family and is still spoken by some in the village of Nikolai. This study is based on my field research conducted since 1997. The data includes natural and arranged conversations recorded between 1997 and 2010.

Transcripts are organized as sequences of elementary discourse units (EDUs). EDUs are prosodically identified quanta of local discourse structure, similar (but not exactly identical) to what is known as intonation units (see e.g. the work by Chafe, 1994). In the analysis below some EDUs are excluded from consideration, specifically those fully consisting of code switching to English, truncated EDUs, and regulatory EDUs without propositional content.

Upper Kuskokwim, like other Athabaskan languages, is polysynthetic, that is expresses multiple grammatical meanings within verbal words. Among other things, so expressed are referential features of clause arguments, including Principals (subjects), Patientives (direct objects) and some other. These arguments appear as pronominal morphemes on the verb. Other clause participants (adjuncts) are expressed as combinations of pronominal prefixes and postpositional stems. These kinds of participant expression, characteristic of polysynthetic languages, may appear unusual against the background of more familiar languages, but actually is widely spread cross-linguistically.

An analysis of the dataset gives rise to the following quantitative generalizations. 76% of all analysed EDUs are clausal. The remaining 24% EDUs are biclausal, typically consisting of a matrix clause and an embedded clause. I suppose that the high number of biclausal EDUs is related to the polysynthetic nature of the language. Among the clauses, 83% are verbal clauses, and the rest are nominal, adjectival, existential and verificational clauses. Clauses can be classified according to the number of participants as follows. 50% of all clauses have just one participant, 37% two participants, and 4% more than two participants. The remaining clauses (nominal and verificational) have no participants. Of course, not all participants are arguments. 72% of clauses have one argument, and 20% two arguments. The remaining clauses have no arguments.

As is common in polysynthetic languages, it is very frequent that clause participants are only expressed by means of morphologically bound pronominal morphemes on the verb or on adpositions. This kind of expression is found in 57% of all clause participants and in 63% of arguments. Accordingly, lexically expressed are 43% of clause participants and 37% of arguments. Among the clauses having two or more participants, there is not a single one that would have more than one lexically expressed participant.

The excerpt below consists of two consecutive EDUs, the first of which illustrates a two argument clause with both arguments only expressed by pronominal affixes. The second EDU illustrates a clause with a relatively heavy noun phrase that plays the role of clause Patientive.

Comment Clauses in Spoken Turkish: An Analysis of *san/zannet/bil* (presume/suppose/know)-predicates

Panel contribution

Prof. Deniz Zeyrek¹

1. Middle East Technical University

This paper deals with the Turkish equivalents of comment clauses/CCs formed by three complement taking predicates/CTPs (Thompson 2002): *presume/suppose/know*. In their CC role, CTPs are syntactically defective because the verb lacks its obligatory complement. CCs have positional freedom, tend to be prosodically separated from the rest of the clause, have metatextual functions (e.g., they hedge or express stance), behave in ways akin to discourse markers.

CCs have been examined in many languages, e.g., English (Brinton, 1996, 2001; Traugott, 1995), Finnish (Laury & Helasvuo 2020), Mandarin (Endo, 2013), Hebrew (Maschler, 2012), and a recent line of research has even targeted negative constructions (Lindström et al., 2016, and the references therein). I will examine the CC role of positive forms of *san/zannet/bil*-predicates in Turkish, an agglutinating, verb-final language with variable word order and ask the following questions:

- Are *san/zannet/bil*-predicates used in atypical ways (e.g., in syntactically deficient clauses)?
- Do CCs that involve *san/zannet/bil*-predicates take the form of converbial/subordinate clauses?
- How is the CC role of *san/zannet/bil*-predicates distinguished from their CTP role?

The data will be drawn from the spoken section of Turkish National Corpus (Aksan et al., 2012) and analyzed using descriptive statistics.

Results from the initial analysis indicate that (a) *san/zannet/bil*-clauses may lack syntactic constituents shown by the absence of morphosyntactic cues that signal complementhood. In these cases, they have metatextual functions and can be classified as CCs. (b) While *san-/zannet-* ‘presume/suppose’ mostly occur in 1stP taking the form of main clauses, *bil-* ‘know’ may occur in 2ndP and take the form of converbial/subordinate clauses. (c) The initial findings show that main-clause CCs are common in initial and medial positions with respect to their associated clause, subordinate-clause CCs may appear post-verbally (i.e., clause-externally), and both types convey epistemic/evidential/evaluative meanings. I will assess whether such findings extend to the whole data.

Emergent clauses in three Tibeto-Burman verb-final languages

Panel contribution

*Dr. Pavel Ozerov*¹, *Ms. Stephanie Yam*²

1. University of Innsbruck, 2. University of Münster

Tibeto-Burman languages are commonly characterised by optional expression of NPs, verb-final syntax, and rich sets of non-obligatory case-markers and particles whose distribution is driven by elusive pragmatic principles. Using multimedia corpora of natural interaction, we explore recurrent grammatical structures in three languages from different branches of the family: Karbi (isolate), Burmese (Lolo-Burmese) and Anal Naga (South-Central). Our talk will focus on the distribution and use of structures illustrating how the basic unit of a verb and its arguments is routinely expressed in everyday speech in these languages.

Anal Naga has an obligatory system of verbal indexation for core arguments. In Karbi, there is optional infrequent indexing of non-agentive arguments, and Burmese has no verbal indexing. In all three languages, a clause can consist solely of the verbal predicate without any overt NP argument(s). Thus, clauses in Anal Naga are more grammaticized with argument expression linked to the verb, whereas clauses in Burmese and Karbi may involve only “bare verbs”. Prosodically, the verb can be accompanied by the core and non-core argument NPs (typically one, rarely two) in the same Intonation Unit (IU). This renders a minimal (N)(N)V unit, observed e.g. in ~30% of structures in the Burmese data.

NPs can alternatively be expressed in separate IUs. In this case, the overall structure emerges incrementally, where the speaker introduces NPs as separately planned moves, tentatively aiming at yet unplanned verb-containing final IU. In Anal Naga and Burmese, such intonationally separate NPs are common, with hesitations and inter-speaker negotiation, and are typically marked by adnominal clitics (“differential case” and pragmatic particles), as illustrated below for Burmese (pragmatic clitics in bold, verbal IUs underlined).

A: *ʔaiʔ-kobizĩ=Kq*,
this-Covixin=**sbj**

B: *ẽ<nod>*

Mhm

A: *ĩdija-s^hèbù*,

Indian-medicine

B: *ẽ<nod>*

Mhm

A: *ʔè.da=lè*,

this=**add**

so this,

B: *kòbiʔ.èi!*

CovidShield

A: *ẽ kòbiʔèi*.

mhm CovidShield

ʔè-ʔè.di=bousta=Ko=lè,

th- this=booster=**obj**=**add**

t^haʔ-t^hò=lq jɑ=là

again-get.vaccinated=for suitable=q

so this booster, is [it] OK to get [it] for the re-vaccination?

Although the clitic-marked NPs project a specific relation to the verb, they constitute a local move whose projection can be overridden in the temporality of spontaneous interaction. Prosodically separated NPs often end up being structurally detached (as happens in 30% of Burmese structures, e.g. *Covixin=sbj* above). Moreover, adnominal clitics are mostly absent if the NP constitutes part of an IU together with the final verb. Thus, rather than representing case in its traditional view, these are (in our view) local cues guiding the interpretation of the NP in the unfolding structure and foreshadowing the referent's role in the preliminary conceptualisation of the reported event.

In Karbi, when nominal arguments are marked with pragmatic clitics, they generally do not occupy an IU separate from the verb. However, -marked NPs may occur after the verb whereas unmarked NPs generally do not occur in this position. Additionally, in some relatively infrequent cases, a postposed double-marked nominal argument may occur in its own IU.

From clause connectives to utterance-final suffixes in Korean: A discourse-pragmatic approach

Panel contribution

Prof. Sung-Ock Sohn¹

1. University of California, Los Angeles

Korean is a verb-final language with the basic word order subject-object-verb. As an SOV language, the verb occurs at the end of an utterance- or turn-final position, while the other elements may be moved around quite freely. The use of clause connectives without main clauses is pervasive in Japanese and Korean. For instance, the Korean clause connective *-nuntey* 'but' and the conditional suffix *-ketun* 'if' are commonly used in a turn or utterance-final position. This use of clause connectives without main clauses has been traditionally considered a syntactic ellipsis derived from a main clause omission.

However, conversation-analytic (CA) approaches to turn-final elements reveal that these final connectives are used in a particular context as a vehicle for implementing a particular social interaction (Park 1999, Kim & Sohn 2015). Specifically, Park (1999) illustrates that the Korean connective *-nuntey* 'but' in a turn-final position (without a main clause) indexes interactionally delicate actions such as requests, disagreements and denials. Based on the authentic conversational discourse, Park's study demonstrates that the speaker invites the interlocutor to infer the speaker's intention by employing *-nuntey* at a turn-final position. Furthermore, Park's study confirms that the interlocutor does not have any trouble in understanding the invited inference. Likewise, the conditional suffix *-ketun* 'if' is frequently used in utterance-final position in spoken discourse. Used in turn- or utterance-final position, the erstwhile conditional connective functions as an interpersonal marker which directs the listener's attention to certain interactional features such as 'informing/reporting' and 'account-giving' (Kim & Suh 2010). Produced with a diverse pitch pattern (e.g., rising, falling, falling-rising, or continuing) and final lengthening, *-ketun*-marked utterances invite the recipient to make an inference about the validity of the propositional content.

While previous studies have demonstrated the interactional functions, the sequential contexts, and the grammaticalization path of *-ketun* (Koo and Rhee 2001, Kim and Suh 2010), there were very few that have examined the prosodic features of *-ketun*. This paper explores the interplay of discourse function and prosody by examining the use of clause-connectives in turn-/utterance-final positions in Korean spoken discourse. Cross-linguistic studies on prosody and interaction have shown that the boundary tones of utterance-final elements play a crucial role in interaction (Beeching & Detges 2014). By analyzing various intonation patterns of the final suffix *-ketun*, we hope to illuminate how prosody and features of grammatical items mutually elaborate each other to achieve a particular interactional function in utterance-final position. The target form historically originates from a conditional connective 'if' and is predominantly used as a suffix in contemporary Korean, in particular in spoken discourse.

Produced with a diverse pitch pattern (e.g., rising, falling, falling-rising, or continuing) and final lengthening, *-ketun*-marked utterances invite the recipient to make an inference about the validity of the propositional content. This paper presents how the interactional functions of grammar (e.g., morpho-syntactic units) interplay with prosody and speaker stance in spoken discourse from the perspective of interactional linguistics by analyzing the emergence of the clause-connective suffixes in a turn-/utterance final position.

How far can we go with the clause?

Panel contribution

Dr. Toshihide Nakayama¹

1. Tokyo University of Foreign Studies

As is often the case with concepts that have been widely referenced and utilized in different theories and practices, it is rather difficult to give a single universally applicable precise definition to the term “clause”. However, it is probably safe to say that the clause is typically considered a linguistic unit (e.g., see Radford 2004, Genetti 2018):

- (i) consisting of a predicate, its arguments, and all other modifying expression associated with the predicate,
- (ii) expressing a complete predication

The celebrated status of the clause within linguistic studies may very well be because of the feeling that the clause is where the two different (syntactic and semantic) dimensions of the linguistic organization meet. Although such a characterization may seem reasonable within the context where the concept had initially been developed, i.e., written texts and idealized sentences in English and other well-studied European languages, it does not easily carry over to languages of a different structural type.

This presentation will survey the syntactic, semantic, and discourse-pragmatic organization in Nuuchahnulth, an endangered indigenous language of Canada, and show that it is not easy to find a linguistic construct in Nuuchahnulth that neatly lines up with the clause that is assumed in syntactic analyses in English.

Structurally, the domain formed around the predicate in Nuuchahnulth is very limited in its internal structure, i.e., the predicate and its direct arguments. Because of this limitation, a semantically rich predication that could be expressed in English within a clause using modifiers (such as adverbs) or prepositional phrases must be expressed with a combination of multiple clauses (i.e., predicate-argument pairs) in Nuuchahnulth. A structural unit consisting of a predicate and its argument, therefore, does not necessarily correspond well with a semantic unit of a predication in Nuuchahnulth (as a single predication can consist of multiple sets of predicates and their arguments). With respect to discourse-pragmatic organization, English-type clauses are less visible in Nuuchahnulth, especially in interactive, spoken discourse. Expressions utilized in such discourse are often not formed around a predicate.

This presentation hopes to show that the concept of “clause” that has been assumed in the traditional study cannot be extended easily beyond the context of written texts and idealized sentences in English and that we need careful examination as to if and where we can find justification for positing the clause as a significant organizational unit.

Repeated predicates in Japanese conversation: special focus on adjectives

Panel contribution

*Dr. Ryoko Suzuki*¹

1. Keio University

It is commonly observed that Japanese speakers respond to a question or show a reaction to something in repeated forms in everyday talk, as in the following example:

A: *ashita gakkoo aru?*

tomorrow school have

Do you have classes tomorrow?/(lit.) Are there classes tomorrow?

B: *n, aru aru.*

yeah exist exist

Yeah, (I) do./ (lit.) There are.

B answers A's question by repeating the verb *aru*. Suzuki and Ono (in press) point out that a wide range of verbs occur in repetition in response to or showing reaction to something. Some verbs are particularly commonly repeated, such as *chigau chigau* 'differ, differ (meaning no, no)' and *aru aru* '(something) exist, exist/have, have' *iru iru* '(someone) exist exist' to name just a few. Suzuki and Ono propose that "verb repetition is a template that creates new reactive tokens (13)." Some repeated verbs, such as *chigau chigau* '(lit.) differ differ' or *wakaru wakaru* '(lit.) understand understand' occur frequently, and speakers repeat them multiple times. Those frequently repeated forms seem to function as independent reactive tokens.

As the translation suggests, verb repetitions in Japanese work just like English clauses. Speakers use those forms naturally. A verb is only one of the parts of speech that is repeated in Japanese conversation. In this study, we focus on adjective repetitions, using video-recorded natural conversational data (Corpus of Everyday Japanese Conversation).

In our preliminary investigation, the data come from 104 tokens of the non-past form of adjective repetitions in 86 conversations. Just like verbs (as shown in Suzuki et al. in press), a wide range of adjectives (31 adjectives) occur in repetition. Of these, 14% occur in direct responses to the interlocutors' questions or requests. On the other hand, 71% are reactions of the speaker to various things in the immediate context: (1) reacting to another speaker's narrative as shown below with *sugoi sugoi* 'incredible incredible'; (2) reinforcing one's own point of view (*ii ii* 'good good'); verbalizing bodily reactions (e.g., *itai itai* 'painful painful,' *kayui kayui* 'itchy, itchy'); (3) reacting to some people (e.g., a baby) or things (e.g., Sumo match on TV, delicious food) right in front of himself/herself (e.g., *umai umai* 'skillful skillful,' *oishii oishii* 'delicious delicious').

A: *Kazoku zen'in kita no. Kazoku zen'in.*

family all came PRT family all

The entire family came. The entire family (did).

B: *e:, sugoi sugoi.*

Wow, incredible incredible.

Repeated adjectives are often pronounced emotively, and just like repeated verbs, they can occur without utterance-final pragmatic particles. Some adjectives are repeated multiple times without pause, suggesting that those forms function as unitary expressions showing speakers' reactions. Whereas repeated verbs function as reactive tokens to immediately preceding utterances by another speaker, repeated adjectives seem to be associated with a broader range of speakers' reactions. This study shows that predicative forms, not only verbs but also adjectives, are repeated multiple times commonly in Japanese conversations, suggesting that they form a template that creates expressions showing the speaker's reaction to something.

Split Clauses as a Byproduct of Speaker Incongruent Stance and/or Action Misalignment in Mandarin Conversational Interaction

Panel contribution

Prof. Hongyin Tao¹

1. UCLA

One of the manifestations of atypical clauses in Mandarin is a situation where major components of a full clause are split into multiple parts but are eventually produced over the course of several turn constructional units. This is illustrated in Extract (1), which is taken from an international telephone call between a couple.

(1) M : □, 我等-, 我等着就是了.

Wo, wo deng-, wo dengzhe jiushi le.

1SG, 1SG wait-, 1SG wait-STAT just PRT

'I, I'll wait-, I'll just wait (for your letter) then'.

The first two prosodic/punctuation units may not be considered typical full clauses as they either lack a predicate altogether or lack a full predicate; it is in the third unit where the full clause is finally realized.

In this paper I examine the dynamic production of such atypical clauses in Mandarin conversation. I argue that atypical clauses such as those illustrated in (1) are byproducts of interactional moves in dispreferred interactional contexts such as incongruent stance and/or action misalignment (Stivers 2008). Thus in Extract (1), prior to these utterances, M (the husband) has asked his wife to stop talking about the mail she has sent him a few days ago and focus instead on a more pressing matter, yet the wife keeps giving more detail about the mail - upon hearing which M produces (1).

Overall it will be shown that the online production of typical and atypical clauses such as those splits in Mandarin conversation is attributable to a host of grammatical, semantic, and interactional pragmatic factors, and stance congruence and action alignment seem to be among some of the most prominent ones to be taken into account.

The (a)typicality of main clauses of relative clauses in Finnish conversation: syntactic and pragmatic lightness

Panel contribution

*Prof. Marja-Liisa Helasvuo*¹, *Prof. Ritva Laury*²

1. University of Turku, 2. University of Helsinki

Our study shows that in everyday Finnish conversation, copula clauses and existential clauses are overrepresented as main clauses of relative clauses (RCs). They are used as main clauses of RCs much more frequently than in our corpus as a whole. In our data from the Arkisyn Corpus of Finnish conversation, these two clause types account for well more than half of the main clauses of RCs (61%), while they account for less than a quarter (22.5%) of all clauses in the corpus. Below, the main clause of the RC in example (1) is a copula clause and example (2) has an existential main clause.

(1) **sehän on tilaisuus** jota sponsoroi Prisma

DEM-CLT be-3SG event REL-PAR sponsor-3SG P.

‘that is an event that Prisma sponsors’

(2) **siin on se Veeti** joka heitti sitä lunta sillon talvella

DEM.INE be.3SG DEM V. REL throw-PST.3SG snow-PAR then winter-ADE

‘there’s that Veeti who threw that snow in the winter’

Existential and copular clauses are atypical in that instead of predicating about some state or event, they characterize or classify some referent or place a referent in some location. They are also one-participant clauses and lack transitivity. Such clause constructions are called ‘nonverbal’ by Haspelmath (2022).

It was also quite common in our data for RCs to occur without any main clause, with only a free NP (e.g., Ono & Thompson 1994; Tao 1996; Helasvuo 2001) as head. Consider example (3):

(3) **ja sitte kukkakauppias** jolla #e# joka oli kaikkien tuntema tässä talossa

and then florist REL-ADE REL be-PST all-PL-GEN know-PTCP this-INE house-INE

‘and then the/a florist who was known by everyone in this house’

Thus, the main clauses of RCs in conversational Finnish tend to be syntactically simple and informationally light (cf. Fox & Thompson 1990), if there is a main clause at all. We suggest that these structural and informational characteristics reflect their function. They might also be characterized as ‘pragmatically light’, serving merely a framing or presentational function, introducing the referent of the head noun then predicated upon in the RC. In this way, the RCs regularly contain information more central to the interaction than what is expressed in the main clause: they are more likely than the matter in the main clause to be further discussed in the conversation (cf. Thompson (2002) regarding object complement clauses in English conversation).

The atypicality of two-place clauses in Indonesian Conversation

Panel contribution

Dr. Michael Ewing¹

1. University of Melbourne

Although transitive clauses have traditionally been a common starting point for grammatical analyses, it has become increasingly evident that much of language use is dominated by intransitive clauses. This is clearly the case for colloquial Indonesian conversation, where intransitive predicates make up roughly 85% of total predicates with the remaining 15% being predicates that would conventionally be classified as transitive. This picture can be further problematised when we consider that in naturally occurring Indonesian discourse, arguments are rarely expressed explicitly. In a sample of 673 predicate constructions from a corpus of conversational Indonesian, 367 (54.5%) had no explicit arguments, 280 (41.5%) had one explicit argument (whether intransitive or transitive), and only 25 (4%) had two explicit arguments.

This presentation examines these less-frequent transitive clauses. I first provide an overview of (potentially) two-place clauses in Indonesian conversation, including those in Agentive Voice (1 and 3) and Patientive Voice (2 and 4) formats, and in elaborated formats with a range of explicit arguments (1 and 2) and minimal formats with no explicit arguments (4 and 5).

(1) Weni: Kan aku bagi-bagiin brosur yang untuk lomba-lomba model kan,

PART 1S distribute-APPL brochure 2S for competition model PART

'I was distributing brochures for a modelling competition you know.'

(2) Febri: Kamu di-cari sama Om Soman tuh.

2SG PV-look.for by uncle Soman PART

'Uncle Soman is looking for you.'

(3) Alfa: Can pernah nyoba emang?

not.yet.SUN ever AV-try indeed

'(You've) really never tried (it)?'

(4) Asmita: O jadi di-bagi-in gitu?

oh therefore PV-divide-APPL like.that

'Oh so (you) share (your cigarettes) is that it?'

Focusing on atypicality, I conduct a close analysis the elaborated clauses (e.g. 1 and 2) in order to better understand what discourse functions and social actions such infrequent formats might be playing in interaction. These elaborated formats typically appear in narrative portions within conversation, however interestingly not part of relating the sequence of events being narrated (which usually involve given, tracked referents that are not stated explicitly), but rather in setting up a narrative scene (as in (1) which introduces a new narrative) or segments that link the narrator to the narration, such as evaluations. Reporting on actions going on in the moment of interaction (such as discussing orders at a restaurant or using apps while on a device) is another typical location for elaborated transitive clauses, as are statements that introduce entirely new topics (as in 2). Precisely because fully elaborated clauses are rare, identifying distinctive patterns across contexts where they are used can be problematic, nonetheless some commonality emerges. Noting that more minimal predicate constructions with few if any explicit arguments often occur during the incremental development of narratives, exchange of ideas and negotiations of stance, elaborated transitive clauses seem to do much of their interactional work at the edges of ongoing talk, e.g. framing and evaluation. Further exploration of larger and more diverse data sets should help shed more light on the role of these atypical constructions, which far from being anomalies,

occur consistently if infrequently in interaction.

The atypicality of verb-final clauses in Japanese conversation

Panel contribution

*Prof. Sandra A Thompson*¹, *Prof. Tsuyoshi Ono*², *Dr. Yasuyuki Usuda*³

1. University of California Santa Barbara, 2. University of Alberta, 3. National Institute for Japanese Language and Linguistics

We have observed that a typical constructed clause of Japanese in previous research looks like this:

(1)

Shoichi ga hon o yonda.

NOM book ACC read

‘Shoichi read a book.’

Typical examples involving verbs in our conversational data, however, look like this:

(2)

shoogakkoo san shii go nen gurai ni kakete zenbu yonda no ne

grade.school 3 4 5 grade about at over all read FP FP

‘(I) read (it) all during about (the) 3rd to 5th grades (in) grade school

Many features distinguish these two examples, but one obvious difference is that the verb is followed by further elements in (2). In fact, only roughly 6% of 26,000 verbs taken from the Corpus of Everyday Japanese Conversation have verbs in finite form followed by a pause without any further elements (hereafter, ‘bare’ final verbs). The remaining 94% are followed by further elements, such as final particles, as in (2). Such post-verbal elements have long been known to convey a wide range of social meanings (references provided on request); we argue that a realistic account of Japanese clauses must therefore include the fact that the post-verbal marking of social meaning is grammaticized into their organization.

‘Bare’ final verbs, featured as typical Japanese clauses in much previous literature, are thus atypical and quite rare. But do these ‘bare’ verbs really occur in clauses like (1)? Our data suggests that they do not; the utterances they occur in differ from (1) in two key respects.

First, the distribution of verbs in this minority type is markedly different from the majority type, where the verb is followed by further elements. For example, verbs such as *aru* ‘be’, *chigau* ‘differ’, and *omou* ‘think’ comprise roughly 35% of roughly 1500 tokens, but these occur in only 13% of the majority type.

Second, the use of such bare verbs tends not to be of the clausal form seen in (1). In (3), for example, Masa is telling students about music that was popular when he was younger.

(3)

1 Masa: ‘(during) my student time, folk song was hip’

2 Taka: fookudansu toka no kooyuu yatsu desu ka

‘is (it) folk dance like this?’

3 Masa: **chau chau cha-**

‘no no no’

4 ALL: laugh

In line 3, Masa immediately refutes Taka’s question using *chau*, a shortened form of *chigau* ‘differ’, repeated three times. Though bare, the repeated *chau* (without associated arguments), produced quickly in one intonation contour, are not at all like (1). We suggest that the verb *chigau* in *chau chau cha-*, in fact, is a ‘reactive token’ (Clancy et al. 1997),

responding to Taka’s question, and not three separate clauses.

We find that post-verbal elements are so deeply embedded into the grammar of Japanese that verbs rarely occur without them in everyday interaction. In the 6% of cases where bare verbs apparently do occur, closer examination reveals that they are doing a very narrow range of highly specialized social work.

Gestures and information structure manage common ground to adhere to pragmatic frame

Panel contribution

*Ms. Sofia Koutalidis*¹

1. Bielefeld University

In communication, we constantly exchange information and update the common ground shared with our co-speakers. Information structure refers to the means with which information is marked on sentence level to most optimally convey our communicative intentions. Information can be given or new, the topic of an utterance, or can be focused or backgrounded (Féry & Krifka, 2008). The linguistic means assigned to information structure, are already existent in the language's repertoire (Dipper et al., 2007) and recent research has revealed that gestures are also employed to highlight information in our utterances (Ebert et al., 2011; Rohrer et al., 2022). In German next to gestures those means can be prosodic or syntactical (Pittner & Berman, 2015).

Utterances are not produced arbitrarily in speech though. Combined coherently they enable discourse contextualization to comply with the given communicative goals the interactive situation poses. Pragmatic frames, meaning pre-patterned speaking practices, will trigger expectations about verbal packaging since they define how discourse will be structured and what is expected from speakers (Günthner & Knoblauch, 1994; Rohlfing et al., 2016).

This study focuses on the role information structure and its gestural marking plays regarding the communicative demands the pragmatic frame sets during language acquisition. Focus is considered to express pragmatic aboutness or at-issueness of the highlighted element (Koev, 2018) and should thus adhere to the given pragmatic frame. Utterances of 10 German preschool children in a setting of explaining a game were analyzed with that in mind [1]. Initial findings suggest that multimodal marking of information structure functions on utterance level drawing on available linguistic means to keep discourse on track, but simultaneously operates on contextualization level, in order to meet speakers' expectations and the general goals of the pragmatic frame.

Multimodal entrainment in conversation: a pilot study on parallel gestures and phonetic variation in Swedish

Panel contribution

*Ms. Martina Rossi*¹, *Dr. Maria Graziano*², *Dr. Margaret Zellers*¹

1. Christian-Albrechts-Universität zu Kiel, 2. Lund University Humanities Lab

The phenomenon of entrainment refers to the increasingly synchronized communicative behavior that interlocutors often adopt over the course of a conversation (e.g., Wynn & Borrie, 2022). In face-to-face interactions, entrainment has been observed to occur in different modalities: in gestures, through the paralleling or mirroring of (some aspects of) each other's gestures, as well as in speech, through the repetition of lexical items or phrases and mutually converging phonetic values (Kimbara, 2006; Graziano et al., 2011; Levitan & Hirschberg, 2011; Holler et al., 2011; inter alia). Not many studies, however, have paid attention to the possible interaction between modalities in the achievement of entrainment (Rasenberg et al., 2020). This pilot investigation attempts to assess whether, and to what extent, entrainment in one modality is accompanied by entrainment in another modality by observing parallel gestures alongside the variation of phonetic features in face-to-face interactions.

We analyzed excerpts from 3 conversations from the Spontal corpus (Edlund et al., 2010), each involving 2 Swedish native speakers, for a total of 15 minutes of dialogue. Conversations were transcribed and divided into turns. Using ELAN (Wittenburg et al., 2006), we identified all instances of parallel gestures, i.e., those sequences where one of the two speakers repeats, completely or partially, a gesture previously made by his/her interlocutor. A total of 17 parallel gestures were identified. To investigate global entrainment (Wynn & Borrie, 2022), each dialogue was subdivided into 5 sections of 1 minute each using Praat (Boersma & Weenink, 2022). F0 (in semitones above 1 Hz) and intensity (in dB), both normalized for the speakers' means, were subsequently extracted from the sections, in order to compare, for each conversation, the values of the sections where parallel gesturing is present to those where it is not.

Preliminary results point towards a possible cooperation of phonetics and the gestural modality for entrainment, and to an increased similarity between the speakers over the course of the conversation. For instance, the mean F0 in one conversation and the mean intensity in another become more similar to those of the speakers' conversational partners in the sections where a parallel gesture is present, especially in the dialogue sections closer to the end. In the third conversation, entrainment in the phonetic parameters seems to occur independently of the presence of a parallel gesture. This could be explained by the fact that, in this dialogue, parallel gestures mainly occur at the end of the speaker's utterance, during silent pauses, and not together with speech, as in the other two conversations. It is also possible that, in this case, the entrainment in the gestural modality might be accompanied by entrainment in other phonetic features that we have not yet analyzed.

These preliminary observations suggest that entrainment could be a cross-modal phenomenon. Further analyses on a larger dataset will involve more phonetic values (e.g., voice quality and speech rate), also at the turn level, as well as the lexical content of the turns with or without parallel gestures. Finally, entrainment will be quantified using inferential methods.

On the coordination of prosody and hand gestures in native-nonnative conversations

Panel contribution

Mr. Valentijn Prové¹, Prof. Bert Oben¹, Dr. Kurt Feytaerts¹

1. KU Leuven

It is a well-established fact that native speakers (NS) slow down their speech rate when interacting with non-native speakers (NNS). This general feature of NS-NNS interactions has been studied as the consequence of speaker adaptations at more detailed phonetic levels such as segmental articulation (e.g. syllables are extended, Scarborough et al. 2007) and prosodic chunking (e.g. more pauses occur, Derwing 1990). However, the available empirical studies leave slow speech rate to be a rather monolithic phenomenon, so we know little about its dynamicity in NS-NNS conversations and the functions it serves correspondingly. In this paper, we aim at a more fine-grained account that is anchored in a multimodal study of intonation phrases (IP's) and that focusses on the coordination of prosody and hand gesture. Based on Kendon's (1972) seminal hypothesis that gesture closely follows the structure of speech at different phonetic levels, we should expect that speech and gesture continue to be coordinated, even if the speech production is segmented into smaller chunks. Such behavior would enhance transparency for non-native interactants as to how an utterance is formulated.

Based on a video corpus of spontaneous speech with 46 NS of Dutch each having a free conversation with both another NS and a NNS (creating within-subject conditions), we investigate whether, in NS-NNS compared to NS-NS conversations:

- (a) Hand gestures overlap more tightly with co-expressive IP's.
- (b) Gesture size and gesture velocity are more strongly correlated with speech rate in the co expressive IP's.

In our quantitative approach, we use nested mixed-effects linear models with the IP as observation level. We annotated gesture units using the Neuroges coding system (Lausberg 2013) and we extracted two-dimensional movement data using the OpenPose framework for pose estimation (Cao et al. 2017) to calculate different kinematic measures in terms of gesture size. We transcribed the conversations orthographically and we used the BAS Webservice pipeline (Kisler et al. 2017) to temporally align the transcribed words with the sound signal. Subsequently, we kept IP's that were delimited by pauses more than 200 ms (Cucchiaroni et al. 2002) and that temporally overlapped with a gesture unit.

While most of the annotation work is done, we are still working on the analyses. We expect to find that gesture and speech are more closely coordinated in NS-NNS conversations, that is, there is a more strict temporal overlap between speech chunks and co-expressive gestures. Moreover, we expect larger and slower gestures to correlate with a reduction in speech rate. As such, gestures might contribute to the multimodal prominence of speech rate adaptations. We think this paper is relevant for the panel 'Prosody, Gesture and Conversation' because it provides the basis for a functional explanation of the interdependence of prosody and gesture in conversation.

The role of nonverbal and paraverbal features in Lingua franca communication in therapeutic mental health encounters. A case study.

Panel contribution

Prof. Leona Van Vaerenbergh¹, Dr. Sofie Van de Geuchte¹

1. University of Antwerp

Communication is an essential aspect of mental health: it is used not only during anamnesis but also to make a diagnosis and to treat patients. These conversations are marked by a complex interplay of verbal, nonverbal (gesture), and paraverbal elements (prosody): “[...] for both counselor and client, voice tone and rhythm, smiles, frowns, and body positions play a central role in the interaction [...]” (Donovan et al. 2017: 12). When the psychiatrist and the patient do not speak the same language and try to communicate in a common foreign language (lingua franca), the extra-verbal messages gain importance and become more prominent.

This paper investigates the role of nonverbal and paraverbal features in lingua franca conversations in mental health. The basis for this study are four psychiatric interviews with a Rwandese patient in a psychiatric hospital in Flanders (Belgium). The interlocutors used French, a foreign language for both the psychiatrist and the patient. The consultations were video recorded in 2018 over a period of 4 months in which the patient was treated ambulatory. The recordings were transcribed and analyzed using conversation analysis, focusing on verbal, nonverbal, and paraverbal features.

We noticed that the nonverbal and paraverbal elements could have two different functions. The first function is to indicate communication difficulties. Interlocutors show, among other things, that they are looking for words by gesturing, looking away, pausing, and stuttering. The second function is to compensate for the lack of verbal messages (see Albl-Mikasa 2022: 69; Watzlawick et al. 2017: 58-59). Nonverbal expressions like gestures and facial expressions are used to replace words, and nonverbal and paraverbal elements make it clear to the other participant that something was understood (or not).

By taking the multimodal nature of conversation into account in the analysis, we can observe how the lingua franca consultation unfolds and how the interlocutors manage to understand one another, which would not be possible without the nonverbal and paraverbal elements.

Turn uptake in potentially-competitive contexts using manual gestures by speakers of Luganda

Panel contribution

*Dr. Margaret Zellers*¹

1. *Christian-Albrechts-Universität zu Kiel*

Turn-taking in conversation is observed across a variety of languages to function relatively smoothly without large gaps or overlaps (Sacks et al., 1974; Stivers et al., 2009). However, overlapping speech arises in many contexts (Çetin & Shriberg, 2006; Kurtić et al., 2013), and often without causing any problems in the conversation. For example, many backchannels arise in overlap with ongoing speech, without disrupting the main speaker's turn; this may partly arise since their phonetic form reflects their placement, normally being quieter and having a lower pitch than the ongoing turn (Gardner, 2001). Even when overlapping speech does not consist of a backchannel, though, it is not the case that overlapping speech is always problematic for participants in a conversation. Rather, overlapping speech can be classified as turn-competitive or non-competitive, with competitive contributions often showing increased pitch and loudness compared to surrounding speech (French & Local, 1983; Kurtić & Gorisch, 2018).

Gesture, and specifically hand gesture, has long been recognized as a resource for turn uptake. Schegloff (1984) identifies turn uptake as a context in which a person who is not the active speaker can use a hand gesture, and gestures as turn-uptake tools have been identified in such diverse languages as Ilocano (Streeck & Hartge, 1992), French (Mondada & Oloff, 2011) and Mandarin (Li, 2014).

An emerging body of evidence supports the argument that prosody and gesture comprise a single system within linguistic, and there is substantial support for the idea that prosody and gesture interact in complex ways, for example, in the expression of prominence (Swerts & Kraemer, 2010; Wagner et al., 2014; Prieto et al., 2015; Ambrazaitis & House, 2017, 2022, *inter alia*). However, there has been relatively little investigation of the ways in which prosodic and gestural cues interact in the context of turn uptake. The current study investigates this interaction using data taken from two Luganda conversations. Luganda is a Bantu language spoken in Uganda; the current data consist of excerpts from two-party conversations which were recorded in July 2019 in Kampala. A salient feature of the data is the frequency with which a self-selected next speaker will indicate the desire to take up a turn by initiating a hand gesture before the current speaker's turn has ended. So far, 24 tokens of such pre-gestures have been identified in 12 minutes of annotated data from two conversations. Initial analysis suggests that these early gestures may be a tool for avoiding the need to treat overlapping speech as turn-competitive, which may be a face-threatening action; neither the turn launches that immediately follow the early gestures, nor the turn ends with which they overlap, appear to display the prosodic features associated with turn-competitiveness (e.g. increased pitch or loudness). This contribution will investigate the extent to which such pre-gestures may either replace prosodic marking of turn-competition, or avoid the treatment of turns as competitive by giving early warning of an interlocutor's desire to take the floor.

Dialogue interpreting in maternity: insights into rapport building and intersectional challenges

Panel contribution

Dr. Elena Davitti¹, Ms. Soumely Madell¹

1. University of Surrey

Rapport is a key construct when investigating interactional management in dyadic, triadic and multiparty exchanges, especially in collaborative settings, where trust between the parties-at-talk is key to a smooth development of the encounter. Different approaches to communication analysis have captured how rapport is co-constructed in dialogic, interpreter-mediated scenarios across different settings, highlighting the importance to account for the interplay between verbal and embodied resources (Davitti & Braun 2020).

This paper will explore rapport building in an underresearched setting for dialogue interpreting (DI), namely language discordant maternity settings between midwives and pregnant women (Bridle et al. 2021). Despite recommendations that healthcare professionals should use interpreting services for *all* patients requiring it, several multilingual communication practices are adopted to offer language support. These can be placed on a continuum from less to more ‘technologized’ (Davitti 2019) and range from using one *lingua franca* to *ad hoc* interpreters to professional interpreters, either onsite or remotely connected, to relying on speech-to-text/speech translation applications. Evidence suggests a certain lack of confidence in relation to how to handle multilingual communication scenarios and that current language provision policy may not be fit for midwifery promoting a women-centred and individualised-care approach (NHS 2020).

Against this landscape, this presentation will characterise the midwifery setting as a journey, from antenatal to intrapartum and postnatal appointments during the course of midwifery care. Rapport is an essential component of the midwife-woman therapeutic relationship, which is conceived as a partnership built through mutual trust, respect, empathy, appropriate use of power, through safe, effective, ethically correct, and non-discriminatory communication. While midwifery literature has been prolific with regards to monolingual communication issues, the midwifery journey has never been explored in its entirety and in terms of multilingual communication (Akselsson et al. 2022).

Constructivist Grounded Theory is used to access the voices of midwives and childbearing women, within an NHS Maternity Trust setting. The paper will report on rich, in-depth findings from extensive interviews with over 40 participants, focusing on how rapport emerges from their different accounts of the multilingual practices they have experienced first-hand in both onsite and remote interpreting alongside the midwifery journey, what interactional challenges emerged and how these affected communicative goals during maternity care. The paper will show how such data can provide a suitable springboard for further microanalytical investigations, especially in a setting where accessing video-recorded interactions is particularly challenging.

Exploring multimodal face work in video remote interpreting and face-to-face interpreting

Panel contribution

Dr. Esther de Boe¹, Mr. Mathijs Verhaegen¹

1. University of Antwerp

Research on dialogue interpreting has widely recognized interpreters as “fully fledged social agents”, whose behaviour impacts on the dynamics of the interaction – including face work –, and whose “additional image of self is at stake during the communicative event” (Merlini, 2013, p. 268). However, as Cavents and De Wilde (in press) point out, contrary to research on monolingual face work (e.g., Culpeper et al., 2003) showing that participants use a multitude of verbal and embodied resources (e.g., gaze, body posture, gesture) to manage face work, in interpreting studies, there is a dearth of research investigating multimodal aspects of face work. This paper explores the interpreter’s multimodal face work strategies during repair sequences, more specifically, in cases in which the interpreter requests clarification, hesitates and self-corrects, and provides meta comments on her task. These instances can be considered face-threatening, since the interpreter risks negative evaluation from the other participant(s) concerning her professional competence. Data were collected by means of semi-simulations in an educational setting involving a school psychologist and a certified community interpreter, as well as an actor playing the parent role. The three participants took part in two video-mediated interpreting events (one with all participants in a different location and one with the psychologist and “parent” together, while the interpreter was connected remotely) and one face-to-face interpreting event. All participants wore mobile eye trackers for the purpose of analysing their gaze behaviour, since the use of multimodal resources such as gaze may be less efficient in remote interpreting (e.g., Davitti & Braun, 2020). Drawing on an interactional, multimodal framework, the analysis of the selected excerpts provides salient insights into the ways in which the interpreter manages face sensitivities in remote and face-to-face interpreter-mediated events.

Face Threatening Acts in Telephone Interpreting

Panel contribution

Prof. Raquel Lázaro Gutiérrez¹

1. Universidad de Alcalá

Telephone interpreting has increased considerably in Spain in recent years, becoming one of the most demanded forms of interpretation. It is an innovative technology in the language services industry, which was introduced to facilitate communication for immigrant communities and is also proving extremely useful in enabling effective communication in the provision of services for tourists and other foreign-speaking populations. As the immigrant population, tourism and other population movements increase, the demand for telephone interpreting increases too, intensifying and generating the need for a more technologically advanced service. This modality of interpretation is increasingly used in more diverse sectors and its exclusivity in the field of public services has been left behind, since more and more private companies that provide services such as insurance, electricity, gas, banking, etc. use the telephone as the main means of assistance to their clients, eliminating physical offices and expanding beyond physical boundaries.

The project PRAGMACOR (Corpus pragmatics and telephone interpreting: analysis of face-threatening acts, Ref. PID2021-127196NA-I00) aims to continue and substantially expand the line that began with the projects Design, compilation and analysis of a multilingual corpus of mediated interactions on road assistance (Ref. CCGP2017-HUM002) and Analysis of Face Threatening Acts in Telephone Interpreting (Ref. CM/JIN/2019-040). Once the methodology has been validated and the usefulness of the analysis of the corpus of interactions has been proved, the aim is to continue expanding the number of languages and conversations, extending the research beyond road assistance to include the rest of the areas where telephone interpretation is used, focusing on a specific aspect related to pragmatics: face-threatening acts.

Interpreted telephone conversations are an example of distance communication as opposed to face-to-face communication and, on the other hand, can be considered a type of asynchronous interaction as a speaker's speech is reworked before reaching the final receiver (Lázaro Gutiérrez, 2021). Our starting hypothesis is that, due to these characteristics, a high number of different face-threatening acts occur in these conversations, particularly taking into account the participants cultural diversity, which may cause the appearance of discriminatory discourses. To confirm or refute this hypothesis, we set ourselves the following objectives: 1) detect FTAs, 2) classify FTAs according to a) their type (attack against the positive or negative image) and b) their author (service provider or user), 3) analyse their impact on the discourse and on the performance of the interpreters. Our methodology is based on corpus pragmatics.

The aim of this contribution is to present the results of the projects Design, compilation and analysis of a multilingual corpus of mediated interactions on road assistance (Ref. CCGP2017-HUM002) and Analysis of Face Threatening Acts in Telephone Interpreting (Ref. CM/JIN/2019-040), and the first steps of PRAGMACOR (PID2021-127196NA-I00).

Rapport management and multimodality in onsite and video remote interpreting

Panel contribution

Mr. Dries Cavents¹, Prof. July De Wilde¹, Dr. Jelena Vranjes¹

1. Ghent University

In recent years, there has been a growing demand for video remote interpreting (VRI). However, few studies have explored the influence of VRI on the management of interpersonal relations. Conversely, some studies have already investigated the management of interpersonal relations in onsite interpreting (OSI), using Brown and Levinson's (1987) *Politeness Theory* and, recently, also Spencer-Oatey's (2008) *Rapport Management Theory*. In addition, earlier research has pointed to the importance of both verbal and non-verbal behaviour for the management of rapport. However, previous research into video mediated communication has also revealed interactants' reduced access to visual cues (Hale et al., 2022). Therefore, we hypothesise that this lack of visual cues will influence interactants' rapport management strategies. In order to test this hypothesis, the present project aims to investigate (1) the (non-)verbal rapport management (RM) strategies employed by participants to OSI and VRI interactions; and (2) the influence of the VRI setting on participants' use of RM strategies.

To this end, we conducted experiments, for which we recruited 12 professional interpreters who were each asked to interpret one OSI interaction and one VRI (i.e. none of the three participants joining remotely share the same physical space) interaction. To increase ecological validity, the simulated interactions were script-based, drawing on input from authentic cases. The experiment was recorded with video cameras and an *Eyelink Portable Remote* eye-tracker. Immediately after the experiment, all participants were asked to fill in a short survey informing about their overall experience. After having analysed the video-recorded interactions, we conducted semi-structured interviews with the participants who were asked to retrospectively report on their experience of the interactions and discuss the adopted rapport management strategies. Our hypotheses for the experiment were that (1) the VRI setting would require more rapport management than the OSI setting; (2) the participants would use more non-verbal RM strategies in OSI than in VRI; and (3) the participants would compensate for the lack of access to non-verbal communication in VRI by using more verbal and disruptive rapport management. The presentation will discuss the findings from the experiments and how these relate to the proposed hypotheses. Furthermore, it will zoom in on the specific impact of OSI and VRI on how rapport is managed in dialogue interpreting (DI). Our findings contribute to existing theories on the use of (non-)verbal behaviour for the management of interpersonal relations in a DI context, both in OSI and in VRI.

Rapport management in remote interpreting in court settings. A psychological perspective.

Panel contribution

*Mrs. Diana Singureanu*¹, *Prof. Sabine Braun*¹, *Dr. Graham Hieke*¹, *Dr. Joanna Gough*¹

1. University of Surrey

This paper presents a selection of the findings emerging from a wider study investigating the challenges professional interpreters face when working in court-prison video links at a busy court complex in London, and how they respond to these challenges. Drawing on the psychological concept of Emotional Intelligence (EI), we investigated the influence of court interpreters' EI levels on their views regarding video-mediated interpreting (VMI) and their coping strategies in VMI. This is a multi-method study that combined qualitative methods, which consisted of observing and interviewing interpreters, and quantitative methods, namely the TEIQue self-report inventory used to assess interpreters' levels of emotional intelligence.

Our study corroborates some of the inherent VMI challenges established in previous research in terms of defendants' reduced sense of presence (Fowler, 2018; Davitti and Braun, 2020) but also reaffirms that that interpreters' perspectives on VMI varied considerably (Devaux, 2016; Braun, Davitti and Dicerto, 2018). Aimed at investigating psychological factors that may contribute to this variation, our cross-analysis between the qualitative and the quantitative data showed relationships between interpreters' EI profiles and their rapport management approaches. For example, interpreters with a high level of social awareness appeared more perceptive of the lack of engagement exhibited by the remote defendant showing an increased understanding of the role of gaze in bridging the physical distance in VMI. Furthermore, high levels of emotion perception, empathy and social awareness seemed to translate into these interpreters having a better insight into the impact of the busy court environment on the rapport between co-present parties and the remote defendant.

This presentation will introduce the data and the methodological instruments used in the cross-analysis and then exemplify and discuss what the identified relationships between the different data sets reveal about the interpreters' rapport management in VMI in court settings.

This study offers an innovative way of looking at VMI through a psychological lens, highlighting that interpreters' individual differences have an impact on how they approach and/or cope with a VMI assignment in court, including how they manage the rapport between the participants; it strongly suggests that EI as an intrapersonal aspect needs to be considered whenever interpreters' views are sought or when the appropriateness of different approaches to implementing VMI is discussed.

Social workers' perceptions and experiences on rapport management in onsite and remote interpreting

Panel contribution

Dr. Anu Viljanmaa¹

1. Tampere University

This paper looks at service providers' experiences on rapport management in onsite and remote interpreting. More concretely, it reports findings from a qualitative exploratory study that focuses on Finnish social workers' experiences in using technology-mediated interpreting services in child welfare, family work and integration services. Specific focus is laid on the social workers' perceptions and experiences of managing rapport with the service user and the interpreter in situations where the interpreters' presence is reduced, i.e. technology-mediated interpreting (video-remote or telephone interpreting) is used.

Interpreter-mediated social work is a field of practice that comprises practical and interactional challenges and requires a high degree of professional discretion in order to optimize client outcomes (Connor, Zubrzycki & Foreman 2021). Previous studies on interpreter-mediated social work report social workers experiencing difficulties in engaging families and building relationships when sessions are carried out with an interpreter (Kriz & Skivenes 2010; Tipton 2016; Westlake & Jones 2018). Much of the existing research on the challenges of interpreter-mediated social work is concerned with problems related to poor verbal renderings, i.e. problems relating to inaccurate or incomplete translation, but also to questions of trust (Sawrikar 2015, Tipton 2016, Westlake & Jones 2018).

The multimodal aspects of rapport management in social work using technology-mediated interpreting deserve more attention. This exploratory study sets out to address this gap by investigating the impact of the interpreter's reduced presence on the service provider's experiences on how they can manage and do manage rapport.

The study sets out to answer following research questions: What are the challenges social workers' associate with rapport management in interpreter-mediated social work when distance vs onsite interpreting is used? In technology-mediated interpreting, how is the interpreter's active involvement in interaction management experienced to challenge the direct contact between service provider and service user? And finally, what are the social worker's rapport management strategies in technology-mediated interpreting?

The research is based on qualitative in-depth interviews conducted with social workers in Finland. The interviews explore social workers' perceptions and experiences of working with interpreters. The analysis conducted is a thematic analysis focusing on patterns of multimodal elements of rapport building and management in interpreter-mediated social work.

Staying connected: The effect of interpreting modality (onsite vs. video-mediated) on rapport management in interpreter-mediated police interviews

Panel contribution

Prof. Sabine Braun¹

1. University of Surrey

Interpreting in police interviews requires professional skill and a high level of sensitivity to the communicative situation (Hale et al., 2017). As in other instances of dialogue interpreting, a crucial aspect of interpreting in police interviews is rapport management (Spencer-Oatey, 2008), especially through the selection of appropriate strategies to enhance, maintain and/or challenge the relationship between the primary interlocutors and the interpreter. Rapport management strategies draw on a wide range of resources, including direct verbal interventions (e.g., requests for clarification) but also ‘small’ verbal and embodied cues ranging from changes in volume and prosody to gestures, gaze and posture. It has been argued that many of these resources are more difficult to use effectively in the fractured ecology of video-mediated communication (e.g., Due & Licoppe, 2021), leading to reduced social presence and creating difficulties with ‘staying connected’ in online communication. Against this backdrop, the increasing use of different configurations of video-mediated interpreting in legal and other settings (Braun, 2015), including police interviews (Braun, 2013; Hale et al., 2022), raises important questions about how the fractured ecology of video-mediated communication and video-mediated interpreting impacts the management of rapport in interpreter-mediated police interviews when the interpreter is offsite, and what the implications may be for cross-lingual police communication involving vulnerable people.

This presentation addresses these questions through analysis of a corpus of (simulated) police interviews involving experienced police officers and qualified police interpreters. The interpreters were either co-located with the primary interlocutors or connected via video link. The presentation first identifies the multimodal resources and strategies employed in each of the two interpreting modalities to manage rapport and then investigates the relationships between rapport management and interpreting modality.

The analysis and interpretation of the findings draws on Spencer-Oatey’s (2008) comprehensive framework of rapport management, which is particularly relevant to the complex context of interpreter-mediated police interviews, as it emphasises the different dimensions of rapport management such as interactional goals, face work, and interlocutors’ sociality rights, which are linked to equity, fairness and social inclusion/exclusion.

The presentation and interpretation of the findings will be followed by a discussion of the wider social implications of the increased use of video-mediated interpreting in the context of cross-lingual police interviews and fairness of justice.

Beyond war: Turbulent landscapes and affective regimes of Bosnia-Herzegovina

Panel contribution

Prof. Maida Kosatica¹

1. University of Duisburg-Essen

This paper seeks to carefully demonstrate the results of an interdisciplinary work which brings together and builds upon a range of critical theories (e.g. trauma theory (LaCapra, 2016), performance theory (Bell and Gibson, 2011)) that call for different ways of approaching the complex politics of language and communication in post-war societies. Theories the paper builds upon are framed as discursive and semiotic inquiries of remembering which predominantly, but not exclusively, rely on 'raw' material memory in physical space, and thus are situated under the umbrella of memoryscapes research. Aiming to understand (the sites of) trauma in Bosnia-Herzegovina, my paper is designed in a way that recognizes the power of war memory which is implicated in the production of complex, affect-filled spaces and discourses of remembering (Kosatica, 2022). To illustrate how war memory meaningfully and affectively prevails in public space, I look at different genres of data and communication domains in which the 1992-1995 war is discursively and semiotically (re)constituted. There are two datasets at the heart of this paper. The first considers post-war monuments evidencing the habitual struggle to disrupt and reorder space and reinterpret the violent past. The second data-set includes eerie murals depicting a war criminal sentenced to life imprisonment for genocide, crimes against humanity, and war crimes committed in the 1992-1995 war in Bosnia-Herzegovina. In this regard, I am taking a multimodal social semiotic approach (Kress and van Leeuwen, 2001) concerned with meaning and semiotic resources such as textual content, visuals, color, design, emplacement, and material. Historical acts of violence in Bosnia-Herzegovina are conveyed, (re)negotiated and generally remembered in quite ordinary, banal ways. It is through the remembering of the past, through different communicative modes, that the country endures as a *traumascape* (Tumarkin, 2005) with the past war extending into the present. And often in quite material, consequential ways – the war is by no means over even though the killing has ceased.

Debating war (and the chances for peace) in the German public and media. Two open letters to the German chancellor and their uptake in the German quality press

Panel contribution

Prof. Helmut Gruber¹

1. Department of Linguistics, Vienna University

The Russian invasion of Ukraine on February 24, 2022, marked a turning point in (European) history. Although being part of NATO (which backed Ukraine from the beginning of the war with arms supply), Germany found itself in a difficult situation because of its historical role in the so-called “bloodlands” of Europe (Snyder, 2012) of which Ukraine is part of. This resulted in an initial reluctance of the German government to supply Ukraine with heavy arms and a public discussion on this issue. This discussion was fueled by the successive publication of two open letters to German chancellor Olaf Scholz by different groups of German intellectuals and public figures, one opposing and one supporting Germany’s heavy arms supply for Ukraine, at the end of April and beginning of May. These two open letters (as well as an article by philosopher Jürgen Habermas, a supporter of the open letter against heavy arms supply and a public call for the immediate start of peace negotiations on the Ukraine war published some weeks later by yet another group of German public figures) caused a heated discussion in the German speaking quality press.

In my presentation, I will firstly analyse the claims, the representation of social actors (concrete vs. abstract, van Leeuwen, 1996), the types of emotive pro and contra arguments (Macagno & Walton, 2014), and the justification strategies used (van Leeuwen, 2007) in the four public statements. In the second part of my presentation, I will present the results of an analysis of the public discussion of these four texts in the German speaking quality press. I limit my analysis to quality press texts as the tabloid press mainly echoed the discursive positions which were put forward in the quality papers, and as an analysis of the huge amount of social media posts on this issue is far beyond the reach of this presentation. The current corpus size is about 40 texts which may, however, slightly increase. This second part of the analysis will focus on the recontextualization of claims, arguments and justification strategies from the four “source” texts in the public discussion as well as evaluations, metapragmatic expressions, and argumentations used in the media texts. The general aim of the presentation is to provide a concise and nuanced picture of one aspect of the current war-discourse in Germany through a socio- and discourse-pragmatic lens.

How do States Reminisce? Building Relations Through Bonding Narratives

Panel contribution

***Prof. Zohar Kampf*¹, *Dr. Tracy Adams*², *Prof. Gadi Heimann*³**

1. Hebrew University of Jerusalem, 2. Yale University, 3. The Hebrew University of Jerusalem

This study asks how national memories are harnessed for building and maintaining peaceful interstate relationships in political speeches made during foreign states visits. We focus on the practice of reminiscing, the recounting past events (Butler 1963), and demonstrate how it is used to create the emotional glue binding two states and, through which peaceful interstate relationships can be sustained. We suggest that reminiscing is done through a specific type of strategic narrative, which we term a *bonding narrative*. Such a narrative harnesses cultural, ideological, and historical sources and resources to construct and sustain positive relations between two collectives by underlining their common history, experiences, and values.

We consolidated three separate datasets of speeches delivered to and by three Western states during state visits—the United States, the United Kingdom, and Israel. Studying evocations of past events in 455 speeches delivered between 2010 and 2020, we demonstrate the prevalence and significance of bonding narratives, highlighting the discursive efforts that political leaders invest in establishing and strengthening commonality between states.

Our findings show that in the process of narrating the intersections of their states' legacies, state actors hierarchically organize events from the past, selecting the most relations-advancing components history can offer. The better the component serves the strategic narrative of bonding, the better it will serve the dyadic tale of peaceful relations. Accordingly, political leaders prefer to rely on a shared past that is based on cooperation between their collectives rather than a parallel past, which is limited to similar experiences and values. They tend to prefer ongoing and recent events that still live in the memory of the collectives over specific and distant events. When the opportunity arises to further harness the past for strengthening relationship, political leaders present a familial connection or personalize a past events in order to create an appearance of kinship, the most intimate tie in human relations.

Alternately, when past shadows of war hover over the peaceful relations, political leaders mitigate the traumatic past, transforming the events into a resource for bonding in the present. We conclude by arguing that despite the unique nature of bonding narratives, the bilateral collective memory mostly relies on shared memories of wars, once again underlining the link between nations and violence.

Legacies of war, cosmopolitan spaces & diasporic discourses: Insights from the Sri Lankan Tamil diaspora in London

Panel contribution

Dr. Lavanya Sankaran¹

1. King's College London

This paper seeks to understand the role of conflict legacies and conflict discourses in processes of *forming* diasporic spaces and diasporic identities within the Sri Lankan Tamil community in London. Drawing on a Leverhulme funded linguistic ethnographic project carried out between 2015-18 (Leverhulme Trust Ref: RPG-2015-279), the paper will examine how conflict & post-conflict discourses in relation to the Sri Lankan civil war move across borders and are reshaped in London's urban cosmopolitan environment. Specifically, the interview and questionnaire data that focus on participant biographies, aspirations, routines, beliefs, experiences as newcomers to the UK/Europe, language ideologies, civil war experiences, language practices and linguistic repertoires will inform the analysis.

In order to avoid regarding the Sri Lankan Tamil diaspora as a homogeneous group, the project has adopted a theoretical framework that views diaspora as social and communicative practice and analyses the production of diasporic spaces as a discursive and affective project (Brubaker 2005). To explore how diasporic imaginings are created, reproduced and changed over time, I examine what role language socialisation (Ochs & Schieffelin, 2012) has in shaping discourses related to identity, home, belonging and involvement in conflict & post-conflict socio-political action, taking into account factors related to intra-group dynamics and varied migratory trajectories. Such an approach focuses on the analysis of socialising interactions, offering an empirical grounding in the study of identity formation. Given that diasporas are not always formed as a direct outcome of migration movements and that it is possible to *become* a diaspora through developing a new imagination of a community, even many years after the migration/s took place (Sökefeld 2006:267-268), the project investigates how “younger or newer members of communities are socialized to the beliefs and sociocultural and linguistic practices of their communities, both explicitly and implicitly,... while also being socialized to community-specific ways of using language” (Baquedano-Lopez & Kattan 2007:74). This suggests that the role that ‘memory’ plays and its interaction with participants’ experiences in a multi-ethnic metropolis is also important.

The findings reveal that there is currently no consensus on what should be codified as the mainstream conflict discourse in the Sri Lankan Tamil diaspora and that there are several difficulties around articulating one that seems acceptable. However, amongst the younger generation there is the need to remember the past as a matter of ‘duty’ toward their family and community and to show respect for the trauma and hardships endured by the older generations.

Nationalist rhetoric in political speeches as a strategic manoeuvre to mobilise for war. A Discourse-Historical Approach

Panel contribution

Prof. Martin Reisigl¹

1. Department of Linguistics, Vienna University

Political speeches have many functions, including remembering the past, taking stock of the present or preparing future decisions. Sometimes they also serve to legitimise acts of war and military aggression. Nationalist rhetoric plays a key role in this. This will be examined in detail in my paper within the framework of a comparative discourse-historical analysis.

Empirical basis for my analysis is formed by influential speeches that were held on various historical occasions. Among others, the following speeches will be taken into consideration: Slobodan Milošević's commemorative speech delivered in 1989 on the occasion of the 600th anniversary of the "Battle of Blackbird Field" in 1389, George W. Bush's speech delivered in January 2007 in Fort Benning (in which he announced the increase of troops in Iraq), Barak Obama's speech in West Point, New York, in December 2009 (in which he announced the increase of troops in Afghanistan), Vladimir Putin's speeches on the occasion of the annexation of the Crimea and Sevastopol in 2014, Joe Biden's speeches on the withdrawal of American troops from Afghanistan in August 2021, and Vladimir Putin's speeches at the beginning of the Russian war against Ukraine in 2022.

First and foremost, the critical discourse-historical analysis will look (a) at nationalist argumentation patterns referring to causes and consequences of specific war events in the past and (b) at nationalist argumentation patterns that aim at justifying military attacks or entries into wars. Second, the paper will identify tropological (metaphorical, metonymical and synecdochic) patterns employed in order to discursively deal with important dimensions of wars. These tropes can fulfill important argumentative functions. A central analytical focus will be given on the ways how the "national body" is discursively imagined in the speeches – for instance as a "wounded, injured body" whose past integrity or unity must be restored.

Peace into war transformation in Ukraine: What media keywords suggest

Panel contribution

***Prof. Serhiy Potapenko*¹, *Mr. Oleksii Deikun*¹**

1. Kyiv National Linguistic University

Media keywords, belonging to the sociopolitical group of terms referring to ideology and culture (Jeffries, Walker 2018: 4), occur in headings and news texts to attract and keep the reader's attention. Consequently, the research question of this presentation is whether media keywords can be organized into successions indicating the peace into war transformation.

Drawing on the BBC's online news texts of 2013 to 2022 when peace in Ukraine gradually converted into a full-fledged war, the presentation singles out three media periods of that process. The pre-crisis of 2013-2015 is indicated by the succession of keywords *unrest – protests – standoff – conflict – crisis (potential war)*. The pre-war of 2021-2022 is divided by the keywords *conflict – crisis – tension – war*. The two active stretches are linked by an intermediary period termed by the keyword *crisis*, characterized by the complexities of the word-concept relationship (Freeden 2017: 14).

The changes within the stretches are best captured by image schemas, i.e. cognitive patterns of body-environment interactions (Johnson 1987: xix), with the COUNTERFORCE schema focusing on the head-on meetings of forces represented by source, vector and target (Johnson 1987:46).

In the pre-crisis period the keywords *unrest* and *protest* differentiate an increase in COUNTERFORCE sources' strength; *stand-off* indicates the inability of either source or target to overcome each other while *conflict* offers a balanced representation of COUNTERFORCE. Meanwhile, the keyword *crisis* adds BLOCKAGE components resulting in imbalance and enhancing the inability of the COUNTERFORCE opponents to find the way out. This understanding of crisis is in concert with its interpretation as impasse and deadlock (Freeden 2017: 23). At the end of the period, the noun *war* doesn't function as a media keyword: it denotes a potential COUNTERFORCE of a large scale in textual background positions: in Ukrainian politicians' quotes, analytical publications etc.

In the pre-war period the keyword *conflict* introduces the events associated with small-scale COUNTERFORCE targets: chemical plants, besieged ports, murdered civilians etc. The keyword *crisis* foreshadows events based on large-scale COUNTERFORCE targets and combines with the units describing panic, risks, fear etc. The *tension* stage is mainly characterized by the words of speaking (*say, accuse, threaten* etc) and the modal verb *can* implying an imminence of an armed conflict. The *war* stage evokes COUNTERFORCE sides of global, international, national, local or individual status.

To conclude, the BBC's construction of peace into war transformation in Ukraine falls into three periods with crisis ending the initial stretch, dominating throughout the intermediary stage and being emotionalized before the period of tension. Moreover, the singled out successions seem useful for placing other disturbances on the post-Soviet territories between peace and war. The Kazakhstan clashes of early 2022 termed by the keyword *unrest* can be positioned at the outset of the peace-war succession. The Belarus post-electoral *protests* of 2020 are a step further while the Belarus / Poland border *crisis* of 2021 moves a step on though remains distant from war being devoid of emotions and pre-war tensions.

Re-writing history through fabricated historical narratives: a discursive “justification” of war.

Panel contribution

***Dr. Chang Zhang*¹, *Dr. Anastasia Stavridou*²**

1. Communication University of China, 2. University of Manchester

Russia's invasion of Ukraine on 24 February 2022 has spelled tremendous geopolitical consequences to Europe and brought enormous sufferings to global populations. How did Putin mobilise discursive resources to justify the Russian-Ukrainian war is of great value to the investigation of war discourse. While Russia receives intense denouncement from several countries for its violation of international law, resulting in sanctions on Russian energy exports by the international community (Dodd, 2022), Putin seems to think the opposite. In a series of speeches Putin delivered the around the war outbreak, he eloquently defended his decision to initiate the war and justified Russia's aggressive and unjustifiable invasion. While some studies have elicited the line of arguments embedded in Putin's speech (Laruelle & Grek, 2022; Ugoala, 2022), they are mainly single text analysis rather than systematic analysis of Putin's speeches before and after the invasion.

Taking this as a reference point, this paper analyses seven speeches made by Vladimir Putin prior to and after the invasion to Ukraine (between 12 December 2021 and 27 March 2022) in order to unpack the historical narratives that Putin has formulated to shape collective memories about the Russian-Ukrainian relationships to reinforce the pro-Russian propaganda (Pearce, 2018). Inspired by Goddard's (2015) legitimisation theory, the paper argues that the legitimisation strategies of the waging of war will significantly shape the response of the rivals and the international community, thus the trajectory of war in a broader sense. Employing the methodological tools of Critical Discourse Analysis (CDA) (Fairclough, 2013), we seek to unpack the discursive devices Putin draws on to formulate historical narratives. Preliminary findings suggest five key themes that shall be understood inter-textually with Putin's broader historical memory narrative. These include (i) the denial of the Ukrainian statehood, (ii) the romanisation of Russian-Ukraine relationship, (iii) the securitisation of the West, (iv) the radicalisation of Ukrainian elites, and (v) the proposal of returning to history and revamping the international system.

The research aims to contribute to the fields of political science and discourse studies by employing critical discourse analysis to the emerging tensions of Russo-Ukraine war. With this small-scale study, we intend to promote interdisciplinary dialogue that indicates the value of political rhetoric analysis in understanding the rise of wars and political conflicts.

Reframing from interpersonal to intractable conflicts: an argumentative approach

Panel contribution

*Dr. Chiara Jermini-Martinez Soria*¹

1. Università della Svizzera Italiana (USI)

Reframing is broadly defined by the conflict resolution dictionary as the “technique of relabeling or redefining a particular concept or reality so as to give it a slightly different and more constructive perspective” (Saponek, 1983: 42). The literature has established that it can contribute to the “tractability of intractable conflicts” (Shmueli, Elliot & Kaufman 2006), i.e. “violent and prolonged [conflicts]” (Bar-Tal 2013), ideally reversing or at least interrupting the negative spiral of conflict escalation (Glasl 2004) that in worst case scenarios inevitably lead to tragic outcomes such as armed conflicts. In fact, reframing allows for “frame convergence” – a prerequisite for conflict resolution (Drake and Donhoue, 1996). This is true for any type of conflict: as long as people’s framing of events and other agents involved in the conflict differ in incompatible ways, conflicts cannot be solved. For example, in interpersonal conflicts if one views the other party’s behaviour as a personal attack (instead of, let’s say, originating from a misunderstanding), s/he will not be ready to open a fruitful dialogue with that party. This readiness to communicate must be present in order to really explore peaceful options for conflict resolution. However, a clear definition of what reframing actually is was lacking. Relying on the definition of reframing developed by the author’s PhD dissertation’s, the author proposes a theoretical reflection on how this definition can be applied to “intractable conflicts” – presenting a case study as an illustrative example. The findings discussed in Jermini-Martinez Soria (unpublished PhD dissertation “Reframing as an argumentative competence in dispute mediation”) derive a definition of reframing as an “umbrella term” which includes four different argumentative phenomena: 1) changes of discussion issues not supported by arguments; 2) changes of discussion issues supported by arguments; 3) counterarguments; 4) reformulations. This definition is derived from an analysis of two multilingual corpora of data on interpersonal conflicts of different kinds (such as workplace conflicts, divorces, neighbourhood conflicts and so on) – 26 transcriptions of role-played mediation sessions (approx. number of words: 200’000) with professional mediators working in Switzerland and volunteers playing the roles of the conflicting parties (for more details see Jermini-Martinez Soria 2021). In this contribution, the author is going to discuss how this definition of reframing can be useful in the attempts of resolutions of “intractable conflicts”, firstly discussing it in relation with relevant literature, such as the contribution of communication scholars Shmueli and colleagues (2008) and secondly proposing an analysis of a case-study of a public conflict in Switzerland with the potential of becoming intractable, concerning the regulations about the hunting of wolves in order to prevent the killing of sheep bred for agricultural purposes – with the aim of illustrating the conflict-resolution potential of reframing.

Toxic masculinity, toxic femininity and war

Panel contribution

Dr. Jana Valdrová¹

1. *University of Innsbruck*

Masculinity and femininity are research topics of gender studies, more particularly, gender scheme theory (cf. Bem 1983, Starr/Zurbriggen 2017, Valdova 2018) and critical men's studies (von Heesen 2022, Tippe 2021). Toxic masculinity is a manifestation of masculinity that emphasizes aggressiveness, competitiveness, strength, sexual performance, superiority, the need to lead and control others, suppression of emotions. It is a social construct that harms women, men and society as a whole. Underestimating the influence of toxic masculinity leads to the deepening of social inequalities in a given society, the suppression of different opinions and identities, and the increase in the incidence of violence, which can end up in armed conflict and war. From this point of view, I will critically follow one of the ways whereby an insignificant member of the KGB, nicknamed the Pale Moth, became a Russian dictator admired by some as an idol of manhood.

My research is based on two corpora: the first one contains selected TV-shows of the Russian First Channel (Pervyi kanal) before the Russian invasion of Ukraine. From the perspective of Bem's gender scheme theory I will analyze how these talk shows construct the „only correct“ versions of masculinity and femininity, every day, many years. I also will observe how Pervyi kanal promoted the image of Putin as an all-knowing and adored leader (cf. Kress/van Leeuwen 2020, Galeotti 2022, Hunter 2022).

The second corpus consists of recordings of independent media after February 24, 2022: Navalnylive, Freedom, Unian, Telekanal Doshd (tvrain.ru) and others. I will bring evidence for the clearly observable erosion of the instilled toxic masculinity and toxic femininity in Russian Society.

And last but not least, as a Czech native speaker, I will use a few examples to compare approaches to toxic masculinity in Russia and the Czech Republic.

Vladimir Putin's war rhetoric: between cold reflexion and loss of control

Panel contribution

Prof. Daniel Weiss¹

1. University of Zurich

My talk aims at elucidating the whole width of Vladimir Putin's war rhetoric by focusing on two of his nationwide broadcasted speeches delivered at the same location (the Georgievj Hall in the Kremlin) to the same auditory (the two chambers of the Russian parliament) on two similar occasions: the annexation of the Crimea (18.3.2014) and the annexation of four occupied Ukrainian territories on September 30, 2022. The preceding steps that seemingly legalized these acts were also the same: in both cases Russia had imposed fake referenda on the local population that allegedly approved their separation from Ukraine. Despite these commonalities, the contrast between the two speeches could not be more striking. The triumphant 2014 appearance (Guttke 2015, Nedashkivska 2015) took place during a rise of patriotic enthusiasm in Russian society, marked by such slogans as "The Crimea is ours!" or "Putin has raised us from our knees!" Putin's verbal legitimization of the annexation was based on a host of factual knowledge (percentage of voters of the Crimea referendum, surveys made in Russia, numbers of inhabitants of the Crimea and Ukrainian workers in Russia) and pseudo-rational arguments (mostly analogical reasoning) related to the history of Crimea, Russia and NATO's alleged approaching Russia's borders in space and time. Many formulations invite an analysis in terms of relevance theory including irony, metaphors and humoristic accents, others defy a reliable interpretation due to their vagueness; this holds in particular for the attribute "historical" ("our historical borders", "historical Russia", "historical unity").

By contrast, the 2022 speech was held after several defeats of the invader's army on the occupied Ukrainian territories and Putin's announcement of partial mobilization. The overall strategy has radically changed: 77% of the whole speech is now dedicated to the West and its alleged misdeeds, which encompasses accusations of colonialism and US subjugation of its "vassals", the wish to dismember Russia's territories (!) and above all a cultural degeneration attested by having same-sex parents ("mother one and two") or sex transformations offered to children. All this culminates in the accusation of satanism. The Western threat is thus located on the ideological axis and described as an attack against traditional values, "russophobia" being a new manifestation of racism. The whole strategy has switched from pseudo-argumentation to blunt aggression. Thus, the overwhelming part of this speech has no relation whatsoever to the reason for the celebration at hand, i.e. the annexation of the four Ukrainian territories. The only figurative device left are rhetorical questions, otherwise, we see a considerable amount of abusive language. On the whole, one may conclude that this speech points to a striking loss of a sense of reality and self-control due to the disastrous failure of Putin's warfare. It may however be added that similar losses of control are attested much earlier in Putin's verbal behavior.

The main tools serving to analyze this contrast are proximization theory (Cap 2013, 2017, Weiss 2019, 2020), cognitive metaphor analysis (Charteris-Black 2014, Musolff 2004) and relevance theory including implicatures and irony (for the first speech).

War-peace dialectic revisited: Scrutinizing neutrality-focused discourses in Sweden

Panel contribution

Prof. Cornelia Ilie¹

1. Strömstad Academy

Most conventional accounts of war and peace belong to a binary frame of thinking based on a sharp distinction between the two, which "is not fit for the 21st Century" (Fry 2019). According to Perot (2019), the growing challenges of the post-cold war phenomena of hybrid warfare and aggressive political subversion point to the role of aggressive autocracies like Russia in a perceived dissolution of the boundaries between war and peace. The grey zone between war and peace that we have been experiencing in recent times has been captured by Leonard (2021) in two interrelated labels: 'unpeace' and 'unwar'. They encapsulate the new world disorder, which is persistently unstable and crisis-prone.

It is in this new geopolitical climate that neutrality, which has long been viewed as impartiality in war (and generally in armed conflicts), has been called into question. Neutrality as a legal concept dates back to the early 1600s (Grotius 1646/1925). During WWII, neutrality amid total warfare was a precarious condition, and the conflict began with a spectacular violation of Belgium, despite its status being internationally guaranteed. Russia's invasion of Ukraine in 2022 has prompted a reconsideration of the concept of neutrality in international law, as well as a reassessment of geopolitical alliances and many countries' security position. Sweden is a case in point: its NATO application, which was submitted (together with Finland's) in May 2022, marks a major shift away from its longstanding position as a neutral state, stretching back to 1812 (Agius 2006).

After Russia's 2014 invasion of Ukraine, Sweden, regarded as a 'nation of peace' due to its neutrality (Parker 2017), recognised that it would need military cooperation and assistance from other states to realistically prepare for a possible Russian military aggression in the Baltic Sea area. While Putin's annexation of Crimea in 2014 was seen by Sweden as a wake-up call, Putin's and Russia's barbaric and senseless war in Ukraine in 2022 was promptly understood as a potentially existential threat to Sweden's independence and sovereignty. Thereby Sweden wisely abandoned the neutrality principle in favour of the dictum "Si vis pacem para bellum" (If you want peace prepare for war).

Using Sweden as a case study, this paper aims to identify and problematize recurrent patterns of argumentation in neutrality-related discourses delivered by top Swedish politicians before and after the NATO application that triggered wide-ranging public debate. A pragma-rhetorical and argumentation framework of analysis (Ilie 2018, 2021) will be used to de-construct and re-construct the arguments meant to persuade Swedish citizens about the justification and legitimacy of the decision for Sweden to join NATO, while abandoning its traditional status of neutrality. Particular attention will be given to examining the strategic socio-cultural keywords used by Swedish politicians to reevaluate and reconceptualize the notion of neutrality in relation to the currently blurred war-peace distinction. This analysis will be carried out based on Rigotti and Rocci's (2005) mixed approach to both argument and keyword analysis, and on Steinmetz et al's (2017) conceptual history approach.

“Argumentative Patterns in Peace Discourse”

Panel contribution

Prof. Manfred Kienpointner¹

1. University of Innsbruck

The concept of “argumentative patterns” was recently introduced by Frans van Eemeren as part of the extended theory of Pragma-Dialectics and defined as follows: “a particular constellation of argumentative moves in which, in dealing with a particular kind of difference of opinion, in defence of a particular type of standpoint a particular argument scheme or combination of argument schemes is used in a particular kind of argument structure” (van Eemeren 2018: 150). Argumentative patterns which are typical for a certain communicative activity type are called “prototypical argumentative patterns” (van Eemeren 2018: 165). In my contribution to the panel, I would like to describe prototypical argumentative patterns within peace discourse, a subtype of political argumentation.

In order to do this, I have assembled a small corpus of four texts which argue for peace from a pacifist point of view (although not all authors are pacifists in a strict sense). The texts (three treatises and one speech) are written in different languages and come from different epochs and cultures: Erasmus of Rotterdam’s (1469-1536) *Querela pacis* (“The Complaint of Peace”; first published 1517), Immanuel Kant’s (1724-1804) *Zum ewigen Frieden* (“Toward Eternal Peace”; 1795), Emma Goldman’s (1869-1940) *Speech Against Conscription and War* (1917) and Mahatma Gandhi’s (1869-1948) *History of the Satyagraha Ashram* (1932).

My study has a threefold purpose: 1. A detailed argumentative analysis will try to explore which constellation of argumentative schemes is prototypical for the genre of peace discourse as manifested within the four texts I have chosen for illustration. 2. Apart from the descriptive perspective I will also try to critically evaluate the argumentation within these four texts. 3. Furthermore, I would like to show how the argumentative patterns which are characteristic for peace discourse react to (some of) the arguments brought forward in justifications of war. From a practical perspective, this is important because there is no doubt that discourse which justifies war represents the culturally hegemonic discourse in most of the contemporary societies (cf. Ivie 2016: 127ff.).

Black women fighting for justice: a comparative study of narrative performances of Brazilian and American social movements

Panel contribution

*Dr. Liliana Bastos*¹, *Dr. Etyelle Pinheiro de Araujo*¹

1. Pontifícia Universidade Católica do Rio de Janeiro (PUC-Rio)

Every year, thousands of people —mostly young, Black individuals— are killed by the police in Brazil. Rio de Janeiro, in particular, consistently ranks as the city with the highest rates of police brutality in the country. Some of these victims' mothers have engaged in social movements such as the *Rede de Comunidades e Movimentos contra a Violência* to fight for justice. Similarly, in the U.S., where Black people are often victimized by police brutality, movements such as *Mothers Against Police Brutality* and *Black Lives Matter* have been fighting structural racism and State-sanctioned violence. In general, social movements demand change and denounce problems in the public sphere while making use of different repertoires of contention (Tarrow, 2009). In this paper, we argue that movements such as these, more than merely pursuing justice in the context of racialized police brutality, employ storytelling as one of their most important strategic repertoires. Narratives are instrumentalized through artful modes of speech — that is, by means of a performance which, in Bauman and Briggs' (1990) words, “puts the act of speaking on display — objectifies it, lifts it to a degree from its interactional setting and opens it to scrutiny by an audience.” We argue that such performances constitute an enactment of the poetic function of language, a highly reflexive mode of communication through which Black women simultaneously express pain and grief over the loss of a child, and engage in resistance against the invisibilization, or the banalization, of young people's murders. The purpose of this qualitative interpretive paper is to carry out a comparative analysis of the performances of Black Brazilian and African-American mothers engaged in social movements which seek justice. To do so, we observe how the narratives told by these mothers, in different contexts of production, speak to wider issues of structural and structuring racism in their respective countries and denounce the banalization of violence against Black communities. Performed in public places and largely reported by the media, these mothers' discourse travels through time and space, reaching broader audiences and granting these women visibility across the world. The study's corpus comprises narratives, available on websites such as YouTube, told by both Black Brazilian and African-American mothers at events and demonstrations. The analysis also draws on an ethnography of demonstrations in Brazil and the U.S. in 2018/2020. Understanding narrative as a device which organizes human experience (Bruner, 1997) and as a productive discursive lens by which to examine social life (Bastos; Biar, 2015), initial findings suggest the existence of a prototypical narrative performance which organizes the suffering of losing a child and draws attention to both the act of expression and to the performer herself. When the performances of both Afro-Brazilian and African-American mothers are taken together, what emerges is not only the repetition of the same tragedies and the collectivization of these women's pain, but also an understanding that these fights, rather than isolated or limited to any given country, may be perceived as transnational efforts to address the same issue — namely, structural racism.

De-/Re-contextualized Western Mono Performances: from Settler-colonial “Texts” to an Emergent Mono Language Performance Genre

Panel contribution

Prof. Paul Kroskrity¹

1. University of California, Los Angeles

This paper celebrates the sea change in verbal art research that is so deftly represented in the landmark review by Bauman and Briggs’s (1990): “Poetics and Performance as Critical Perspectives on Language and Social Life.” Here I contrast two different historical presentations of Western Mono storytelling and how they demonstrate that “decontextualization and recontextualization of performed discourse bear upon the political economy of texts, texts and power” (Bauman and Briggs 1990:76). The Western Mono are an Indigenous community, numbering about 1,800 members, who live in such Central California towns as Northfork, Auberry, and Cold Springs. A Numic language from the Uto-Aztecan family, Western Mono is currently spoken by about 20 traditional speakers in a revitalizing language community that includes learners and “new” speakers.

The first representations of Mono storytelling appears in academic and popular cultural representations of Western Mono narrative traditions. These are entextualizations that translate the Mono language narratives into recipient-designed English texts. In the popular cultural examples, they eliminate or reduce features of the Mono originals that are viewed as unnecessary “repetitions” or excessive in their use of dialog by story characters (Judson 1912; Gifford and Block 1930). In academic examples, such as Gayton and Newman (1940,) these scholars critique the style of Mono traditional narratives as deficient because they lack “typical” features of contemporary English language narratives. These decontextualized representations typically fail to consider the cultural contexts in which the narratives occurred or even the fact that these performances were instances of an oral tradition in which engaging vocal delivery was a fundamental part of the storyteller’s art (Kroskrity 2015). The power to extract these cultural texts and subject them to a hegemonic gaze displays both the control and power of the settler-colonial state and its attendant cultural products.

But running parallel to the historical trend to move from “text-centered” approaches to “performance-centered”, as observed by Bauman and Briggs (1990) is the movement away from decontextualized texts as artifacts of dispossession disguised as a natural history that erases Indigenous authors, their communicative goals, and their communities. The second representation of Mono storytelling performances refocuses agency not on outsiders who radically de-contextualize but rather on a Mono storyteller, Rosalie Bethel (Kroskrity 2009, 2017) who recontextualizes these narratives for her own purposes, including not only personal, conversational use but also as an instance of an emergent performance product—a pedagogical story that is offered as a prospective exemplary teaching performance. In this novel recontextualization of Coyote Races Mole, Bethel includes an explanatory coda that is not an expected feature of this Western Mono narrative genre but one she regards as now necessary to better reach youth who have not been socialized to traditional narrative contextualization. The performance focus is thus necessary for understanding this atypical and emergent genre as an emergent vitality (Perley 2011) of Western Mono language revitalization.

De/centering vulnerability: A/typicality and communicative justice in a squat in Athens

Panel contribution

Dr. Birgul Yilmaz¹

1. University of Reading

This contribution approaches vulnerability ethnographically and how it is shaped and contested in international law and the everyday communicative practices of refugees living precariously in a squat in Athens. I focus on vulnerability as a legal categorisation and its de/centralisation (Bauman and Briggs 1990) in everyday communicative practices of refugees and squatters in a neighbourhood of Athens. When refugees apply for asylum, their vulnerability is measured according to their gender, age and health conditions. However, the invention of vulnerability as a protective measure in refugee governance, brings various kinds of complexities including refugees' co-dependency on humanitarian aid and problems around agency and autonomy while they are trapped in the asylum procedures.

During and after the so called "refugee crises" in Europe, squats in Athens, often associated with transgression and a/typicality in government discourses (as they alternate themselves to state infrastructures such as refugee camps) hosted and continue hosting migrants fleeing war and persecution in Syria, Afghanistan, Iraq and various other North African countries. However, since the right wing political party New Democracy came into power, most squats in Athens have been evicted, leaving many vulnerable people on the streets. By engaging with Bauman and Briggs's work on poetics and performance and Butler et al.'s work on *Vulnerability in Resistance* (2016), I account for the processes of the de/centralisation of vulnerability in a self-organised squat and the entanglements that emerge in relation to communicative justice (Briggs 2017). Based on these theoretical and analytical vantage points, and my fifteen month long ethnographic fieldwork in alternative spaces in Athens, I examine interactions that took place during Monday assemblies where squatters including refugees, the homeless, former drug users, anti-authoritarians, leftists and anarchists invested in interpretation and translation from Turkish, Arabic, Farsi to English and Greek as a form of democratic participation in communal life and the entanglements emerged in these interactions. I will also examine legal documents and policy papers, reports (as well as news stories) for an in depth ethnographic account of the de/centralisation of vulnerability.

Disputes and textual trajectories of the sexuality of a gay military officer in Brazil

Panel contribution

***Dr. Flávia Correia Lima Huber da Costa*¹, *Dr. Liana De Andrade Biar*²**

1. Pontifical Catholic University of Rio de Janeiro, 2. Pontifícia Universidade Católica do Rio de Janeiro (PUC-Rio)

In this article, we accept Bauman and Briggs (1990) invitation to reflect on how certain individuals gain rights to particular modes of transforming speech. We also resort to the Foucauldian concept of discursive order, within a multi-sited ethnographic perspective, in order to better understand the process of entextualization - decontextualization and recontextualization - of the story of a openly gay Brazilian Army officer.

After choosing to open up about his sexuality in the barracks, the officer suffered virtual lynching processes on digital platforms. In the flow of text movements, prints of virtual groups where the defamations occurred are presented. Next, the narrative of the participant who resists the will to truth of the hegemonic masculinity in the barracks is analyzed. The repercussion in the media is also object of investigation because it creates other meanings in the discursive chain of viralization.

The aim is to discuss which meanings emerge from each movement of the textual transit, observing the elements of the text-event that are recovered, erased and transformed. The aim is to highlight historical, social and cultural structures that participate in the construction of the homophobia discourse in the Brazilian military context. It also explores how the officer creates meaning for his life story while resisting the order of discourse rooted in the military scenario.

The results indicate that, in the textual trajectories, meanings about homoaffectivity circulate and are disputed in different orders, sometimes adhering to, sometimes defying the will of institutional military truth. It is observed that despite the veiled persecutions the officer may suffer, he chooses to open up about his private life in the contemporary panopticon of social networks. He also seeks to establish a new order of discourse in the military context concerning the acceptance of other ways of experiencing sexuality.

In addition to the theoretical framework, the study seeks to contribute to understandings about the current conflict between the legal and institutional acceptance of the presence of homosexuals in the barracks and their rejection by individuals who occupy this same space.

Indexical Disorder: From the Situated Nature of Power to the Power to Situate Nature

Panel contribution

Prof. Jonathan Rosa¹

1. Stanford University

Through their reconceptualization of poetics and performance, Bauman and Briggs have profoundly contributed to scholarly analysis of the culturally situated nature of meaning making and knowledge production. Importantly, for Bauman and Briggs, poetics and performance must be understood neither as derivative of purportedly pure language use nor as essentialized enactments of cultural difference. Instead, poetics and performance are crucial sites for and perspectives from which to examine the reflexive (re)production and (trans)formation of ideologies, relations, and structures. While Bauman and Briggs' framework attends to the role of power in structuring the creation and interpretation of poetics and performance, I'm interested in examining the tension between focusing on the situated nature of power on the one hand, and the power to constitute situatedness—context, being, meaning—on the other. I seek to put Bauman and Briggs' approach in dialogue with Povinelli's recent provocations in *Between Gaia and Ground*, which critically examines the stakes of focusing our analyses on the diversity of ontologies, interpretations, and experiences globally, as compared to the colonial and imperial capacity to constitute global ontologies, interpretations, and experiences. Put differently, this is the tension between studying Silversteinian (2004) indexicality as compared to Inoue's indexical inversion (2003); or Silverstein's indexical order (2003) as compared to what Briggs has formulated as indexical disorder (2018). By bringing these frameworks to bear on the analysis of boundary-making and transgression in the context of raciolinguistic ideologies and formations (Rosa and Flores, 2017), I argue for refocused attention to naturalization, inversion, and disorder in the study of poetics and performance.

Performance, Memory, and Poetics: The Role of Scribal Memory in the Transmission of Ancient Texts

Panel contribution

Dr. Raymond Person¹

1. Ohio Northern University

This paper draws from the similar range of scholarly work as in Bauman & Briggs (1990), drawing significantly from both the comparative study of oral traditions and Conversation Analysis (CA). The comparative study of oral traditions has led to discussions of scribal performance in the transmission of ancient (Person 1998; Ready 2019) and medieval literature (O’Keefe 1990; Doane 1994) and the role of scribal memory within scribal performance (Kirk 2008; Miller 2019). Scribal performance and scribal memory build upon the analogy of multiforimity in the oral composition of traditions as an explanation for textual fluidity and textual plurality of literary texts, characteristics that allow text-critical “variants” to exist within the tradition. Although Bauman & Briggs were clearly aware of early studies in CA, it is unfortunate that they did not have access to Gail Jefferson’s “On the Poetics in Ordinary Talk” (1996), especially since in my opinion Jefferson’s work on poetics has not received the recognition it deserves both within CA and beyond. In recent work (Person forthcoming) I have drawn from Jefferson’s poetics to describe cognitive-linguistic mechanisms in which text-critical “variants” are produced within scribal memory in the composition/transmission process of ancient texts. In order to make this argument, I must overcome common assumptions of (1) a wide gulf between the “typical” (e.g., ordinary talk) and the “atypical” (e.g., poetics and performance) and (2) the “crystallization” that occurs in entextualization, especially of “canonical” texts. Drawing from Jefferson’s understanding of the relationship of poetics to both “ordinary talk” and “the work of poets,” I will discuss examples of text-critical “variants” in the composition/transmission history of literary texts that are foundational to the “Western canon”: the Hebrew Bible, the New Testament, and Homeric epic. I will demonstrate that these “variants” that are found even within canonical texts (the “atypical”) draw significantly from mechanisms found in the “typical”—that is, the “poetic” mechanisms of “sound-triggering” and “category-triggering” that Jefferson identified in “ordinary talk.” This conclusion certainly continues the trajectory identified by Bauman & Briggs—that is, from a “traditionalist view” to “communicative action” (1990: 79).

Psychic Doppelgängers: Poetic Resonance During the Therapeutic Encounters

Panel contribution

Prof. Xochitl Marsilli-Vargas¹

1. Emory University

In their groundbreaking article, *Poetics and Performance* (1990), Bauman and Briggs provided a framework for understanding how verbal interactions travel around taking a variety of forms. Moving away from analyzing verbal performance as a single bounded interaction, they approach it instead as forming a web of intertextual encounters. Pushing this framework forward, and taking at face value Freud's idea that the psyche is extended, in this paper I focus on the concept of resonance as an embodied practice that defies the here-and-now of sound production through the poetic function by analyzing how words sound and resound in the listener. I explore "the music in the words" or how messages/sound/words *resonate* in the therapeutic encounter. By analyzing excerpts of the Multi-Family Structured Psychoanalytic Therapeutic communities in Buenos Aires, where both analysts and analysands shift their attention from semantic content to the poetic function during the therapeutic encounter, I question what kinds of textual artifacts are being produced in this setting when the emphasis is not in the text but what the text invokes in the listener.

The therapeutic encounter is quintessential heteroglossic (Bakhtin 1986) and intertextual. Multiple voices (audible and non-audible) are present and emerge during the dialogic encounters between an analysand and analyst and the emergence of their psychic doppelgängers. Through resonance, inside the Multi-Family Structured Psychoanalytic Therapeutic, the interactional framework expands to everyone attending the meetings (and beyond). In this setting, a particular form of reported speech emerges in which what is being reported is not an indirect or direct form of quotation, but instead the report of unconscious motives and actions. The attention shifts to what the words invoke in the listener rather than on their denotational content. Thus, the type-token relationship in this form of quotation becomes complex, because many different tokens of the same type can emerge (e.g., when more than one listener interprets different meaning out of the same statement). Thus, there is no clear contextualization framework.

If, as Bauman and Briggs convincingly show, the illocutionary force of an utterance emerges from the indexical relations between the performance and other speech events that precede and succeed it, I ask what is the indexical relation in resonance? If a text that is being recontextualized is in itself a text that has no clear trajectory (source) but that is part of a broader discourse that does not rely on a direct sign-object relation, what kinds of centering/re-centering is happening? What role does reflexivity play in contextualization? I intend to explore some of these questions by analyzing the concept of resonance and the emergence of what I call the "psychic doppelgänger" during analytic encounters.

Reading ‘trans-’ perspectives through Bauman & Briggs’s ‘entextualization’: Reformative or Destructive?

Panel contribution

Dr. Sender Dovchin¹

1. Curtin University

Recent debates in bi/multilingual studies have problematised some paradigms, such as codeswitching for reifying static language boundaries and for their inability to account for creative communicative practices. Instead, ‘trans’ perspectives, reflective of new terms such as translanguaging, transidiomia, transglossia etc., have been introduced to capture the critical ‘linguaging’ practices, which reflects the fluid movement between and across languages. Drawing on Bauman & Briggs’s idea of ‘entextualization’, some of the key terminologies such as ‘recontextualisation’, ‘re-semiotisation’, ‘translocalisation’ and ‘relocalisation’ and so forth, have started emerging in trans- perspectives. The main ethos of these terms is to understand language as ‘fertile mimesis’ (Pennycook, 2010, pp. 35–37) - a form of language repetition that creates a difference and linguistic forms and resources take on locally relevant or even new meanings, depending on different localities.

Note, however, that the idea of ‘entextualization’ has been both celebrated and problematised by conflicting language ideologies. While reformists celebrate entextualization as linguistically ‘creative’, ‘novel’, ‘eccentric’ and ‘innovative’, the traditionalists seem to oppose the idea as linguistically ‘destructive’, ‘pollutive’ and ‘contagious’. Drawing on longitudinal online linguistic ethnographic studies from various parts of/from the Global South, this study presents how ‘entextualization’ can indeed be linguistically and discursively constructed in trans- perspectives. Yet, the presumed entextualization is neither to celebrate nor to deplore but something to observe and examine with interest like anything else. I conclude, following Higgins and Coen (2000, pp. 14-15), ‘we accept that as Homo sapiens, we are all the same in terms of genetic structure and cognitive potentiality ... Beyond that, we do not think that as humans we have anything in common but our differences ...’ Linguistic entextualization is rather common - a necessary condition of linguistic commonality is its entextualization.

The ethnopoetics of reverie: Direct reported thought as (a)typicality.

Panel contribution

*Dr. Alex Pillen*¹

1. *University College London*

This paper addresses how thought surfaces in interaction amongst other quoted utterances as direct reported thought. To broach this topic, I not only rely on Bauman & Briggs's article on poetics and performance from 1990. A seminal piece by Briggs & Bauman published two years later on 'Genre, Intertextuality and Social Power' also underpins this paper. Inner worlds are often made up of an inner conversation we carry on with ourselves. Inner speech comes in at least two different varieties, the monologue of ordinary verbal thought and dialogic thinking, or conversation between more than one internal point of view. The subjective feeling is often one of talking to oneself. Given our comprehensive knowledge on poetics and performance in an outer world, the ethnopoetics of inner performance fascinates but eludes us. We can but invoke elements of generic ambiguity and dynamism between mundane interactive speech and inner conversation.

In this paper I hone in on a few instances of direct reported thought found within my corpus on language practice amongst Kurdish speakers in London. These take the form of "I said to myself" or "I thought" followed by a direct, verbatim quotation reflecting the here and now of inner conversation. In Kurdish, this window on an inner world is shaped by the direct reported speech patterns of daily interaction. Such well-trodden citation paths include a reported inner conversation with oneself, but also self-quotation in real time as speech unfolds. The latter is brought to the attention of interlocutors by means of "as I am telling you", or "as I always say" followed by a direct quotation. Direct reported thought fits within this wider ecology of quoting oneself as one speaks. Both unique and habitual utterances and thoughts can be rendered in this manner.

This leads me to address seminal work by Bauman & Briggs in terms of contemporary (geo)political challenges. The 'Kurdish question' is often framed in geopolitical terms, and the globalisation of the shape of inner interaction is no exception. The indirect reported speech marker 'ku' has featured in Kurdish novels and the media, since the beginning of the 20th century. The novel as a genre is characterised by a literary simulation of inner speech by writers like Virginia Woolf or James Joyce. Novels in the Kurdish language are seen as an important cultural symbol of the nation, articulated in equally modernist terms. Nation and indirect narration go hand in hand and offer a contemporary political backdrop to direct reported thought and the inner conversations of diverse Kurdish speakers. With this paper I commence a conversation about ethnopoetic reverie, a state of being pleasantly lost in one's thoughts - in Kurdish - despite ongoing cultural pressure.

The poetics and performance as critical perspectives: Young Bangladeshi Professional Women

Panel contribution

Prof. Shaila Sultana¹

1. University of Dhaka

Young Bangladeshi professional women have given rise to a kind of new womanhood through their financial freedom, life-style, consumption of modern amenities, and locatedness in the social milieu. However, globally women at the margin are represented as unidimensional, subjugated and oppressed in a patriarchal society by social institutions, cultural practices, and religious prejudices. They are considered stable, ahistorical, and reductive homogeneous powerless groups within the monolithic notion of patriarchy, shared oppression, and male dominance. In other words, there is an ‘ethnocentric universality’ in how women at the margin are conceptualised.

Hence, it seems important to understand the discursive construction of new womanhood in Bangladesh at the crux of the normative societal, cultural, and religious norms and explore the possible differences and dissonances Young Bangladeshi professional women may experience in their life trajectories. Keeping in consideration the contemporary take on poetics and performance as critical perspectives, the paper intends to see in what ways these young Bangladeshi professional women’s decontextualization and recontextualization of performed texts help their gender performativity.

This study combined digital ethnography with face-to-face interviews. The aim was to venture beyond screen-based/text-based observations through the long-term observation of, and contact with, the participants in on-line and offline contexts. The initial focus was on participants’ digital practices on social media. The data were collected over two years (2000-2022) and included around 1700 screenshots of Facebook wall interactions. In addition, in-depth interviews with each participant were conducted. They were asked about their life trajectories as Bangladeshi women, focusing on their lived experiences. The research was interested in participants’ interpretations and opinions about expected norms of womanhood in Bangladesh, so questions were based on these topics.

As suggested by Bauman and Briggs (1990), Leppänen, Kytölä, Jousmäki, Peuronen, and Westinen (2013) and Blommaert & Varis (2015), young Bangladeshi women seem to enjoy authority and the power of their individual agency when they decide which resources they want to decontextualize and show their legitimacy and competence in reusing and assessing differential values associated to various linguistic and multi-modal resources. However, this authority is not valueless – it is influenced by socio-cultural ideologies, eligibility, accessibility to institutional structures, legitimacy, cultural propriety, and the competence to conduct decontextualization and recontextualization. The decisions and choices made during the process of decontextualization and recontextualization are also closely related to what identity individuals prefer to perform. The same agency is observable in their pragmatic maintenance of the tactic of silence and a ‘positive face’ in front of family members, colleagues, and acquaintances offline.

The paper concludes that the poetics and performances through carnivalesque contextualization and decontextualization in social media and pragmatics of silence in offline spaces should be explored with reference to their societal, cultural, and religious boundaries. Only then a better understanding may be achieved of the linguistic, societal, cultural, and religious inequalities and marginalisation even educated professional women to face in a South Asian context like Bangladesh.

The poetics and politics of pornographic rhetoric: high performances in an extremist right wing government

Panel contribution

***Dr. Branca Fabricio*¹, *Dr. Luiz Moita-Lopes*¹**

1. Universidade Federal do Rio de Janeiro

In their article *Poetics and Performances as Critical Perspectives on Language and Social Life*, Bauman and Briggs draw attention to the “poetics and politics” of texts, highlighting the inextricability of artful language and day-to-day life. In this paper, we resort to such an understanding to approach the high performances of the former extremist right wing government in Brazil and the pornographic scripts they index. These performances deploy lexis, metaphors, and imagery whose apparent concern is the denouncing of the sexualization of society. They allegedly understand that such degenerate practices have reached harmful levels, particularly in regard to children they want to save from left wing parties and the “sickening” minds of their followers. As such, they invoke sexualized imagery, filled with perversions that threaten family values and morality, which circulate intensely on social media to the horror of many. To use a Foucauldian formulation, these practices excite and incite moral panic. Such route is pursued by the extreme right wing in many parts of the world, as its members make recourse to political agendas that defend totally masculinist societies, in which women would solely serve for human reproduction, equating feminism with anarchy and with the apocalypse. Others totally reject LGBT+ lives (Sedgewick, 2019). These practices thrive on Internet post trolls, pranks, and memes. As Nagle (2017, p. 17) argues, “the view of psychopathy and rejection of imposed morality runs through the ethos and aesthetic of the rightist trolling culture”. While presidents and members of extreme right wing governments have used sexuality to attack their opponents, in Brazil, the president and some of his ministers have been artfully involving themselves with intricate and sophisticated semiotic labor that conveys pornographic meaning-effects. We analyze two of these semiotic events in particular, drawing attention to how pornography is entextualized in them. The first is a social media post by the former Brazilian President, Jair Bolsonaro, immediately after his inauguration in 2019, which has been popularly referred to as the “golden shower post.” The second is a speech given by the female minister of Family and Human Rights in 2022, while campaigning for the reelection of the president, in which she described how children are sexually abused on an island in northern Brazil. The analysis detects highly stylized and well-planned semiotic performances that, orienting to a pornographic storyline, operationalize a pedagogic agenda. These findings indicate that everyday troll culture on the Internet has colonized governmental posts and addresses beyond any expectation levels.

“Marielle vive”: The work of mourning and the politics of poetics and performance in contemporary Brazil

Panel contribution

*Dr. Daniel Silva*¹, *Dr. Daniela Palma*²

1. *Universidade Federal de Santa Catarina*, 2. *Universidade Estadual de Campinas*

Periods of prolonged mourning resulting from political disappearances and the slow resolution of crimes against life in Latin America raise challenges for both the sociology of social movements and the psychoanalysis of mourning. In Freud's (1917) pioneering approach, mourning is treated as a normal affect wherein the inhibition of interest for the external world is accompanied by an over-investment in the image of the lost object. He suggests that through resources that include affective over-investment and reality-testing, the libido will eventually be redirected and grief alleviated. Although Freud speaks little of the role of performance in “Mourning and Melancholia” (Briggs, 2014, 2015), we now know the importance of the materiality of rituals and poetics in the work of mourning, including in the necessary reality-testing that facilitates libidinal reinvestment. Yet how does one perform reality-testing in situations where reality itself defies the limits of credibility? How to complete the work of mourning when it is uncertain whether the loved one is really dead? How to undertake reality-testing when real knowledge about criminal responsibility is foreclosed? This paper draws from the research project “Trajectories of peripheral lives: Violence between the ordinary and extraordinary in (auto)biographical narratives and poetics” (funded by the São Paulo Research Foundation/Fapesp, Proc: 2021/02618-8) and examines the work of mourning following the assassination of Marielle Franco, a Black, LGBT councilwoman from a Rio de Janeiro favela. The project has built an archive documenting textual, imagetic and political expressions of the mourning movement for Marielle. This documentation serves as the basis for an analytical work that looks at the poetics and performance (Bauman & Briggs, 1990) of the collective work of mourning as dimensions of politics in Brazilian peripheries. As of January 2023, almost five years have passed since Marielle's brutal assassination in an ambush, and it is still unclear who ordered the crime and what their motives were. Yet, rapidly the murder of this Black woman – a member of the largest but least politically and economically included demographic segment in Brazil – has been recontextualized as a crime against democracy, with major political consequences. The repetition of poetic elements that reenact her “presence” (such as the chant “Marielle vive”, or “Marielle lives”) plays a central role in performances that reclaim accountability for her death and celebrate her memory. The ritualized biographical time in this work of mourning is forged by the iteration of her “presence” and remembrance and is coupled with projections of future and hope – and has both individual and collective consistency. Alongside Briggs's (2015:267) suggestion that “[p]erformances weave tapestries of life in particular ways, which are then picked apart and rewoven in subsequent performances,” we will analyze the interweaving of quotes, chants, images, and temporal reinventions in the Marielle Franco Staircase, built in São Paulo as a grassroots monument. The analysis of the condensation of entextualized “fragments” and the continuous juxtaposition of their layers may be instructive for understanding the poetic and temporal dimensions of an open and inconclusive mourning process.

Creating private space as a requirement for interaction: The Case of an Autistic Child

Panel contribution

Prof. Friederike Kern¹

1. University of Bielefeld

Recent empirical research in the area of Ethnomethodological Conversation Analysis (EMCA) children's interactions has addressed the use of objects and space as environmental resources in collaborative play and various learning activities. Studies have shown how children employ such resources to shape their friendships (Bateman, 2011) or exclude other children (Evaldsson & Karlsson 2020); others have demonstrated how spaces create opportunities for learning activities (Kyratzis & Johnson, 2017), such as language-learning (Bjork-Willen, 2017). Building on research on children's use of objects and space as resources for interactional purpose, the paper presents a case study on an autistic child who, during an ongoing playing time with another child and an educator, employs environmental resources in order to create an area in which he can separate himself from the other participants. The analysis draws on video recordings of playing time sessions in an inclusive nursery school. Micro-analysis informed by EMCA will focus on the embodied practices with which the child moves in and out of interactions with others, and how he uses the affordances of the room and its equipment to build a spot where he can be alone. The analysis suggests that building an exclusive space provides the child with the crucial opportunity to have control over his interactions with others.

The findings will be interpreted with regards to diagnostic features described for autistic children in the American Psychiatric Association (2013, p. 50), especially their assumed difficulties in communicating and interacting with others.

Multimodal interactional competence in the early years

Panel contribution

***Dr. Christophe Parisse*¹, *Mrs. Sophie de Pontonx*², *Prof. Aliyah Morgenstern*³**

1. INSERM-CNRS-Paris Nanterre Université, 2. CNRS-Paris Nanterre University, 3. Sorbonne Nouvelle University

For most authors, the visual-gestural modality is more accessible to hearing children than the audio-vocal modality. Children's gestures are interpreted as constructing meaning earlier than their vocal productions (Rowe et al. 2022) and are considered to facilitate learning (Hall et al. 2022). Infants' imitation and general production of gestures has been studied as a precursor to constructing prelinguistic concepts, as a pathway into the symbolic function of language, and as a bridge between language and embodiment. Gestures are viewed as representational structures, often constructed through imitation, which are enacted overtly and can be shared with others. Gestures are also presented as having a compensatory function for both L1 and L2 language learners' expressive difficulties (Graziano & Gullberg, 2018) as well as at the end of the lifespan (Göksun et al., 2022). However a close analysis of children's development of gesture demonstrates how they do not emerge as a full-fledged complex semiotic system but are constantly endowed with meaning by scaffolding expert interlocutors. Multimodal approaches to interaction have highlighted the sensory features in the organization of social interaction thanks to the affordances that are perceived. Various types of behaviors (gaze, speech, gestures) and their (a)synchronicity have been analyzed (C. Goodwin, 2013, Mondada, 2011). Haptic formats were identified as being a means for adults to control and shape children's embodied actions both in family and primary school contexts.

In this paper, we present an integrative view of language development in which all semiotic resources are progressively deployed according to children's motor, cognitive and linguistic skills but also to the expectations and language practices of the children's cultural community.

Our analyses were conducted on a series of data sets combining multi-party family dinners and dyadic longitudinal recordings of children between 9 months and 6 years old. We annotated all participants' actions, gaze, and languaging (Linell, 2009) throughout our data using the software ELAN (<https://archive.mpi.nl/tla/elan>).

We show that in their early years, children's blossoming gestuality is less elaborate and skillfully produced, gaze is less expertly controlled and movements are less fluid than later in development. But for young children's "expert" interlocutors, they might seem easier to interpret and to endow with full-blown meaning than budding vocal productions. Indeed adults seem to have greater formal expectations for verbalizations, possibly based on the impact of their own schooling and the importance of literacy.

Our detailed qualitative analyses illustrate how language development is variably multimodal. Children's speech and gesture develop simultaneously and nourish each other constantly. Their first syncretic, holistic, multimodal buds blossom into more complex constructions, and bloom into full multimodal intricate productions containing positioning, displacement, and argumentation. With constant exposure to language through interaction, scaffolding, reformulation, and repair, children's language gradually develops into rich linguistic constructions containing multiple cross-modal elements subtly used together for communicative functions in which speech, as a very powerful tool, takes a very important part.

Prickly peas and potato walls: The affordances of food pretend play during preschool lunches in Sweden

Panel contribution

*Dr. Annerose Willemsen*¹, *Prof. Sally Wiggins Young*¹, *Prof. Jakob Cromdal*¹

1. Linköping University

The question of whether young children should be allowed to play with their food during mealtimes can elicit strong stances on food being primarily for consumption. However, studies have indicated that play could have a positive effect on children's willingness to taste foods (e.g., Coulthard & Sealy, 2017) and enhance their participation in mealtime interactions (Bae, 2009). Little research so far has taken a detailed look at food play sequences providing insight into how these come about and what they afford. This is of particular interest in early childhood education and care settings, where the mealtime is both a pedagogical and a social setting: the children learn how to eat and behave in the presence of their teacher(s) and peers, while the mealtime also facilitates togetherness and peer relations (Os, 2013) where opportunities for food play may arise.

This presentation gives a detailed insight into food play during mealtimes at Swedish preschools and demonstrates how it is initiated and responded to, and what these play sequences afford. The data comprise 100 lunches video-recorded in four preschools over a series of consecutive weeks. At each lunchtime, two to seven children between 2 and 6 years old eat a meal together with one to three teachers. Within this dataset an inductive collection of food pretend play was conducted: occasions where the food was oriented to as something other than just food. Discursive psychology and multimodal conversation analysis were used to explicate the interactional practices of the participants employing a multitude of resources to manipulate their food and utensils and invite others into their pretend worlds where peas can be 'prickly' and potatoes can be walls trapping other food items.

The analyses demonstrate that both children and teachers initiate food pretend play during mealtimes and that these initiations of play receive various degrees of uptake. While in some cases the play constitutes brief comments receiving little to no uptake or even a correction by the teacher, in other cases the play develops into complex narratives where other participants join in and extend it. On some occasions, the teacher engages in these narratives and gradually steers back towards eating the food, for example by recommending to be careful while eating the prickly peas. Our findings reveal therefore that preschool mealtimes provide rich contexts for play and, moreover, that this play does not necessarily disrupt the mealtime. Instead, it can function as a collaborative and multimodal means affording enjoyment of food and social participation during preschool lunches, and even provides teachers with a resource for stimulating eating without explicitly exerting control.

Recruiting objects to scaffold spatial thinking in early learning environments

Panel contribution

Dr. Amelia Church¹, **Dr. Amanda Bateman**², **Dr. Caroline Cohrsen**³

1. university of melbourne, 2. University of Waikato, 3. University of New England

The aim of this presentation is to illustrate how teachers can recruit local resources to scaffold children's learning about spatial concepts. The analysis here explores how early childhood professionals 'teach mathematics' to demonstrate how real-life child-teacher interactions illustrate responsive engagement – a practice principle in most early childhood frameworks or curricula. Key findings include effective teaching practices through participation frameworks co-produced through question answer sequences and “collaboratively organized embodied action” (Goodwin, 2018, p.318).

The video for this presentation is an extended extract of a teacher guiding four-year-old children in an Australian kindergarten to see spatial relationships between objects – specifically the principle of bilateral symmetry (as the teacher says, “a really difficult question”). We draw directly on Goodwin's (2007; 2018) depiction of environmentally coupled gestures to see how the teacher recruits local resources to scaffold children's spatial thinking, both in questioning and providing feedback through pointing at the shape and position of blocks on a light table. The analysis shows how teachers can use the salient features of resources in the immediate environment to reinforce or illustrate the concept under discussion. The conversation analytic approach to the unfolding action reveals distinct participation frameworks – here the activity of a teacher and three children gathered around and orienting to shapes on a lightbox – to show how concept development depends on embodied action (Goodwin, 2000). Importantly, we discuss how embodiment is not simply sequential (i.e. the teacher does something and the child does something else next), but visible as shaped and moderated by the actions of interlocutors.

Understanding the practice of responsivity necessarily needs us to pay attention to all the resources children and teachers are using to construct meaning, display understanding and scaffold concepts. Here, we demonstrate the pragmatic utilization of environment resources, including bodily orientation to specific objects (e.g. tapping blocks on the lightbox), and gesture that co-occurs with question-answer shaped talk to emphasize the salient properties of the objects in relation to each other (i.e. the concept of symmetry). Illuminating the details of these interactions has implications for pedagogical practice across curricula in early childhood education.

Social interactional affordances of walking outdoors in preschools in Sweden and Japan

Panel contribution

*Prof. Asta Cekaite*¹, *Prof. Matthew Burdelski*², *Dr. Olga Anatoli*¹

1. Linköping University, 2. Osaka University

This presentation discusses the interactional affordances constituted during group walking among preschool teachers and children (1 to 5 years old) within (sub)urban environments in Sweden and Japan. The data come from approximately 100 hours of video-recordings of naturally occurring social interactions in two early childhood educational settings, they are presented using multimodal interaction analysis. The analysis shows that walking along sidewalks, roads, and through outdoor places—often to arrive at a specific destination (e.g., gym, park)—constitutes a liminal space where children and adults recruit multisensorial resources in the environment, such as other people, sounds and objects (Mondada, 2019), to perform pragmatic acts and engage in social interactions.

Previous educational research has drawn on the notion of “affordances” (Gibson 1977) and argues for the importance of “unedited” natural landscapes, with an idealized depiction of, for example, a forest, as potentially more engaging for children than a playground (Aziz and Said, 2015; Hammarsten, 2021). We propose to broaden this approach and look at affordances not as a static characteristic of environments, but rather as engendering dynamic and dialogically constructed pragmatic meaning. Previous research has described adult-child interactions during outdoor walking as an educational activity for encouraging “environmental noticings” among children (Bateman, 2015: 102–104), as well as an opportunity for playful “occasioned knowledge exploration” (Goodwin, 2007). In this talk, we build on this research to look at walking that while instrumental—a compelled activity or “a mode of transport” (Loukaitou-Sideris, 2020)—affords opportunities for the co-construction of meaning. We suggest that for young children, walking outdoors allows for initiating spontaneous conversations that draws upon environmental resources, while at the same time “mastering” their bodies (Kern, 2018) in relation to their surroundings.

Toddlers' humorous use of environmental resources in peer interactions within an ECEC setting in Iceland

Panel contribution

*Ms. Bryndis Gunnarsdottir*¹

1. University of Iceland

Within ECEC in Iceland, the outside play area is an important environmental space that plays a large role in children's everyday lives in the settings. On average, children in Iceland spend around 8 hours a day in ECEC settings (Statistic Iceland, 2021), and between 1-4 hours of those are spent outside, depending on the season (Ministry of Education and Science, 2011). The outdoor space offers certain affordances for young children to interact with each other that are not found in indoor spaces (e.g. Dinkel et al, 2019). The play materials available in the environment can provide opportunities for interactions between children through multimodal resources that they use to co-construct their peer culture within the peer group (Corsaro, 2017; Løkken, 2010). This they often do in playful and humorous ways.

Two-year-old children (toddlers) are competent at expressing their understanding and intentions in peer-to-peer interactions through embodied gesture (Kidwell, 2005; Engdahl, 2011; Bateman & Church, 2017). This age group often utilise objects and materials in the outdoor natural environment in humorous ways to engage their peers and co-construct their cultural understanding of what is acceptable and what is not (Pálmadóttir & Johansson, 2015).

The study reported on in this presentation is an ethnomethodological study using CA to transcribe and analyse the interactions of toddlers that were video recorded over a period of nine months in Iceland. The study examines humorous embodied use of environmental resources in the outdoor space in peer interactions within an ECEC setting. This presentation will be focusing on the role that environmental resources play in supporting peer to peer interactions.

Preliminary findings suggest that toddlers are competent in utilising different play resources in the outdoor space to initiate and support their interactions with their peers. Through humorous embodied interactions intertwined with vocalisation and short sentences, they participate in these playful interactions through turn-taking and repair resulting in acceptance and successful interactions.

Young children's local deployment of material resources: negotiating social relationships during peer play

Panel contribution

*Dr. Magnus Karlsson*¹

1. *University of Gothenburg*

In collective settings such as preschools, children are afforded a rich environment of play spaces and materials that they can use in play interactions with others. The properties and characteristics of objects influence and shape their local uses by participants, but participants might also creatively use them for their various social purposes at the local level (Cobb-Moore et al., 2010; Danby et al, 2017).

This presentation focuses on a specific case of this relationship between objects and the daily construction of children's social world, namely the role of objects in peer play interactions and in the local negotiations of relationships, positions, and spaces within moment-to-moment social interaction. Drawing from video-ethnographic research in a Swedish preschool, and by utilizing an integrative framework that combines the paradigm of (peer) language socialization (Goodwin & Kyratzis, 2012), and a multimodal approach to human social action (Goodwin, 2018; Mondada, 2019), an extended sequence of naturally occurring play with objects among children aged 5 is investigated.

As the analysis illustrates, through children's multimodal categorizations (Burdelski & Fukada, 2019), and positioning of objects in the play space, they index affiliative or disaffiliative stances toward playmates, co-constructing thereby the social organization of the peer group. Specifically, children use the affordances of the environment, i.e. play objects and spaces, both to engage with others or restrict their access to the current activity. These various practices, involving deployments and interactions with specific objects (and the material environment), are relevant to children's local negotiation of their respective positions in the social organization of the peer group, which regards *both* children's friendships and (dis)affiliative relationships *and* the hierarchical power structure of the peer group (see Kyratzis 2004). In the discussion, an agentic view of children's deployment of objects that takes into consideration the affordances of a specific setting is put forward. It is argued that this perspective can cast light on the (cultural) ways through which multimodal resources are used by children to co-construct complex interactions, negotiate hierarchies and relationships in the early years.

‘Transformation objects’ – A help for bilingual preschoolers to transit from home to preschool and vice versa

Panel contribution

Prof. Polly Björk-Willén¹

1. Linköping University

The aim of the presentation is to highlight how young preschoolers’ language-switch between their mother tongue and Swedish and vice versa, is accomplished through language and nonverbal interchange between parents, the preschool teachers and themselves where the preschool entrance hall environment plays an important part in this process.

The present data draws on a video study focusing on everyday talk and social interaction between parents, children and teachers in the entrance hall of two Swedish preschools at drop-off and pick-up time (Björk-Willén, 2017). From an ethnomethodological view (Garfinkel, 1967), the participant’s interaction has been analysed in detail, sequentially to shed light on how they orient themselves to each other in this unique environment (Sacks, 1984; Schegloff, 1999; 2007).

Seeing the entrance hall as a transit zone for a child’s travel between home and the preschool, it will be shown how a child’s language-switch is a joint accomplishment where the parent, the preschool teacher and the child participate in different ways and to different extents. A couple of illuminating examples have been analysed, and chosen from a collection of events when a parent uses both her mother tongue and Swedish. The analyses show how the child’s transfer consists of embodied (Goodwin, 2003) and sometimes sensitive actions (Goodwin, M. H., 2017) together with the language-switch (Cromdal, 2004). The analysis also shows how concrete artifacts (shoes, mittens etc.) work as *transformation objects* and constitute a *transition point* that scaffold the child’s language commuting between home and preschool, and in addition these transition signals help the child to develop pragmatic skills that are necessary to manage the language and the cultural switch (Björk-Willén, 2017).

Forms and functions of repetitions in doctor-patient interaction in cancer treatment encounters

Panel contribution

Prof. Piera Margutti¹, Dr. Vittoria Colla¹, Dr. Valeria Barbieri¹

1. University of Modena and Reggio Emilia

Cancer treatment involves a long and complex process, featuring many medical encounters in a variety of specializations (e.g., oncology, surgery, and radiotherapy). During this process, patients often acquire a substantial amount of medical knowledge, to which they refer in talking with the physicians they meet along their treatment path (Colla & Margutti, forth.). This aspect affects the management of epistemic authority (Heritage, 2013; Fatigante et al., 2020; Lindström & Weatherall, 2015), turn taking, and the overall a/symmetry framework of interaction, entailing negotiations on doctors' deontic authority and patients' agency. In the oncology-related visits we examine here, doctors display to be oriented to patients' prior knowledge about their health conditions, while patients often stage themselves as consciously aware of their health status. Owing to such a 'knowledgeable patient', these visits are characterized by an interactive process of knowledge co-construction, whereby physicians and patients cooperatively establish suitable treatment. Such features are particularly visible in the participants' multimodal forms of repetitions of one another's contributions. Drawing on a corpus of 80 oncology-related visits video-recorded in 5 Italian hospitals, and relying on the intrinsically multimodal analytic framework of Conversational Analysis, this paper illustrates how physicians and patients repeat and reshape one another's utterances and/or gestures in their own turns and change the course of the ongoing action as a resource to negotiate epistemic primacy and achieve a shared decision on the treatment.

In the following extract an example of the phenomenon. In line 1 P is reporting what she has been told by another doctor.

BL PZ6 VS1 v.1 (13.35-14.08)

1 P: e lei mi ha spiegato che appunto va fatto perché- euhm::-
and she explained to me that indeed it must be done because- euhm::-

2 D: un tem[po togliEvano-
in the past they used to remove-

3 P: □ [in è quella che sostituisce la
to put it simply it's what substitutes

4 D: □ [>in parole povere<-
to put it simply

5 P: mastectomia.
mastectomy.

6 D: sì un tempo facevano la mastectomia, adesso si è visto nel
yes in the past they did the mastectomy, now it has been observed

7 corso degli anni, che appunto i risultati son sovrapponibili,
in the years, that indeed the results are the same,

In the course of P's word search (l. 1), P and D enact practices such as repetition rephrasing of the other's turn, producing action changes on a moment-by-moment basis, with the aim of maximizing their mutual understanding. In our collection, these practices are performed by participants relying on multimodal resources (verbal and bodily conduct, as well as prosody).

Painting hands: recycled visitors' gestures in a museum guided tour

Panel contribution

Dr. Biagio Ursi¹

1. Université d'Orléans

In the last few years, more and more work has been done on sensoriality which is considered as a primordial analytical dimension for taking into account the complexity of actions performed by social actors in the field of multimodal interactional studies (Mondada 2019). In particular, research involving several types of video data has proposed important methodological reflections (Greco et al. 2019) as well as analytical insights into the sequential organization of sensorial experience in institutional (Routarinne et al. 2020) and various settings (Cekaite & Mondada 2020).

In this contribution, I study guided tours that deal with the tactile exploration of painting reproductions by visually impaired and sighted people in a contemporary art museum in Italy (Ursi 2020). The guide, who provides bodily assistance and verbal explanations, accompanies visitors' experience of the tactile reproductions. Visitors sometimes relate their personal sensory experience of the artwork by performing representational gestures (McNeill 1992), within multimodal configurations. Some gestures are reused by coparticipants in the reformulation of previous remarks and the description of their own experience.

Here, I will specifically focus my attention on the visitors' gestures that are reproduced and mobilized by the guide in turns-at-talk for expressing affiliation with visitors. These multimodal resources can be considered as conversational routines (Chernyshova et al. 2022) that are used by the guide not only to stabilize meaning and ensure mutual understanding, but also to construct her professional discourse. Thus, multiple multimodal resources are retrospectively recognizable as a whole and sequentially mobilized for practical purposes. By relying on these resources, the guide can eventually point to visitors' assessments as well as to the spatial and temporal trajectories of the museum guided tour.

Recycling turns in multimodal dance instructions

Panel contribution

Prof. Oliver Ehmer¹

1. University Osnabrück

This paper addresses a specific type of recycling material from previous turns in interaction, namely recycled turns in multimodal instructions. A common feature of instructional interaction is that in the course of an instructional project (Reed/Szczepek Reed 2013) instructors address one and the same learnable several times. For example, an instructor may give a first instruction (Deppermann 2018) in front of a group and then guide individual learners through their trials, by giving further explanations or directives to be complied with more or less immediately. While it has been shown that instructors adapt the design of their instructions to local contingencies (e. g., Helmer 2021), recent research has also demonstrated that instructions may conventionalize within a single interaction. Based on recordings of self-defense trainings in German Stukenbrock 2021 has shown that by means of repetition and routinization multimodal gestalts may sediment, often leading to highly reduced forms. Building on these recent findings the paper analyzes how instructors recycle previous turns in Spanish spoken instructions of dancing Argentine Tango. The main claim of the paper is that in recycling multimodal instructions there are two competing interactional affordances. This is, on the one hand, a need for the recognizability of the instruction on behalf of the student (often under time pressure). On the other hand, there is the need for adjusting the instruction to local contingencies (in the sense of Sacks et al. 1974). These competing affordances lead to locally conventionalized instructional patterns that are still flexible in nature. The aim of the paper is to showcase the emergent nature of language (in the sense of Hopper 1997) in recycled instructions, that is, grammatical structures being in a continual movement towards sedimentation while at the same time always being provisional. The paper will analyze recycling of multimodal turns that occur within a single interaction, i. e. a single class of dance teaching (cf. Keevallik 2010). It is based on a large corpus of authentic classes on dancing Argentine tango, recorded in Argentina 2018-2019 which will be analyzed using methods of multimodal interaction analysis.

Repetition and instruction in blind pedestrians training with guide-dogs

Panel contribution

***Dr. Monica Simone*¹, *Dr. Chloé Mondémé*², *Prof. Renata Galatolo*¹**

1. University of Bologna, 2. CNRS, Triangle (Lyon) & Cefres (Prague)

This study investigates how reuse of a sequentially prior verbal instruction is employed by next speakers to implement a subsequent instructive action addressing non-human recipients.

Using videorecorded data from training sessions in French in which trainers teach blind persons to walk with their prospective guide dogs, our analysis focuses on instructional activities that entail navigational tasks such as crossing a street and heading for a door or a sidewalk with the guide dog.

We identify two distinct configurations underlying the organization of such instructional activities. In the first configuration, the trainer produces an instruction to tell the blind trainee *what to do next to (or with) the dog* (e.g., “Here you can reward the dog”), and the trainee produces the complying action (e.g., patting and praising the dog).

In the second configuration, the trainer produces an instruction telling the trainee *what to tell the dog to do next*. In this configuration, the trainer’s instruction projects repetition as the relevant next action that is expected from the trainee.

Our focus is on this second configuration. The results of our analysis show that the trainer’s instruction may either formulate re-saying as the relevant next action (e.g.: *Dis lui traverse*, “Say cross to him”) or occur in an elliptical format consisting only of the verbal cue to be given to the dog (e.g.: “Trottoir”). These elliptical instructions are delivered in specific ways as regards both their timing and prosodic design to provide the blind trainee with the appropriate verbal cue required to instruct the dog while simultaneously ‘neutralizing’ the potential of the cue to be interpreted as a direct command to the dog.

As far as the trainee’s subsequent repetitions are concerned, we identify three different formats: exact repetition, addition or subtraction around a pivotal term from the previous instruction, and re-organisation of the previous linguistic material.

We observe a systematic relationship between the formatting of first and second (repeated) instructions and ongoing activity contingencies that may put pressure on the participants to get the dog to promptly accomplish a certain action. More specifically, we show that the trainer’s elliptical instructions are routinely followed by the trainee’s *immediately adjacent exact repetition*. Also, such repetitions are delivered with louder voice than their first saying to ensure prompt reception by the dog.

Overall, our study illuminates the routine organization of repetition in a setting where this practice is integral to the instructional activity at hand rather than being configured as an emergent phenomenon. Our analysis highlights the co-operative (Goodwin, 2018) achievement of actions in the setting under examination by showing how participants reuse materials inherited from previous turns to build new actions and progress current activities. This ultimately challenges the view of repetition as the same thing happening again (Cf. Brown, 1999) suggesting in fact that even exact repetition may include reshaping and tailoring of previous actions to different recipients up to accomplishing a different and new action.

Reproducing multimodal configurations in interpreter-mediated healthcare interactions

Panel contribution

***Dr. Vanessa Piccoli*¹, *Prof. Véronique Traverso*²**

1. Université Paris Nanterre, 2. CNRS, ICAR

In recent years, an important body of research has explored the dynamics of interpreter-mediated communication in healthcare consultations (Baraldi & Gavioli 2012, Ticca & Traverso 2015 among others). These studies have shown that in this kind of interactions the interpreter accomplishes the very delicate task to coordinate talk-in-interaction while ensuring mutual understanding between the patient and the physician. However, in this triadic configuration, a full intersubjectivity is hard to achieve. The changing participation framework entails the risk of letting out momentarily some of the participants. For instance, some studies have shown that patients' contributions may be marginalized (Davidson 2000) and so may be their affective manifestations (Farini 2016). In order to convey both the participants' contributions and their affective stance (Koole 2015), the interpreter may reproduce some of their emotional manifestations through multimodal practices (e.g. adopting the same mimics or reproducing the same gestures) (Ticca & Traverso 2017, Piccoli 2019). In these cases, the translation process is not only realized through verbal turns but rather using a plurality of multimodal resources, which can be described as a 'multimodal gestalt' (Mondada 2015), i.e. a configuration involving different semi-otic resources that make sense together and are accomplished for practical purposes in talk-in-interaction. Grounding on a corpus of 91 naturally occurring interactions collected in the framework of the REMILAS project (*Refugees, migrants and their languages in healthcare encounters*, 2016/2020), this contribution deals with multimodal repetitions and reformulations in interpreter-mediated healthcare interactions. A sequential analysis of some selected excerpts will be proposed, focusing on the recycling and reshaping of multimodal configurations. These practices will be considered both as communicative resources – for reaching intercomprehension – and as affective resources – for showing emotional alignment. Particular attention will be paid to cases in which all three participants reproduce the same configuration in a sequential order.

Gillmann)**

Non-canonical uses of *man* ‘one’ and *vi* ‘we’ in medical consultations in Finland Swedish

Panel contribution

***Prof. Camilla Wide*¹, *Prof. Camilla Lindholm*²**

1. University of Turku, 2. Tampere University

This paper analyzes non-canonical uses of the indefinite pronoun *man* ‘one’ and the first person plural pronoun *vi* ‘we’ in doctor-patient interaction in Swedish in Finland. We focus on cases where either the doctor or the patient is referring only or primarily to themselves by using these pronouns.

The use of first person plural pronouns such as *vi* by doctors is well-known (Skelton et al. 2002). Indefinite pronouns such as *man* are also frequently deployed as resources in doctor-patient consultations (Norrby et al. 2015). But in what situations are these pronouns used in non-canonical ways? Are they used to solve communicative problems or to carry out non-preferred actions?

Non-canonical uses of pronouns are interesting also from the perspective of the tendency in Finland to avoid emphasizing the person. As discussed by Yli-Vakkuri (2005), impersonal, ambiguous and vague expressions are used in Finland both when referring to oneself and others. How does this affect the use of the pronouns *man* ‘one’ and *vi* ‘we’ in medical consultations?

Our data consist of 20 consultations between 5 doctors and 20 patients with fibromyalgia (Lindholm 2003). We use Conversational Analysis to analyze the occurrences found in their situated contexts.

Perspectivation and typification – on generic uses of “ich”, “du” and “man” in German talk-in-interaction

Panel contribution

Dr. Jens Lanwer¹, Ms. Nathalie Bauer¹

1. University of Münster

The interactive achievement of person reference in conversation is a phenomenon that has been thoroughly studied in Conversation Analysis and Interactional Linguistics (Auer 1984; Enfield 2013; Lerner/Kitzinger 2007; Stivers/Enfield/Levinson 2007). But so far, the focus has been primarily on reference to non-present persons in the spirit of the seminal paper of Sacks/Schegloff (1979). Less attention has been paid to referential practices that anchor referents deictically in the participation framework (Sidnell/Enfield 2017), as it is already assumed in classical grammatical descriptions regarding 1st and 2nd person pronominals (Jespersen 1922:123). Against this backdrop, practices of generic reference involving the non-canonical use of these pronouns have received even less attention in interactional research. Regarding German talk-in-interaction, first studies on the generic use of *du* ('you') have recently been conducted from a usage-based and interactionally oriented perspective (Auer/Stukenbrock 2018; Stukenbrock/Bahr 2017). Furthermore, Imo/Ziegler (2019) offer an analysis of usage patterns of *man* ('one') in the context of interactional construction grammar, which already reveals initial differences between different kinds of genericity evoked by generic *du* and generic *man*. Still, a theoretical framework is missing, which would allow an integration and systematization of the diverse observations of context-sensitive functional descriptions of the whole inventory of generics in interaction. Such a systematization seems essential to further contribute to the grammatical description of the “systematically ordered inventory [...] of reference practices for persons” (Schegloff 1996:467) with respect to the analysis of spoken German. This is the starting point for our talk, in which we aim to develop a classification scheme for the functional description of generic uses of *ich* ('I'), *du* ('you') and *man* ('one') in a data-driven fashion. Based on sequence analytical work on dinner conversations from northern Germany we will try to illustrate (1) the added value of describing generic reference with respect to aspects of the intersubjective perspectivation and typification (Schütz/Luckmann 1979:90–124) of social agents and (2) that with respect to perspectivation and typification functional differences between the generic uses of the pronominals *ich* ('I'), *du* ('you') and *man* ('one') become apparent.

Practices of Displaced Person Reference Forms in Interaction: Uses of Possessor-Possessive-Constructions for Self- and Other-Reference

Panel contribution

Prof. Susanne Günthner¹

1. University of Münster

This presentation – based on German WhatsApp-interactions – addresses practices of ‘third-person reference forms’ used to refer to speaker and addressee; i.e. to participants present in the interaction. In particular, I will focus on possessor-possessive-constructions – e.g., „Drücke *meinem Enkelchen* [=ADRESSAT] die Daumen!‘; ‘Keep my fingers crossed for *my dear grandson* [=ADDRESSEE]’ – used as routinized communicative practices in computer-mediated interactions.

I will argue that possessor-possessive-constructions – mobilized in the place of default deictic pronouns “I” (*ich*) or “you” (*du/Sie*) – go against the „preference for using a minimal form” (Sacks/Schegloff 1979) and do more than simply refer to speaker and addressee: In activating these ‘quasi-direct’ forms (Vološinov 1929) of person reference, participants evoke „social indices“ (Silverstein 1976: 37) to contextualize meanings which would be hidden in cases of „referring *simpliciter*” (Schegloff 1996) by means of the deictic pronouns „ich” (‘I’) and “du/Sie” (‘you’). Speakers (e.g., a student informing her boyfriend „*Dein Schatz* [=SPRECHERIN] *vermisst ihren Kuschelbär* [=ADRESSAT]“; ‘Your darling [=SPEAKER] misses her teddy bear [=ADDRESSEE]’) not only mobilize these non-canonical forms as an interactional resource to reconfigure self and other in specific roles (e.g. as a grandson, grandma, lover, etc.), but this reference practice (including possessive pronouns) also turns out to be closely connected with ongoing social activities and contextually induced stance-taking in the process of interaction.

Practices of Using the Overt First-Person Singular Pronouns in Japanese Conversation: The Case of Displaying Disaffiliative Stance to Assertions

Panel contribution

*Ms. Miyabi Ozawa*¹

1. University of Wisconsin-Madison

The use of first-person singular pronouns in conversation is marked in Japanese, which is a predicate-oriented language. The markedness is attributed to the structural and socio-cultural considerations. Therefore, the overt forms occur for not only disambiguation (i.e. referential motivation) but also for other causes, including “frame-setting” and “emotion” (Ono & Thompson, 2003). In addition, in “opinion-negotiation sequence” (Mori, 1999), the utterance with overt form occurs in different social actions depending on the co-participants’ stance toward the target they are discussing (Ozawa, 2022). One of them is to display the speaker’s (lack of) epistemic access toward the target(s) as the evidence in account when they have different opinions (Ozawa, 2022).

Given these features of the use of the overt first-person singular pronouns in Japanese, this study investigates how the overt forms are deployed in conveying disaffiliation to the stance displayed in the co-participant’s assertion (Vatanen, et al., 2021). The targets of the assertion in this study include the ones that are accessible to the co-participants, namely the third person, things, events or the speakers themselves. For this study, I analyze face to face social interactions among two to four speakers of symmetrical relationships, taken from the Corpus of Everyday Japanese Conversation curated by the National Institute for Japanese Language and the author’s video-recorded collection.

The study shows that the utterances with overt forms are used to display either lack of epistemic access or epistemic primacy to the target, which implies that the overt first-person singular pronoun in Japanese interaction is relevant to indexing epistemic authority (Heritage & Raymond, 2005). For example, the following excerpt includes the first-person singular pronoun *watashi* at line 3, when the speaker displays disaffiliative stance to the presupposition indicated in Taka’s utterance at line 1, which is that Maya is not always modest.

01 Taka: *nani sono kenkyo na no*

what that modest COP FP

‘Why are (you) so modest?’

02 Maya: *hahaha*

‘hahaha’

03 Maya: *iya kenkyo desu yo watashi itsumo. desho?*

no modest COP FP I always right

‘Well, I am always modest, right?’

As shown in this example, where Maya displays her first-hand knowledge about herself, the utterance with overt form can be used to claim the epistemic authority toward the target in conveying disaffiliation in Japanese conversations.

The pragmatics of non-canonical usage types of personal pronouns in Lingála (Democratic Republic of Congo)

Panel contribution

*Prof. Michael Meeuwis*¹

1. Ghent University

On the basis of naturally occurring data culled from corpora, five non- (or less) canonical usage types of the personal pronouns in the Bantu language Lingála (Meeuwis 2020) are discussed. The first pertains to the well-known pro-drop parameter (Camacho 2013; Rohde 2019): Lingála being a null-subject language, speakers may choose to explicate the pronoun in subject position to effectuate contrast and highlighting.

Second, the plural pronouns **bísó** (1PL) and **bínó** (2PL), although already denoting a plural referent, may be inflected with the nominal pluralizing prefix **ba-** to convey a simulative (“associative”, “non-additive”) plural (i.a. Daniel & Moravcsik 2013), i.e. to express that the referent of the pronoun is an example of the totality.

(1)

A lingáí ba bísó té

3SG.AN like PRS1 PL 1PL NEG

‘He doesn’t like people like us.’

Third, speakers can make use of the anticipatory (or “inclusory”) plural, a non-canonical strategy only recently explored in Bantu studies (Gunnink 2022). A first or second singular pronoun in a conjoining construction may be pluralized, although its referent remains singular, to convey an inclusory and comitative meaning for the construction.

(2)

Bísó na Pierre to kend ékí na Ø wenze

1PL and Pierre 1PL go PST1 to 9 market

‘I and Pierre went to the market together.’

Fourth is the use of plural personal pronouns as identical conjuncts. Each of the conjuncts is the same pronoun, designating the same referent. This is used to stress that the event obtains exclusively among the referents.

(3)

ma kambo óyo ba yé b í bangó na bangó

6 matter REL 3PL.AN know PRS1 3PL.AN and 3PL.AN

‘the things that only they know (among themselves)’

A fifth non-canonical usage type with pragmatic effects is that of personal pronouns co-referring with the subject (but not reflexive) and appearing in a prepositional adjunct (with the preposition **na** ‘in’, ‘with’, ‘to’) which immediately follows the verb. The prepositional adjunct is optional. Speakers use such constructions as a discourse strategy to intensify the subject referent’s “involvement”, “agentivity”, or “accountability”, a phenomenon reminiscent of but not coinciding with so-called non-argument datives (e.g. Horn 2008). In some cases this stresses that the subject acts intentionally, consciously, purposefully, with determination, or accountably.

(4)

Ba sómb ákí na bangó mó tuka

3PL.AN buy PST1 with 3PL.AN 3 car

‘They had taken the firm and accountable decision to buy a car’

Also, the construction can be used with inanimate subject referents (which by definition cannot be ascribed intentionality), in which case it expresses a surprising situation, i.e. the modality of counterexpectationality.

(5)

Eɓbúkɓání na yangó!

3SG.INANɓbreakɓNEUTɓPRS1 with 3SG.INAN

‘What a surprise, it is broken!’

The paper will offer more discourse-strategic examples than the abstract allows.

The pragmatics of the 1st person plural in Catalan parliamentary debate

Panel contribution

*Dr. Neus Nogué*¹

1. *Universitat de Barcelona*

As it is well known, in its basic meaning the grammatical category of 1st person plural (1PL) consists of two semantic features: one feature refers to the speaker and the other, to a number of animate beings, mainly persons, greater than one. The first one is what makes it a deictic expression —because of the contextual dependence it entails— and at the same time what makes it 1st person; and the second one, what makes it plural.

Its special plural nature (*plural of approximation* in terms of Jespersen (1925)) is probably related to the adoption of a wide range of uses that go beyond the sum of the speaker and some other animate entity, participant or not in the communicative event; hence, beyond the distinction between inclusive and exclusive 1PL.

This contribution will begin by briefly presenting the eight non-prototypical uses of the 1PL that have been identified in Catalan (Nogué-Serrano 2010), among which the six described by Helmbrecht (2015) for other languages. In these uses, the basic reference is modified and moved in several directions (Kerbrat-Orecchioni (1980) calls them *énalages*; Levinson (1988), *slippages*; and Vanelli and Renzi (1995), *forme “alternative” a quelle “canoniche”*): in some cases, the reference to the speaker is maintained; in others, some kind of recipient (addressed or unaddressed) is included in the reference, or even people not participating in the communicative event.

Next, the occurrences of these non-prototypical usages of the 1PL found in a corpus of more than 600,000 words of parliamentary debate (Parliament of Catalonia, 1932-38 and 1980-2020) will be analysed. The aim is to observe which strategies are preferred by the MPs, among those available in Catalan, and which pragmatic effects associate with them; for example, the mitigation of disagreement with MPs from other parties or with the Government (Brown and Levinson (1978 [21987])); De Cock 2011). Thus, we will see to what extent a relationship can be established between certain strategies and a specific communicative event, the parliamentary debate.

Whose voice, whose experience? The open use of Finnish person constructions in tellings of personal experience

Panel contribution

Dr. Karita Suomalainen¹

1. Åbo Akademi University

This presentation investigates the open use of Finnish person forms—i.e., pronouns and verbal forms—in the construction of intersubjective experiences in everyday conversations. By *open use*, I mean person forms that are used in a deictically open way, so that they do not exclusively refer to a specific participant of the interaction but, rather, are open to different referential interpretations in their context of use (see e.g., Helasvuo 2008; Suomalainen & Varjo 2020). My data consist of face-to-face conversations drawn from the Arkisyn corpus of conversational Finnish. My methodological framework is that of interactional linguistics.

The presentation focuses on the way that openly used Finnish person constructions modify the participation framework in sequences that contain tellings of personal experiences. It has been shown that the open or generalized use of person forms is especially typical in sequences in which speakers share their own experiences with others (e.g., Auer & Stukenbrock 2018; Stirling & Manderson 2011; Suomalainen & Varjo 2020). In the tellings of personal experience in my data, the speakers may use different person forms to create open reference; these include, e.g., first person and second person forms as well as the Finnish passive or the so-called zero-person. These person forms affect construal of the participation framework of the speech situation differently (see Goffman 1981), thus suggesting varying participation roles for the recipients. However, what is common for all of the open person forms is that by using them, the speakers may present their personal experiences as more than individual, inviting the recipients to recognize and potentially affiliate with certain aspects of the told experience.

My presentation will also consider the responses to the tellings of personal experience and examine what kinds of person forms are employed in these responses. I will analyze the interactional work that the recipients' referential choices do in creating a mutuality of experience in sequences with tellings of personal experience. By using a certain person form in the responsive turn—accompanied by other turn constructional elements, including multimodal ones—the recipients may demonstrate recognition of the kind of experience that was told by the previous speaker and thus show affiliation. However, the recipients may also step back and distance themselves from the telling, thus indicating that they do not share the presented point of view.

“When you” Non-/Generic pronouns, conditional clauses, and the role of particles in referential practices

Panel contribution

Prof. Monika Dannerer¹

1. University of Innsbruck

Personal pronouns are a very prominent means for indicating positioning (Imo 2016:164), as references show perspectives of inclusion into a group (*wir*/'we'), exclusion or distance (*sie*/'they') as well as generalizing commentaries on behaviour.

The German pronoun *man*/'one' is usually described as generic (cf. e.g. Kern 2000, Imo/Ziegler 2019), “cutting” or “veiling” the relationship towards the speaker (Stukenbrock 2015:84), but contrary to the English *one* it can also be used in a non-generic way (Zifonun 2000). Additionally, the pronoun *du* ('you') can shift between genericity and subjectivity, with a relation to the hearer but to the speaker as well (Auer/Stukenbrock 2018).

The paper deals with the question, which verbal means are used for to differentiate or even disambiguate between a personal and a generic use of the personal pronouns *I*, *you*, *we* and *one* in German.

The focus lies on conditional clauses which can serve to formulate specific but also general conditions, which enhances the foregrounding of a generic interpretation.

Within this focus I will also consider the role of certain particles which can encourage a disambiguation (Dannerer 2022): This holds for the modal particles *einfach*/'simply' and *halt*/'just' as well as the adverbs *jetzt*/'now', *heute*/'today' and *heutzutage*/'nowadays' that might be used as particles, too (Diewald 2013).

The corpus for this paper stems from various subcorpora of the “Datenbank für Gesprochenes Deutsch”, that favour different communicative contexts.

Challenges and Opportunities of Linguistically Diverse Data: Government-mandated Contact Tracing as a Multilingual Tool to Reach Linguistic Minorities

Panel contribution

***Mr. Romeo De Timmerman*¹, *Ms. Anne-Sophie Bafort*², *Dr. Sofie Van de Geuchte*², *Prof. Mieke Vandenbroucke*², *Prof. Stef Slembrouck*³**

1. Ghent University, 2. University of Antwerp, 3. Linguistics, Ghent University

The COVID-19 pandemic has highlighted the importance of collecting and disseminating public health information from/to lay audiences to combat global health crises. During the pandemic, reaching linguistic minorities proved to be a global challenge, which necessitated the implementation of multilingual crisis communication across the globe (Piller, Zhang & Li, 2020). In Flanders, Belgium, reaching linguistic minority groups was largely dependent on government-mandated contact tracing through telephone interactions, which was initially put in place to contain the level of outbreak, but was gradually tasked with relaying important safety measures and other information related to the pandemic. In line with this development, Flemish contact tracing over the telephone initially supported Belgium's three national languages, viz. Dutch, French and German, as well as English and French as lingua francas, but this list was gradually expanded with minority languages including, among others, Turkish, Arabic, Bulgarian and Polish. Within the context of a one-year COVID-19 FWO research project, we recorded and analyzed telephone contact tracing conversations in Dutch, English, French, Turkish and Arabic. This list ranges from languages that the researchers are highly proficient in, to languages that they have no knowledge of. In this paper, we would like to reflect on some of the challenges and opportunities that accompany collecting and analyzing such a linguistically diverse dataset. More specifically, we want to consider the ethical implications of informed consent which is mediated in multiple languages by the institutional agent rather than the researcher, the methodological and heuristic challenges associated with transcribing, translating and analyzing linguistically diverse data in spaces of linguistic non-understanding (van Hest & Jacobs, 2022), while underlining the epistemological value and affordances of linguistically diverse data.

Co-constructing meaning through semi-understanding: Conducting the sociolinguistic interview in an (un)known language

Panel contribution

Dr. Carol Ready¹

1. Oklahoma State University

In my research I examine the linguistic practices of Moroccans in Spain, many of whom speak Moroccan Arabic as well as Modern Standard Arabic, Tamazight, French, English and Spanish at varying levels of proficiency. As part of my research, I conducted a 10-month linguistic ethnography carried out in the summer of 2017 and the academic year of 2018 and 2019. I was able to rely on my native English and near-native Spanish language skills for my research, but it was also necessary to use Modern Standard Arabic and even Moroccan Arabic in my sociolinguistic interviews. I possess limited working knowledge of Modern Standard Arabic and even more limited knowledge of Moroccan Arabic. In this presentation I will discuss one instance of conducting a sociolinguistic interview in Moroccan Arabic and Modern Standard Arabic. I conduct a discursive analysis of the interaction and linguistic resources utilized in this 60-minute interview to demonstrate how, regardless of the knowledge of the language being spoken by the speakers, the sociolinguistic interview remains a site of social practice in which knowledge is co-constructed in rich and meaningful ways (see Talmy 2010). In addition, I argue that such analysis demonstrates the value of viewing the sociolinguistic interview as a site for investigation (see Talmy, 2011). Lastly, I aim to provide tools for further sociolinguistic research in which the researcher has limited proficiency in the language(s) used and/or preferred by participants.

Cultivating capabilities and coping: accepting moments of communicative opacity in multilingual encounters

Panel contribution

Dr. Emma Brooks¹

1. Birkbeck college, London

While current preoccupations with (super)diverse populations rest on the presupposition that such demographics are something new (Vertovec, 2007; Pavlenko, 2016), there is no doubt that researching in linguistically, culturally and ethnically heterogenous communities may present challenges for the most experienced of researchers, even when highly prepared with a linguistically representative team, attune to situational sensitivities (Andrews, Holmes, Fay & Dawson, 2019). This is especially true in the context of ethnographic work, where the dynamism and unpredictability of a research setting can make it difficult to anticipate, and prepare for, the languages spoken by potential participants.

Building on experience gathered during my doctoral journey, exploring multilingual practices in antenatal consultations, this paper reflects upon how a naïve understanding of ‘multiple cultural competence’ (Vertovec, 2009) morphed into a recognition of my own linguistic shortcomings, when interaction extended beyond the scope of my limited repertoire. Appointments routinely featured unfamiliar languages which restricted the immediacy of inference. In turn, discomfort with my ‘linguistic incompetence’ (Phipps, 2013) was frequently exacerbated by ongoing processes of analysis, when the circularity of transcription, translation, clarification and (re)transcription, complexified what could be understood as ‘interpretation’ and contributed additional layers to possible (mis)representation.

On the other hand, such experiences allowed me to accept the consulting room as a ‘third’ space (Bhabha, 1990) of potential unknowability, which could give rise to new cultural articulations and translation of difference. A recognition of linguistic non-understanding also offered the opportunity to take a capabilities approach and a stance which enabled me to focus more keenly on what I was able to do (Phipps, 2013). Attention was drawn to the corporeal and prosodic aspects of relationality demonstrated by health care professionals, and which appeared key to enhance women’s experience of antenatal care. In this talk I hope to share my experience of vulnerabilities which emerge during ethnographic fieldwork and data analysis, highlighting practical and ethical considerations, as well as the advantages to be gained by open conversations about personal limitations.

Multilingualism in institutional settings: Linguistic-ethnographic fieldwork and spaces of linguistic non-understanding

Panel contribution

*Ms. Ella van Hest*¹, *Dr. Marie Jacobs*¹

1. Ghent University

In the age of superdiversity, linguistic ethnographers interested in institutional settings are increasingly focusing on multilingual interactions, and therefore, more likely to be confronted with ‘spaces of linguistic non-understanding’ (spaces of LNU) throughout their research process.

This tendency is exhibited in both our research projects. Author 1’s linguistic-ethnographic research zooms in on multilingual interactions that take place at an abortion clinic. Her research focus on language barriers is particularly relevant because scholarship has argued that globalisation results in an increasingly linguistically diverse clientele in most social service settings. Author 2’s ethnographic inquiry into asylum law firms, similarly, took into account the inevitably multilingual nature of its pursuit. As asylum institutions deal with the consequences of increased transnational mobility, her research project had to take into the account the multilingual intricacies of lawyer-client communication. The distribution of spaces of LNU was quite similar in both research settings: they typically opened up when a client and a third person (mostly an interpreter or a companion) interacted in a language we as researchers had no command of. Our panel contribution aims to cast a backward glance into all stages of our investigative trajectory (fieldwork, data processing, analysis and beyond) to discuss how spaces of LNU influenced our institutional ethnographies.

In doing so, we reflect on how we relied on collaboration with external translators who transcribed and translated the parts of the audio-recordings incomprehensible to us. Concerned about the inevitably filtering role of translation practices, we considered, designed and employed strategies aimed at minimising such risks. Practices such as tracing omissions by replaying audio-recordings and consulting multilingual colleagues, provided us with a certain degree of analytical control in the interpretative endeavour of making sense of our institutional fieldwork settings. Interestingly, the spaces of LNU in our respective data sets also generated a form of emic insight. Just like the researcher, the interactants in multilingual abortion or asylum encounters do not understand all stretches of talk as they unfold throughout the interaction. This implies a shared experience between the interactant and the observer with similar linguistic repertoires (in our case the service provider) who might both fall victim to illusions of (mis)understanding during a consultation. This fieldwork insight into the insider perspective of the service provider forms an analytical added value post-translation, i.e. when the spaces of LNU have been filled.

To conclude, we want to argue that reflexivity about the multilingual research process and the negotiation of spaces of LNU are an added value—and maybe even a necessity—for linguistic-ethnographers keen on gaining insight into linguistically diverse settings.

The meaning making process in an ethnographic family research in the context of flight and Asylum

Panel contribution

Dr. Jiayin Li-Gottwald¹

1. University of Kassel

Taking an ethnographic approach and based on in-depth home visits in several German cities, the study *Changes and Dynamics of Family Generational Relationships in the Context of Flight and Asylum (DyFam)*[1] reveals how family structures, family relationships and child-upbringing practices are (re)established, organised and negotiated in the context of refuge and asylum in Germany (Manuela et al. 2019). Despite the non-linguistic focus of DyFam, as a post-doc with sociolinguistic background in the project, I would like to present my reflections during my 18-month stint on the fieldwork, in particular the situations where I encountered ‘spaces of linguistic non-understanding’ (van Hest, & Jacobs in press).

Drawing on Silverstein’s (1985) notion of ‘the total linguistic fact’ (p. 220), I view the forming of space in the research setting as the total experience of all participants and resources in the context of the particular place and time (see Li-Gottwald, forthcoming). Building upon this concept, I begin with a review of the experience of two visits when I was accompanied by a student assistant as an interpreter, and reflect on the challenges of the linguistic and human communication I encountered. I then present a guide to fieldwork in which I was the sole research visitor to the refugee families and reveal the non-comprehensible space with which I was confronted. Thereafter, I reveal the multilingual space in which family members interact with each other through a linguistic resource that is beyond my linguistic repertoire and reflect on how I make sense of it via other linguistic resources from a broad linguistic landscape approach (Shohamy 2015, Canagarajah 2017; Pennycook 2019). Finally I present some of the data I have collected based on a sensory ethnographic approach (Pink 2015) in which language is not the mere focus and reveal my own interpretations on the research space repertoire .

[1] DyFam project (2020-2023) is led by Professor Manuela Westphal at University of Kassel in Germany and founded by German Research Foundation

Triangulating multilingualism: incorporating ‘spaces of linguistic non-understanding’ through the integration of several perspectives

Panel contribution

*Dr. Samantha Goodchild*¹, *Dr. Miriam Weidl*²

1. University of Galway, 2. University of Vienna

In this presentation, we describe a systematic method to study multilingual settings, collecting and analysing in-depth data, where researchers are likely to encounter ‘spaces of linguistic non-understanding’. In investigating a multilingual and multicultural world, distinct advantages in data collection and analysis derive from fluid research agendas, open predictions and reflecting on one’s own expectations of the research and its outcome. Furthermore, as qualitative researchers aligning with non-positivist approaches, we embrace the position of being a “non-knower” (Holsapple 2022) as a prerequisite for future understanding.

We take this to mean that as researchers we only have a partial interpretation of any given event we are studying. To mitigate this we incorporate others’ perspectives into the analysis of the multilingual settings in question. Using data from our ethnographic based studies on fluid multilingual language use in Senegal we will present examples of everyday language use backed by thick descriptions of the speakers’ social realities, connected to contexts and spaces. We will show how by integrating the perspectives of repertoire users and observers in a triangulated fashion (Weidl & Goodchild submitted), we arrived at analyses that go beyond a priori assumptions about named languages. When the repertoire user and communicative event are the starting point for analysis, translanguaging is a more appropriate way of analysing multilingual linguistic practices (Goodchild & Weidl 2019).

Our understanding is that during multilingual and fluid translanguaging conversations involving several (unequally-documented) languages (Li Wei 2018), but also lects, styles and registers, all interlocutors can encounter situations in which some kind of (linguistic) non-understanding occurs and needs to be compensated. Consequently, western(-ised) scientific researchers have to move away from claiming an omniscient and un-touchable position as being capable of capturing all contextualised linguistic, semiotic and semantic properties of social interactions and accurately analysing them (e.g. Ndhlovu & Makalela 2021). In this talk we critically self-reflect on the challenges of fieldwork using multi-perspective analysis showing how open approaches are used to maintain high ethical standards, allow for and compensate for various kinds of non-understanding. Using our method resulted in rich, multilayered analyses and varied understandings, which also represent the views on language use of non-linguists, whose fluid practices and perspectives might go beyond the boundaries of named languages.

“It’s a bit difficult to understand because it isn’t native Spanish”: Silencing, voicing and adjusting linguistic contributions in multilingual courtroom encounters

Panel contribution

Dr. Marta Kirilova¹, Prof. Martha Karrebæk¹

1. University of Copenhagen

Although monolingual and monoglottal ideologies characterize many societies, the everyday life of key societal institutions is often multilingual. Interpreters mediate between the institutional representatives who speak a societally dominant language and laypersons whose linguistic repertoires may deviate in many ways from what is preferred and expected. This is the case in medical encounters, in schools, at municipal offices, and in court. As socially oriented linguists interested in linguistic diversity, we enter different societally important settings to see how language is performed, understood, oriented to, and to what extent and how linguistic diversity characterizes the everyday life—given institutional expectations, issues of power, and language ideologies. Although as researchers we are not limited by institutional ideologies or regulations in terms of language choice, we often encounter and do research in settings where there are languages, we do not speak, or in which our competence is limited. In such cases, we have something in common with the institutional representatives who may not understand the languages spoken around them. Yet, we cannot do justice to our data, to the participants, and to our research questions without both making an effort to achieve understanding and acknowledging the limits to our competence.

In this presentation, we draw on audio-recorded data from a sociolinguistic project on interpreter-mediated courtroom encounters in Denmark. We will first give a practical account of the spaces of cultural, institutional and linguistic non-understanding (van Hest & Jacobs, in press) we encountered while collecting the data. We will then focus on two examples – one of an alleged non-native speaker of Spanish, the other of two speakers of Farsi. The first example illustrates a number of dilemmas in terms of how to understand, represent (in e.g. transcription), and analyze the data, as the register of Spanish used by the accused was far from standard Spanish. The second example illustrates a fundamental discrepancy in the understanding of the interpreter’s role and it raises ethical questions in terms of communicating research outcomes to institutional representatives. When we received the translations, we realized that the Farsi interpreter was guiding the two accused in how to align their stories for the defense lawyer.

There exists very little research based on recordings of multilingual courtroom interaction in Denmark, but we cannot have an informed discussion about the ideals and challenges of this type of social encounter without engaging academically with it. Our project has enabled the beginning of this type of conversation. At the same time, we are aware of a number of pitfalls and inherent difficulties as we are not competent in all the languages we have met during our research.

Accessibility and Inclusion? Reshaping academic communication using visual-gestural modality

Panel contribution

***Prof. Christiane Hohenstein*¹, *Ms. Larysa Zavgorodnia*¹**

1. ZHAW School of Applied Linguistics

For deaf and hard-of-hearing students (DHH students), linguistic challenges in Higher and Tertiary Education (HTE) are notorious (Hohenstein et al., 2018, Hohenstein & Zavgorodnia, 2021). Their access to the spoken and written standard language is mediated, never immediate. Both types of students need visual cues or visual-gestural modality (lip reading, gestures, sign language, visualizations).

In academic communication, incomplete access to the standard language poses a problem. In addition, various academic settings, e.g., lectures, group interaction, and autonomous study tasks, set differential challenges for perception, understanding, and interaction. Since 2020, in the wake of rapid digital transformation in HTE, accessibility evolves around big data, machine learning, and adaptive learning developments. We argue that accessibility is not enough to bring about inclusion. This raises the question of how digital opportunities for inclusion can reshape academic communication in an inclusive manner and complement a predominantly technical pragmatism.

Using a qualitative case study approach, video observation data from two DHH students were collected in various academic settings. They were complemented by retrospective interviews and eye-tracking data in order to explore how knowledge-building and processes of understanding are helped by speech-to-text translation, SL interpreting and digital media presentation of academic content. Content-based and spoken discourse analysis, fine-grained functional-pragmatic analyses of selected video passages, and imaging techniques were used. Findings reveal that combinations of visual-gestural modality, e.g., sign language interpreting, and spoken-language-based modality, e.g., speech-to-text interpreting, lip-reading and various interactive forms of learning may provide accessible and inclusive academic communication. However, *accessibility* in terms of practical access to learning spaces, language-based resources, applications and interactions does not necessarily match *inclusion*. We will highlight the linguistic and pragmatic processes that can make access and inclusion happen in academic communication. Using multimodal transcripts from lecture inputs and interactive group work in an academic environment that strives for accessibility and inclusion, we will discuss where boundaries for inclusion still exist. In the plenary, we would like to discuss how Universal Design for Learning (UDL 2022) could be used to reduce specifically linguistic and pragmatic boundaries for inclusion in academic communication.

Barriers and facilitators to inclusive communication as revealed by students with invisible disabilities

Panel contribution

Dr. Agnieszka Sowinska¹

1. Nicolaus Copernicus University, Toruń, Poland (Department of Experimental Linguistics) & Universidad Católica del Norte, Antofagasta, Chile (School of English)

Increasingly more and more universities worldwide are facing an enormous challenge to provide equitable higher education. It is especially relevant and timely to implement support services which would cater for diverse students' needs. Yet, there is a paucity of research which explores students' experience of inclusion in higher education, in particular with reference to communication in a university setting. Universities seek to eliminate any form of discrimination based on disability, and seek to develop concepts associated with inclusion, even though with different degrees of commitment. While referring to disabilities, the UN Convention on the Rights of Persons with Disabilities (2006) underscores the interaction between a person's long-term impairment and the environmental and attitudinal barriers that may prevent them from their full participation in society on an equal basis with others, rather than the condition itself. The objective of this qualitative study is to identify the barriers and facilitators to inclusive communication in a tertiary education setting. Data comes from semi-structured interviews conducted with university students, who volunteered to participate in the study and who self-identified as having an invisible disability. The interviews are first analysed drawing on the thematic analysis proposed by Braun and Clarke (2006) to identify and organize the most salient themes. Next, students' narratives are extracted and analysed in order to gain insight into the personal experiences of the students. The results of this study may contribute to the development of strategies to decrease barriers and increase the inclusion of disabled individuals in higher education.

Interactions of people with and without disabilities in participatory research groups

Panel contribution

Prof. Bettina M. Bock¹

1. University of Cologne

A central factor of participatory research processes, which has nevertheless hardly been analysed so far, are the interactions between the academic and non-academic researchers in the course of the work and research process. Only if it is possible for all researchers to participate appropriately in these interactions and to get involved, participatory research can be considered successful.

We analysed audio- and videotaped interactions from team meetings in participatory research groups. The participatory teams are highly heterogeneous and consist of people with and without disabilities, including intellectual disability, cognitive impairments, motoric, visual and speech impairment. This heterogeneity causes different barriers of interaction. Nevertheless, the presentation does not focus on the barriers but on how obstacles in interaction are handled by the participants and how impaired actors function as competent participants. In a conversation analytical sense, participation is understood as „actions demonstrating forms of involvement performed by parties within evolving structures of talk“ (Goodwin/Goodwin 2004: 222) and thus considers verbal and nonverbal multimodal communication resources.

The presentation wants to discuss two phenomena which turned out to be typical for the recorded team meetings: 1. speaking-for-others as a means of securing mutual understanding. It emerges in several constellations involving different actors in different roles (speaking for so. vs. being the one whose utterance is repeated or paraphrased for third parties), and generally deals with the problem of being potentially face-threatening, especially in the case of other-initiated speaking-for-others. 2. (supposed) digressions by actors and its role for the progression of interaction. Here, we focus on how (expected) digressions contribute to the course of action, and how participants constitute digressions by their actions.

In our closing reflections we want to discuss based on the empirical analyses in what way interactions on such highly heterogeneous contexts are ‚atypical‘ or in the end use ‚common‘ patterns of interaction and cause ‚common‘ interactional problems.

Interdiscursive positioning of the sign language interpreter in the educational translation process

Panel contribution

***Dr. Priscila Regina Gonçalves de Melo Giamlourença*¹**

1. Federal University of São Carlos

Sign language interpreters mediate inclusive communication for deaf students in higher education, and plural knowledge is required for this performance. As an active interlocutor, continuous training is necessary due to the complexity of (inclusive) communication in an higher education context (Lacerda, 2010). Their training can be constructed through community, systematic and in-service modalities. All combined, these can increase training experiences, which, in turn, can be expanded through distance learning (Giamlourença, 2018). Considering the internationalization of educational policies and the relevance of debates on the professionalization of education professionals (Akkari, 2011), the production of international comparative studies could enable the knowledge construction and network collaboration in a public space for reflection and discussion (Nóvoa, 2017). The implementation of multilingual, open, and free distance courses with open educational resources provides opportunities to that end (Taziri & Akkari, 2022).

In Brazil, we investigated training needs of sign language interpreters working in federal higher education institutions. Taking an interactionist perspective (Mizukami, 1986), we used a research-intervention approach with participants of a continuing distance education course in Portuguese that we planned, using narratives from written discussion forums as data.

As a method of analysis, we developed the *Process of Articulation of Element*, which included the following steps: 1) Successive reading of the material; 2) Elaboration of a textual scheme; 3) Identification of elements (singular, responsive, complementary, and plural); 4) Articulation of plural elements and synthesis. This process was developed considering that interaction plays a fundamental role in the construction of the knowledge in mediated processes, including those mediated by information and communication technology (Costa, 2014; Nóvoa, 2009). We found three categories that we named dimensions of training needs, namely specific, educational, and professional, each consisting of knowledge that is interrelated and interdependent.

Considering these findings, the research question of the present paper is how sign language interpreter could develop an interdiscursive positioning in the educational translation process. In this context, this professional can be understood as an educational agent whose performance can have linguistic, technical, political, institutional, and pedagogical implications for practice and research.

Is it a special communication in higher education? Mutual intentions and reciprocity among interlocutors with different neurotypes

Panel contribution

Dr. Lívía Ivaskó¹, Ms. Regina Mezőlaki²

1. associate professor, 2. PhD student

Provisions in recognition of the UN Convention on the Rights of Persons enact that inclusion and inclusive communication should be accessible for persons in tertiary education (UNESCO, 1998; Fazekas, 2019).

Neurodiverse students with communicative barriers reported several concerns about their well-being and their personal, social, and academic life in relation to educational experiences (Clouder et al., 2020).

According to the literature, there are some explicitly declared barriers in social interaction between autistic adults requiring support (level 1) and non-autistic adults (APA, 2013).

Social difficulties are linked to the autism spectrum, though communicative barriers must depend on both interlocutors due to the mutual and reciprocal nature of interactions. The guarantee of barrier-free communication could be explained as a social interaction where various perspectives and accepted boundaries are considered (Mezőlaki & Ivaskó, 2021).

Does mutual misunderstanding (Williams, Wharton & Jagoe, 2021) occur because of linguistic impairments or because of the different perspectives of the interlocutors?

Milton (2012) claimed in the account of the double empathy problem, that similar minds seem to understand each other easily, while Below, Spaeth, and Horlin (2021) introduce the concept of an attitude-behaviour gap, meaning that one's knowledge about autism and diversity is not always implemented into their behaviour in university environment.

What are the core and most relevant features of inclusive communication?

Our aim with this presentation is to analyze the explanatory effort of the referred theories and the adaptability of their conceptions to inclusive communication in tertiary education in a cognitive pragmatic framework (Sperber & Wilson, 1995). The study is conducted mostly on examples from semi-structured interviews from Hungarian autistic subjects.

Our findings would hopefully contribute to exploring the feasibility of applying theoretical frameworks to practice.

Language anxiety as a barrier to academic participation

Panel contribution

Ms. Esther Jahns¹, Dr. Oliver Bunk²

1. Carl von Ossietzky Universität Oldenburg, 2. Humboldt-Universität zu Berlin

In this paper, we investigate language anxiety as a factor hindering students from oral participation in university classes and explore reasons that feed into it.

Language anxiety has been researched in various linguistic disciplines, e.g., foreign language learning (Horwitz 2001), and within the context of multilingualism (Sevinç and Dewaele 2018). These contributions highlight that formal communicative situations foster language anxiety. Therefore, the academic context is an interesting and important research site for language anxiety as it offers a large range of highly formal communicative situations in a place where participation of students with different backgrounds should be ensured. We understand participation not only as having access to university education, but as active participation in academic communication.

Academic language can be conceptualized as distinctive registers that have to be acquired by students. This acquisition is thus the prerequisite to participate, i.e., to make one's voice heard and contribute to the process of knowledge production. However, it is seldom made explicit what linguistic competences are expected and that their acquisition is a process. This might trigger feelings of anxiety in the classroom, that might be further boosted by several factors.

One of these factors is the monolingual habitus, which transpires particularly in the educational sector (Wiese *et al.* 2020) and might lead to linguisticism (Dirim *et al.* 2018). The lived experience and perception of not belonging due to one's linguistic repertoire (Busch 2021) is, however, also relevant for monolingual speakers. Especially for first academics the perception of mastering the academic register to a lesser extent compared with others might intensify the feeling of not-belonging and lead to silence (Wagner 2012). We argue that in comparison to other types of language anxiety, it is not necessarily the pressure to master several named languages that might lead to anxiety, but that it can arise also concerning a distinct register or language use that is supported by prevailing language ideologies.

We present data from a focus group discussion and from individual semi-structured interviews with students from German universities with different linguistic and social backgrounds. The analysis of the interviews is inspired by qualitative methods like Grounded Theory (Charmaz 2010). This means that even though we hypothesize that monoglossic ideologies and a non-academic background contribute to an academic language anxiety, the data is coded in order to discover (other) emergent categories that trigger anxiety and prevent inclusion.

Multimodal and multisensory interactions in the orientation and mobility training sessions as the intersection of the visual-sensory and mobility impairment: With focus on instructors' use of existence verbs and verbs of perception

Panel contribution

*Prof. Rui Sakaida*¹, *Prof. Hiro Yuki Nisisawa*², *Prof. Mitsuhiro Okada*³, *Prof. Yasusuke Minami*³

1. Future University Hakodate, 2. Tokiwa University, 3. Seijo University

This paper observes, analyses and describes the interaction between an instructor and a student in the orientation and mobility (O&M) training sessions for the visually impaired using the EMCA methodology.

The O&M session is where sensory and mobility impairments intersect.

In the interaction between the visually impaired and the O&M specialist there is an asymmetrical and atypical interaction in a multimodal and multisensory sense.

This paper investigates the interaction, focusing on the use of existence verbs and verbs of perception by the specialist.

The original data are in Japanese.

There are four existential verb constructions: 1) (A) is X., 2) There/Here is X or X exists. and, although not strictly an existential verb, 3) (When) X comes out. In Japanese, sentences without a subject such as (A) is X. are frequently used.

The construction with perceptual verbs is 4) X can be seen. This is also a sentence without a subject as the agent in the original Japanese.

1) differs from the others in that it mostly appears as SPP of the adjacency pair.

3) is used when a visually impaired contacts an object in the environment by means of a white cane, hand, sole, etc., and is an expression close to the senses of the visually impaired. This is an expression of the instructor's orientation towards asymmetry and atypicality in a multimodality and multisensoriality between instructor and the visually impaired.

The two expressions 2) and 4) are basically interchangeable in the grammar of action of sighted persons. However, in interaction in the O&M training situation e.g. talk between a student who is visually impaired and an instructor who is sighted, they are different actions.

2) is a possible instruction as well as providing useful information for the student. That is, when this expression is used, the student can and should explore objects in the environment by tactile and auditory.

In contrast, 4) is neither information nor instruction that student can use directly. It gives information about the environment that is not directly available to the student, such as 'where are we now', i.e. how far the training has now progressed. It appears to provide a context (geographical information) that is clearly distinct from the activity of real-time teaching.

Further analysis of the linguistic forms described above reveals a distinctive feature of talk in the orientation and mobility training sessions. It is that the 'topicality' of talk changes with the course of training, i.e. with mobility.

This also implies that the similarity between the two activities in a workplace such as air traffic control, i.e. the fact that the reference to events outside the talk is an important purpose of the talk, and the fact that the events themselves, the objects of reference, change over time in a time flow different from that of the talk. On the other hand, however, it differs from air traffic control, which does not require confirmation about physical geographical information, in that the latter's degree of coincidence is extremely high in the O&M training.

Racialized and minoritized voices in critical academic writing in Canadian higher education

Panel contribution

***Dr. John McGaughey*¹, *Dr. Heejin Song*²**

1. University of Toronto, 2. York University

The paper reports on the findings of a critical action research (Kemmis, McTaggart, & Nixon, 2014) project in an academic reading and writing course at a Canadian university English for academic purposes (EAP) program. The project takes place as part of a content and language integrated learning (CLIL)-based course for international students. In an attempt to restructure and advance the teaching to be more inclusive and critical, and at the same time coherent with the increased institutional demands of incorporating equity, diversity and inclusion (EDI)-related topics for the construction of teaching content, a new instructional design was proposed and practiced with EDI-focused teaching materials and learning tasks. Critical multiculturalism (Grant & Sleeter, 2010; Nieto & Bode, 2011) was adopted as a pedagogical lens to shine light on discussions of discrimination surrounding race, ethnicity, gender, class and sexual orientation (Dei, 1999; Kubota, 2015). Through in-depth course readings and a multi-stepped research project, students researched how equity/human-rights seeking groups (e.g., Indigenous peoples, BIPOC, and 2SLGBTQ+) were included in their university in comparison to other local and international universities. Through a discussion of student written samples, the study reveals how the new instructional design contributed to students gaining an increased critical intercultural awareness and capacity to discuss contentious topics surrounding systemic racism, marginalization and the intersectionality of oppression faced by students of equity/human rights seeking groups, including the international students themselves. Yet, the findings also reflect instances where a minority of students' writing appears reluctant to critique their institution, echoing the need to create a space where all students feel comfortable to express critical and atypical viewpoints. The talk concludes by discussing the need to create further opportunities for students to critically engage and resist dominant discourses that reflect settler/colonial ideologies.

Social sustainability and inclusion in higher education: Analysis of the (changing) institutional discourse of counsellors, lecturers, and students on Belgian and German university websites

Panel contribution

Prof. Magdalene Lévy-Tödter¹

1. FOM University of Applied Sciences

In recent years, there has been increasing expectation that higher education institutions (HEIs) take on a central role in the transformation process towards a sustainable society. This includes a whole- institution approach of sustainable development at HEIs (Kohl et al. 2021). While the identification of challenges in the implementation of participation (Arnstein 1969, Bock 2018) in higher education has been investigated in numerous studies (Barkas et al. 2020), it is surprising that the role of students with impairments as drivers of the transformation process has rarely been highlighted in discourse analysis and higher education communication against the background of the questioning of “normality” (‘cultural turn’ Waldschmidt 2017) and the increasing focus on competences in disability/diversity studies.

Studies from various disciplines explore the perception of students, counsellors, or lecturers regarding the challenges in implementing inclusion in higher education at institutional level. While some website analyses of HEIs revolve primarily around (digital) barriers in addressing students with impairment or other specific needs (Gabel et al. 2016), there is still a lack of discourse-linguistic or (functional-)pragmatic analyses on the positioning of adviser and other change agents in context of inclusion or “equal opportunities” in HEIs. Drawing on the corpus of websites from German and Belgian universities in German and French, I investigate the agent layer (roles, discourse positions, mediality) (Spitzmüller & Warnke 2011, Pauwels 2012) of counsellors or the ratified recipients in this multimodal form of institutional communication. Changes in communication due to the COVID-19 pandemic, such as the positioning of students as counsellors in podcasts or the increasing intersectionality in websites, will be also examined.

Social-haptic communication: an additional - (a)typical - resource for communication with and amongst deafblind individuals

Panel contribution

***Dr. Laura Volpato*¹, *Prof. Johanna Mesch*²**

1. "Ca' Foscari" University of Venice, 2. Stockholm University

A severe combined sensory loss of sight and hearing is defined as deafblindness. Deafblind individuals can experience difficulties in mobility, access to information and participation in social life.

Communication with/amongst deafblind people is possible through several methods of communication, for instance: tactile sign language, spoken language (supported by aids), alphabet letters typed on the hand, and braille.

Due to time restraints, such communication methods are mostly used to convey the linguistic messages occurring in a conversation, this resulting in a loss of contextual information for the deafblind person. What happens in the surroundings often represents crucial information for the deafblind person to take control and act consequently.

Social-haptic communication (SHC) consists of touch signals (*haptics*) performed on the body (arm, back, knee, hand, foot) providing brief messages revealing key happenings in the context (e.g., someone is leaving the room, the audience is laughing). SHC also allows to integrate tactile/spoken communication with relevant descriptions of the environment (e.g., how the room is furnished, how people are dressed). In Scandinavia SHC is extensively used by the deafblind communities and is part of the training for guide-interpreters.

The Italian deafblind community is now contributing to the development of its own SHC system. Research has been conducted within the Erasmus+ project "Social Haptic Signs for Deaf and Blind in Education", involving Ca' Foscari University of Venice and deafblind individuals from the Foundation Lega del Filo d'Oro Onlus, aiming at collecting and negotiating new haptics to build a free online SHC dictionary.

Approximately 80 haptics have been collected and co-created so far within the Italian team. A selection of these has been tested with 32 deafblind individuals and 34 volunteers during three weeks of holiday. Participants were provided with a brief introduction to SHC and a demonstration of the haptics. They were monitored throughout the whole holiday. Data collection was based on video recordings, observations, and interviews.

Early findings show how SHC has been used as a resource for contextual information in combination with other communication methods, or when the preferred communication method was not accessible (e.g., when hands are busy handling something; when the environment is too noisy to rely on residual hearing). Sometimes SHC was more economical than the preferred method of communication (e.g., body positions make hands inaccessible; or in sport situation when it is useful to share the same perspective over the visual field). All informants gave positive feedback about SHC, this representing an additional - (a)typical - resource for communication.

(Dis)affiliative uptake of new information: Requests for reconfirmation in German and English conversation

Panel contribution

*Ms. Marit Aldrup*¹

1. University of Potsdam

Responding to deliveries of new information is a recurrent task in ordinary conversation. As previous research shows, recipients of news, informings, or new information more generally have different response types at their disposal, including change-of-state tokens (e.g., *oh*), ‘newsmarks’ (e.g., *really*), evaluative appreciations (e.g., *wow*), and assessments (Heritage 1984; Jefferson 1981; Maynard 1997, 2003; Terasaki 2004 [1976]; Thompson et al. 2015).

In contrast to other responses to new information, ‘newsmarks’ routinely engender sequence expansion, in that they invite the prior speaker to, at a minimum, reconfirm their previous statement. However, such reconfirmation-seeking responses do not invariably index news- or noteworthiness. In fact, they are also regularly used to treat the new information as problematic. Since the label ‘newsmark’ does not adequately capture such rather repair-implicated uses, it is substituted with the more neutral term ‘request for reconfirmation’ (RfRC) in this interactional-linguistic study. Through detailed sequential and multimodal analyses of reconfirmation sequences in video recordings of informal German and English face-to-face conversations, it reveals a continuum between newsmark-like and problem-indicating RfRC uses and highlights how turn design contributes to action disambiguation and displaying (dis)affiliation. The following purely verbal transcript gives a sense of why co-participants might find it difficult to make out the implications of an RfRC without any additional prosodic-phonetic and bodily-visual cues:

[LoE+_ENG_01, 00:40:12-00:40:13]

01 A: no=i can' have kids

02 (.)

03 → B: °h real[ly]

04 A: [yeah]

The extract begins with a counter-informing in line 01, which is responsive to a jocular remark on B's part that A should tell her future kids about an absurdity they just joked about. In this context, the RfRC in line 03 can be seen to invite different response components next to the reconfirmation in line 04 depending on whether it is taken as, e.g., (a) genuinely calling the informing into question or (b) displaying unexpectedness in connection with empathy or the like. This study shows that especially with RfRCs like these which principally allow for different readings, participants largely rely on various aspects of turn design for action ascription. The study also exposes that multimodal marking may be employed to upgrade the (dis)affiliative force of an RfRC, whereas the absence of noticeable marking serves to downgrade its (dis)affiliative implications.

A cross-linguistic study of newsmarks in Arabic, English, and Mandarin

Panel contribution

Dr. Michal Marmorstein¹, **Prof. Beatrice Szczepek Reed**², **Dr. Xiaoting Li**³

1. Hebrew University of Jerusalem, 2. King's College London, 3. University of Alberta

In this presentation, we approach the interactional phenomenon of 'newsmarks' in three languages (Arabic, English, Mandarin). We examine the extent to which linguistic forms serving as newsmarks are cross-linguistically comparable by juxtaposing the two most frequent newsmark forms in each corpus: Arabic *wallāhi* (lit. 'by God') and *bigadd* (lit. 'in-seriousness'); English *really* and elliptical polar interrogatives, such as 'did you'; and Mandarin *shi ma* (lit. 'is (it)?') and *zhende(a/ya, ma)* (lit. 'real/really'). Particle responses to news have been described, for example, in Mandarin (Hsieh 2017), Icelandic (Hilmisdóttir 2016), Finnish (Koivisto 2015), and German (Gubina & Betz 2021). However, the interactional category of newsmark, distinct from news receipts, has only been explored explicitly for English and German. Newsmarks have been described as indexing prior talk as new and as opening up opportunities for sequence expansion (Jefferson 1981) and have been claimed to be resources for showing disbelief (Heritage 1984). In addition, confirmation is commonly viewed as a conditionally relevant next, either as a minimal or initial component of a larger activity (Thompson, Fox & Couper-Kuhlen 2015) or as the dedicated task achieved by these items (Stivers & Enfield 2010). The presentation interrogates these findings, focusing on participants' displayed orientations toward the news and on the trajectories that newsmarks set up for further talk. It is suggested that newsmarks do not simply treat prior talk as new or questionable information; rather, newsmarks can be used to index prior talk as 'remarkable' (Marmorstein & Szczepek Reed, forthcoming) or 'topicalizable' (Gubina & Betz 2021), negotiate divergent epistemic stances, and display (dis)affiliation. The data are recordings of naturally occurring interactions in the three languages.

Alternate newsmark response designs in Korean

Panel contribution

***Prof. Mary Kim*¹, *Prof. Stephanie Hyeri Kim*²**

1. *University of Hawaii at Manoa*, 2. *California State University, Northridge*

This study examines two nearly identical responses equivalent to the English newsmark *really* in Korean: *cincca* and *cincca-ya* (really-COP), which are some of the most prevalent ways of responding to news in Korean conversational data. The only structural distinction between the two forms is the attachment of copula *-ya* ‘be’ to the noun *cincca* ‘real’. At a glance they appear interchangeable (and both are translated into ‘really’). However, a closer investigation of the sequential and interactional environments in which they emerge shows that they implement separate action formats that pursue different responses, thereby resulting in divergent interactional trajectories. *Cincca-ya* questions the validity of an informing thereby mobilizing confirmation and elaboration (Thompson et al., 2015), whereas *cincca* does the work of simply receipting news.

Extracts 1 and 2 from the same telephone call between two friends show how one recipient (Ara) responds to the news deliverer’s (Mia) informing or telling as news with different response designs, *cincca* or *cincca-ya*.

Extract (1) A friend’s troubles I

01 Mia: ‘I have to go to (Korea).’

02 Ara: ***cincca?***

03 Mia: ‘Because of Dong Ho. And I will go crazy if I stay here. I think I am a little crazy.’

04 Ara: ***cin[cca?]***

05 Mia: ‘[And], I have aged so much. Because I had so many upsetting incidents- so many upsetting incidents, I noticed myself aging so much.’

06 Ara: ***cin[cca?]***

07 Mia: ‘[I was shocked when I looked myself in the mirror.]’

With *cincca* the news recipient Ara displays that she finds the prior speaker’s information to be new or surprising but does not necessarily mobilize confirmation (Extract 1: lines, 2, 4, 6). This is evidenced by Mia’s continuation of her telling without confirmation (Extract 1: lines 3, 5).

On the other hand, with *cincca-ya* (Extract 2: lines 3, 7) the recipient does not simply take the information as news but treats it as a matter that requires further verification or elaboration from the news deliverer (Extract 2: lines 4, 8).

Extract (2) A friend’s troubles II

01 Mia: ‘He dumped me.’

02 (0.2)

03 Ara: ***cincca-ya[:?]***

04 Mia: ‘**[Yes] I am so embarrassed.**’

05 Ara: ‘(That’s) nonsense.’

06 Ara: ‘But I decided to forget him. Recently I have been crying every, every day.’

07 Ara: ***cincca-ya?***

08 Mia: ‘**Yes, I’m not kidding.**’

Here, *cincca-ya?* displays trouble with acknowledging the news and questions its validity. The news deliverer Mia puts her telling on hold and provides a confirmation beginning with a response token ‘yes’ (lines 4 and 8). In summary, the addition of the copula *-ya* ‘be’ transforms *cincca*, a *particle response* (Thompson et al., 2015), into a *minimal clausal response* (Thompson et al., 2015), which serves as a pseudo-question. Overall, this study contributes to our understanding of how news responses are constructed across languages with data from Korean.

Finnish [verb-repeat + vai ‘or’]: from understanding checks to newsmarks

Panel contribution

Dr. Aino Koivisto¹

1. University of Helsinki

As a “particle-rich language”, Finnish embodies a large set of particles that are specialized in receipting new and newsworthy information (at least *aijaa*, *ahaa*, *jaa*, *ja(a)ha*, *ai*, *vai nii(n)*, *mhy*). These particles may vary with respect to whether they, for example, orient to the newsworthiness of the informing (*aijaa*) or whether they suggest that the information is something that redirects the anticipated course of interaction (*aha(a)*) (Koivisto 2016). In addition to the particles, Finnish has a construction that consists of a verb repeat and the question particle *vai* (‘or’), e.g., *on vai*, *tuut vai* (‘be-3SG or’, ‘come-2SG or’). It is thus formally a question but used as a response to news (see Hakulinen et al. § 1701). I will show that while turn-final *vai* is also used in “genuine” understanding checks, the format [verb repeat + *vai*] is specialized in treating the prior turn as new, possibly surprising/noteworthy and thus potentially expandable information. This use is to some extent comparable to the use of English “minimal clausal responses” (*you are? are you?* Thompson et al. 2015), also termed “displays of ritualized disbelief” and “newsmarks” (Heritage 1984). [Verb repeat + *vai*] is typically followed by a minimal (re)confirmation; however, is it not uncommon that no confirmation is offered. This shows that the use of the format is partly detached from the “original” question function, now merely treating the prior talk as having offered surprising or noteworthy information that could, in principle, be contested in terms of its truthfulness. In this paper, I will outline the typical uses of [verb repeat + *vai*] that extend from 1) requesting verification to the information received (suggesting that the speaker is concerned with the truth of the informing) (cf. Thompson et al 2015: 94), 2) to treating the prior information as surprising/unexpected and to 3) a “ritualized” way of receipting new information. Furthermore, I will discuss the division of labor between the [verb repeat + *vai*] and the most frequent new particles in Finnish (*aijaa* and *aha(a)*). I will consider whether the division between particles as news receipts and question-formatted turns as newsmarks holds for Finnish or whether the issue is more complex (cf. Thompson et al. 2015: 52–53). The data are Finnish everyday conversations.

Jo? Fakt? ‘Yeah?’ ‘Really?’ - registering and confirming (surprising) news in spoken Czech

Panel contribution

Prof. Florence Oloff¹

1. Leibniz-Institute for the German Language, Mannheim

This presentation will focus on news receipts and newsmarks in spoken Czech and the social actions they implement in everyday face-to-face interaction. While newsmarks have been explored in various languages (most prominently in English, cf. Heritage 1984, Local 1996, but also in typologically different languages such as Finnish, Koivisto 2015, 2017, and Mandarin, Liu & Yao 2021) or, cross-linguistically, regarding specific lexical items (such as ‘okay’, see Betz et al. 2021), receipting news in Czech has not yet been studied, at least not from a conversation analytic point of view. Spoken Czech has been previously investigated regarding particles and discourse markers, but from a more traditional sociolinguistic and general communicational or stylistic perspective (e.g., Adamovičová 2017, 2021, Jílková 2017, Hoffmanová 2018), or with a contrastive focus, frequently regarding English or German (e.g., Nekula 1996, Rinas 2013, Válková 2020, cf. also Oloff 2022).

Based on a corpus of more than 15 hours of video recordings of everyday conversations in Czech (with two or more participants), this presentation will therefore provide a first description of how newsmarkers and news receipts distribute in this West Slavic language. In spoken Czech, the main lexical item used for this interactional task in second position, i.e., responding to an informing, is *jo* ‘yes’/‘yeah’, usually with a clearly rising intonation (*jo?*). The item *fakt* ‘really’ typically occurs in third position, usually receipting a response to a previous question of the same speaker. While *jo* seems to register new information in a rather neutral way (typically followed by a minimal response and a sequence closing), *fakt* emphasizes the news recipient’s surprise and a need to elaborate or to provide further comments. The change-of-state-token *aha* (cf. also the use of a similar token in Polish, Weidner 2016), however, always closes an informing sequence. Finally, this presentation will also consider the practice of (partial) repeats of previous turns (in various sequential positions) that confirm and register new information. These repeats can either aim at a simple reconfirmation or present the receipted news as in need of elaboration (cf. Robinson 2013). In order to describe the various ways news can be handled and receipted in Czech, I will look both at the larger sequential trajectories of these tokens and at possibly concurrent embodied conduct.

Navigating degrees of informativity in responses to news: Trajectories of request for reconfirmation sequences in Yurakaré

Panel contribution

Dr. Sonja Gipper¹

1. University of Cologne

News in interaction vary with respect to their informational import: While being new, they can be more or less predictable to the news recipient, and thus possess different degrees of informativity. The degree of informativity, defined as the relative predictability of a meaning in a context (Myslín & Levy 2015: 877–878), has been argued to affect many aspects of words' and utterances' forms in language use, such as the robustness of phonetic contrasts (Sano 2018), article (Lemke, Horch & Reich 2017) and complementizer omission (Jaeger 2010), word order (Komagata 2003), and language chosen in bilingual code-switching settings (Myslín & Levy 2015). In this paper, I propose that these observations scale up to the level of sequence trajectories in interaction, showing that degrees of informativity play an important role in shaping trajectories of request for reconfirmation sequences in Yurakaré, a language isolate spoken by around 1,600 people in central Bolivia. In this language, requests for reconfirmation—polar questions that react to news by asking the interlocutor to reconfirm something they just said—are ubiquitous in interaction and constitute an important resource for responding to news. They can have regularised one-word formats such as *achama* 'is it so?', the most frequent format, however, being that of a repeat.

Combining a qualitative and quantitative analysis of a collection of around 160 requests for reconfirmation sequences extracted from conversational corpora, I demonstrate that a range of features tend to cluster to collaboratively contextualise news as representing higher and lower degrees of informativity: Prosodic features of the initial turn presenting the news, overlap of the request for reconfirmation with the initial turn presenting the news, and format of the reconfirming response (repeat vs. response particle). The results suggest that degrees of informativity have consequences for linguistic form at the level of the interactional sequence, thereby demonstrating that concepts from information theory (Shannon 1948) can fruitfully be applied to sequence trajectories dealing with news in interaction.

Ne? ('yes?'): Between surprise and challenge in Greek telephone calls

Panel contribution

Prof. Theodossia-Soula Pavlidou¹

1. Aristotle University of Thessaloniki

Like 'yes' in other languages, the Greek adverb *vai* ([ne] 'yes', henceforth *ne*) is multifunctional, its overarching function being the affirmation of polar interrogatives across contexts. It is also widely used as an answer to a summons in general and, in particular, to the ringing of the telephone. Such functions are unequivocally determined by the different sequential positions in which *ne* occurs, i.e. as a second pair-part to polar interrogatives vs. summonses, and its distinctive prosodic design in these environments. In the present paper, I would like to point to another use of *ne*, namely in second or third position after volunteered or question-elicited informings respectively (cf. Thompson et al. 2015).

The data for this study are drawn from 145 telephone calls among familiars (a subset of the Corpus of Spoken Greek, cf. Pavlidou 2016). In the calls under examination, we find some 45 relevant occurrences of *ne*, most of which are stand-alone (80%), in other words *ne* makes up the whole turn by itself. In about 1/3 of the cases *ne* is preceded by the interjection *a* 'ah' (the closest Greek equivalent to English *oh*), while in very few instances *ne* is followed by *e* (a confirmation seeking interjection). The intonation contour of *ne* in this environment is interrogative (hence depicted as *ne?*), and modified accordingly, if in combination with *a* or *e*.

In this context, *ne?* seems to be accomplishing a kind of hybrid action as it combines both an expressive aspect (indexing unexpectedness, surprise, doubt, etc.) and a directive one (requesting confirmation), i.e. it functions as a newsmark. According to Thompson et al. (2015: 52), newsmarks make relevant "at least one more turn at talk". Being a polar interrogative that indexically refers to the proposition put forward by the informing, *ne?* invites an answer that at least affirms (or disaffirms) that proposition. Indeed, in almost all of its occurrences *ne?* receives an answer. The question is of what type this answer is and what it does.

The stand-alone instances of *ne?* (mostly occurring after volunteered informings in the data) are commonly responded to by the repetition of *ne* (with falling intonation). This raises an interesting problem, since the response can be regarded both as an 'interjection-type' and a 'repetition-type' polar answer (Enfield et al. 2019). Interjection-type answers are considered to be pragmatically unmarked while repetitional answers count as pragmatically marked (ibid.). In our case, analysis suggests that the answer to *ne?* is more likely to be of the repetition-type. Taking into account among others (a) what happens when *ne?* is followed by more TCUs in a multi-unit response to the informing, (b) how the (original) informer handles *ne?* and (c) the way other newsmarks, like *σοβαρά?* ('seriously?') and *αλήθεια?* (lit. *truth*, 'is it true?'), are responded to in the data, I argue that the repetitional response to *ne?* indexes upgraded epistemic rights on the informer' side, thus retrospectively characterizing *ne?* as an expression of ungrounded surprise, doubt, etc.

Newsmarks from a multimodal perspective: The case of be'emet 'really' in spoken Hebrew

Panel contribution

*Dr. Leon Shor*¹, *Dr. Michal Marmorstein*²

1. Achva Academic College, 2. Hebrew University of Jerusalem

The category of 'newsmarks' pertains to items that treat prior informings and tellings as being unusual, unexpected, or remarkable, thereby negotiating divergent epistemic stances and managing problems of acceptability (Marmorstein & Szczepek Reed, 2022; Gubina & Betz, 2021). This paper focuses on a lexical item that is typically associated with newsmarking in spoken Hebrew: *be'emet* 'really' (lit. 'in truth'). In previous research *be'emet* is described as a discourse marker that constructs a stance of amazement and disbelief with regard to a prior informing (Maschler & Estlein, 2008). However, the sequential unfolding and the multimodal patterns which accompany *be'emet* have not been studied yet. Based on a collection of video recordings of ordinary informal conversations, we examine the following questions: (1) Which types of informings occasion the use of *be'emet*? (2) How is *be'emet* treated subsequently? (3) What is the prosodic-embodied design of *be'emet*?

The following excerpt illustrates our analysis. Sharon and Tamir are discussing the rent that Sharon pays to his father for an apartment located in the city of Tel Aviv. Sharon indicates that his cost of living is unusual (lines 1-6), which prompts Tamir to inquire about the exact rental amount that Sharon pays (lines 7-8). Sharon's answer is not straightforward. Displaying initial hesitation (lines 9), Sharon first describes his father's willingness to negotiate the rent (line 10), and only then mentions the actual number which he qualifies as lower than expected (line 12). Tamir's response to this informing is initiated immediately after the report on the markedly low rental cost ('two thousand') through eyebrows' raising. This facial display is maintained throughout the subsequent verbal response that is initiated by a token of *be'emet*, delivered with a sharp pitch jump on the second syllable, followed by a vocalization of amazement ('wow', line 14). Rather than doubt or disbelief, we propose that, *be'emet* displays an orientation toward the prior talk as being remarkable due to its contrast with the speaker's own experience. This interpretation is corroborated by two observations: First, *be'emet* elicits a minimal affirmation from Sharon, which acknowledges the remarkability attributed to the previous informing without providing any justification (lines 15-16). Second, *be'emet* is preceded by, and co-occurs with, the raising of both eyebrows, which can be interpreted as visually conveying a change of state (Dix & Gross 2021). Rather than questioning the prior talk, and thus indexing an "intermediary stage on a path between K- and K+" (Thompson et al. 2015: 77), the use of *be'emet* involves an already completed change of epistemic state which gives rise to the construction of previous contents as remarkable.

(DZ_YRC_23:50-24:07)

- 1 Sharon: The living here (is),
2-5 (omitted)
6 unusual.
7 Tamir: Why,

Prosody as a Stance Marker in Responsive so-Prefaced Yes-No Questions

Panel contribution

*Mr. Nadav Matalon*¹

1. The Hebrew University of Jerusalem

Stance taking is intrinsic to questioning. Most basically, asking a question involves positioning oneself in a lower epistemic stance with respect to the addressee. However, via question design, questioners display more nuanced stance-related aspects. For example, questioners may choose one of several syntactic question formats to adjust the degree of their epistemic inferiority (Heritage, 2012). In this study, I focus on *prosodic* variation in question design and explore the range of stance-related meanings that it could convey. To this end, I focus on a specific syntactic question format – *so*-prefaced yes-no questions (*so*-YNQs) – and examine instances in comparable sequential positions, that is, in response to informing sequences.

One way to respond to an informing in interaction is to offer “an inference that goes beyond the substance of the informing as a candidate understanding” (Thompson et al., 2015: 134). Such responsive moves function as yes-no questions, making relevant next an affirmation or disaffirmation of the inference by the other more knowledgeable participant. They are typically clausal and non-repetitive (ibid: 128), and in English they are often prefaced by the discourse marker *so*, which further displays the inferential or causal connection to the preceding turn/s (Drew, 2018; Schiffrin, 1987).

I conduct an interactional linguistic analysis of recorded everyday telephone conversations in American English, and find that the prosodic design of *so*-YNQs is a methodical resource for the expression of various stances, both epistemic and affective. Epistemically, producers of *so*-YNQs use prosody to display the level of congruency between the inference they present for affirmation and their prior knowledge, and, not unrelatedly, their degree of certainty to receive an affirming response (Couper-Kuhlen, 2012). At the same time, specific prosodic modifications allow questioners to ‘lamine’ *so*-YNQs with affective aspects as well, such as the expression of a highly positive evaluation of the inferred detail, on one hand, or an intended display of lack of enthusiasm, on the other. These expressions of stance are consequential for the continuation of talk, as reflected, first and foremost, in the different types of answers they consistently receive.

In conclusion, this study demonstrates the benefits in examining prosodic variation while controlling for syntactic design and sequential position. The findings reveal additional depths of meaning that prosody can convey in interaction, and point to the scalar and multi-layered manner in which it is used.

Responding to informings in German and Low German – On the fuzzy boundaries of newsmarks in cross-linguistic research

Panel contribution

***Dr. Kathrin Weber*¹, *Dr. Katharina König*²**

1. Friedrich Schiller University Jena, 2. University of Münster

In mundane conversation, the delivery of news creates a sequential slot in which responses are due. In this ‘possibility space’ (Stivers 2019, Couper-Kuhlen 2021) speakers can choose from different response types with which they can receipt, assess or challenge the news. Often, conversation-analytic studies focus on one of the many possibilities respondents have at their disposal, i.e. they usually describe particular forms which can be found in this slot in a given language (see e.g., Gubina/Betz (2021) on German *echt*). Moreover, studies distinguish between change-of-state tokens as a class of sequence-curtailling particles, which display a transfer of knowledge (such as English *oh* (Heritage 1984) or German *ach (so)* (Golato/Betz 2008)), and newsmarks, which – as “assertions of ritualized disbelief” (Heritage 1984: 339) – minimally make re-confirmation relevant and thus expand the delivery of news (such as English *really?* (Thompson et al. 2015)). Some studies assume a clear-cut distinction between these resource types (Imo 2009).

In our talk, we would like to take an action-based approach that compares newsmarks in German and Low German talk-in-interaction. We argue that such a cross-linguistic endeavour should be rooted in the newsmarks’ interactional treatment rather than their form, in order to better understand what invites re-confirming responses in different languages. Based on a sequential analysis of newsmark sequences in both languages, we hope to show that languages differ in the specialisation of formats routinely used for marking a prior as news. Whereas newsmarks are lexically quite distinct from change-of-state tokens in German talk-in-interaction, speakers of Low German routinely deploy resources such as *ach so* as a display of newsworthiness in interaction, which invites re-confirmation. By conducting in-depth sequential and prosodic analyses we would like to show that there are gradient transitions between newsmarks and change-of-state tokens which have to be taken into account in comparative conversation-analytic research.

Teachers' responses to child-initiated informings in a bilingual preschool

Panel contribution

Dr. Olga Anatoli¹

1. Linköping University

This talk discusses child-initiated informings and teacher's responses to those in a bilingual Swedish-English preschool. Videorecordings of naturally occurring interactions are analyzed with the method of conversation analysis with particular attention to the multimodal aspects of interactions. The analysis reveals that child-initiated informings can be considered as an important display of children's bilingual interactional competence. Children pursue conversational engagement with teachers through particular turn-taking and recipient design, as well as nominate a topic that is relevant and coherent within the local material and conversational context. In so doing, children navigate institutional constraints on participation, establish themselves as knowledgeable speakers, and secure the teacher's reciprocity. When teachers recognize informings as such, they regularly demonstrate their alignment with the child's course of action, while situating it in the institutional practice. In doing so, teachers support a learning environment that confirms children's participation rights. Child-initiated participation in the multiparty institutional setting proves to be a co-operative, transformative social process that constitutes an essential affordance for child pragmatic development amid bilingualism.

Eastern European perspective on the study of English language ideologies

Panel contribution

Dr. Loreta Vaicekauskiene¹

1. Vilnius University

The presentation focuses on the development of Eastern European ideologies of the English language over the three post-1990 decades since the collapse of the Soviet empire. The question is raised how the growing acceptance of and the tensions surrounding the spread of English have been tied to the broader processes of democratisation and globalisation in the revived nation states of this post-Soviet region. In contrast to Northern Europe, where English was gradually integrated into the everyday lives and self-awareness of the population during the period after WW2, English language-related ideological processes in Eastern Europe shifted from a frozen state to a sudden acceleration at the end of the 80s. This relatively late exposure to English along with simultaneous re-evaluation of Russian, that took place at a time of a dramatic socio-political change, makes Eastern Europe a unique laboratory for the study of language ideologies.

The presented investigation is based on, but not limited to, Lithuanian data on social value attribution, learning, self-reported proficiency and use of English for communicative and identification purposes. The data set consists of original and secondary data sources such as representative surveys, qualitative interviews, metalinguistic comments and observations of interactions on social media, covering different aspects of the study throughout the three decades. In addition to the universal findings on the socio-demographic stratification of 'non-native' speakers of English and on the indexicality of English reported in other studies as well, the investigation highlighted a specific Eastern dimension and additional axes of conflict. It will be shown that in Eastern Europe, English language ideologies are embedded in socio-political discourses on Eastern and Western civilizational zones. English is seen as indicative of democratic progress and contrasted with Russian which is associated with the Soviet- or Russian-influenced mentality. At the same time, because of the specific form of nationalism and anti-Western ideology fostered during the Soviet period, positivity towards English has become an arena for cultural confrontation particularly targeting young consumers of the contemporary global culture, for whom English has become an integral part of their everyday social practices. The presentation will conclude with a discussion on the growing role of new media in the younger generations' ideology of English, which seems to be erasing regional differences.

Exploring conflicting ideologies: the relationship of exceptionalism and English in Finland

Panel contribution

***Dr. Elizabeth Peterson*¹, *Ms. Katariina Pyykkö*¹**

1. University of Helsinki

The Nordic countries have been described as struggling to acknowledge their participation in global colonial histories (Hoegaerts et al 2022), an ideology which has been characterized as “exceptionalism” or being an “innocent outsider” (ibid; see also Keskinen 2019). A sense of Finnishness, in particular, often espouses ideologies of being “the oppressed in exclusion to being an oppressor” (Hoegaerts et al 2022: 5), drawing on Finland’s historical status as a part of the Swedish kingdom and later a Grand Duchy of the Russian empire, before gaining independence in 1917. Another ideology in Finland is a sense of equality and lack of social class distinctions (Keskinen, Skaptadóttir and Toivanen 2019). Against this backdrop, Finland can today be defined as a global “winner” (ibid) according to various global measures.

One of these measures is overall per capita proficiency in English. Current statistics inform that the vast majority of Finns are proficient in English. This leads to questions about ideologies concerning English in the Finnish context. Globally, ideologies about English range from exclusionary practices based on racial, class and other social distinctions to neoliberal ideals of equality and inclusion. This range of ideologies presents a multitude of possible outcomes in Finland. For example, does the Finnish population of English speakers adopt ideologies about English that gravitate toward a localized sense of equality, or toward externally propagated ideologies which uphold, for example, class and racially-based distinctions of English? This presentation makes examples from three studies addressing ideologies about English in Finland: 1) an overview of English language requirements for international students at universities (Peterson and Hall forthcoming); 2) a study of the reception and evaluation of the English spoken by migrants in public health settings (Iikkanen 2020); 3) an ongoing study of educated migrant women who have moved to Finland (Pyykkö forthcoming). The examples point toward a linguistic reality in which ideologies external to the Finnish notion of equality are favored, gravitating toward exclusionary practices rooted in English language elitism and ethnic and class-based distinctions.

Ideologies of English among Danish high school students

Panel contribution

Ms. Marianne Haugaard Skov¹

1. University of Copenhagen

In this paper, I present results from my ongoing PhD project *English as a Relationship-Building Resource among Danish Youth* where I investigate the use of English as a linguistic resource among a group of Danish high school students with an emphasis on the social functions the use of English serves for them. Signaling that you are young and part of a shared youth community (both online and offline) seems to be relevant for them. But English also appears useful as a stance-taking device for managing socially sensitive situations by creating distance to what is said.

I hypothesize that mediatization influences the use of English among Danish high school students, which is why I have chosen a multi-sited online and offline ethnographic study (Androutsopoulos & Stæhr 2018) as my methodological foundation. This allows me to investigate the adolescents' communicative practices across on- and offline contexts and allows me to see where and how English plays a role in these different contexts. My study is based in a high school in Copenhagen and the data consists of field notes, interviews, audio recordings from school situations, and social media data collected over a period of five months. In this paper, I will focus on ideologies of English and how these ideologies are articulated among my participants across different data types.

My preliminary findings suggest that English is considered a natural and unremarkable linguistic resource by the students, but also that English has the potential to be used for different social meaning-making purposes e.g., as part of the students' identity work or as mentioned for dealing with awkward or socially sensitive situations. My participants also express a connection between their use of English and their use of social media, which supports the hypothesis that mediatization does influence their use of English.

Revisiting ideologies of English in the Nordic countries – setting the scene

Panel contribution

***Dr. Janus Mortensen**¹, **Dr. Dorte Lønsmann**¹*

1. University of Copenhagen

In this paper – and the panel it introduces – we set out to explore how language ideologies related to English have changed over the past 25 years in the Nordic region. From the middle of the 20th century onwards, English has increasingly come to be seen as an indispensable language in the Nordic countries, for the individual as well as for society. English is the dominant foreign language in primary and secondary school, it is increasingly adopted as a medium of instruction in higher education, it plays a prominent role in popular culture, and it is considered the default language of international business. In short, as in many other parts of the world, English is a language associated with great promise – a powerful semiotic resource in practical as well as language ideological terms. Yet, the increased importance of English in the Nordic region has also caused concern. This came most clearly to the fore as part of the domain loss debate in the early 2000s where English was regularly framed as a threat to local Nordic languages. While these language ideological stances undoubtedly linger, the domain loss debate is much less prominent today. Taking our starting point in an overview of key themes in the literature on English in the Nordic countries and drawing on ongoing research in the ENIDA project at the University of Copenhagen, we explore how recent processes of social change, including increased transnational mobility and new forms of mediatization, have helped shape – and potentially change – language ideologies related to English in the Nordic countries. Our argument is that ideologies of English in the Nordic countries – now more than ever – need to be approached as complex, multidimensional phenomena that cannot, and should not, be reduced to a simple dichotomy of ‘opportunity vs threat’ which has been a common trope in the discussions around English since the domain loss debate at the beginning of the century.

The role of English for young Norwegians

Panel contribution

Dr. Ulrikke Rindal¹

1. University of Oslo

This contribution reports a study that explores ideologies of English among children and adolescents in Norway. The paper presents data from qualitative interviews with 12 participants aged 6, 11 and 15 who have English as an additional language (L2), investigating how their English language practices relate to identity work and experiences of ownership of English.

English does not have any official status in Norway, but formal instruction begins year 1, and English is a mandatory school subject for 11 years with its own curriculum separate from other foreign languages. Children and adolescents are daily exposed to considerable amounts of English outside of school, particularly through popular and social media. Although traditionally categorised as a ‘foreign’ language in Norway, English is today “simply a fact of 21st-century life” for young Norwegians (Linn, 2016, p. 201).

The interview study is part of the research project STAGE – Starting AGE and Extramural English, which investigates the relative influence of *extramural* English (self-initiated English use outside of school) on English language proficiency (Sundqvist, 2023). STAGE is a multiple-method study with participants from grades 1, 6 and 10 from Norway and Flanders, Belgium ($N=900$), including data from language logs, questionnaires and various proficiency tests. The interview participants ($N=12$) are selected from the larger STAGE sample based on the quantitative data sources, aiming to include participants with various linguistic and cultural backgrounds. The participants are interviewed in pairs in a room at their school. In addition, I visit the youngest participants in their home to conduct additional informal interviews with artefacts in combination with observations. Interviews across all levels are semi-structured, with age-appropriate operationalisations of concepts related to language ideologies.

Based on informal conversations with a selection of the participants, the data is expected to show how English is related to media and the internet, and different from the English taught in school. Participants at all levels are expected to consider English a language that they acquire naturally. The older participants are expected to engage on interactive digital platforms outside of school that are closely related to their interests and identities, thus involving English in their identity work.

Increased extramural English adds to an already multifaceted sociolinguistic climate in Norway, leading to complex ideologies related to English. The role of English for young Norwegians challenges traditional categorisations where the status of English is defined by national borders (e.g., Kachru, 1985), and has considerable implications for how English is taught in school and in higher education.

The role of English in Nordic multilingual families: help or hindrance to the national language?

Panel contribution

*Dr. Kaisa Pietikäinen*¹, *Ms. Louisa Gühr*²

1. NHH Norwegian School of Economics, 2. University of Jyväskylä

The Nordic countries represent an interesting case in globalisation because of their high English competence without having English as an official language. Among other contexts explored in the panel, this has affected where and how romantic relationships are sought for and how families are established in the region. On the one hand, Nordic citizens' English skills expand their opportunities to find a desirable partner from abroad, but on the other hand, not knowing the local language(s) represents a barrier for the foreign spouses to settle in and become fully-fledged members of the Nordic society. Having English as a lingua franca between the parents also poses both threats and opportunities for their children's multilingual development, and the parents may find themselves in a situation where they need to adjust their language practices in order to cope with challenges brought about by their multilingual realities.

This paper explores interviews of four Nordic-international families residing in Finland and Norway where one parent is a highly skilled migrant who has relocated to the country either before or after meeting their Nordic spouse. All four couples began their relationships using English as their lingua franca, and none of them had English as their first language (L1).

Combining qualitative content analysis with phenomenography, we first seek to investigate the role of English in the couples' reported language practices, particularly from the perspective of the non-Nordic partner. Our findings reveal a contradicting relationship to English as both a support and a hindrance – even an obstruction – to learning the local language. In three of the four families we investigate, English had, however, remained as the main private language between the parents, and had the emotional attachment of having been the language through which the relationship had been built and sustained (see also Pietikäinen 2018).

We then explore the role of English as a part of the families' *multilingual familylects* (Van Mensel, 2018). While in one family, English had an almost equal, uncontested role with the two parental L1s as a part of the familylect, the other families described more negative stances toward English, having planned to or already restricted its use when children were around. For these three families, English had less of an ideological importance than the parental L1s, and the parents were certain that the children would learn English through the school system anyway, so they did not see the need to further support it within the family.

Our findings illustrate the complex ideological stances educated Nordic-international families hold toward English: On the one hand, English is almost self-evident, a necessary currency learned through the education system, used for personal purposes and sculpted to suit individual needs. On the other hand, English may impede the non-Nordic partners from learning the necessary "local currency": the local language; or it excludes the children from the interactions between the parents, which is why some of the families had implemented strategies to limit the use of English at home. We conclude the paper with suggestions for further inquiry.

“‘In Denmark we speak Danish’. No, we speak English in Denmark”: Ideologies about English in Denmark

Panel contribution

*Dr. Jacob Thøgersen*¹, *Dr. Dorte Lønsmann*¹, *Dr. Kamilla Kraft*¹

1. University of Copenhagen

In this presentation, we investigate current attitudes to and ideologies about English in Denmark using results obtained through two different methods: A large-scale survey and a focus group study. As a consequence of globalization, migration and mediatization, English has come to play a larger role in Denmark in the last few decades. No longer just a foreign language, English has a wide range of uses and meanings in Denmark, often positioned in relation to Danish culture and language.

In order to draw up a language ideological landscape, we combine data from two studies of English and globalization in Denmark that we are currently working on: a diachronic comparison of two surveys with 850 participants each and a qualitative study using ethnographic focus group interviews. Using both types of data allows us to compare and contrast the results from direct and more indirect methods of studying language attitudes.

To study the current lay of the land as well as its changes, we compare our 2022 survey to a similar study conducted more than 25 years ago (Preisler 1999). In comparing the results from these two large-scale surveys conducted in 1995 and 2022 respectively, we are particularly interested in how assumptions of Danes' English competences have changed, and how attitudes towards English, e.g. 'English as an opportunity' vs. 'English as a threat', have changed as well as remained the same.

In the qualitative study, we analyse what attitudes and ideologies about English emerge in different social groups. The groups have been selected based on (1) their degree of local vs. global orientation, (2) their use of online media, and (3) their age, based on the hypothesis that these background criteria will generate a representation of groups with very different relationships to and uses of English, and subsequently a rich variety of ideologies about English and globalization. For example, we find that a group of role-playing gamers with ties to an international subculture subscribe to ideologies of both linguistic fluidity and monolingualism, and that they associate each position with specific political values. In contrast, a group of retired farmers place great value on Danish and their local community, while English is seen as an (inevitable) intrusion in their everyday lives.

Taken together, the results indicate that the role of English in Denmark is informed by a range of ideologies, pressuring established sociolinguistic orders and making way for new ones.

Conversational AI Platform for Digital Robot-Assisted Autism Therapy

Panel contribution

Dr. Sviatlana Höhn¹

1. LuxAI

Large general-purpose language models such as GPT3 (OpenAI), GPT-NeoX (EleutherAI) and LaMDA (Google) have achieved highly notable performance in simulating fluent conversations. At the same time, the field of digital therapeutic is developing into an important area of medicine with vast areas of applications. With the ever-increasing application of digital therapeutics to be embedded in our natural environments, there is a high need to empower these systems with more natural interaction and conversational capabilities. An example is the QTrobot (LuxAI) with applications for therapy of persons with neurodevelopmental disorders. Currently, the interaction capabilities of the QTrobot are tailored for persons with developmental age of 1-5 years. To support therapy of persons of higher developmental ages, QTrobot needs more advanced conversational capabilities. However, the application of large language models such as GPT3 and GPT-Neo in digital therapeutics is limited because they lack important requirements such as trustworthiness, quality assurance, governance, explainability, auditability, etc which are needed for digital therapeutics. Moreover, language models of this size are currently only available for English. However, digital therapeutics in the European context must be offered in different European languages. To empower the QTrobot with the right level of conversational functionality, we design a conversational platform that covers multiple European languages in addition to English, allows for full control of the conversation while offering powerful language understanding capabilities, implement methodology and tools for non-technical people, such as therapists and parents, to easily use and extend the conversational functionality for their patients and children. We explore how external dialogue management and knowledge bases can be integrated on top of the large, general-purpose language models, to enable fully controlled therapeutic conversations. We pay attention to intellectual property rights in the training data to make the QTrobot more interactive while ensuring its ethics, trustworthiness, and therapeutic dialogue design. This talk will outline the design of the system, the technical and scientific challenges as well as the opportunities that will become available for researchers working in non-technical disciplines, due to the new platform availability.

Culturally-aware educational language technologies

Panel contribution

Prof. Justine Cassell¹

1. *Inria*

Children seamlessly shift their ways of speaking, adopting and adapting language they hear spoken by adults around them, as well as constructing their own variants. These speaking styles play an important role as children experiment with who they want to be, and how they want to be perceived. They also allow children growing up in situations where different dialects or languages are in contact to mark their affiliation to dominant and minority ethnic, racial, and gender identities (Rampton 1995).

Young people who move between marginalized and mainstream communities often report code-switching as a way to maintain affiliation with their home community, while also making their way in a world where the standard dialect is associated with various kinds of success (Kallmeyer & Keim, 2003). However, moving back and forth may lead to what Ogbu (2008) has called “oppositional culture” to describe how school systems may inadvertently set up a situation where the student feels the need to define her identity *contra* the expectations of the school, and for that reason to refuse the dialect that the school insists on.

Unfortunately, language technologies, including and very persistently, educational technologies, may inadvertently carry negative stereotypes about ethnicity and how it is carried in language, leading to stress and lack of a sense of agency as children try to navigate a path that allows them to benefit both from the support of their community and the opportunities offered by mainstream education.

My students and I have examined this issue by building “culturally-aware” educational language technologies, and specifically “virtual peers” that either speak only the child’s own dialect, or that model a code-switching strategy between what linguists call low-prestige and high-prestige dialects. Results using a variety of methodological approaches, in both one-shot and longitudinal studies, demonstrate the positive impact of technologies such as these that take issues of culture, and of power, into account on children’s school performance. On the other hand, careful assessments of the children’s reactions to the technologies shows that they will need further development to improve the children’s own internalized biases against low-prestige dialect speakers.

Explainable Embodied Intelligence for Collaborative Robots: An Interactive Approach

Panel contribution

Dr. Dimosthenis Kontogiorgos¹, Prof. David Schlangen¹

1. University of Potsdam

Over the past century, we have encountered a historical transition from an economy established throughout the manufacturing industry to an economy characterised by information technology. Technological artefacts shape how we live, work, learn, and communicate. With the rapid advancement of machine-learning methods, the last decade has seen substantial progress in collaborative robotics, promising to bring together manufacturing and information technology, and enable that technology to work in the physical world.

One of the main barriers is that AI systems are inherently opaque, unable to explain how decisions are taken through prediction algorithms. In the field of explainable AI, some researchers argue that systems do not always need to be transparent, as humans are also not always able to explain how they take decisions [1]. Others believe that model transparency does not only have scientific value, but also societal implications in exposing biases [2], either in decision-making or in the data utilised [3]. The interactive approach of explainability places explanations at the same level as other communicative actions, which differs from the interpretability perspective of making statistical causality more transparent. Explanations also portray a significant factor in the development of trust in AI systems [4]. Human-centred explanations should be generated along with algorithmic transparency; explanation interfaces should be able to determine how to convey decisions in human terms.

We propose that explanations should be examined from the perspective of common ground, with XAI interfaces generating explanations utilising language models, along with their classification predictions [5]. There is a lack of explainability work tailored to interactions with users not knowledgeable of how these systems work, and in particular, how to best convey explanations to a diverse set of users with different expectations. Existing approaches conceive explanations as autonomous processes decoupled from dynamic user environments, without knowing whether an explanation is needed, or how to best convey it.

Data-driven generation of explanations promises great potential for HCI, where traditionally explanations have been limited to system failures and miscommunication [6]. In pragmatics, utterance production is known to be a collaborative process; natural-language explanations should as well be adapted to the user's needs and concurrent to changes in the environment. We discuss how knowledge gets transferred from one agent to another through language, embodied actions, and explanations, both in moments of successful communication and in miscommunication.

Field testing an interactive language technology in an elderly care facility

Panel contribution

Ms. Rosalyn Langedijk¹, Prof. Kerstin Fischer¹

1. University of Southern Denmark

This study focuses on the lessons learned from a one-week long case study in which we deployed a drink-serving robot in a German elderly care facility.

In our study, a drink-serving robot served orange juice, apple juice and water to the residents who were sitting in the common area of the care facility. The robot facilitated interactions with the residents by using speech. For safety reasons, the navigation and the speech of the robot were controlled by wizards, i.e. by human operators who controlled the robot manually.

Our results show challenges with respect to speech synthesis, speech recognition and situation understanding. Regarding speech synthesis, our observations show that the synthesized speech by the robot was often not heard by residents with hearing aids. In our study, the experimenter (or a caregiver) was forced to repeat the robot utterances to 22.3% of the residents because they could not understand what it was saying. The problem may not only be due to the (not adaptable) loudness of the robot's voice, but also due to the specific voice the robot was using or due to the fact that the voice was synthesized and thus not recognized as relevant; in many cases, the robot utterances were just ignored.

Furthermore, the robot itself made sounds that caused problems for some residents who were using hearing aids; one resident did not come to the common room when the robot was there because of feedback in her hearing device.

Regarding speech recognition, the older persons we observed tended to speak quietly, and their low voices make it hard for an automatic speech processing system to recognize their speech.

Regarding natural language understanding and situation awareness, we observed several instances in which the robot interrupted interactions between residents; here, more advanced natural language processing would have been beneficial.

In our field studies, we furthermore observed that residents in care facilities have very different needs; for instance, some residents suffer from dementia, some from diabetes (and hence should not have all drinks), some suffer from hearing or vision loss; and some residents use a wheelchair, while others use a walker, and many are restricted in mobility (which makes it difficult for them to use a touch screen, for instance). Therefore, a care facility is a place with great diversity, which requires adaptable and flexible technology that can smoothly adjust to its individual users.

To sum up, building robust interactive language technologies for the use in elderly care facilities requires an understanding of not just basic interactional principles but also the challenges posed by the diversity of the residents.

How do users with mild cognitive impairment deal with Conversational User Interfaces? Investigating situations of signaling trouble

Panel contribution

Prof. Karola Pitsch¹

1. *University of Duisburg-Essen*

While Conversational User Interfaces (CUIs) are mainly designed for and targeted at ‘typical’ users who dispose of adult standard communicational abilities, they could eventually provide an extra benefit for so-called ‘atypical’ users. For example, persons with mild cognitive impairment or elderly participants might be able to extend their autonomy in the routine activities of daily life, if a technical system was able to assist e.g. in managing a stable daily structure and rhythm. In order to develop assistive systems for such so-called ‘atypical’ user groups, empirically-grounded insights into their ways of communicational dealing with a CUI are required.

Against this background, we will explore how a person with mild cognitive impairment uses a CUI (research prototype involving speech, a virtual agent with head and arm gestures, a calendar display) over a period of several weeks in their home (see Kopp et al. 2018). The system is set up to be used for entering appointments in a calendar application, to suggest potential activities and events to the user and to remind him/her of the activities which are planned for the corresponding day. Analysis is based on a corpus of video-taped recordings which stem from an interdisciplinary project which has focused on the development of socially cooperative dialogue for technical agents (e.g. Kopp et al. 2018). In particular, the system is equipped with facilities for managing dialogue in an incremental way, to signal understanding and to initiate repair sequences (Yaghoubzadeh & Kopp 2017). While the investigations so far have mainly centered around the design of the multimodal CUI and its evaluation (e.g. Opfermann & Pitsch 2017, Cyra & Pitsch 2017), in this presentation, the focus will shift on exploring the ways in which the user attempts to deal with the CUI and how this evolves over time. Considering in particular sequences involving repair, we will also discuss in which way the user’s conduct and communicational practices might be considered as specific for an ‘atypical’ user or rather reflect more general communicational practices in situations with a CUI.

The machine/deep learning perspective for conversational AI and the modeling of language specifics

Panel contribution

Prof. Chloe Clavel¹

1. *Telecom Paris, Polytechnic Institute of Paris*

In this panel, I will discuss the potential of machine learning for the development of interactive language technologies, particularly in the context of conversational AI. I will illustrate the problem of modelling language specifics through machine learning using studies we have conducted. For example, I will present models trained to predict a user's self-confidence and analyse their ability to incorporate information about filled pauses (Dinkar et al., 2020). I will also present the method we are developing to improve the explainability of Machine/Deep Learning models by highlighting the linguistic phenomena that play a role in different prediction tasks (the hedging strategies of the tutor (Raphalen et al., 2022), the quality of a particular speech (Hemamou et al., 2021)). Finally, I will discuss how the paradigm behind the social science discipline of conversation analysis can support machine learning research for the development of a human-robot interaction that better takes into account the specifics of each interaction (Rollet & Clavel, 2020).

Contextualized Laughter and Joint Construction of Humor in Dementia Interaction: A Discourse-analytic Case Study

Panel contribution

Ms. Carolin Schneider¹

1. Utrecht University

Keywords: dementia, conversational humor, discourse analysis, joint joking, humor support, co-constructed humor

In social interaction, people living with dementia and their conversational partners can encounter many communicational challenges (Hamilton 2019) due to the high dependence on contextual knowledge, cognitive resources, and emotional demands (cf. Wray 2020). It is well documented that pragmatic abilities, including the comprehension and production of humor, are among the first communicational abilities affected by neurodegenerative disorders such as dementia of the Alzheimer's type (DAT) (cf. Bayles & Tomoeda 2007). Humor, nevertheless, may still be valued by people living with DAT to foster interpersonal relationships and as a means to present themselves as worthy, funny, and capable communicational partners (Davis et al 2016; Schneider & Qalaj forthc.). At the intersection of humor and dementia, thus far, retained pragmatic abilities are still under-researched.

Thus, this study investigates data from three narrative interviews held with people living with DAT and their primary care partners speaking English and Spanish in informal settings. The analysis focusses on the humorous moves employed by the people living with DAT and their conversational partners, their co-constructions and respective humor support. Drawing on the ethnomethodological approach to discourse analysis of humor (cf. Davies 1984), this study sheds light on the complex construction of joint humor and laughter as well as their functions in discourse.

Results indicate that, in line with prior findings, laughter is not always indicative of humor (cf. Priego-Valverde 2003), especially so within the context of dementia (cf. Lindholm 2008), when laughter might be a sign of communicational trouble spots or nervousness. However, in particular, contextually situated laughter can be a form of shared humor and joint joking when the person living with dementia is otherwise not talking much. Further, people living with dementia demonstrate their trust in 'common ground' (Clark 1996) by competently formulated puns and humorous utterances.

Fictional interaction in humorous children's narratives: a pragmatic analysis of the corpus CHILDHUM

Panel contribution

*Dr. Larissa Timofeeva-Timofeev*¹

1. *University of Alicante*

This presentation aims to analyse the construction of fictional interaction in humorous narratives written by 8-, 10- and 12-year-old children, which belong to the corpus CHILDHUM (under construction). This corpus is intended to contain samples of humorous stories written by primary schoolchildren from different areas of Spain, processed and tagged according to the pragmatic tagging system of humour markers (Timofeeva-Timofeev & Ruiz-Gurillo, 2021) developed by the GRIALE research group (<https://griale.dfelg.ua.es/>).

Our informants were asked to write their humorous stories following some basic guides pursuing certain thematic homogeneity of all the samples. Thus, in this paper, stories about an imaginary school exchange program with Mars are presented. More precisely, we will analyse how children shape the fiction of their conversational interaction with Martians and how these data may be correlated with their psychosocial and metalinguistic maturation.

The young writers of our study compose their written stories assuming a range of features that they intuitively associate with literary narratives. Therefore, they go into a special type of interaction, that is, literary communication, where they should be able to adequately manage different components of a literary fact, that is, the speaker, the imaginary addressee, and the context in a broad sense (cfr. Chico-Rico 2021). It is clear that this competent manage implies high levels of metalinguistic maturity, and more specifically, of the metatextual and the metapragmatic sub-competences (Gombert 1992, 1997; Doherty and Perner 1998; Myhill 2012; Timofeeva Timofeev 2017; Timofeeva Timofeev and Ruiz Gurillo 2021). In this sense, the (scarce) previous body of research points at the metatextual sub-competence as one of the latest to be acquired (cfr. Myhill 2012), which is why children aged 8 and 10 still demonstrate a high level of 'orality' in their written narratives (Crespo *et al.* 2010). Moreover, at these ages, a clear lack of confidence in inferential abilities of the addressee is observed (cfr. Timofeeva Timofeev 2016; 2017; 2021).

Our preliminary approach to the topic reveals that informants aged 8 basically write as they speak. Furthermore, at the age of 10 it seems to be a turning point towards a higher awareness about typographical conventions of written representation of the orality. In regard to the psychosocial aspects, children aged 8 demonstrate certain aggressiveness towards Martians' image, whereas, again, this seems to descend in 10-year-olds' narratives.

Gender and Humor in Lebanon

Panel contribution

Ms. Sasha Ghazal Louis-Karam¹

1. Université Paris Nanterre

What strongly distinguishes a person's conversational style from another's is (among other features) their use of humor which appears to be sex-linked (Tannen, 2005). Conversational humor helps in mutual construction of identities and is strongly determined by the gender of participants (Boxer and Cortés-Conde, 1997, as cited in Norrick, 2010). Research conducted on humor have identified power and solidarity as some of its main functions (Coates; 2014; Hay, 2000), and these have equally proved to be some of the major themes of gender and discourse studies (Kendall & Tannen, 2015; Tannen, 1994). Cultural miscommunication may occur between men and women even when both parties attempt to treat each other as equals because they belong to two different sociolinguistic subcultures and have learned to converse differently (Maltz & Borker, 1982). Since gendered patterns of interaction as well as humor are culturally grounded (Hay, 2000), it would be interesting to investigate the applicability of this theoretical framework in different cultures outside the US and Europe (Bell, 2015; Scollon & Scollon, 2001); in this case, Middle East's Lebanon as its unique culture presents an interesting case to look into due to the complexity of the "hybrid" Lebanese identity that is at once Arab and Western (Louis & Khoudary, 2021). Thus, this paper employs an interactional sociolinguistic (IS) approach to examine gender differences in using humor in spontaneous, everyday conversations of Lebanese men and women and the occurrence of miscommunication patterns and stereotyping as a result of humor usage as well as failed humor. In this respect, the main corpus of this study consists of two live, naturally-occurring dinner conversations among 10 Lebanese friends of equal gender distribution and subjecting them to careful analysis using IS methodology (taking into account context, playback, markers of humor, miscommunication and misinterpretation, and contrasting gender differences and identities).

Humorous styles in a conversational radio show

Panel contribution

Ms. Natàlia Server Benetó¹

1. The Ohio State University

Using the paradigm established by research on conversational humor (Coates 2007; Norrick & Chiari 2009; Mulan & Béal 2018) and interactive humor (Chovanec & Tsakona 2018; Ruiz Gurillo 2021a), I expand on the label ‘humorous conversation’ (Server Benetó, 2020), used previously to classify dialogic interactions whose main goal is to create humor. In this investigation, I analyze the humorous styles used in one interactional context of this type. The unit of analysis are 39 humorous sequences (Schegloff 2007; Ruiz Gurillo 2021b), taken from 3 episodes of the Spanish, humorous, conversational radio show ‘Nadie sabe nada’.

Given the constant framing of the program through a ‘humorous mode’ (Raskin 1985; Boxer & Cortés Conde, 1997; Shilikhina 2017), the humorous sequences are first delimited, indicating the initiation strategies or contextualization cues (Kotthoff 2006) used when possible. The analysis then focuses on the humorous style(s) present on each sequence, divided into affiliative, self-enhancing, aggressive, and self-defeating (Martin et al., 2003). These styles have been successfully located in colloquial conversations (Lampert & Erving Tripp, 2006; Ruiz Gurillo, 2021b) and humorous monologues (Linares-Bernabéu 2021). However, the intersection of these two loci has not been explored. Therefore, the present investigation fills the gap in the literature by focusing on a form of atypical conversations, particularly, in that conceptualized to be humorous.

The results show that initiation strategies for the humorous sequences can be located, demonstrating that even within a broad humorous mode, speakers design and orient their interaction in particular ways. The predominant humorous style is affiliative (46%), closely followed by aggressive (37%), self-defeating (13%) and self-enhancing (4%). Thus, there is a combative, humorous style in the show, leading to a discussion on the limits of interpersonal offense, as it seems apparent that confrontative humor is not rejected by the interlocutors, but encouraged, as it serves their overarching goal of being funny to a third-party.

This investigation applies core concepts on conversational humor and interactive humor to a scarcely researched context which combines a conversational structure with a humorous goal with a constant humorous key. The results lead to considerations on the framing of humorous sequences, on the acceptability of using aggressive and self-defeating humorous styles, as well as on the strategies employed in making an audience laugh. This expands on previous research within the field of interactional humor, poses new questions, and contributes to the understanding of how humor takes shape in interaction(s).

Interactional humour strategies in improvised theatre: Co-constructing humour in performed fiction

Panel contribution

Prof. Daniela Landert¹

1. Heidelberg University

In this paper, I investigate humour strategies in one specific type of performed fiction, improvised theatre. In improvised theatre, performers create fictional scenes spontaneously in front of a live audience. Humour is one central aspect of such performances. Due to the spontaneous and collaborative nature of the performance, humour in such settings is often co-constructed by the performers (Landert 2021). In addition, audience responses – laughter, emotional sounds, verbal contributions – can contribute to the identification and development of humour in the course of the performance. The aim of this paper is to study such collaborative humour strategies both quantitatively and qualitatively.

This study helps bridge the gap between humour research in spontaneous conversation (e.g. Attardo 2015; Norrick 2003) and in scripted fiction (e.g. Brock 2016; Dynel 2011; Messerli 2016; Simpson and Bousfield 2017). Humour in improvised theatre shares similarities with both these settings. As a consequence, the study of humour in improvised theatre can identify continuities across spontaneous conversation and scripted fiction. The data for this study come from a corpus of video recordings of improvised theatre performances and corresponding transcriptions. They include performances of four duos of improvisers: *Ella & Stacey*, *Katy & Rach*, *Middleditch & Schwartz* and *TJ & Dave*. All performances share strong similarities with respect to form: They consist of coherent narratives of around 35 to 60 minutes. At the same time they differ from each other with respect to the size of the audience, gender of the performers and style of performance. Taking audience-laughter as the starting point, the realisation of humour is analysed through a multimodal analysis of the video material. This is followed by a classification of the instances and subsequent quantification. The results show that the main communicative strategies for creating humour are similar across the four sets of data, but that the way and the frequency with which they are used differ depending on the performance style of the improvisers.

Making fun without words: the use of WhatsApp stickers in group interactions

Panel contribution

*Dr. María Belén Alvarado Ortega*¹, *Dr. Esther Linares-Bernabéu*²

1. University of Alicante, 2. University of Valencia

The aim of this study is to show how humour is negotiated in the course of interactions through the use of stickers in Whatsapp. Indeed, users choose to use stickers for humorous purposes, as they are potentially perceived as more 'expressive' (Tang & Hew, 2019, p. 2459) than emoji. We should also take into account that this process of co-constructing humour in WhatsApp groups is shaped by the affordances and constraints of the virtual spaces in which these interactions take place (Tagg & Lyons, 2021). As the focus of this research is the co-construction of humour, the analysis has also been inspired by research on the pragmatics of humour (Linares Bernabéu, 2021; Yus, 2022). Thus, the corpus material selected for the purposes of this study gathers 523 stickers collected from 8 different WhatsApp groups. Regarding ethical concerns, participants' consent was granted and references to all participants are fully anonymised.

Our results reveal that stickers can be seen as fulfilling not only a comic purpose but also a pragmatic function of mitigation (Herring & Dainas, 2017), and might be experienced as non-face-threatening, thus enhancing communicative fluidity (Lim, 2015). Likewise, we have identified that 67% of the conversations contain a stream of stickers. This is not surprising, since repetition has long been recognised as an important interpersonal resource which structures everyday conversation and enables the (re)forming of patterns, while the development of ingroup resources is an established humour strategy.

Non-impolite evaluations in the VALESCO.HUMOR corpus. The case of mock impoliteness in Spanish

Panel contribution

Prof. Leonor Ruiz Gurillo¹

1. University of Alicante

Mock impoliteness can be defined as a specific instance of evaluated politeness, one in which interlocutors perceive an impolite act, such as jocular mockery, insult, banter, etc. as non-impolite (Haugh & Bousfield 2012). Following the model of the third wave of politeness and Sinkeviciute (2019), the aim of this paper is twofold. First, it seeks to contribute to a better understanding of mock impoliteness in multi-party, colloquial conversation. Second, it illustrates this phenomenon in a language other than English, looking at informal interactions in Peninsular Spanish.

The database is composed of 148 humorous sequences from the VALESCO.HUMOR corpus (http://www.observahumor.com/corpus_valesco) which were extracted from 67 real colloquial conversations in Peninsular Spanish from the Val.Es.Co. research group (www.valesco.es). Although these sequences mostly show an affiliative style in endogroup sequences (Ruiz-Gurillo in press), mock impoliteness could be identified in 25.67% of these ones.

A variety of aspects of the phenomenon were assessed using the VALESCO.HUMOR corpus. These included the issue of which linguistic and paralinguistic elements are used by participants, and the interpretation of the initial aggressive style focused on the target, be it the direct recipient in a discourse, another participant, an absent third party, or something funny in the conversation. Finally, we also considered the question of whether or not the humor introduced by mock impoliteness was sustained throughout a sequence. Results showed how colloquial features function in these authentic conversations, especially in terms of how participants share social equality and mutual knowledge in an unmarked space where a non-specialized topic is discussed (Briz et al. 2002). Although in-group solidarity is sought (Dynel 2021), other collateral effects were also observed, such as the promotion of social distance and the sense of feeling offended by the speaker (Culpeper 2011).

Pragmatic differences between left- and right-wing online satirical news

Panel contribution

***Dr. Shelby Miller*¹, *Mr. Joshua Loomis*², *Dr. Stephen Skalicky*³, *Prof. Salvatore Attardo*⁴**

1. University of North Texas at Dallas, 2. Victoria College, 3. Victoria University of Wellington, 4. Texas A&M University-Commerce

There is a broad consensus that there are significant differences in how left-wing (progressive) and right-wing (conservative) satirical news websites (e.g., The Onion and Babylon Bee) employ linguistic resources for the purpose of creating satire (Young, 2020; Sienkiewicz & Marx, 2022). While research has found that left and right satirical news appropriate linguistic features of their parent genre in similar ways (i.e., news; Brugman et al. In press), no studies have compared these two sources using fine-grained linguistic features which have been shown to distinguish satirical from non-satirical texts (e.g., Skalicky and Crossley, 2015).

In this paper we use several text analytic techniques to determine whether left and right satire news websites differ on a range of linguistic features. Specifically, we analyze the linguistic make-up of two small corpora of satirical news, collected for this purpose, as well as a larger corpus of online satirical news, consists of the entire set of stories from The Onion, Babylon Bee, and other web sites. The smaller corpus is balanced around themes (e.g., targeting Biden vs Trump), to account for possible topic-related bias, whereas the larger corpus is intended to capture broader linguistic trends from the different satirical news websites. We use a variety of text analysis tools, such as LIWC (Boyd et al. 2022, SEANCE (Crossley et al. 2017), etc. to analyze the “sentiment” (affect, subjectivity) or stance (Dubois, 2007) toward the subjects in the satirical news (both the targets of the satire and those merely part of the situation). As is well-known, satire involves a critical stance vis-à-vis its target. We wish to determine if this stance is modulated by other aspects of sentiment or other linguistic choices.

This analysis will shed light on how the genre of online news satire is organized, particularly on how the humorous mode is signaled and/or construed. This is particularly significant due to the common confusion between satirical (fake) news and real non-satirical news, evidenced by the fact that many publications and users “fall” for the fake satirical news, i.e., consider them to be serious.

Pragmatic study of affiliative style of humour in colloquial conversation

Panel contribution

Ms. Anastasia Khaylina¹

1. University of Alicante

In recent years, scholars have studied humour styles primarily in the context of humorous genres (Greengross, Martin, & Miller, 2012; Linares Bernabéu, 2021; Ruiz Gurillo, 2015; Russell, 2002). The focus of this paper, however, will be on how humour styles perform in colloquial conversations, a genre that is not humorous per se. To do so, we will build on previous research carried out within the GRIALE group, such as that of Alvarado Ortega (2016a, 2016b, 2021, 2022) and Ruiz Gurillo (2021, 2022). In this sense, the aim of this study is to observe the occurrence of the affiliative humour style proposed in the *Humor Styles Questionnaire* by Martin et al. (2003) in the ironic-humorous sequences of the VALESCO.HUMOR corpus (http://www.observahumor.com/corpus_valesco) through the pragmatic labelling developed within the GRIALE group (Ruiz Gurillo, 2012; Timofeeva Timofeev & Ruiz Gurillo, 2021; Alvarado Ortega & Khaylina, in press).

Following Ruiz Gurillo's (2012) elaboration of the General Theory of Verbal Humour (Attardo, 2001), we understand humour markers and indicators to be those linguistic choices speakers employ to generate humour in conversation. These help the listener in the process of resolving incongruity by activating the inferences required to extract the humorous meaning. Humour markers are paralinguistic, kinesic and typographic elements that accompany humour and help in the humorous interpretation, while humour indicators are linguistic elements that are humorous procedures in a particular context (Ruiz Gurillo, 2012, pp. 78-86). In this way, an attempt is made to investigate the existence of specific recurrent patterns of humour markers and indicators that may be characteristic of the affiliative style of humour used in the corpus of colloquial conversations, and consequently, how this style manifests in linguistic terms.

Relational connection and separation in a football team: Conversational humour as relational practice

Panel contribution

*Mr. Nicholas Hugman*¹

1. *The University of Queensland*

Conversational humour is one of the most pervasive interpersonal practices. It is frequently employed to manage and negotiate our relationships with others, carrying out relational work among interlocutors and bringing them together harmoniously. Conversely, scholars have noted the paradoxical nature of conversational humour, with regard to its concurrent construction of relational distance through possible out-group indexicalities and subversive elements (Holmes & Marra, 2002).

The contradictory relational functions of humour have been investigated in a variety of different contexts, such as the workplace (Chang, 2015), on social media (Zhao, 2020) and in initial interactions (Haugh, 2010). The sporting context, however, has been largely neglected. This is a notable lacuna, given the prevalence of sport in contemporary society, particularly team sport, which is a core site of human sociality. Addressing this gap, in this paper I investigate how humour is used to accomplish relational work in one male amateur sports team. The sport I have elected to focus on is football, given its status as the most widespread team sport on the planet and significant sociocultural institution.

In analysing the participants' relational work, I utilise Arundale's (2020) Face-Constituting Theory (FCT) to examine the genesis and ongoing maintenance of relationships in the team. FCT views face as the participants' interpretations of relational connection and separation, which exist in a dialectical interplay. I combine this understanding of face with Bakhtin's (1981) notion of double-voicing, which considers discursive phenomena to be the dialogic result of conflicting, sometimes contradictory voices. These voices are particularly manifest in conversational humour, given its dichotomous, multilayered nature.

In the analysis, I examine naturally occurring sequences of humour before and after matches, collected using ethnographic methods. I pay particular attention to the micro-level detail of these sequences, especially the sequential organisation of social actions, as relational practices rest directly on this interactional detail. From the analysis, it transpires that the participants engender both connection and separation through their humorous practices. They construct the former through the affiliative practice of mode adoption, orienting to the humorous tone of utterances and thereby indexing camaraderie. Against this backdrop, they simultaneously engender separation by underscoring asymmetrical differences in different domains. Based on these paradoxical relational orientations, I propose that a rapprochement of FCT and double-voicing is fruitful when examining certain humorous practices.

The pragmatics of GPT-3, an Artificial Intelligence creating humor: exploring interaction with the audience in Jerry Seinfeld's routine

Panel contribution

*Mr. Jose Antonio Ortega Gilabert*¹

1. University of Alicante

One of the most important computer advances in recent years is the arrival of Artificial Intelligence (AI). Specifically, the most notorious AIs are based on creative results, starting with graphic artistic creation generated from basic inputs provided by the user -as in Midjourney (<https://www.midjourney.com/home/>), Dall· E 2 (<https://openai.com/dall-e-2/>) or Stable Diffusion (<https://huggingface.co/spaces/stabilityai/stable-diffusion>)-, or the writing of texts of all sorts. In this last section of AIs, we should highlight GPT-3 (<https://openai.com/blog/openai-api/>), presented by OpenAI, which focuses on text generation. Consequently, GPT-3 uses “deep learning” to replicate written human language quite satisfactorily (Dale, 2021).

The group GRIALE, from the University of Alicante (Spain), is studying humor from different aspects of linguistics and, especially, pragmatics. Based on the scientific production presented by GRIALE (<https://griale.dfelg.ua.es/>), the present work will focus on discovering what are the pragmatic strategies used by Seinfeld in a specific humorous sequence of his speech to interact with the public (Ruiz Gurillo, 2019). After that, the next step will be to do the same with the production of GPT-3 imitating the style of Jerry Seinfeld routine. The comparative analysis based on the use of humor markers and indicators (Timofeeva Timofeev and Ruiz Gurillo, 2021) of both fragments will help us understand which are the humorist's own characteristics, and whether AI has been able to reproduce them.

Additionally, for a long time, the production of human language by a computer was thought to be a science fiction concept. In fact, some aspects that belong to linguistics, such as humor, were believed to be unique to human beings. Apparently, GPT-3 is able to create a piece of humorous monologue just like any other comedian would, and it is surprisingly funny to humans. But how effective is, in a humorous sense, this monologue created by an AI? What are the pragmatic foundations that GPT-3 employs to maintain contact with its “audience”? What are the typical interaction markers that we can find in humorous monologues produced by an AI, and how are they similar to those of humans? This study aims to answer all these questions.

To do so, we will analyze a fragment of a Jerry Seinfeld routine created by GPT-3 with the humorous style of this specific monologist, as subject of study. Therefore, we will compare this fragment created by GPT-3, presented in the video “AI Wrote and Performed a Jerry Seinfeld Routine!” (<https://youtu.be/1onxri0duN0>) by the content creator Speaking of AI, with one of Jerry Seinfeld's own production for the Netflix streaming platform (Demaio, Jensen and Miller). Therefore, the main purpose of this work will be to analyze the Seinfeld's kairos (Mock, 2012; Bernabéu, 2022) and how an AI uses its “point of view” in a dialogic way as an interactive strategy to maintain the audience attention. To achieve this, the markers and indicators of humor found in Seinfeld's monologues must be examined, in order to collect all of them and then compare them with what was produced by the AI.

“Uhm, Bean.” – Interactional humour in films using dephonemicised language

Panel contribution

*Dr. Cornelia Gerhardt*¹, *Dr. Maximiliane Frobenius*²

1. Saarland University, 2. WWU Münster

This contribution investigates interactional humour in comedy films where language is turned into incomprehensible sound. In classic comedy like Mr. Bean or M. Hulot, spoken language is deliberately dephonemicised into a merely prosodic stream of suprasegmental verbal emission. This paper investigates the humorous function of willfully making language incomprehensible.

This deviation from naturally occurring language use creates humour in two ways: first, it creates an incongruity; secondly, it serves to exaggerate characters and indicate their absurdity. Faced with incomprehensible sound (albeit with regular intonation patterns), the audience needs to fall back on their knowledge of embodied, multimodal resources, such as the characters' movement in space or use of artifacts. Importantly, the audience relies on cognitive schemata, their general world knowledge, to follow the activities on screen and make the doings of the characters meaningful. When at this point something unexpected happens in the sequence of unfolding actions, against the backdrop of the 'normal' or 'usual', it is made even more incongruent, absurd and funny.

Mr. Bean, for example, is known to use very few words, a seemingly unnatural tone of voice, and a low and mumbly voice. Often gestures and facial expressions carry the semantic load while the words turn into an unintelligible stream of sounds. In the example below, Mr. Bean is approached by the parking valet at a hotel reception:

1 Valet: °(inaudible) your car,

2 Sir,°

3 Bean: ((puts suitcase on reception desk, opens it, hands the valet a steering wheel))

4 ((audience laughter))

Here, the audience is not meant to fully understand the valet's words. Instead, they need to ask themselves what usually happens in such a situation. When Mr. Bean produces a steering wheel rather than the expectable keys, the incongruity of the scene and the absurdity of his behavior is reinforced through this use of incomprehensible speech. This use of language in film sets up the humorous situation by making the audience fall back on known patterns, accessible through the characters' embodiments, props, and general context for the production of meaning.

Based on a corpus of 180 minutes of Mr Bean sketches and complementary material by other comics, this contribution investigates this use of multimodal, embodied interactional patterns in humorous films and TV productions. It uses an EMCA approach, employing the models of multimodal gestalt (Mondada 2014) and multimodal activity (Reber and Gerhardt 2019), adding to our understanding of coherence (Bublitz 2011). Besides the theoretical implications for the study of the timing of multiple semiotic resources in interaction and filmic interaction more specifically, we hope to contribute to the development of the field of humor theories from the EMCA perspective.

Change in social meaning to project celebrity persona: use of the Japanese causative-benefactive construction in a TV talk-show

Panel contribution

*Ms. Kimiyo Matsui*¹

1. University of Sydney

This study empirically examines the following question: How do semantics and pragmatics interact in the process of grammaticalization to generate social meaning? In many contexts in Japanese society, attitudes of modesty and humility are emphasized as pragmatically appropriate in communication. The study examines synchronic contextual variation in one construction in the process of its grammaticalization (Heine, 2002) that reflects these social expectations.

The presentation focuses on the use of the causative-benefactive construction in Japanese by celebrities on a TV talk-show, in which two aspects of grammaticalization are observed: semantic generalization and semantic persistence. Semantic generalization contributes to decreasing the referentiality of the causative benefactor, while semantic persistence maintains the sense of benefit to the speaker. In the context of the talk-show, this allows speakers to create an ostensible connection with their audience and build their personas as celebrities with humility and gratitude.

The causative-benefactive construction, *-(s)ase-te itadak-u*, consists of two main components: 1. the causative suffix *-(s)ase-* (here expressing permissive meaning) and 2. a benefactive auxiliary verb, *itadak-u* (grammaticalized from the verb 'to receive' and functioning as a humble honorific expression). The original meaning of the construction is that one receives permission from a respected party (= a benefactor) to do something beneficial to oneself (e.g., *Sensei ni hon o tsukaw-asete itadaki-mashi-ta* for 'Thankfully I was allowed to use the book by my teacher.').

In the dataset for this study, a total of 122 examples of the construction were identified in 13 hours of the talk-show. Qualitative analysis revealed that 110 examples involve further grammaticalization of the construction, yielding the meaning: speakers do something good for themselves which is/becomes possible through the context they are in (e.g., *Tsuyoi josei o enji.s-asete itadak-u koto ga ōku-te* for 'I have had many opportunities to play strong women'). The original notion of 'benefactor' is metaphorically generalized to 'everyone/everything that "allows" the possibility of the speakers' actions – their fans and supporters, good fortune, opportunities, etc.' The benefactive meaning of *itadak-u* enhances nuances that the speakers are grateful for these circumstances. In the process of grammaticalization, the referential meaning of the concept of 'benefactor' is decreasing through semantic generalization, even though the sense of gratitude persists. In the original meaning, the speaker shows humility to a referent (a human benefactor) who is conceptualized as superior in a real-world event (Humble form 1). In the grammaticalized meaning, however, there is no specific referent to whom the speaker expresses this humble attitude. In the context of a talk-show, the humility is, instead, understood as directed toward the addressee(s) (Humble form 2), including the audience and beyond. Thus, the semantics of the grammaticalization process interacts with the pragmatic context to convey an increasing sense of intersubjectivity.

This study claims that, through the acquired social meaning of the construction, the speakers on the talk-show project a positive image as celebrities who are humble and grateful.

Expanding social meaning to its most general: considering underlying cognitive processes

Panel contribution

Ms. Inbal Kuperwasser¹, Prof. Einat Shetreet¹

1. Tel Aviv University

Social meaning has long been treated as an element of an utterance that allows listeners to infer information about a speaker's social identity (Salmon, 2022). Recent works have expanded this notion to highlight its complement, i.e., information about the speaker's identity that leads to differential meanings attributed to the same utterance (Beltrama & Schwarz, 2022). This direction still focuses on specific knowledge or stereotypes concerning the speaker's social group that pertains to the utterance content (e.g., 'nerdy' individuals are precise).

We argue that social meaning could also be expanded to neutral content under different social contexts. In a recent study, we examined how intergroup interactions in both high-threat groups (US political affiliations) and random minimal groups affected pragmatic inferencing of highly-regularized scalar implicatures (with the quantifier 'some'). Importantly, the content of the sentences did not concern the group. We found that when interacting with outgroup members, participants responded less pragmatically (high-threat groups) or reacted more slowly when responding pragmatically (minimal groups). We theorize this might be due to the negative impact intergroup interaction is known to have on cognitive abilities (Hackel et al., 2014; Richeson & Trawalter, 2005) that facilitate pragmatic inference, like Theory of Mind and Executive Functions (Fairchild & Papafragou, 2021).

This work proposes a possible cognitive process that mediates some aspects of social meaning. This process is neutral to specific world knowledge or stereotypes about the speaker's social identity. Instead, it occurs because pragmatic processing depends on mechanisms that are affected by social context. This does not negate other definitions of social meaning, but rather expands it to its most general cases. As such, it might be considered a background effect underlying other linguistic inferences from social identity.

This conceptualization emphasizes the need to consult similar ideas in social psychology, concerned with the evaluation of others based on social identity. Beyond group membership, works on the role of stereotypes in social meaning (general and specific) can be enriched by the vast theoretical and experimental literature social psychology has produced on the subject. In addition, our findings also emphasize the importance of considering cognitive aspects of the bidirectional facets of social meaning, which encourages the use of psycho- and neurolinguistic tools.

Incorporating social meaning into a broader account of meaning in communication. How can a theory of Hearer's Meaning help?

Panel contribution

Prof. Maj-Britt Mosegaard Hansen¹

1. University of Manchester

Recent work has demonstrated that social meanings, i.e. assumptions that hearers make about the social characteristics of speakers on the basis of those speakers' manner of speaking (including, for instance, accent, voice quality, and the realization of sociolinguistic variables), are of importance to the processing and/or the interpretation of what speakers say.

Arguably closely adjacent to such meanings are (a) knowledge about speakers' identities that hearers have obtained by other means, and (b) aspects of the social relationship between speaker and hearer. The experimental pragmatics literature has shown that these latter knowledge sources may inform interpretations in very similar ways. It is thus unclear that it is helpful to make a sharp distinction between these adjacent sources and social meaning in the strict sense.

Saliently, it has been shown that social meanings and adjacent sources of knowledge may impact on (i) lexical access (Tesink et al. 2008; Kim 2016), (ii) ambiguity resolution (Casasanto 2008), (iii) presupposition projection (Mahler 2020), (iv) implicature derivation (Bonneton & Villejoubert 2006; Mazzarella et al. 2018; Sikos et al. 2019; Bazzi et al. 2022), (v) assessment of the truth values (Beltrama & Schwarz 2021), and (vi) the hearer's expectations regarding future interaction with the speaker (Fairchild et al. 2018).

Eckert (2019) rightly calls for the incorporation of social meaning into a more general theory of meaning in communication. A chief obstacle to achieving that goal, however, is the fact that dominant Anglo-American pragmatic theories rely more or less strongly on speaker intentions as a basis for deriving meaning, both "what is said" and "what is meant" (e.g. Searle 1969, Grice 1975, Sperber & Wilson 1986, Levinson 2000). This is problematic with respect to the incorporation of social meaning, in as much as social meanings often cannot easily be regarded as intentionally communicated (Acton 2022). Moreover, even if some social meanings may arguably acquire a degree of conventionality over time (Salmon 2022), such meanings are fundamentally indexical, rather than symbolic, in nature. Purely indexical meanings are also not straightforwardly incorporated into dominant pragmatic theories of meaning.

This paper proposes a move away from the dominant theories' focus on the speaker and their intentions towards an alternative theory specifically designed to account for hearers' interpretations and the sources of those interpretations, the desirability of which is suggested by Campbell-Kibler (2008). Hansen & Terkourafi (subm.) propose precisely such an alternative theory of Hearer's Meaning. In my talk, I will outline our theory with a focus on how, among other parameters, it explicitly incorporates hearers' assumptions about the identities of speakers, as well as assumptions about the social relationship between speaker and hearer, as important bases for interpreting what is being communicated. Insofar as our theory takes its point of departure in Peircean semiotics (Peirce 1958-66), where the distinction between iconic, indexical, and symbolic signs originates, I will show that it has the added advantage of being able to accommodate the indexical nature of social (and adjacent) meanings.

Off-the-shelf features and pragmatic trajectories: The years of *cioè* in Italian

Panel contribution

Dr. Chiara Ghezzi¹

1. *University of Bergamo*

The development of discourse markers, “trivial” linguistic phenomena (Trudgill 2014) or “off-the-shelf” features (Eckert 2003), offers a privileged point of observation on the role of social meaning and on its place within pragmatics and sociolinguistics. Discourse markers contribute to creating discourse styles and can easily develop into catchphrases, but as easily be abandoned. Their social meaning indexes “naturalness and friendliness” and project a friendly sociability (Beeching 2016). The pragmatic trajectory of Italian *cioè* ‘that is’ is exemplar in this regard.

The 1970s are known in Italy as ‘the years of *cioè*’. Among teenagers *cioè* is a polyfunctional ‘verbal tic’ to the point that it is considered “emblematic” of young speech (Silverstein 2003) and the form is “enregistered” within the community as an emblem of the teenage register (Agha 2006). Its social meaning is dependent on linguistic practices widespread within the community: for instance its use is stylised to create young-sounding social personae, e.g. by comedians, or openly discussed, and often criticized, within the community.

Moving from these premises, this study focuses on how, between 1976 and 2010, the social meaning of *cioè* interacted with (1) sociolinguistic variation, based on the age of speakers, and (2) its pragmatic trajectory. Basing the analysis on two corpora of listeners’ phone-ins to a radio station, stratified by age and gathered in 1976 and in 2010, the study shows that in 1976 *cioè* is a socially indexical, ‘meaningless’ filler word, highly versatile, frequent and polyfunctional, especially among teenagers. In 2010 it is less frequent, not only among younger speakers, but also among other age cohorts, less polyfunctional, and less socially salient, even though speakers still connect its use with impoliteness, ignorance, lack of education (status dimension) or unpopularity, informality (solidarity dimension).

The trajectory of *cioè* shows how social meaning is based on specific linguistic practices within the pragmatic domain, which entail structural contexts of use, position and scope of a variable. These practices find their humus in sociolinguistic variation in the use of the variable which is exploited by speakers as a performative resource to mark in-groupness (Eckert 2019). Secondly, if the social meaning of *cioè* as in-group identity marker had initially a role in accelerating its spread among young speakers, later stigmatization promoted its abandonment. *Cioè* became stigmatized, because it was used by young speakers in the way they used it. Increase in social meaning not only had a role in the diffusion of the form, but also in its progressive loss of semantic and pragmatic meaning, and the reverse.

Pragmatic alternatives and social meaning

Panel contribution

***Prof. Eric Acton*¹, *Dr. Matthew Hunt*²**

1. Eastern Michigan University, 2. University of Southampton

Pragmatic research has shown that enrichments to an utterance's semantic meaning are often derived from comparing the utterance to alternative utterances that could have been said instead (Grice 1975, Horn 1984, etc.). In this talk, we show that alternatives play a crucial role in understanding not only utterances' descriptive meaning (as in *some* +> 'not all'), but their social meaning as well.

First, we show that ideas about pragmatic inference developed in Gricean and related frameworks can be generalized to account for a wide range of social meanings. The general dynamic is this. Utterances are interpreted in part via how they compare to alternatives in terms of their (i) *desirable informativity* (i.e., apparent benefits): the entailments and socioindexical associations they bear that the speaker might wish to invoke in the context; and (ii) *markedness* (i.e., apparent costs): how complex, infrequent, and socially incongruous (see Levinson, 2000) they are in context. Whenever it seems that a speaker of an utterance *u* had access to an alternative utterance *a* with a relatively attractive combination of desirable informativity and markedness, it may raise the question of why the speaker said *u* instead. Answers to that question, are in essence, implicata. Thus, where a speaker says, 'some X,' one may ask, 'Why not the more informative and no-more-marked, "all X"?' (one possible answer: 'all X' would've come at the hidden cost of lying). We show that this dynamic—comparing utterances to apparently attractive alternatives—accounts for a multitude of social meanings, involving phenomena ranging from expressives (Hunt, 2022) to demonstratives (Acton & Potts, 2014) to phonetic variation (Campbell-Kibler, 2008). E.g., referring to one's own spouse 'the wife' may sound distancing given its contrast with the more presuppositionally informative and no-more-marked *my wife* (Hunt & Acton, 2021). Thus, while some social meanings are entailed or arise via socioindexicality, social meaning can also be pragmatically derived (see also Acton, 2014; Salmon, 2020, among others).

Second, we show that alternatives help determine whether a given social meaning was *intended*. As Campbell-Kibler (2008, 2009) points out, not all social meanings are intended—indeed, some depend on seeming *unintended* in order to obtain. Building on Acton (2022), we show that whether a social meaning seems intended depends partly on whether it appears that the speaker had access to an attractive alternative less likely to suggest that social meaning. E.g., the social meaning of a speaker's use of a nonstandard linguistic variant depends on whether the interpreter believes the speaker also has a more standard variant in their repertoire. If not, the speaker may come off, unintentionally, as, e.g., less educated. If the speaker makes selective use of the nonstandard variant, however, knowledge of the speaker's forgoing of a standard variant may suggest that the speaker intends to signal, e.g., subversiveness or solidarity.

Altogether, the picture we develop is that alternatives are crucial to the dynamics of social meaning, shaping our understanding of not only what social meanings an utterance conveys but also whether those meanings were intended to be conveyed at all.

Pragmatic and knowledge lenience towards foreigners

Panel contribution

Dr. Anna Lorenzoni¹, Prof. Eduardo Navarrete¹

1. University of Padua

Sentences uttered by foreign-accented speakers are often judged differently compared to those produced by native speakers. For instance, true statements that are not widely known (*Ants don't sleep*) tend to be judged as less credible when produced by foreign-accented speakers. This phenomenon has been explained based on different intelligibility whereby foreign accent involves more processing load in the listeners, influencing the judgment of the statement. Critically, foreign-accented speech may also lead to an implicit categorization of the speaker as an outgroup individual (foreign) in terms of cultural and social heritage. Our main aim here was to explore whether the identification of an individual as a native or foreign speaker has an impact per se on unknown statement judgments. To avoid any influence of the auditory signal, we used a written modality presentation of the statements. In the two studies we present here, we first aim to replicate the Fairchild and Papafragou study on scalar implicature (Study 1); then we used the similar procedure to test unknown statements (Study 2). In study 1, 244 native Italian speakers participated. The experimental set was composed of 20 under-informative sentences. Furthermore, three filler conditions were added. Participants first saw short-bio description of two speakers. Each short-bio either gave a description of a native Italian speaker with a strong Roman accent (Native speaker condition) or a native speaker of Moldovan with a strong Moldovan accent (Foreign speaker condition). The participants were then instructed that they would be reading 40 sentences that were originally uttered by the speaker they had just read. Participants had to rate how each sentence made sense on a five-point Likert scale. Analyses were performed on the rating responses of the critical sentence condition. Results showed a main effect of the Speaker due to the fact that ratings for Under-Informative sentences were higher in the Foreign speaker condition ($M=2.55$, $SD=1.48$) than in the Native speaker condition ($M=2.49$, $SD=1.47$). In study 2, 239 native Italian speakers participated. The experimental set was composed of 20 unknown sentences ('The capital of Botswana is Gaborone'). Furthermore, true and false filler conditions were added. The same task, presentation modality, and analyses as for Study 1 were used. Results revealed a main effect of the Speaker with ratings for Unknown sentences were higher in the Foreign Speaker ($M=2.99$, $SD=0.86$) condition than in the Native Speaker ($M=2.95$, $SD=0.88$) condition. Together, our results showed that the categorization of speakers as foreign or native per se modulates the acceptability of statements independently from differences of processing linked to fluency. The results showed more acceptable judgments when under-informative (Study 1) and unknown (Study 2) sentences were associated with the foreign speaker as compared to native speakers. Together, our results suggest that native speakers do not only tend to forgive lack of linguistic competence of foreign speakers, by accepting as more sensible under-informative statements, but they also tend to trust more foreign speakers in situations of lack of knowledge.

Predictions and uptake of social meaning in others' utterances: Gender-neutral vs. gender-marked role nouns

Panel contribution

*Dr. Benjamin Weissman*¹

1. *Rensselaer Polytechnic Institute*

It has been proposed that role nouns in English can reflect speaker ideology; choosing an optional gender-neutral form over a gender-marked alternative (e.g., *congressperson* over *congressman/congresswoman*) can signal a socially progressive gender ideology (Papineau, Podesva, & Degen, 2022). In that study, more progressive individuals were more likely to select the gender-neutral form than the gender-marked form in a forced-choice production task, though progressiveness did not correlate with self-paced reading times (*ibid.*). The present study extends this line of inquiry to investigate whether the perceived progressiveness of *others* affects our predictions of *their* gender-neutral/gender-marked productions. If this social meaning is robust, and speakers utilize it to index their own ideology, we should expect uptake and predictions of that signaling to follow (Beltrama & Schwarz, 2021).

This study presents the results of two experiments: a forced-choice production task and a self-paced reading task. Stimuli have been adapted from Papineau et al. and consist of sentences like “Sally is a congressperson/congresswoman from Kansas.” In the production task, participants are asked to select between the gender-neutral and gender-marked options; in the self-paced reading task, reading times to the two sentence versions are measured. In these experiments, however, fictitious characters are introduced as the speakers of these sentences. These characters are presented as having ideologies on opposite sides of a conservative/progressive continuum. The production task now asks participants to select the term {congressperson/congresswoman} they believe this fictitious character (e.g., MAGA Mary, Progressive Pam) would say; the self-paced reading task now presents the sentences as lines of dialogue spoken by these characters.

172 English-speaking participants (84m, 85f, 3nb, average age=37.4 (sd=13.3); 87 Dem., 79 Rep., 6 Ind.) completed the forced-choice production task. Per a logistic mixed effects analysis, there was a significant main effect of speaker progressiveness ($z=9.72$, $p<.001$); the progressive speakers were selected as using the gender-neutral form significantly more often than the conservative speakers. There was also a significant interaction between speaker progressiveness and participants' own beliefs about gender; participants with more progressive gender ideologies projected a larger difference between progressive and conservative speakers than did participants with more conservative ideologies. Data collection for the self-paced reading study is currently underway.

Additional analyses will explore the relationships between the relevant dependent variables (i.e., reading time, production selection), the participants' own ideology, and the fictitious speaker's presented ideology. That higher rates of gender-neutral role noun production are attributed to the progressive characters suggests this social meaning is indeed robust. Self-paced reading results will reveal whether there is a corresponding slowdown when encountering the conservative characters producing the gender-neutral form, though there were no reading time effects in the Papineau study. It may also be the case that attributions differ based on the participants' own ideologies, so interactions between speaker ideology and participant ideology will be analyzed as well. This work complements existing accounts of social meaning, many of which focus on how linguistic choices signal elements of identity (Burnett, 2017; Eckert, 2019), by assessing the extent to which these signals are predictively attributed to others.

Social Meaning and Pragmatic Implicatures

Panel contribution

Prof. William Salmon¹

1. University of North Texas

Sociolinguists have for decades discussed *social meanings* associated with given linguistic forms. This is meaning related to social or demographic qualities of the speaker, ideologies, interpersonal relationships, and more. It is primarily in the last several years, however, that researchers in linguistic semantics and pragmatics have begun to ponder these questions and to rely upon the tools of semantics and pragmatics to shed light upon this kind of meaning.

In this present paper, I consider two syntactic constructions associated with rural Southern US speech, i.e. Negative Inversion (Salmon, 2020) and the Personal Dative (Horn, 2013), as in (1) and (2), respectively. Both forms carry multiple dimensions of social meaning, such that they are understood to be informal and familiar in some contexts, though are viewed as stigmatized and uneducated in others.

(1) Can't nobody lift that rock.

'Nobody can lift that rock'

(2) John got him some candy yesterday.

'John got some candy yesterday for himself'

In the present paper, the social meanings of informality and lack of education are shown to be conventionally associated with the syntactic forms, viewed here as idiomatic constructions (Fillmore et al., 1988). The conventionality of the social meaning is shown via a wide range of meaning diagnostics from the semantics and pragmatics literature, including: projection, defeasibility, calculability, detachability, backgroundedness, and more, which are commonly used in distinguishing differing dimensions of meaning such as conversational and conventional implicature (Grice, 1975), truth conditional meaning, and presupposition (Stalnaker, 1974). The result for (1) and (2) is that the social meaning is seen as conventional but non-truth conditional, qualities most associated with Gricean conventional implicature.

Once the social meanings of (1) and (2) are established as conventional, we then have a basis for explaining other meanings often associated with these forms in terms of *conversational* implicature. Thus, NI is often claimed to be conventionally emphatic; however, this property does not appear in every usage, which is an argument against conventionality. But, with the understood conventionality of the social meaning mentioned above, we have a means of deriving the emphatic properties pragmatically via Gricean reasoning with speaker choice inviting hearer inferences.

Similarly, Horn (2013) considers that Personal Datives carry a component of subject affect: "[...] the speaker assumes that the action expressed has or would have a positive effect on the subject." However, this property of the PD can also be shown to be absent in some instances, aligning it as well more closely with a pragmatic implicature, similar to the NI. With the conventional social meaning of the PD established above, we likewise have a means of deriving the speaker affect pragmatically as a product of speaker choice of a marked versus unmarked form.

These results allow us to minimize the lexical content that needs to be associated with these idiomatic forms and also provide an intuitive explanation for the variability of both the emphatic and affective meanings that have been previously posited in the literature. [490 words]

Address terms in conflictive interactions

Panel contribution

Dr. Virginia González¹

1. Universitat de València

Address terms have values traditionally associated with politeness that go beyond their mere appellative or identifying use (Alonso-Cortés 1999), but they are also frequent in impolite contexts, where disaffiliation and conflict predominate, such as in conflictual conversations between close people.

The aim of this paper is, first of all, to find out the communicative context in which the vocative address appears in conversation between close people, in order to determine specifically its combination in discourse, alone or together with interjections (e.g. ay, uy, jo, jolín, etc), as well as its position (at the end or at the beginning of the turn) . In this sense, it is also essential to determine with which type of speech acts it is mostly associated (expressive of disagreement, directive, etc.).

Finally, this work establishes multiple pragmatic values in the use of the vocative related to this discursive genre (interpersonal conversation) and the conflict/non-conflict variable. The purpose of this analysis is to determine whether the address terms can be considered markers of disalignment or disagreement as happens in other genres such as news interviews (Clayman 2010), telephone counseling (Butler, Danby and Emmison 2011) or political interview (Cuenca 2013).

To carry out the analysis it have been used two different corpora. On the one hand, the spontaneous conversations from the ESPRINT corpus (Albelda and Estellés, coords.). This corpus consists of everyday conflictive interactions between couples who reported having relationship and marital difficulties. The second corpus is a non-conflictive oral corpora involving the same couples that had been analysed in the ESPRINT corpus.

The first results of this work reveal that the use of address terms in both corpora is more frequent in contexts of conflict, and that it can in itself constitute disaffiliative speech acts such as complaining or expressing disagreement. For this reason, the address terms can be considered, also in conversation between close people, as a carrier of disaffiliative values. It can be affirmed, as Cuenca (2013) states when analysing the political interview, that vocative address can be considered as a marker of disaffiliation even in contexts where its affiliative value is expected to be more frequent.

Between conflict and cooperation: The role of gestural (mis)alignment in spontaneous interaction

Panel contribution

Mr. Javier Yániz¹, Dr. Inés Olza¹

1. University of Navarra

Background and research questions

The various resources with which speakers align with their interlocutors in interaction (i.e. repetition and/or resonance of other's behavior) are topical objects of research in Cognitive Science, Psycholinguistics, Pragmatics and Behavioral Studies, where alignment is taken under the scope of high-scale cognitive mechanisms (priming and grounding) that regulate human interaction (see Stivers 2008; Fusaroli & Tylén 2016; Rasenberg, Özyürek & Dingemanse 2020, among others). Until now, this body of research has focused mainly on verbal forms of aligned behavior (phonetic, syntactic and lexical level), with still limited attention paid to the multimodal channelings of alignment in gestures and prosody (Kimbara 2006; Bergmann & Kopp 2012; Olza 2022).

In parallel, the interplay between conflict and mediation strategies has been scarcely studied in spontaneous, non-institutionalized settings like everyday conversation. Yet mediation naturally emerges in such contexts when conflict arises, as certain speakers tend to mitigate and re-conduct disputes that take place between other participants in the interaction.

Objectives, methods and expected results

Against this background, this paper aims to offer empirical evidence on the role and multimodal display of cognitive alignment in spontaneous interaction, with a special focus on how (mis)alignment contributes to conflict development and management, and to informal mediation in such contexts.

The article presents a qualitative data-driven analysis of two 30-minute multimodal recordings of spontaneous interaction between 3-4 participants, with the aim to provide answers to the following research questions.

- (a) Do speakers gesturally align with their interlocutors? If so, how does this (mis)alignment relate with the arousal and management of conflict and informal mediation?
- (b) What does all this tell us about the cognitive processes involved in conversation?

Our results preliminarily show that alignment -either in its verbal or gestural manifestation- is a core category of interaction that is present both in cooperative and non-cooperative contexts. In the latter, gestural alignment has a two-folded function: while it often feeds the conflict between participants, it also helps the 'informal mediator' to re-conduct the conversation and mitigate the negative impact of confrontation (e.g. through irony and humor).

Doctor's animating practices as responses to third-party complaints in familial conflict mediation

Panel contribution

Ms. Zhenzhen Zhu¹, Prof. Yongping Ran¹

1. Center for Linguistics & Applied Linguistics, Guangdong University of Foreign Studies

This study investigates animating as an important relational practice in familial conflict mediation. Previous studies have examined the various forms of “doing voices”, such as reported speech/thought, ventriloquism, and animation etc., and their functions of marking indirectness and constructing identities (Haakana, 2007; Tannen 2010; Gunthner 1997). However, less is known about how these practices contribute to the negotiation and (re)building of relationships (Stallone & Haugh 2017).

Animating, defined as the process where different voices are introduced and actions are brought about through a number of verbal and non-verbal resources (Cantarutti 2020), entails the enacting of characteristics of the animated targets and the values or perspectives they hold. In conflict-implicative social activities such as third-party complaints against a co-present complainee where different views are at issue, a recipient needs to negotiate the oppositional stances (Laforest 2009). This is particularly salient in our data of accompanied psychiatric consultations in China, where parents commonly complain of the co-present children, thus implicating relational conflict. The doctor, acting as a witness and mediator, is obliged to intervene into such familial discord while attending to the medical agenda.

Based on third-party complaints made by parent-children dyads in accompanied consultations, this analysis focuses specifically on how the doctor deploys animating practices to resolve the familial conflict and what culturally specific interpersonal concerns are shaping this mediation process.

Preliminary findings indicate that the doctor primarily uses three categories of animating practices to resolve the parent-children conflict, including 1) animating the child-patient via Hypothetical Active Voicing (HAV); 2) animating the parent-accompany via reported speech/thought (RS/RT); and 3) animating the doctor him/herself via Hypothetic Act Reports (HAR). By deploying these animating practices, the doctor manages to display the divergent perspectives on the relational issues and hypothetically act out the potential conflict to avoid actual rapport damage. At the same time, with the frequent invocation of kinship affection (mutual care and tolerance) and relational indebtedness and obligations in these animating practices, the doctor attempts to invite the conflicting parties to revisit the importance of traditional Chinese family values and thus helping them to re-align.

This study adds understandings to how animating may serve as rapport-repairing act and how it is influenced by socio-pragmatic factors.

Formulations in Triadic Interactions: Insights from Couples Therapy and Criminal Case Mediation

Panel contribution

*Dr. Carolina Figueras*¹, *Dr. Katariina Harjunpää*²

1. University of Barcelona, 2. Tampere University

In Conversation Analysis, (re)formulations of what a prior speaker has said or implicitly conveyed have been examined as transformational means by which institutional agents rework and reshape laypersons' claims and accounts of events (Antaki 2008; Heritage 1985). In psychotherapy, formulation sequences constitute institutionally specific means for achieving transformation of the client's experience (Peräkylä 2019). A central element in the transformative process is that delivering a formulation invites the recipient to confirm or disconfirm the formulated version, and sometimes to elaborate it. The recipient thereby has an opportunity to accept and incorporate the formulated view as their own. In the context of mediation in disputes and criminal cases, mediators use formulations to shift the topic, to highlight common ground between the parties and to reduce aspects of blame in their talk, which can serve the goal of conflict transformation (Garcia 2016; Glenn 2016; Stokoe & Sikveland 2016).

In this presentation, our aim is to examine the particularities of formulations when used in triadic participant constellations. We examine formulations in two types of triadic institutional interactions: couples therapy sessions and mediation sessions in criminal and civil cases. Both therapists and mediators use formulations to propose selective and altered versions of what the parties have previously conveyed, which can serve shaping the communicative behavior of the two parties in conflict. Our presentation has two complementary focuses. First, we discuss how formulations produced by the third party can be used in couples counselling for promoting interpersonal understanding; that is, relational empathy (cf. Della Noce 1999), which entails expressing recognition of the other's perspective and emotions and interactional negotiation of shared meanings transforming the terms of the relationship; and second, how participants use verbal and embodied resources during formulation sequences to coordinate the multiparty participation framework in mediation sessions (e.g., Goodwin 2007). The analyses shed light on how the formulations produced by the third party become incorporated in the interaction between the two main parties. Data consist of video-recordings of authentic couples therapy sessions in Spanish and mediation sessions in Finnish.

Functions of *no sé* ('I don't know') in couple therapy corpus

Panel contribution

Dr. Dorota Kotwica¹

1. *University of Valencia*

This paper focuses on the discursive and pragmatic functions of first-person negative construction *no sé* ('I don't know') in a couple therapy corpus. As previous studies show, in colloquial Spanish, *no sé* can be used literally to express the lack of knowledge (real or pretended) or as a discourse particle with several pragmatic, interactive and textual functions (López & González 2018; González 2018; Llopis 2002). The strategic potential of epistemic structures equivalent to *I don't know* has also been described in the interdisciplinary research. For example, in medical contexts, *I don't know* displays epistemic positioning, and the asymmetry between expert knowledge and personal experience (Heritage 2012; and Heritage & Raymond 2012; Lindström & Karlsson 2016). Moreover, studies focusing on the context of therapy and mental-health interviews have shown the therapeutic importance of distinguishing cognitive from non-cognitive uses of *don't know* (Hutchby 2002; Pichler & Hesson 2016).

To account for different functions that *no sé* accomplishes in the context of couple therapy, our corpus analysis considers both formal parameters and contextual features specific to this genre. This includes the speakers' roles, the topic discussed, etc. Preliminary results show that *no sé* is often used as a mitigating device, more precisely, as a mechanism deployed in contexts where speakers describe their own feelings and problems, criticize the behavior of their partner, or position themselves in conflict situations. The factors related to face-protection seem especially relevant in this discourse genre where the couple must confront their past/ongoing conflicts and disagreements in presence of the therapist.

How to keep on fighting. Enumerative narrations as a device to promote conflict

Panel contribution

*Dr. Gloria Uclés*¹

1. *University of Helsinki*

In this presentation we analyse the use of narration and its interactive effects in conflictive sequences between couples. We will focus on a specific narrative structure, namely, the schematic recapitulation of a shared experience between the speaker and their interlocutor in the form of enumeration. To do so, we perform both a quantitative and qualitative corpus-based study using two Spanish corpora in which conflict between couples is present in two different environments: a corpus of couples counselling, where interaction is mediated by a counsellor, as well as the Casa corpus, where couples record themselves interacting at home. The results show that the enumerative narration is a relatively frequent element in conflictive sequences. In fact, this device appears to be specialised in conflict, since nearly all the instances found in both corpora are found in conflictive sequences. Regarding its distribution in the two corpora, the frequency rate between couples counselling and Casa corpora appears to be quite similar. The qualitative analysis has focused on the different types of responses that enumerative narration triggers in interlocutors. When enumerative narration is used in conflict, interlocutors can challenge the events narrated, explain their side, or ignore it altogether in the following interventions. In all cases analysed the conflictive sequence continues after an enumerative narration, which seems to indicate that this device ultimately contributes to the development or the enhancement of conflictive sequences.

Intercultural Conflict Management: A Preliminary Study Based on Chinese and Spanish Narrative Analysis

Panel contribution

Ms. Lin Shao¹

1. *Universitat de Barcelona*

Intercultural conflict generally refers to the experience of emotional frustration together with the perceived incompatibility of values, norms, face orientations, goals, scarce resources, processes, and/or outcomes between a minimum of two parties from two different cultural communities in an interactive situation (Ting-Toomey & Oetzel, 2001). The greater the disparity between two cultures' realities, the wider the misunderstanding and conflict gap between their members. Even though during the interaction, both parties are typically "well-meaning" (Brislin, 1993), attempting to eliminate the conflict and achieve a "harmonious outcome" (Mayer, 2020; Ting-Toomey, 2010), in most cases, they end up escalating the initial disagreement into an intractable dispute or even a stalemate in the conflict negotiation (Wilmot & Hocker, 2007), thus bringing about the mediation process.

During intercultural mediation, both conflict parties and mediators frequently view narration as a fundamental strategy for de-escalating the conflict and resolving the dispute (Mayer, 2020; Stewart & Maxwell, 2010). Based on this premise, the current study presents a comparison and analysis of narratives produced by participants from different cultures in response to a variety of hypothetically problematic situations, and thus seeks to investigate how individuals from diverse cultural backgrounds, specifically China and Spain, tend to escalate and de-escalate the intercultural conflict. To achieve this purpose, this study employs a micro-macro analysis approach to examine 20 samples of recorded interviews with Chinese and Spanish informants. At the macro level, it analyzes how Chinese and Spanish cultures influence the cognitive and affective representation of conflict among its members, giving particular emphasis to their perceptions and attributions of conflict causes. At the micro level, it analyzes the linguistic features that Chinese and Spanish speakers use to soften or downgrade the impact of a particular message, such as the third-person attributions of blame, the elision of agent, the displacement of agent, etc. (Flores-Ferrán, 2020; Garcia, 2019).

Interrogative sentences in conflict talk

Panel contribution

Mrs. Maria Bataller¹

1. Universidad Católica de Valencia

The aim of this paper is to describe the strategic use of interrogative sentences and the act of questioning in the communicative interaction that takes place during couple therapy sessions. The literature describes the different interrogative sentences and their function in some communicative contexts, however, this paper focuses on describing how the act of questioning may contribute to escalate or deescalate the conflict talk that emerges in this specific type of contexts and what type of interrogative sentences are involved to that end.

To this end, this research is based on the corpus generated by the recording and transcription of therapy sessions of different Spanish couples. Specifically, four sessions of four different couples were selected for this work, which represents approximately 16 hours of recording. Once the interrogative sentences were identified in the corpus, the following aspects were observed and interrelated: (a) the type of interrogative sentences used by the Spanish participants in those situations, (b) the role of the participants (couple vs. therapist, speaker vs. listener) in the conflict situation and, finally, (c) the strategic use of the question to escalate or de-escalate the conflict.

Based on the analysis of the corpus, this paper identifies strategic uses linked to the thematic progression of discourse, pragmatic strategic uses linked to the modification of the illocutionary force of speech acts, and social strategic uses linked to the attempt of (dis)alienation and (dis)affiliation with the other participants of the interaction.

Management of disagreements in online focus groups: on the use of mitigation and intensification strategies

Panel contribution

Ms. Laetitia Aulit¹

1. UCLouvain

This contribution aims to investigate the expression of opposite positionings in the context of three online focus groups on a controversial Spanish tradition, the Moors and Christians festivals. This tradition commemorates the confrontations of the Reconquest and has been contested for its representation of the Muslim community and for the limits to the participation of women. Organised on Teams, each focus group brought together six people involved in the organisation, celebration or promotion of the festivals and lasted between an hour and an hour and a half.

In this context, this research analyses the expression of disagreement and the development of the argumentative moves it produces, based on the pragma-dialectical theory of critical discussions (van Eemeren, 2018). Specifically, the analysis focuses on the mitigation and intensification strategies used in these contexts and the effects they have on the aggravation or resolution of the disagreement. From a rhetorical and pragmatic perspective, mitigation is used for reducing or compensating for threatening acts that challenge the speaker's or interlocutor's face whereas intensification is used argumentatively for strengthening the propositional content or the speaker's intention (Albelda & Briz, 2020). For this reason, this contribution aims to look at the types of linguistic strategies used in the formulation and management of disagreements, and this, by taking both the argumentative and social dimensions into account.

The analysis is based on the methodology developed by Albelda *et al.* (2014) for the pragmatic analysis of mitigation, also adapted to the analysis of intensification, and aims at answering the following questions. Which mitigation and intensification strategies are used? What are their effects? Do they occur to mitigate or to intensify the disagreement? Preliminary results suggest that mitigation strategies are mainly used to express an opposite positioning in the initiation stage, i.e. in the formulation of the disagreement, and this, mainly by expressing a partial agreement with the interlocutor's stance, which deescalates the conflict and allows to "coexist in dissensus" (Amossy 2011, 2014). As far as intensification is concerned, the results suggest that the strategies appear mainly to reaffirm the speaker's stance in the argumentation or concluding stages, i.e. in argumentative moves in which the speaker seeks to legitimise his/her opposite or divergent positioning, without producing an aggravation of the disagreement and the development of a conflict.

Mitigation and affiliation strategies in couple therapy

Panel contribution

Dr. Josefa Contreras-Fernández¹

1. Universitat Politècnica de València

Among the various types of therapies that have been developed to treat couples in conflict is the Emotionally Focused Couple Therapy EFT (Wiebe & Johnson, 2016; Power, 2020). In EFT, the importance of emotions is emphasized; also, therapists are instructed on how they are to proceed in order to enable couples to have new emotional experiences and thus resolve their difficulties. When visualizing a corpus of therapies, provided by Dr. Rodriguez Gonzalez from the EFFECTs project, the use of pragmatic strategies can be appreciated in order to protect the images of the people involved by managing the sensitivity of the issues addressed and the conflict between the couple.

Among these strategies, worth noting is the use of mitigators, which seems to be an instrument for both social friction reduction and rhetoric to manage the relationship between the therapist's work and the couple (Albelda, Briz, Cestero, Kotwica & Villaba, 2014; Albelda, 2016; Figueras, 2018, Contreras, 2020). Likewise, mitigators also fulfil an affiliative function, which present characteristics of identification with the other (Hernández-Flores, 2008; Steensig, 2012; Lindström & Sorjonen, 2013; Bravo, 2015; Peräkylä *et al* 2015; Figueras, 2018; Uclés, 2020). The aim of this work is, on the one hand, to analyse which specific strategies therapists use in couple therapy sessions and, on the other hand, to find out for what purpose they use them. In order to carry out this research, twenty therapy sessions by different therapists were viewed and the fragments where the therapists used these strategies were selected, noting the reactions of the interlocutors. It could be observed that the therapists use different linguistic mechanisms as mitigation strategies and affiliation with the intention of protecting the images and empathizing with the patients in order to establish a good rapport with them and help them in their reflections.

Keywords: Mitigation, affiliation, couple therapy, emotions

Negotiating empathy

Panel contribution

Dr. Carme Sanahuges¹

1. E.U.Gimbernat (affiliated to Universitat Autònoma de Barcelona)

The telling of a trouble commonly involves the production of some kind of response by the recipient. From an interactional point of view, the expected and preferred response is one that is cooperative, empathic and face-preserving (Lindström and Sorjonen, 2013; Guntzviller et al., 2020) and that shows alignment and affiliation (Stivers, 2008). However, sometimes this preferred response is not directly provided—often due to some kind of disagreement over the trouble, its causes or consequences—and, instead, the conversational actors enter into a negotiation usually leading to a point of mutual agreement or acceptance.

In an attempt to explain how this disagreement is managed and negotiated, some role-played empathy-eliciting interactions in which the required empathic response is delayed are analysed within the framework of conversation analysis and discursive psychology. The data comes from a comparative research study on dyadic empathic interactions in Catalan and English where a personal problem is addressed (Sanahuges, 2022).

I will focus on the conversations that present some kind of discord or conflict in both languages. Typically, in the interactions where the story-recipient shows empathy and agreement with the teller, facework and politeness mechanisms are not necessary. However, in the interactions analysed in this paper, the responses provided are characterised by the use of different elements that try to mitigate the message's potential face-threatening character as well as preserve the collaborative nature of the interactional context. The findings show a general convergence in both languages in terms of the type and use of strengthening and mitigating elements employed (e.g. repetitions, terms of address, gestures). There is also a convergence in terms of the stage in the conversation where these elements tend to occur according to the basic outline of announcement, receipt, elaboration, and closing, concurring with existing troubles telling and complaint sequences (Maynard, 1997; Schegloff, 2007).

This paper provides further evidence on how disagreement and 'suspended' empathy is interactionally dealt with. The analysis allows to identify the features that characterise the management of mild conflict during conversation and to better understand interactional empathy in itself (if only by contravening its expected occurrence). The results contribute to research in conversation analysis and cross-cultural pragmatics.

Questioning media reports on human rights abuses: conflict talk in discussing conceptualisations of acts of violence.

Panel contribution

*Ms. Stéphanie Pécher*¹

1. UCLouvain

The discursive analysis of the attribution of responsibility of human rights abuses is particularly interesting because it contributes to the understanding of wider social themes such as the construction of memory (see De Cock & Michaud Maturana 2014). However, little attention has been given to the analysis of the attribution of responsibility in conflict talk about a *contemporary* context. This presentation intends to fill this gap. More specifically, it will focus on conflict talk concerning the attribution of responsibility in Twitter interactions arising from traditional media's tweets during the 2019 Chilean social protests.

In October 2019, the Chilean population started to protest massively in the streets, and the police repression was particularly violent, leading to a large number of human rights violations. Furthermore, a conflict between the press and the protesters arose from this social outburst: journalists were accused of disregarding the abuses committed by State agents.

The corpus of analysis is made of tweets published by mass media during the Chilean social outburst that have been the source of conflictual interactions on Twitter about the attribution of responsibility, and their replies. For instance, on January 29, 2020, a man was run over by a national police truck after a football game in Santiago. The television programme *Teletrece* published the following statement “*Camión de Carabineros impacta a hombre* [Carabineros truck hits man]”. This tweet received more than a thousand replies because of the diminished responsibility of the perpetrators that the sentence seems to imply by using *camión* ‘truck’ as subject. Consequently, people tended to reformulate this statement by emphasizing the agents involved and the intentionality of the action (e.g. use of *matar* ‘to murder’), and by intensifying the statements (e.g. use of exclamation marks and capital letters).

The analysis seeks to understand how people react to these tweets and interact in order to defend their point of view and manage the conflict. We are consequently looking at the attribution of responsibility and the agentivity (given that both concepts are intrinsically connected (Villalba Ibáñez, 2017)), as well as the linguistic mechanisms used in order to mitigate or intensify conflict talk concerning the attribution of responsibility (Albelda & Briz, 2020; Albelda & Estellés, 2021). We will then annotate the statements as to explicit or implicit mention of the agents, intentionality of the action and presence of intensifying or mitigating strategies, thus offering a more comprehensive perspective on how conflictual views are expressed in this context.

Retrospective imperatives, a form of reproach?

Panel contribution

Dr. Cristina Villalba Ibáñez¹, Dr. Marta Albelda Marco²

1. Universitat de València, 2. University of Valencia

According to Bosque (1980), the Spanish past infinitive (independent infinitive + participle, i.e. *haber estudiado*) usually expresses an imperative value, as can be seen in the following example:

A: a mí no me pagan los medicamentos

B: ¡*haber cotizado* más!

A: I don't get paid for my medicines

B: you *should have paid* more contributions to the State!

These expressions, also known as *retrospective imperatives* (Bosque 1980), seem to combine aspectual and deontic information. They refer to actions the addressee performed in the past and which the speaker considers problematic. As regards illocutive force, our analysis of data suggests that this structure may be specialising as a construction to reproach.

Our contribution in this paper is two-fold. First, we investigate the interactive and pragmatic context of the Spanish past infinitive and its different formal-functional combinations to measure its potential degree of specialization as a reproach. Is the past infinitive undergoing a process of becoming constructions (Goldberg 2006)? Second, based on the study of cases of past infinitive, we aim to go more deeply into the characterization of reproaching as a hostile speech act and to try to distinguish its features from other similar speech acts, such as complaints or accusations (Burguera 2009, Albelda 2022).

The analysis has been carried out using two different corpora. On the one hand, the spontaneous conversations from the ESPRINT corpus (Albelda and Estellés, coords.). This corpus consists of everyday conflictive interactions between couples who reported having relationship and marital difficulties. On the second hand, we have searched non-conflictive oral corpora, or at least, without conflict as a criterion for collection, in order to examine the number of cases and their illocutive value in these contexts.

The first results suggest that utterances with past infinitives can only arise as responses to previous turns which are addressed to a second person and which are future-oriented, although paradoxically they are formulated in the past tense. They therefore express counterfactual values. Their resemblance to the value of reproach seems to be high. These uses appeal to the speaker and display that certain duties are not fulfilled. The speaker positions themselves as morally and deontically superior to the addressee and creates a deontic and socio-functional asymmetry between them, as is often the case with reproaches (Stevanovic 2018).

Second-person reports and epistemic stance: a view from therapeutic interactions in Spanish

Panel contribution

Dr. Karolina Grzech¹

1. Stockholm University

This talk explores the use of second-person reports in Spanish-medium therapeutic interactions. The analysed data comes from couples' therapy sessions conducted across Spain, within the E(f)FACTS project (*Emotionally Focused Couples' Therapy in Spanish*, <https://www.effects.es>).

The rationale behind studying second-person reports is that they do not introduce new information into discourse, but rather serve as an epistemic device. In that sense, they differ from the default third-person reports. When we say 'he/she told me that *p*', our interlocutors can expect that we aim to add new information to Common Ground, expanding the pool of shared knowledge. However, when we say 'you said that *p*', this does not add new to the pool of knowledge we share with our interlocutor: we are reporting their words, with which they are already familiar, and to which they have primary epistemic rights (cf. Stivers et al. 2011). Therefore, second-person reports can be analysed as an egophoric resource (cf. Dahl 2001) which can serve to establish the viewpoint of the participants of a given interaction, or clarify the content of Common Ground (cf. Lambrecht 1994). This talk assumes such an analysis, and builds on it to establish how second-person reports are employed in the potentially very conflictive context of couples' therapy.

The findings presented in the talk suggest that, despite previous research showing that second-person reports are used to escalate conflict (cf. Albelda Marco & Sanmartín 2022), they can also be used as a mitigating device. The talk will demonstrate that whether second-person reports are perceived as contributing to the escalation or de-escalation of verbal conflict depends mainly on (1) the identity of the speaker, (2) the discursive stance (cf. Englebretson 2007) the speaker adopts when uttering such a report, and (3) the form and function of the matrix clause introducing a report into discourse. Other relevant contextual factors include the identity of the speaker (whether they are the patient or the therapist) and the position of the report in the interactional sequence. The interactions comprising the corpus were analysed with methods drawing on conversation analysis and Interactional Linguistics (Couper-Kuhlen & Selting 2017).

The perception of conflict in everyday conversation. Human vs. (semi)automatic detection of conflictive fragments

Panel contribution

*Dr. Maria Estelles Arguedas*¹

1. *University of Valencia*

The aim of the present contribution is to study the perception of conflictive verbal interactions in a sample of spontaneous everyday conversations of peninsular European Spanish. The study specifically focuses on

- a. the delimitation of conflictive sequences, and
- b. the prosodic behaviour found in such sequences.

The analysis has been carried out using materials from the ESPRINT corpus (Albelda and Estellés, coords.) The corpus consists of conflictive interactions from two different settings, namely couple therapies and everyday interactions between families/friends, of which only the latter (recorded secretly) have been contemplated.

The materials have been subjected to a double analysis:

1. the fragments considered as instances of conflict are tagged as such
2. the prosodic phenomena found in those fragments are described.

These two actions are carried out by two different researchers. First, the person recording the conversation (who was present, but participated minimally in the exchange(s)) conducts a qualitative analysis and is asked to select the fragments that he/she considered as conflictive, as well as to tag the prosodic phenomena perceived in those fragments (EMPHASIS, MARKED PRONUNCIATION, etc.). In a second stage, researchers different from the observer/presenter analyse the recordings and tag the conflict sequences according to the definition of conflict of Schiffrin (1984), Pomerantz (1984) Muntigl and Turnbull (1998), etc., as a sustained disagreement along several conversational turns. Prosodically, a quantitative analysis is carried out using ORALStats platform (Cabedo, in press 2021) and the intensity, pitch, speech rate and floor transfer offset are automatically calculated. The quantitative and qualitative data are analysed, and later the impressionistic results of the observer/recorder are compared with those obtained in the second stage to observe any correlations between them. Two main research questions arise

A. Are there any recurrent prosodic patterns associated with the conflict sequences in everyday conversation in peninsular European Spanish, like there are in other languages (Ang et al 2002, Caraty & Montacié 2015, Couper-Kuhlen 1996, El Ayadi et al 2011, Kim et al 2012, Roth & Tobin 2010, Szczepek Reed 2010, 2012, etc.)?

B. Does the manual labelling coincide with the automatic labels obtained by applying linguistic parameters? That is to say

B.1. Do all the fragments labelled as 'conflict' by the observer/recorder coincide with the 'linguistic' definition of conflict provided above?

B.2. Phonically speaking, does the prosodic configuration perceived by the observer/ recorder correspond with the phonic parameters calculated automatically, or are they different (absent or present to a greater/lesser degree) in the actual recording?

The preliminary results show only partial coincidence between the observer's and the automatic identification of phenomena. Structurally, some fragments that are conflictive according to their conversational structure were not labelled as such by the observer (not the other way round). Prosodically, the observer tends to perceive the fragments as more marked than the acoustic values would allow to do.

The Role of Empathy to De-escalate Conflict in Couples Therapy

Panel contribution

*Dr. Anna López Samaniego*¹, *Dr. Carolina Figueras*²

1. *Universitat de Barcelona*, 2. *University of Barcelona*

Within psychology, it is well established that empathy, broadly defined as the ability to understand and/or experience the perspective and emotions of the client, plays an essential role in psychotherapy, not only to create the necessary therapeutic alliance between patients and therapists, but also to explore and validate patient's deep feelings and emotions in order to encourage self-exploration and engagement in therapy (Rogers 1949, Bohart and Greenberg 1997, Greenberg *et al.* 2001, Feller and Cottone 2003, Nienhuis *et al.* 2018). On the specific triadic interaction that is couples therapy, where the therapist mediates between two parties in dispute, empathy fulfills an additional key role: promoting attunement to the other's perspective and deflecting conflict between the partners (Livingstone 2004). Both strategies aim at breaking the negative cycle that fuels the underlying conflict (Strokoff 2019). Despite the importance of empathy in these psychotherapeutic processes, little attention has been paid to the linguistic means therapists deploy to promote and facilitate empathic attunement between the members of the couple during counseling.

This study examines the linguistic expression of empathy during the emergence of conflict in a corpus of couples therapy sessions from E(f)FECTs corpus (Emotionally FocusEd Couple Therapy in Spanish, Prof. Martiño Rodríguez González, Universidad de Navarra). We focus on the therapist's moves in response to moments of conflict escalation, attending to its sequential context (escalation of conflict, therapist's response, patients' reaction), as well as to the linguistic and discourse strategies she displays to reduce distance between partners' stances or positionings, to de-escalate conflict. We seek to shed light on the specific role that empathy moves play in these procedures of creation of mutual understanding between partners, as well as on its effects on conflict mitigation during couples counselling.

The role of metapragmatics in conflict mediation: rhetorical-pragmatic strategies used in the breakfast show 'Good Morning, Britain'

Panel contribution

Dr. Esther Linares-Bernabéu¹

1. *University of Valencia*

A number of important pragmatic phenomena are rooted in metapragmatic awareness. In many instances, this reflexive awareness is not always accessible or highly salient to participants (Verschueren, 2000; Culpeper & Haugh, 2014). It may be inherent to their use of language, but it is not necessarily something they can articulate. Occasionally, though, metapragmatic awareness itself may play a significant role in discourse. In this regard, Bublitz and Hübler (2007) identify a number of functions of metapragmatic commentary, including evaluating self and others, doing conflict, doing affiliation, constructing identity, reinforcing or challenging communicative norms, and negotiating meaning.

Accordingly, this study stems from the hypothesis that the mediator's metapragmatic competence is crucial to succeeding in restoring the bonds between the participants involved in the dispute, showing impartiality, establishing a shared space between the parties, and avoiding possible face-threatening acts (Linares Bernabéu, 2022). Our goal is therefore to contribute to mediation studies by examining informal mediation practices, such as those found in tv debates. In this sense, we have selected 20 heated debates from the breakfast show 'Good Morning, Britain'. The data (+160 minutes of recording) was compiled using the programme's YouTube channel. Our preliminary results confirm that strategies such as mitigation or intensification are facework strategies, used by the mediator, in this case, the presenter, to counteract FTA. Additionally, strategies such as paraphrasing, questioning, summarising, reformulation, footing, and verbal humour contribute to the resignification of the conflict, seeking new perspectives, and the establishment of common ground. In addition, our findings reveal that formulation reconstructs parties' versions of events and mediators make use of it when they attempt to scaffold parties to come to an agreement about ways to move forward, without giving direct instructions or advice.

Izutsu, Katsunobu Izutsu)**

For your mind only: On pragmatics and grammar in fictive interaction and extended reported speech

Panel contribution

***Dr. Stef Spronck*¹, *Prof. Esther Pascual*², *Prof. Arie Verhagen*³**

1. Utrecht University, 2. Shanghai International Studies University, 3. Leiden University

At the beginning of the 20th century, speaking to oneself was central to two extra-ordinary studies. Vygotsky ([1934] 1987) took aim with Jean Piaget's mentalist view of language, in which communication derives from the supposedly primary linguistic evolutionary purpose of structuring thought. With his 'inner speech', Vygotsky (1987) argued for the opposite evolutionary and developmental trajectory, from 'social speech' (actual communication) to 'egocentric speech' (talking to oneself) to 'inner speech' (non-verbalised thought).

Vološinov ([1929] 1973) drew attention to 'speech about speech, a message about a message', a linguistic expression type he labelled 'reported speech'. Couched within Bakhtin's philosophy of dialogue, Vološinov (1973) suggests that studying how speakers relay and comment on the words of others provides insight in the most fundamental aspect of human speech *and* behaviour, the fact that we are continuously shaped both by our preceding context and our subsequent anticipated responses. While this uninterrupted dialogic flow is integral to human thought, speech and action, it can rarely be caught in a discrete observation. In reported speech, however, speakers cast such discrete dialogic events in language (Spronck 2019).

These two insights have recently been reintroduced and updated. The 'argumentative theory' of reasoning suggests that the human ability to reason is a consequence of an imagined dialogue in which we challenge our statements with possible counter-arguments (Mercier & Sperber 2011, 2017). Ideas that (imagined) reported speech is constitutive of individual commitment (Geurts 2021) and social cognition more widely (Moore 2021) are ascendant in language philosophy.

All these proposals take 'solitude speech', talking to oneself in non-actual utterances, as a core feature of the human mind, intrinsically linking social capacities and personal perspectives. In this talk we examine this assumption by exploring various forms of non-uttered 'utterances'. So-called fictive interaction is the adoption of the frame of communication for numerous functions other than actual interaction (Pascual 2006, 2014). Occurring at any level of grammar, fictive interaction is thus a construction-agnostic characterisation of instances in which a speaking entity is evoked without an actual speech event (e.g. 'This painting speaks to me'). Taking a corpus-linguistic and typological approach, we show that such structures of non-genuine speech are considerably more varied than commonly asserted and range from pragmatically to grammatically conditioned examples.

By charting these various forms of fictive interaction we provide further evidence for the aforementioned claims and add detail and variation to the interpretation of inner dialogue as the foundation of human (social) thought.

Reports of solitude speech in self-quotations

Panel contribution

Dr. Denys Teptiuk¹

1. University of Tartu

Thought as an individual process does not require the presence of the addressee other than the cognizant herself. Thus, it shares a semantic basis with solitude speech, mostly occurring without any addressee present (Goffman 1978). According to Vygotsky ([1934] 1986: 30), thoughts appear as either voiced egocentric or soundless inner speech, often indistinguishable in reported thought (1). However, the presence of addressees in the context can differentiate solitude speech (voiced or soundless) from addressed speech (2).

(1) *I read it and I was like* “This is like my life story!” (enTenTen15)

(2) Hungarian (Hungarian National Corpus)

a. Solitude speech

(*Mikor a strandot kerestem, akkor láttam a faluban egy fából készült útjelzót, hogy aszongya “Robinson 3 km.”*)
No, **mondok**, biztos ez a kemping neve, vagy mi.

PTCL say:PRS.1SG certainly DEM DEF camping name:3SG or what

‘(When I was looking for the beach, in the village I saw a wooden sign saying “Robinson 3 km.”) Well, **I say**, this is certainly the name of the camping site, or what.’

b. Addressed speech

(*jonnek otthonrol neha, kerdik is: hogy elsz?*)

mondok: *bekesseg, nyugalom, mint szanatorium*

say:PRS.1SG peace tranquility like nursing.home

‘(sometimes relatives come by and ask: how are you?) **I say**: peace, tranquility, like a nursing home.’

In the real world, the thoughts of others remain covert, unless previously verbalized (Teptiuk forthcoming).

This constraint is removed in self-quotations where Reporter is also Reported Speaker/Cognizant. Not only does it lead to thoughts more frequently reported in self-quotations than when attributed to others (cf. Teptiuk forthcoming), but it also enables the reports of speech unwitnessed by others, cf. (1).

The data reflecting solitude speech are difficult to collect in spontaneous oral conversations. In contrast, written modality may offer a possibility for its investigation. Since self-quotations often manifest solitude speech (1)–(2a), this study sets off to scrutinize them in computer-mediated communications of Estonian, Finnish, and Hungarian. The choice of material is motivated by its colloquial style where standard writing combines with oral speech. In addition, features specific to online communications (e.g. emoticons, unstandardized shortenings) often appear in recaps of solitude speech.

(3) Estonian (etTenTen19)

(*Henri oli kirjutanud, kes tahab Teeviidale minna nendega, autos on veel vaba ruumi,*)

ma olin mingi JEEEEEE :D

1SG be:PST.1SG something INTERJ EMOT

‘(Henri wrote: who wants to go with them to Teeviit, there is still place in the car.) **I was like** YEEEEEE :D’

For this study, a dataset of self-quotations containing 400 speech and 475 thought examples is extracted from the online corpora. I focus on differences between the reports of solitude and addressed speech, arising in their content and context, and argue that self-quotations are a suitable domain for researching solitude speech in written modality and beyond.

Speaker-referential Vocatives in Self-directed Solitude Speech: Diverse Manifestations of Self-reference among Languages

Panel contribution

*Dr. Takeshi Koguma*¹, *Dr. Katsunobu Izutsu*²

1. Kanazawa University, 2. Hokkaido University of Education

This study explores “self-directive” utterances cross-linguistically, with special reference to their vocative manifestations for a solitude speaker, revealing that (i) Japanese allows first-person pronouns alone as such vocatives; (ii) English, Korean, and Chinese adopt exclusively the speaker’s name; (iii) Thai enjoys various vocatives: first/second-person pronouns and the speakers’ name.

Koguma et. al. (2020) examine self-referential expressions in two major types of “self-directed” solitude speech: self-blame and self-encouragement. They show that unlike English and Korean, Japanese allows neither second-person subjects nor the solitude speaker’s name as vocative to refer to the speaker in absolute solitude, arguing that Japanese differs from English and Korean in that it disallows a quasi-communicative speech event conception with a split-self (i.e., conceptualized-self). Self-encouragement solitude speech overlaps “self-directive” speech (cf. Izutsu et. al. 2022) in referring to a future event that the speaker would be engaged in. The latter, however, differs from the former in verbalizing what to do rather than merely relaxing him/her-self.

Example (1) is an utterance observed in a major Japanese insurance company’s TV commercial portraying a scene where one of their clients has just bumped into the rear of another car. The imperative form of a self-directive predicate *otituke* ‘calm down’ is followed by *ore* a first-person vocative pronoun representing the speaker, which can be replaced by neither a second-person pronoun nor the speaker’s name. In contrast, the functional counterparts of (1) in English, Korean, and Chinese, exemplified in (2)-(4), all employ the speaker’s name as a vocative, which cannot be replaced by a first-person pronoun.

(1) *otituke, ore.*

calm.down.imp voc-prn (1 msc.)

(2) *Take it easy*[calm[chill] down], Jake.

(3) *jinjeonghae-ra, Gimjihyeon* (진정해라, 김지현)

Calm.down Kimjihyun

(4) *Lěngjìng diǎnr Wáng Jiàn* (冷静点儿, 王健)

Calm.down a little Wang Jian

With self-directive solitude speech in Thai, surprisingly, a wide variety of self-referential vocatives (e.g., first/second-pronouns, the speaker’s name) can take place, as shown in (5).

(5) a. *chai yen korn guu*[chan] (ช้ายเย็น คอร กู [ชาน])

Calm.down now I:offensive [I]

b. *chai yen korn mueng*[^{??}ter] (ช้ายเย็น คอร มูเอ็ง [เต๋])

Calm.down now you:offensive [^{??}you]

c. *chai yen korn* [Bam/Pitcha] (ช้ายเย็น คอร [บาม/พิชชา])

Calm.down now nick name[first name]

As far as this particular kind of self-directive solitude speech is concerned, we can distinguish three types of languages: a seemingly more common type (A) to which English, Korean, and Chinese belong; a minor type (B) that includes Thai; another minor type (C), as represented by Japanese. We argue that the relevant type difference can be partially accounted for on the basis of certain conceptualizations also manifested in other grammatical and discourse-pragmatic phenomena.

Swîch der rede! ['Silence your speech!'] The polyphonic structure of soliloquies in Middle High German

Panel contribution

Prof. Sonja Zeman¹

1. Universität Augsburg

Research question. Are literary representations of soliloquies a reliable source for investigations of solitude speech? And if so – could literary representations of soliloquies give insights in the authentic solitude speech of historical stages of language? With these questions in mind, the talk analyses medieval soliloquies from Middle High German (1050 – 1350 AD) in order to investigate how they differ from authentic solitude speech and how much they are shaped by discourse conventions.

Data and method. The talk presents the results of a qualitative analysis of the soliloquies in the Eneas-Roman by Heinrich von Veldeke. The investigation is based on (i) an analysis of grammatical devices (such as tense, personal pronouns, deictics) and argumentative patterns, (ii) a comparison between the medieval and the Latin tradition of soliloquies (Butzer 2008), and (iii) a comparison between the Middle High German soliloquies and patterns of modern self-talk.

Results. The analysis shows that the medieval monologues of solitude are “polyphonic” in several respects.

(i) The soliloquies in the Middle High German epic prove to be comparable to modern forms of self talk from a structural point of view. Both forms of solitude speech display grammatical patterns of dialogicity, although speaker and addressee referentially coincide in one person, and can thus be modeled as different interactional roles in tradition of Ducrot’s 1984 ‘theory of enunciation’.

(ii) Medieval soliloquies are based on the rhetorical tradition of ancient soliloquies as described by Butzer 2008. Their primary function is not the depiction of the protagonists’ ‘inner world’. Rather, they fulfill narrative functions by discussing complications in the story and giving explanations for the motivation of events.

(iii) The analysis of discourse structure makes obvious that the soliloquies are not representations of individual inner thoughts, but are fictionalized by the overlying voice of a narrator.

Discussion. In sum, the talk contributes to clarifying the methodical question which aspects of literary soliloquies are fictionalized and which aspects are comparable to authentic solitude speech.

What does an adult speaker say when alone? A sequential multiple-task analysis of Japanese solitude speech

Panel contribution

*Dr. Mitsuko Izutsu*¹, *Dr. Katsunobu Izutsu*²

1. *Fuji Women's University*, 2. *Hokkaido University of Education*

Solitude speech is one of our everyday uses of language. However, despite the fact that language is a primary source of investigation, the study of solitude speech has long been outside the scope of linguistic research only with a few notable exceptions (Du Bois 2009, 2011; Hasegawa 2010; Hirose & Hasegawa 2010). The academic inquiry has been relegated to the field of psychology (Piaget 1923/2002; Vygotsky 1934/1986), where their main concern is with the self-regulatory function of solitude (private) speech.

Since it is difficult to obtain sufficient samples of solitude speech in spontaneous discourse, the data have been collected in task-based experimental settings, in which spatio-visual tasks (puzzles, assembling blocks, etc.) have often been used (e.g., Kohlberg et al. 1968, Behrend et al. 1989). On the other hand, Frauenglass & Diaz (1985) conducted two different types of tasks (“perceptual tasks” and “semantic tasks”) and found that the latter type of task (classification tasks, story-sequencing tasks, etc.) elicited more private speech than the former.

Since Frauenglass & Diaz’s research is conducted with children aged 3.5 to 6, it has remained unclear whether a similar tendency will be observed for adults. Given the “internalization” of vocal speech (Vygotsky 1934/1986), it is hypothesized that adults are unlikely to produce solitude speech while doing such experimental tasks. Or even if they do, it is expected that solitude speech will exhibit “syntactic peculiarities” (simplification, predication, agglutination, etc.) (Vygotsky 1934/1986) as compared with social speech.

The present study aims to investigate whether adult speakers will speak while engaged in tasks alone, and, if they do, what kinds of linguistic forms they will produce. Considering our everyday observation that solitude speech appears unexpectedly—even between tasks, we conducted a sequential multiple-task experiment in which subjects were asked to carry out two different types of tasks in sequence: “complicated intellectual task” (number-guessing game) and “perceptual task” (puzzle), instructed to stay alone until they finish all the tasks. Japanese subjects, aged between 18 and 30, participated in the experiment and were video-recorded during the experimental session with no one else in the room. The data were analyzed with reference to the categories of private speech adopted by Berk (1986) and Montero & Huertas (1999) with some modifications. Of the speech samples obtained, task-relevant private speech was classified into “cognitive private speech” and “affective/reactive private speech.”

The results reveal that the adult speakers did produce solitude speech while doing the tasks. Although they showed a wide individual variation in the frequency of solitude speech, both types of private speech were detected: cognitive private speech like “2, 6, 9-toka, 6, 2, 9-toka ‘2, 6, 9 or 6, 2, 9 or’” and “5-de kangae-te 051 ‘considering that (it) is 5, (then) 051’” and affective/reactive private speech like “Yabai ‘awful.’” It is also shown that some of the features of private speech discussed by Vygotsky (e.g., predication, agglutination) did not serve as marked indicators of Japanese private speech because the language exhibits them as its characteristic features in social as well as private speech.

When to prefer split-self conceptions: self-reference in solitude speech in English, Ainu, Korean, and Japanese

Panel contribution

*Dr. Katsunobu Izutsu*¹, *Dr. Takeshi Koguma*², *Dr. Mitsuko Izutsu*³

1. Hokkaido University of Education, 2. Kanazawa University, 3. Fuji Women's University

Solitude speech manifests diversely in different languages (Izutsu et al. 2022). The conceptualization of self-referenced direct thought and solitude speech can vary from one language to another, as exemplified in (1). In direct thought, for example, English conceptualizes solitude speakers as directing vocalized and unvocalized utterance to their other selves, as in (1a). Conversely, Ainu envisions speakers as hearing or listening to their other selves, as in (1b), in which the verb *yaynu* is analyzable into *yay-* 'self' and *nu* 'hear/listen to.' In contrast, Korean and Japanese conceive of solitude speakers as producing utterances in mind rather than directing it to themselves, as in (1c-d).

(1) a. *I_i said to myself_i, "I_i'm[you_i're] a man. I_i[you_i] should go there first. I_i[you_i]’d better go to his place," so....*

b. *okkayo e_i=ne p un eun e=arpa kusune uske hoski e_i=arpa*
 male you=be thing fp there you=go will 's.place first you=go
sitahoei sekor yaynu=an_i kusu....
 had.better quot think=I because

'I_i heard-myself_i, "You_i are a man; you_i go there, you_i'd better first go to his place,"

and so....'

c. *"na_i[neo_i]-neun namja-janha. geujjog-euro ga-ja. meonjeo geu nyeoseog-hante*
 I[you]-top man-be.not that:side-to go-let's first that guy-to
ga-neungejoh-jianheu-lgga?" rago saengaghaess-giddaemune....
 go-had.better-not-will quot thought-because

'(I_i) thought, "I_i'm[you_i're] a man. (I_i) should first go there. (I_i)’d better go to his

d. *"ore_i[?omae_i]-wa otoko-da. atti-ni ik-oo. sakini aitu-no tokoro-ni it-*
 I[you]-top man-be that:side-to go-will first that.guy-gen place-to go-
tahoogaii"-to omotta-node....

had.better-quot thought-because

'(I_i) thought, "I_i'm[?you_i're] a man. (I_i) should go there first. (I_i)’d better go to his

place" so....'

English and Korean more or less allow solitude speakers to make self-reference using not only first-person but also second-person pronominals, as illustrated in (1a) and (1c). This latter reference can be viewed as an instantiation of split-self conception. Japanese hardly allows second-person self-reference in both vocalized and unvocalized solitude speech, as in (1d). In Ainu, second-person self-reference is common in unvocalized solitude speech, as in (1b), but is not in vocalized solitude speech, as in (2). Note that *so* is a final particle "used in solitude speech" and indicates that "the speakers ask themselves for agreement about what they are about to do" (Tamura 1961: 30).

(2) a *ku=kopisi wa kú=inu so.*

I=ask and I=listen fp

'Let's go ahead and go; Maybe I could ask.'

b. *tane k=arpa so.*

now I=go fp

'You don't want to go in, do you?'

(Tamura 1988)

In Ainu, furthermore, the second-person self-reference is preferred in unvocalized solitude speech with some directive force on the speakers themselves. Such self-directive speech can be viewed as comparable in function to what Koguma et al (2020) term “self-encouragement” and “self-blame.” We argue that the self-directive type of speech can motivate many languages to allow second- as well as first-person self-reference in unvocalized solitude speech.

Designing Talk for Humans and Horses: Prosody as a Resource for Parallel Recipient Design

Panel contribution

Prof. Beatrice Szczepek Reed¹

1. King's College London

This talk shows how in horse riding lessons, riding instructors use prosody and other sound patterns to design their talk for human and equine recipients at the same time, while orienting to distinct contributions from each. This is referred to as parallel recipient design. When giving directives to perform ridden activities, instructors may design these as mobilizing not only the rider but also the horse, thus ascribing co-participation and co-agency to the equine participant. Practices for doing so include nonlexical vocalizations, marked prosodic delivery, and conventionalised lexical-prosodic bundles in the form of voice commands. Parallel recipient design is shown to be distinct from alternating recipient design, which addresses one recipient at a time and orients to different interactional activities and projects. In contrast, parallel recipient design allows turn holders to engage in a single interactional project, pursuing a single activity to be performed jointly by the recipients and treating them together as a single recipient pair. Parallel recipient design can be delivered consecutively, with items mobilizing the rider followed by items mobilizing the horse; or simultaneously, with lexical items performing one action to the rider and their prosodic delivery performing another to the horse. The data are recordings of naturally occurring horse riding lessons, mostly in English; some extracts are in German with English translations.

Intraspecies and interspecies acknowledgements by the dairy COW

Panel contribution

Prof. Leonie Cornips¹

1. *NL-Lab, Humanities Cluster (KNAW) & Maastricht University*

In this talk I will make a plea for an animal turn in linguistics (Cornips 2022; De Malsche & Cornips 2021) that may provide the opportunity to develop a theory of a relational framework focusing on language as local meaning-making which is not human-centred, not language-centred, not praxis-centred but, as Pennycook (2018) argues, is distributed among and between species, bodies, materiality, place and time. I will focus on intraspecies and interspecies acknowledging by the dairy cow in intensive dairy farming context. Basing my observations on ethnographic research since mid 2018, I analyse the dairy cow as a linguistic actor who opens the interaction with the human and/or dairy cow who is passing by, by producing a routinized ‘mmmm’ – not as ‘noise’ – but as acknowledging the other (Cornips 2022). This ‘mmmm’-sound is produced with lips closed, sounds in the direction of /u/, that is, in human terms the sound is a so-called (semi-)closed central or back vowel, has a low pitch (F0) and remains more or less flat, at about 80 Hz. In a cow’s mooing sound, the lower overtones, between 200 and 2000 Hz, are maximally strong.

Not all individual dairy cows acknowledge the other vocally which might be related to the different personalities dairy cows have (Marino & Allen 2017). In addition to vocal acknowledging, I will discuss that dairy cows also have an elaborate bodily repertoire expressing that they are acknowledging an other dairy cow such as gaze, flapping ears, nose-nose, nose-chest, head-head contact, and moving towards the other.

The paper will demonstrate that dairy cows, within the power dynamics of industrial farming, make social meaning in their barns and outside in the pasture by relating to well-known human(s) or passing dairy cows via a processually emergent quality arising from multiple assemblages of human and nonhumans, including material things, artefacts and spaces (Cornips & van den Hengel 2021). This finding is important since acknowledging rituals of dairy cows may lead to a new interspecies ethics, i.e. in “respectfully engaging in new rituals with them can function as a gateway to further political interaction and extended conversations” (Meijer 2019).

Making sense of pet sounds – human responses to non-human animal vocalizations

Panel contribution

Dr. Stefan Norrthon¹, Prof. Jenny Nilsson²

1. Stockholm University, 2. Institute for language and folklore

In contemporary Western society, many humans live with domesticated non-human animals as family members and treat them as thinking subjects rather than objects (e.g., Haraway 2003). In doing so, humans spend a lot of time and effort understanding their pets. This presentation focuses on how humans make sense of and respond to non-human animal vocalizations in everyday interactions.

In a video corpus comprising twelve hours of recordings including 35 humans, 30 horses, six dogs and one cat, we have investigated how humans treat animal sounds such as whinnies, whines and meows as meaningful communicative actions. We focus on how humans respond to these sounds (c.f. Cornips 2022) and how the responses display human orientation to the inner feelings and thoughts of non-human animals. Of course, it is not only the vocalizations that humans orient to, but also numerous other bodily cues. We, therefore, use multi-modal interaction analysis (Mondada 2019) to understand how animals and humans engage in communication and joint actions. We investigate the sequential context of the sound, and examine the participants' verbal and bodily actions turn by turn.

In our data, human responses to non-human animals' sounds can consist of a repetition of the sound (where the phonetic realization often is quite similar, see also Harjunpää 2022), embodied actions, and/or verbalizations of the meaning of the sound (e.g., *oh are you hungry?*). In this presentation, we will show that responses to pet sounds have several functions: to signal to other humans that a sound was noticed, to respond to a pet (signal that it was seen and heard), to verbalize the perceived wishes of a pet and to cognitively process sounds perhaps never heard in that context before.

Apparently, human responses to the vocalizations of pets are an important part of family-making and sense-making at work in human-animal-communication. Empirically studying the micro-level (e.g., sound patterns) of naturally occurring inter-species communication contributes to understanding the ongoing convergent evolution that humans and pets are part of (e.g., Hare & Tomasello 2005, Petitt & Brandt-Off 2022). It may also have implications for how humanity views other living species on the planet (see also Wolfe 2010), which we believe is necessary for the Anthropocene.

Prosodic matching in interspecies interaction: humans' responses to cats' vocalizations

Panel contribution

Dr. Katariina Harjunpää*¹, ***Prof. Beatrice Szczepek Reed²**

1. Tampere University, 2. King's College London

This presentation investigates the prosodic design of humans' turns directed at cats in response to the cats' vocalizations. Animal-directed speech has been investigated primarily for its similarities with infant-directed speech (e.g. Mitchell 2001; Burnham et al. 2002). Similarities include high pitch register, repetition, short utterance length, and limited syntactic complexity. Jeannin et al. (2017) describe high pitch being used by humans to express affection, and low pitch to control pets, while MacMartin et al. (2014) describe low pitch, narrow pitch spans, and reduced loudness in human responses to animals in distress. This presentation discusses how the prosodic design of humans' turns can be interactionally responsive to feline vocal actions. The conversation analytic study draws on video recordings of one Finnish-speaking human interacting with a cat and her kittens growing up over the course of several weeks. The study builds on research by Szczepek Reed (2006; 2020) on prosodic matching in human-only talk and by Harjunpää (2022) on matching by humans when interacting with pets. The data show that the human may prosodically match the cats' vocalizations by approximating certain aspects of their vocal design, such as the pitch, duration, and voice quality of meows and chirps. Prosodic matching can occur in onomatopoeic expressions that imitate cat sounds on some level of phonological conventionalization (e.g. *miu*), as well as in talk that does not imitate cat sounds lexically (*mitäs asiaa*, 'what's up'). We examine the combination of prosodic matching with lexically imitative and non-imitative expressions, as well as lexical imitatives without matching. Preliminary findings suggest that humans can use these in different ways to establish responsive sequential ties with the cats' vocalizations, affiliate with, quote or otherwise refer to the cats' vocalizations, deliver a form of commentary on the cats' conduct, or attempt to get a cat's attention. In these practices, the human displays in subtle ways her understanding of and stance towards what the cats are doing and experiencing (cf. Mondémé 2018).

Signs of absence in interspecies play: vocal, verbal, and bodily manifestations of ‘being out of sight’ and ‘being out of reach’

Panel contribution

*Dr. Rea Peltola*¹, *Dr. Marine Grandgeorge*², *Dr. Yaru Wu*¹

1. University of Caen-Normandy, 2. University of Rennes 1

This paper investigates sound patterns and meaning-making during interspecies play, in situations where an object or a playing partner is out of sight or out of reach (hereafter referred to as *absence*). These include e. g. searching or hiding games. The analysis is based on a video corpus of French-speaking children (6-12 years) and pet dogs playing outdoors (approx. 3 h, 3 dog-human pairs) (Grandgeorge et al. 2020). It combines methods and theoretical approaches from linguistics and ethology.

As a shared activity, playing calls for different degrees of detachment from the physical reality, as it deviates in a mutually recognizable way from what is considered by both partners as expected outside the play. The participants are engaged in metacommunicative sign processes where a real-world action (e. g. chasing) is evoked but its consequences (the pain caused when the prey gets caught) are cancelled (Bateson 2000, Kohn 2013). The action becomes a form that receives a new meaning within the play (Despret 2021). This meaning is activated in social interaction, where the participant using the play form must be able to anticipate how the partner is going to interpret the form and count on them for understanding the specific meaning (Bohn et al. 2020, Simonen 2021).

This contribution explores a) how the human and canine participants manifest absence vocally, verbally and through bodily cues, b) how absence is incorporated in the complex interactional dynamics of play, c) how children tailor their dog-directed speech, in terms of prosody and complexity.

The study shows that perceived absence is multimodally marked by both partners, although the schematic meaning-structure of absence underlying human language structures is not necessarily shared. A phonetic and interactional analysis reveals that the canine partner uses specific sound patterns of barks and growls at different moments of ball play where the ball is in sight but out of reach. These are treated by the human partner as meaningful turns and can even be reiterated into a complex grammatical construction through imitation (Mondémé 2018, Harjunpää 2022): *nan pas le droit au rrrh* ‘no you don’t have the right to rrrh’. The children lean on prosodic cues, along with gestures, gaze and grammar, when referring to an absent object: [showing an empty hand that was holding the lost ball 1.5 min earlier] *CELLE-LÀ* ‘THIS ONE’ [showing another toy in the other hand] *pas celle-là* ‘not this one’.

The paper maps the phonetic and prosodic features onto the embodied actions (e. g. the posture and gaze of a dog when the human participant is hiding; the empty hand as an indexical sign) and the grammatical (modal) constructions (negation, directives, interrogation) observed. In doing so, it describes in depth the multilayered semiotics and interactional complexity in human-animal communication. It also shows how the capacity of language structures to target entities of various conceptual degrees (Talmy 2017) is used by human children when co-constructing absence in interspecies play. The study attests to the interdisciplinary complementarity and potential of the approaches used.

Students imitating sounds of non-human animals

Panel contribution

***Dr. Mika Simonen*¹, *Dr. Tuure Tammi*², *Dr. Pauliina Rautio*²**

1. University of Helsinki, 2. University of Oulu

Human speakers are known to imitate non-human animal vocalizations (e.g., what does the duck say? quack quack) (Leevallik & Ogden 2020). Prior studies have also found that animal vocalizations uttered by humans do not necessarily carry symbolic meanings to their interlocutors. For instance, a dog produces a bark and the dog's caretaker imitates the vocalization (e.g., Harjunpää 2021). In this presentation, we investigate (i) how upper secondary school students imitate sounds of non-human animals and (ii) how students orient to the imitations of non-human animals made by other students.

The students participating in our ongoing citizen science project—Citizens with Rats—were instructed to seek places suitable for non-human animals from the surroundings of their school. The students' task was to gather observations with their phones and a video camera; the materials recorded in 6 days (approximately 15-60 minutes x 3-4 groups + short cell phone video clips) were the starting point of this study. Some students were not finding any non-human animals so they walked around the school and organized group presentations of various non-human animals. The students' presentations are investigated in this study.

The data collected by the students were subjected to conversation analysis (Sidnell & Stivers 2013). During the analysis, we decided to focus on sound patterns indexing non-human animals, and for that purpose, we used Praat 6.3.06 to study prosody. We identified several cases where the students are presenting non-human animals.

Example (1) considers a student mimicking a bird. The student utters two short bird sounds and announces being a bird (*mä oon lintu*: "I am a bird:"). The intonation contour moves from 157 Hz to 131 Hz during the announcement. Then, the student produces vocalizations which could be interpreted being sounds from a bird flying high above. The pitch contour depicting the non-human animal descends from 4447 Hz to 976 Hz.

Soon after imitating the flying bird, the student begins to hop forward. Cartoon boing sounds and later produced laugh tokens receive a positive assessment from another student (*hyvä et se lintu pomppii noin* "it is good that the bird is hopping in that way"). The pitch contour of the boing sound moves between 97 Hz and 174 Hz.

The student's presentation is ending. At this point in time, the student is not hopping anymore but uttering bird sounds. The pitch contour fluctuates; the highest frequency for the bird sounds is 7744 Hz. The performance is abruptly interrupted by a classmate who calls the imitator.

The analyzed sound patterns were recorded by the student. The videos recorded on the video camera were analyzed and three bird sounds that were uttered by the student were found: the maximum pitch was approximately 4000 Hz.

Example (1) shows the main finding of the study: the student uses atypical voice frequencies to imitate sounds of a non-human animal. The student performing the imitation was "being and doing a bird," and in this transformation prosodic features played the central role. To conclude, some students fulfilled their school assignment by mimicking non-human animals.

Atypical Hearing-Deaf Signing in an Urban Community

Panel contribution

Prof. Barbara LeMaster¹

1. CSULB

This paper uses narrative and discourse data to explore the atypicality of a deaf school in Dublin, Ireland at a time when everyone signed. All hearing members of this community signed with everyone, including with each other, without using spoken language. This example of a deaf-hearing signing community emerging at a deaf residential school from the mid 1800s to the mid 1900s is atypical in a number of ways, from their location in an urban setting, to deaf people being in the majority, to having deaf staff (from teachers to cooks to custodians), to having hearing staff who signed with everyone. There have been reports of deaf-hearing signing communities, in rural villages, (cf. Kusters 2009, Johnson 1991), with a “high prevalence of deafness” (Kusters 2009) from 1% in the Ban Khor Thai community (Woodward 2003) to 3.3% among the Bedouins (Kusters 2009). In comparison, the school population would have encompassed an overwhelmingly high prevalence of deaf people compared to a minority hearing staff. Yet the staff had greater social authority over the students than is seen in other deaf-signing communities reported to-date. This paper presents an atypical situation of a deaf-hearing signing community, retrospectively comparing what is known about village signing communities with the historic Irish deaf-hearing school signing community. The driving question is one about language and language modality accommodation underlying notions of typicality and atypicality of personhood where deaf people and hearing people live together.

Epistemic stance-taking and advice giving in collaborative planning in an architectural design studio

Panel contribution

***Dr. Min-Seok Choi*¹, *Dr. Leslie Moore*²**

1. Francis Marion University, 2. The Ohio State University

Design instructors consider collaborative planning as a space for opportunities to develop competence in communicating design ideas to others (e.g., other designers, clients). A body of research on *collaborative planning* or student group work time before task presentation and its assessment (e.g., rehearsal, strategic planning) has focused on planning as a product, which often obscures the complexity of meaning-making and its consequences for identity construction (Lee & Burch, 2017). For example, through collaborative planning, who has the right to assess is constructed through students' positioning of selves and others, which often reflects specific language ideologies (e.g., Native vs. Non-Native) to shape their discursive interaction. This study examines how a group of linguistically diverse college students take epistemic stances and negotiate their conflicts in an architectural design studio. As part of a semester-long ethnographic study conducted in a sophomore landscape architecture design studio, the present study analyzed a video recording of the two-hour-long group planning activity outside of the studio class, wherein Solomon, an English monolingual speaker, and his three multilingual peers work together to prepare their in-class presentation. To triangulate, follow-up interviews with the participants were conducted and analyzed. While students focused on design features, students discussed who had the right to assess each other's design. Students embedded the instructor's prior utterances, in the form of constructed dialogue (Tannen, 2007), in their speech to offer and reject critique. Kay rejected Solomon's entitlement to assess her design by reporting the instructor's voice. By modifying the instructor's voice, Kay and two other students claimed their assessment entitlement. Unlike this case, when Solomon shifted their attention to the language of the presentation, no negotiations occurred, and more tokens of alignment and affiliation (Stivers, 2008) were used by others. Solomon explicitly projected the binary positioning, NES vs. NNES, by saying, "I can sympathize on its not your first language so I guess that is hard" and connected it with competence. This speech made visible who has the right or more competence to assess the language of the presentation. This study compares the participation structure on design features and the participation structure on the language of expression. This study shows how ideologies of native/non-native English speaker (NES/NNES) categories shape the interaction.

Metapragmatic commentary and stance-taking in Guadeloupean Comedy

Panel contribution

*Dr. Kathe Managan*¹

1. *University of Louisiana Lafayette*

As Basso (1979) reminds us, humorous public performances provide ethnographers a privileged window into cultural conceptions of people and places. This paper explores metapragmatic commentary on types of persons in sketch comedy from the island of Guadeloupe, focusing on the semiotic processes of differentiation. Most Guadeloupeans are bilingual in a variety of French, the official language, and a variety of Kréyòl, a French-lexicon creole with regional language status. Guadeloupean comedy sketches draw on the entire linguistic ecology: local French, metropolitan French, basilectal gwo kréyòl (a variety of Kréyòl with little influence from French), “Frenchified” Kréyòl, code-switching and even some English and other languages spoken by immigrants. These comedy sketches feature stock characters that playwrights and actors suggest mirror Guadeloupean society (see Naudillon 2010 on Antillean comedy as “un théâtre miroir,” ‘a mirror theater’). Indeed, in my interviews, playwrights and actors insisted that the common characters of their sketches reflect typical persons and situations that they observe in the daily life, rather than exaggerated stereotypes. Through their depictions, actors in Kréyòl comedy sketches position different Guadeloupean “types” into an imagined social landscape that spans the island, the Caribbean and the mainland, past and present. Drawing on ethnographic observation of live performances, this paper analyzes performance recordings (my own and purchased DVDs) to illuminate stance-taking in comedy sketches. I engage with Agha’s (2007) discussion of the process of enregisterment, by which identifiable linguistic styles emerge as metapragmatic models linking linguistic varieties to types of people or contexts. Using this perspective, I study how comedy sketches elaborate and circulate enregistered styles as Guadeloupean performers and audience members engage with stock characters such as the *mamie* (grandmother) to take stances on their society and current social issues (see Jaffe 2009 on stance).

Nahuatl, indigeneity and narrative stance-taking in conversations about bilingual schooling and linguistic activism in Mexico

Panel contribution

Dr. Jacqueline Messing¹

1. *University of Maryland-College Park*

Multiple ideologies of language, indigeneity and progress abound in the Nahuatl-speaking region of central Mexico. In my ethnographic field research, in several communities, schools and revitalization projects, I have observed great linguistic ideological variation among individuals and within families, regarding degrees of knowledge of and interest in learning/using Nahuatl. This paper offers an analysis of narratives selected from recorded, real-time speech of Nahuatl/Spanish bilingual teachers' workshops and elicited interviews with teachers and language activists. Evidence will be offered from this discourse analytic data of individuals who describe how their ideological stances towards Nahuatl language learning/use have changed over time, in some cases leading to a reactivation of Nahuatl. These shifts in ideological stance motivate some speakers to interrogate and seek to invert the racism that has been recursively reproduced in local Mexicano communities in their narratives, particularly within language activist and teacher-training contexts. It is through narrative that local language promoters consciously express and illustrate competing local linguistic ideologies and stances, to socialize new bilingual teachers and their students into more pro-indigenous, rather than anti-indigenous stances. Local identity conflicts related to experiences of racism are mirrored, discussed and ultimately resolved, in and through the telling of these narratives, and thus these raciolinguistic (Flores & Rosa 2015) narratives are of critical importance to Nahuatl language activists and students of language shift and revitalization. These speakers employ pragmatic strategies such as stance-taking (Jaffe 2009) and ideological differentiation (Gal & Irvine, 2019) that serve to position themselves and others along scalar axes of typicality and a-typicality. What speech and nonverbal practices are considered more or less "Indian"? How are notions of "modernity" and "racism" understood and circulated in these narratives? Through my analysis of ideologically-laden, postcolonial speech practices and conscious stance-taking by language activists and resident-scholars, I argue that we must pay close attention to individuals in community language shift to support language revitalization or reclamation efforts.

Stance-Saturated Orthography: Making Sense of Russian-in-Ukrainian Facebook Posts

Panel contribution

Dr. Jennifer Dickinson¹

1. University of Vermont

This paper considers how orthographic play in Ukrainian Facebook posts enacts a form of double-voicing through an interpretive complex of ideological, linguistic, and social stances. These instances of play, in which Russian utterances are represented phonetically using the Ukrainian writing system, serve to buffer or discursively “contain” codeswitching while also effecting interpretive distance from the semantic and ideological content of the Russian text.

As Jaffe (2009: 3) notes, some forms of writing are more saturated with stance than others. In context of the war in Ukraine, codeswitching between Ukrainian and Russian is stance-saturated by itself; the addition of unconventional orthography adds an element of both play and distance between the writer and the words. Like all linguistic play, these written representations of Ukrainian and Russian make significant demands of potential readers, to understand both the representations and their role in supporting the writer’s stance. As orthographic play compresses orthography, language, and political ideology into a “charicaturized” and “othered” Russian-language voice, it also serves to highlight oppositional points of view in the moment of stance-taking. In analyzing written examples from social media, this paper explores the shifting meaning of Ukrainian/Russian bilingual discourse in Ukraine, where bilingualism remains high in spite of recent sociolinguistic shifts. In addition to aspects of stance, including differentiation and representations of typicality, this paper considers the applicability of Bakhtinian notions of heteroglossia to these examples.

The language of political leadership in atypical times: the case of Boston's mayoral campaigns

Panel contribution

Dr. Jennifer Sclafani¹

1. University of Massachusetts Boston

This study examines the discursive construction of political identity in the 2021 Boston mayoral election, which featured two candidates who were both women of color and mothers – Anissa Essaibi George and Michelle Wu. Their campaigns not only reflect the shifting demographics of Boston, which until then had seen only white men seated in the city's top executive position, but the changing face of political leadership during a tumultuous period for the city, as it reeled from the global pandemic and growing economic, racial, health, and educational inequalities.

I perform a qualitative discourse analysis of the campaigns of George and Wu, examining data from campaign advertisements, debates, town halls, interviews, and local news coverage. Focusing on interactional stance-taking (Du Bois & Kärkkäinen 2012) and framing strategies (Sclafani 2015), I examine how the candidates define themselves, their agendas, and their place within Boston's historic trajectory and its current cityscape. The analysis reveals that while both women highlight their roles as working mothers and their professional trajectories to establish existential coherence as mayoral candidates (Duranti 2006), George stylistically emphasizes her status as a native Bostonian, while Wu, who ultimately won the election, draws on generic spatiotemporal categories to connect with a diverse electorate.

This chronotopic analysis of identity work (Blommaert and De Fina 2017) sheds light on the complex scalar projects involved in claiming local belonging in a dynamic, superdiverse, cosmopolitan city. It reveals that through oppositional alignments, politicians call into question typical assumptions about the indexical link between personal identity and political ideology. Along with the other papers in this panel, it contributes to our understanding of the dialectic relationship between ideologies of gender, modernity, and diversity and language use in contemporary public discourse.

**Storytelling about and
over food (organized by
Polly Szatrowski)**

Food and storytelling in German Taster Lunches

Panel contribution

Prof. Stefan Diemer¹, Dr. Marie-Louise Brunner¹

1. Trier University of Applied Sciences, Environment Campus Birkenfeld

Interaction over food is frequently accompanied by storytelling, as observed by Goodwin 1981, 1984, and Mondada 2009, Szatrowski 2010, Karatsu 2012). Our paper examines how stories may be prompted by food, who tells the stories, which types of stories are told, and how stories are contextualized.

The data for this study comes from a set of German Taster Lunches, each with three German native speaker participants, recorded at Saarland University, Germany, in July 2016. Participants were given three different courses to taste, one Japanese, one Senegalese, and one German, without providing information about the respective backgrounds of the meals (see Szatrowski 2014: 27ff. for the concrete setup of the Taster Lunches). The naturally occurring conversation during the meal was recorded and selectively transcribed.

Our data shows that in Taster Lunches, food indeed constitutes a frequent starting point for stories and narratives that anchor speakers' evaluation and establish their (non-)expertise. Food also prompts stories that express individual stance or negotiate joint stance, and to showcase individual or group identity(ies).

Storytelling occurs frequently in our data, and stories are told by all participants, illustrating that they are an integral part of interaction over food. During storytelling, the storyteller's interruption of the tasting (i.e. eating) process (though the other participants continue eating, unless they engage in co-operative storytelling), marks the activity as a telling (and thus different from a remark, see also Goodwin 1984).

In terms of topics, the participants in our dataset tell stories that place food in a personal, experiential, or fictional setting. Participants draw upon the properties of the food they are consuming to tell personal stories that feature this food item in family or regional settings. In these (mostly positively marked) contexts, the food item constitutes an important facet of personal identity. Experiential food storytelling details past tasting experiences and recreates an individual impression from the past, frequently in a travel setting, that illustrates the food in its particular, often exotic, context. Experiential storytelling can contribute to personal identity construction, establish or strengthen expert identity, and also support food evaluation. It is frequently elaborated far beyond the food prompt. Fictional stories start off with a tasting experience, but quickly move beyond food in question and can create complex "food fantasies", often as joint tellings by several participants. Like personal and experiential stories in our data, fictional stories are employed to transport and express humor.

Storytelling over food is an interactive, multimodal experience that uses the food item as a joint locus of attention and access point. Storytelling is accompanied by gestures and frequently structured and framed by laughter. Affirming responses and corroborating second stories create shared identities; stories may also frame disagreement in terms of evaluation, establishing varying identities.

Stancetaking as storytelling in focus groups on food

Panel contribution

Mr. Jonathon Coltz¹

1. Saarland University

In this paper, I ask: Why do participants in focus groups on food tell stories to evaluate the foods they are tasting? Drawing from 8 hours of recorded data ($n = 24$ participants in total), I show that participants tell stories when they dislike a particular food, and I argue that in such cases, they use stories to soften their negative stances.

In focus groups on food, negative evaluations of the foods presented may be considered dispreferred responses to the moderator's probes. Classic work on dispreferred responses has identified several of their features; among them are prefaces, qualifications, hesitations, and accounts (Pomerantz 1975, Atkinson and Drew 1979; summarized in Levinson 1983, Schegloff 2007, and Leech 2014). The stories that focus group participants tell about foods they dislike include some or all of these features. In excerpt 1, Holly takes a stance on a snack bar she dislikes:

Excerpt 1

Moderator: What direction did this one go in?

Holly: Uh, I wasn't sure until I tasted it. I was gonna reserve judgement. But I smelt it before I tasted it; I have a tendency to do that. And then, uh, I kind of thought 'this tastes like something that's supposed to be good for you.'

In this excerpt, Holly avoids a straightforward evaluation of the bar. Rather, she engages in an extended narrative in which she describes the process of consuming the bar. Throughout her narrative, Holly uses prefaces (prefatory 'uh'), qualifications ('I wasn't sure'), hesitations (further use of 'uh'), and accounts ('this tastes like something that's supposed to be good for you'). In this case, each of these features is woven together in a narrative that softens her negative stance.

One feature of interest that may be related to accounts is distancing, or the social closeness among interlocutors (Brown and Levinson 1987). Distancing – and in its extreme case, othering – can be used to create a common identity among participants in interaction (Brunner 2021). Participants' negative stances in focus groups can incorporate such distancing, as is observed in excerpt 2, in which Janel is evaluating another snack bar:

Excerpt 2

Janel: To me this looks healthy. If I opened this up two years ago, I woulda said 'this looks too healthy.' I wouldn't eat it. But as a personal trainer I look at that and go 'oh yeah, that's lookin' pretty healthy.'

Here, Janel attributes her negative stance to her prior, 'other' self. By distancing her 'other' self from her current self in her story, she effectively absolves her current self from the full responsibility of the stance she is taking, thereby enabling her to maintain common ground with the moderator and her fellow participants.

This paper extends current work on politeness in stancetaking, and more generally, it contributes to our understanding of the linguistics of food.

Stories in Japanese Taster Lunches

Panel contribution

Dr. Polly Szatrowski¹

1. University of Minnesota

In this paper I investigate how Japanese speakers tell stories during a Taster Lunch. The data come from video-taped conversations of 13 Japanese triads, each eating and commenting on three courses containing 3-4 foods from Japan, America and Senegal, respectively. The analysis focuses on 1) what kind of stories are told in the Taster Lunches, 2) what triggers the stories, and 3) how the stories influence the assessment and categorization of food in the Taster Lunch.

I divided the stories in the Taster Lunches into two types: simple reports of past experience and stories with a clear event structure. Most of the reports/stories related directly or indirectly to the appearance, taste, smell, shape of the food, the use of eating utensils, eating order, etc. while others were triggered by an association with something in the meal/conversation primarily for amusement (Sacks 1992, Jefferson 1978). I analyzed the types of stories, story triggers, and influence of the stories on the assessment and categorization of food building on previous research on storytelling in interaction (Sacks 1992, Labov 1972, Jefferson 1978, C. Goodwin 1984, Maynard 1987, M. Goodwin 1990, Norrick 2000, Szatrowski 2010, and Karatsu 2012) and language and food (Szatrowski 2014, 2021). The point of the story tended to be made using internal evaluation (Labov 1972), e.g. onomatopoeic words for the climax, and the connection between the story and assessment of a food in the Taster Lunch was displayed by story recipients' responses to the story as it developed.

The content of the stories suggested aspects of food that were important in the participants' culture/social group (Bourdieu 1984, Ochs & Shohet 2006), and memories from their childhood shed light on how they had been socialized around food (Ochs, Pontecorvo, & Fasulo 1996). For example, stories by Japanese speakers showed their concern for eating unfamiliar foods in the correct order with proper eating utensils, and comments and questions related to these concerns and insecurities often triggered a relevant report or story. While participants over 30 told stories about their childhood to reveal how their tastes had changed, participants under 30 recalled foods that they had eaten in their childhood. Recollection of past experiences about food revealed aspects of the storyteller's identity and strengthened bonds between participants when these experiences were shared (Karatsu 2012). Participants' stories about their experiences with and assessments of similar foods in the past influenced other participants by providing support for their categorization of unfamiliar foods and justification for assessments of foods eaten at the Taster Lunch.

Results from this research contribute to the growing body of research on language and food and storytelling by elucidating how stories related to food and eating are triggered and developed in the interaction. They also contribute to cross-cultural understanding.

BUT-Prefaced Turns in L2 Students' Collaborative Talk

Panel contribution

Dr. Leila Kääntä¹, **Dr. František Tůma**², **Dr. Teppo Jakonen**³

1. University of Jyväskylä, 2. Vienna University of Economics and Business, 3. University of Turku

This presentation centres on EFL students' collaborative talk during meaning-focused speaking tasks carried out in pairs or groups. We focus on the role of the turn-initial particle BUT as a component of L2 interactional competence and how students use it to manage the ongoing task and negotiate their ideas. While English grammars tend to describe BUT as a coordinating conjunction with a contrastive meaning, little is known about its interactional functions in turn-initial position. Studies from other languages show that turn-initial particles with a similar meaning, such as the Russian “nu” (Bolden, 2018), German “na ja” (Golato, 2018), or the French “mais” (Pekarek Doehler & Berger, 2018), are employed in conversation to convey disagreement with the previous turn(s), to misalign with the preceding question, or to project the tell-worthiness of a story. To our knowledge, the only study in the L2 classroom context on the French “mais” has shown how students use it to display disagreement (Pekarek Doehler & Pochon-Berger, 2011).

Our analysis is based on video-recorded upper secondary EFL classes from Czechia and Finland, from which we have identified 42 instances of turn-initial BUTs. In line with recent studies that have taken an interest in L2 grammar-for-interaction and its development (e.g. Pekarek Doehler et al., 2021), we employed multimodal conversation analysis to investigate the sequential environments and interactional functions of BUT-prefaced turns during L2 speaking tasks.

Our findings suggest that BUT-prefacing is used by students predominantly to add to the emerging task answer by presenting a counter argument or a different stance; students also use turn-initial BUTs to continue a joke and to pursue a response. We argue that these BUTs in turn-initial position display sensitivity to an action's placement in the broader activity and help configure the upcoming action. The findings contribute to our understanding of L2 interactional competence and grammar as social phenomena and shed light on the interactional organisation of collaborative peer talk in upper secondary educational settings.

Peer interactions around collaborative writing in early childhood education

Panel contribution

***Dr. Myrte Gosen*¹, *Dr. Frans Hiddink*²**

1. University of Groningen, 2. NHL Stenden University of Applied Sciences

This contribution focuses on peer interactions in early childhood education. It will highlight practices of children while interacting with each other during activities that involve collaborative writing. Children involved in this study are in Dutch kindergarten (first two years of Dutch primary education) and are 4-6 years old.

The emergent literacy (Teale et al, 2020) of young children of 2-7 years old forms the base for formal reading and writing development at a later age (Mol & Bus, 2011). One of the first indicators for emergent literacy are children's emergent writing practices. Mostly, young children's writing products are embedded in the task or the activity. Consequentially, emergent writing is a social and functional phenomenon (Friedrich & Peterson, 2022). However, it seems that teachers do not always recognize emergent writing as it becomes apparent in young children's behavior (Berenst & Hiddink, 2022; Deunk, Gosen, Hiddink & Berenst, 2022; Reyes & Azuara, 2005). In addition, teachers are often concerned with the formal development of the alphabetical script (Van Oers, 2007) instead of focusing on emergent writing as social and functional in for instance role-play with peers (Ihmeideh, 2015; Quinn et al., 2021).

Peer interactions are considered to be contributive to emergent reading (Cekaite et al., 2014) and to emergent writing. Studies show that conversations among children about emergent writing performances may stimulate individual children to reflect on their products and on their identity as literate beings (Coates & Coates, 2006; Kissel et al. 2011). So, peer interactions in the process of writing, may contribute to children's emergent writing development. Nevertheless, there are, to our knowledge, no studies on the interactional details of young children's peer interactions occurring in collaborative writing, while studies investigating dialogic writing among older primary school children have revealed very interesting details (e.g. Herder, 2020).

The current study contributes to this lack of knowledge by investigating peer interactions of kindergartners in collaborative writing. These interactions are video recorded at four different kindergarten classrooms as part of a multiannual practice-oriented research (Hiddink, 2021). Relevant pieces of data are transcribed according to Conversation Analytic conventions (Jefferson, 2004). In the analysis, the focus lies on how children interact in this particular context and how the observed practices in interactions relate to emergent literacy. It will be shown that children are involved in at least three main interactional activities: interacting about the correctness of written text, discussing the appropriateness of written text and reflecting on the organization of collaborative writing. Furthermore, it will be demonstrated how these particular discussions look like and what are considered to be practices that offer room for peer interactions that are contributive to children's emergent literacy. Both theoretical and practical implications of these detailed insights will be discussed.

Peers as models for explaining and arguing: Students' recycling practices in whole-class discussions

Panel contribution

***Prof. Miriam Morek*¹, *Prof. Vivien Heller*²**

1. University of Duisburg-Essen, 2. University of Wuppertal

It is widely assumed that classroom discourse may provide opportunities for students to develop their oracy and literacy skills (e.g. Grøver et al. 2019). Predominantly, studies emphasize the role of *teachers* in supporting students' language use and language development (e.g. Michaels/O'Connor 2015; Uccelli 2019; van der Veen et al. 2017; Quasthoff et al. 2022). However, the question of what role *classmates* might play in students' language learning through classroom discourse has not gained attention so far (but see Anderson et al. 2001).

This is surprising as language socialization research has recognized for some time the potential of peers for children's language acquisition (Blum-Kulka/Snow 2004; Cekaite et al. 2014). For instance, studies on play interactions and peer-groups show how peer-talk helps to practice complex discourse practices such as explaining or arguing. One interaction-based mechanism identified as a possible resource for language acquisition through peer-talk is other-repetition (Arendt/Zadunaisky 2020). Other-repetition represents a form of "linguistic recycling" (Haapanen et al. 2020). When reusing prior utterances of others, e.g. by a verbatim repetition or a modified imitation, a speaker does not only tie in with the communicative format established by a co-interlocutor (Goodwin/Goodwin 1987) but s/he also reuses linguistic material in order to build conversational action (Goodwin 2013) and actively practice particular language use. Although Anderson et al. (2001) point to the existence of "snowballing" of argumentative strategies among peer-talk in classrooms, recyclings of peer utterances have not yet been examined systematically.

The present study thus explores the question of whether recyclings of co-learner utterances occur in teacher-fronted whole-class discussions and if so, what recycling practices can be identified. Assuming that recyclings may prove a particularly useful resource when it comes to coping with complex discursive demands, we focus on instances where students are required to produce "big packages" (Sacks 1995; Quasthoff et al. 2017), such as arguments, reports or explanations. We draw on a corpus of video recorded lessons in grade 5 of German Secondary Schools (language classes, biology, maths, history) and use an interaction-analytic approach (Quasthoff et al. 2017) to compare repetitions of linguistic surface structures and underlying global structures in students' neighbouring big packages. In our lecture we present prototypical examples of students' recyclings and show that prior student utterances may be re-used at different levels (e.g. lexical level, syntactic level, level of textualization). The different types of recyclings are discussed with regard to their role in facilitating participation in discourse practices and developing discourse skill over time.

Students' practices in educational peer talk: On the accomplishment of mutual helping

Panel contribution

Ms. Denise Robbins¹

1. University of Wuppertal

Mutual helping is a frequently occurring activity in the classroom in which students negotiate their individual problems with their classmates and thus independently organize and shape their subject-specific learning processes. In educational contexts, helping generally takes place alongside other classroom activities, such as the processing of tasks given by the teacher or even during class discussions in plenary phases. Depending on the significance or urgency of the difficulty in question, the students resort to different practices in order to solve the problem (Wakke/Heller, 2022).

Previous studies on learning-oriented peer assistances already suggest the existence of different “forms of help” (Beaumont, 1999, p. 243), such as copying (Beaumont, 1999), sharing solutions, or providing explanations (Webb/Mastergeorge, 2003; Svahn/Melander Bowden, 2021; Wakke/Heller, 2022). They further reveal that these different forms comprise communicative requirements of varying complexity and allow the co-participants to a variable extent to engage in the construction of problem solutions and thus of knowledge. However, a systematic study of helping practices in educational peer interaction, their sequential unfolding, and the discursive demands they pose on learners has not yet been conducted.

The contribution addresses this research gap by examining students' mutual helping as an activity that is interactively constituted and sequentially organized, focusing the following research questions: 1) What interactive practices do learners draw upon when helping each other with their learning and how are these practices organized? 2) Which participation structures do the practices entail? The data are based on 16 videotaped German lessons from two primary and two secondary school classes (grade 2 and 5). The sequences of interest were transcribed and analyzed using ethnomethodological conversation analysis.

The results indicate that the repertoire of helping practices is highly diverse and includes both sequentially and interactively uncomplex locally organized (e.g., answering information questions, confirming already developed solutions) and complex discursive practices (e.g., explaining, arguing, advising). Moreover, regarding the underlying participation structures, different interaction modes that are largely independent of the practices are evident. Hence, the problem-solving process may be primarily the epistemic responsibility of the helping person, who *provides a (candidate) problem solution*. Alternatively, the participants may discuss different potential approaches and *co-construct solutions*. Thus, the distinct helping practices in conjunction with the interaction modes induce different learning opportunities for the learners.

Students' vocabulary explanations in a beginner-level L2 French classroom: a conversation analysis perspective

Panel contribution

*Ms. Loanne Janin*¹

1. University of Neuchâtel

This contribution addresses L2 students' participation in vocabulary explanation sequences in classroom interactions. Explanations are one of the most typical activities in the language classroom and require mobilizing language, logical thinking, as well as adapting to others and context. They can thus present a challenge, to produce and understand, particularly for students who have limited L2 resources and cannot rely on a shared L1 between them or with the teacher. By zooming in on students' practices to provide vocabulary explanations, a responsibility traditionally assumed by the teacher, I demonstrate how students take initiatives, challenge institutional roles and become active participants in classroom interactions.

My data consist of 50 hours of video-recorded whole-class interactions in a language school for adult migrants in Switzerland, where students follow intensive beginner-level L2 French courses. The collection-based study draws on multimodal conversation analysis (Mondada, 2018) to investigate how vocabulary explanations are accomplished, sequentially organized and how other students respond to them.

More specifically, I will discuss

- how students mobilize a set of linguistic and multimodal resources, including depictive gestures, gaze and classroom artifacts, to provide vocabulary explanations;
- how students respond to these explanations, for instance by claiming or demonstrating (non)understanding.

The analysis builds on previous research on student's initiatives in explanation sequences (Kääntä & Kasper, 2018; Koole, 2010; Merke, 2016; Stoewer & Musk, 2019; Tai & Brandt, 2018; Waring, 2011). It shows how helping their peers to solve knowledge gaps allows students to demonstrate both linguistic and interactive expertise, and to collaboratively create 'frames for their own learning opportunities' (Mortensen, 2011, p. 157). The findings contribute to a deeper understanding of the functioning of vocabulary explanations in the L2 classroom and, in particular, of the specific participatory dynamics in beginner-level language classes for adult students. They also highlight the multimodal participatory practices adopted by students, enabling them to participate actively even with limited language resources.

Taking notes while leading the discussion: Multiactivity in student-led discussion circles

Panel contribution

*Dr. Hanbyul Jung*¹, *Dr. Gabriele Kasper*²

1. *Seoul National University*, 2. *University of Hawaii at Manoa*

Diverse institutional activities are routinely accomplished with the help of notes. From a conversation-analytic perspective, notes have been examined as a category of inscribed object in use (Day & Mortensen, 2017). Across activity types, (1) the production and use of notes is tightly coordinated with the talk and embodied practices in the unfolding interaction, such as gazing and nodding (Svinhufvud, 2016); (2) notes are produced in orientation to their anticipated institutional use. Ro (2021) demonstrates how tutors in language tutorials take notes of student performance and subsequently mobilize the notes as an interactional resource for advising the students on how to improve their language use. Other studies predominantly examine notetaking, i.e. how notes are generated in situ as emergent objects.

Prior research also suggests that notetaking is organized differently in dyadic interaction between a professional and a client and in multiparty interaction among members collaborating on a joint project. In asymmetric encounters such as police interrogations (Komter, 2006), student counseling (Hazel & Mortensen, 2014; Svinhufvud, 2016), and language tutorials (Ro, 2021), notetaking is almost exclusively done by the professional as a category-bound activity. In contrast, in such multiparty events as a collaborative design activity in a business setting (Mortensen, 2013), citizens' planning meetings (Nissi, 2015), and a peer support group (De Stefani et al., 2016), the records or statements are produced collectively by the group members.

Our study further examines how notetaking is managed in coordination with an ongoing institutional activity. The setting is an advanced course in English for academic purposes at a university in South Korea. One course objective is to lead an academic discussion, implemented through several class sessions of student-led discussions on controversial current topics, and report the outcome to the whole class. The video-recorded data comprise 30 discussion circles in groups of 4 students for a total of 15 hours. The students, 43 in all, speak Korean as their first language and are advanced speakers of English. During the discussion circles, the discussion leader takes notes, either handwritten or typed on a laptop. Using multimodal conversation analysis (Mondada, 2019), we examine how the discussion leaders accomplish note-taking while leading the discussion as a multiactivity (De Stefani et al., 2016; Haddington et al., 2014). Specifically, our analysis will elucidate (1) how the discussion leaders manage the two activities in orientation to the current phase of the discussion and the later report to class report, and (2) how the notetaking changes from a peripheral to the focal activity as the discussion approaches its final stage.

“Students’ summons practices for initiating problem solving in small group work – and their interactional consequences.”

Panel contribution

***Dr. Marit Solem*¹, *Dr. Karianne Skovholt*¹**

1. University of South-Eastern Norway

How do students’ initiate the need for assistance from the teacher while working in small groups – and what are the interactional trajectories that follow the students’ initiations? When students work in small groups in classrooms, situations arise where they need the teacher’s assistance to continue with their group work and explicitly request assistance by using verbal initiation cues. We know a lot about how dyadic conversation starts (Schegloff, 1968, 1979), and research on conversational openings in dyadic interaction has found that participants follow a set of modular components to build a copresent opening phase (Pillet-Shore, 2018). However, we know very little about the methods students and teachers use to initiate and coordinate problem solving in classroom group work, even though these activities occur regularly in classrooms. This paper contributes to the study of conversational openings in multiparty interaction in an institutional setting and how the opening contributes to the trajectories for classroom problem solving.

The study is based on a collection of small group work (3 – 5 students) in six Norwegian secondary school classrooms. Using conversation analysis, we transcribed and analysed group work in 11 lessons with a total of 54 student initiated problem solving activities. Analysis revealed that students initiate the interaction in different ways; they summon the teachers by hand raising, by name or a combination of these. Preliminary results show that when students summon the teacher, they are also held responsible for initiating the problem solving activity, and the summons are followed by three types of problem formulations: 1) No-knowledge claims (“I don’t understand anything”); 2) Information seeking questions (“What do literary devices mean?”) and 3) Knowledge displays (Hjalmar was a therapist, right?). The findings suggest that the way students initiate and present the problem solving is consequential for the development of the proceeding interaction. The study provides empirical basis for teachers’ assistance in classrooms, and we discuss the pedagogic implications of the student initiated entries for the proceeding teacher-student-interaction.

“Turn your brain off”: The coaching process of young children

Panel contribution

*Ms. Cynthia Hicban*¹

1. Queensland University of Technology

The capacity for young children in early childhood education settings to engage in peer-to-peer teaching is well documented (Smith, 2012; Williams, 2007). Indeed, the concept of a ‘more knowledgeable other’ moving peers through their ‘zone of proximal development’ is the cornerstone of Vygotsky’s (1934/1978) work in socio-cultural theory. Bruner’s (Wood, et. al, 1976) work on peer-to-peer scaffolding has also been shown to improve children’s participation in early childhood settings (Theobald, 2019). What is less common is the concept of a ‘child-coach’ and the capacity for young children to enact the same practices associated with coaching. Conversation analysis has been used to explore adult coaches in sport (Evans & Fitzgerald, 2017; Miller, 2012; Mondada, 2018), counselling (Stommel & van der Houwen, 2013), and business (Aksu, 2014). This paper uses ethnomethodology and conversation analysis to identify the features of how young children in an early childhood education setting display, negotiate, and co-construct a coach-coachee relationship. It also examines how peers manage risk in the absence of an adult and overcome the epistemic dilemma of access and authority (Heritage, 2011; Sacks, 1984; Versteeg & te Molder, 2016). The study draws on video recordings of educator-child and child-child interactions in an early childhood education setting in Queensland, Australia, featuring children aged 15-mths to 5-years-old. The multimodal transcription is based on Mondada, version 5.0.1, Nov.2019, (www.lorenzamondada.net/multimodal-transcription). The example is a short sequence of children climbing above the sanctioned height in a kindergarten. Findings include how ‘my side’ tellings (Pomerantz, 1980) can be applied by young children to manage risk and describe the potential characteristics of child-led coaching. The paper contributes to the recent investigation of Arminen and Simonen (2021) into the multidimensionality of epistemics in interaction, and how risk and knowledge co-habit in institutional encounters.

Asymmetric interaction as a triggering notion in the speech therapy in the Language Clinic fields

Panel contribution

Dr. Lucia Arantes¹, Dr. Maria Francisca Lier-DeVitto¹

1. PUC-SP

Pragmatics has, indeed, become a source of investigation for both Language Pathology researchers and for speech-therapists. Such a widespread tendency is frequently attributed to the fact that Pragmatics has as central trends of reflection and discussion notions which are core problems for researchers and clinicians who are interested and who deal with questions related to communication and interaction difficulties. In other words, asymmetric interactions and communication problems are permanently at stake in those theoretical and clinical areas. This paper focuses on what we consider “lack of rigor” in the movement of extraction of the interaction and communication concepts from Pragmatics and their subsequent incorporation in the Speech Therapy therapeutic discourse. It is claimed in the above-mentioned field, that patients’ communicative behaviors can be better described with tools imported from that area of Pragmatics. In this article, we discuss the limits of the application of Pragmatics, especially the notions of interaction and communication in speech-language pathology studies. Our critique focuses on the thoughtless use of the notions of communication and interaction and not on the conceptual elaborations that drive the field of Pragmatics. The discussion we make has two defined objectives, namely, to distinguish classical Speech-Language Pathology and Language Clinic, as proposed by Lier-DeVitto (1997, 2000, 2006, among others), through the critical comments that we make and, also, to define the way in which the notion of communication/interaction is understood and theoretically worked in the field of Language Clinic, which has its roots in Interactionism in Language Acquisition, as proposed by De Lemos (1992, 2002, 2005, among others). It is understood, in this context, that Psychoanalysis takes place: difference and non-similarity between participants in a dialogue is taken as the driving force of the relationship among speakers. Segments of intriguing clinical interactions will be presented and discussed.

Body and language: speech acts and the constitution of the subject-researcher in language acquisition

Panel contribution

*Ms. Glória Carvalho*¹

1. *Universidade Católica de Pernambuco*

This work is based on the position taken by Shoshana Felman (2003). It is a unique position on the relationship between body and language, highlighting the intersection between the Austinian theory of speech acts and psychoanalysis. The author assumes the proposal that an act is what leaves traces. As a consequence, there is no act without linguistic inscription, that is, without language effects. Thus, this position breaks the dichotomy between body and spirit, between matter and language. When it comes to the human, the body is, therefore, a speaking body. The relationship between body and language, between act and speech is, however, paradoxical, insofar as it is inseparable and incongruous. For Shoshana Felman, the act cannot know what makes it and, as a consequence, the act (of language) subverts both consciousness and knowledge (of language). Approaching performatives in their enigmatic and paradoxical character, that author also discusses the criterion of “happiness”. By bringing this proposal to the field of language acquisition, we raise the following question: how the speech act of the other, in their relationship with the child, is inscribed in the child’s body. In an inverse movement, we also ask: how is the child’s act of “speech” inscribed in the body of the other (the mother or the investigator)? Firstly, the notion of speech must be broadened, so that it encompasses sound manifestations and other manifestations of the child’s body, extrapolating the Saussurean notion of speech, which allows us to treat them as acts of “speech” that affect the other. Without intending to answer the questions posed, we aim to approach them taking some consequence of the performative proposal, a consequence that could be stated in the following terms: the speech act, both of the child and of the one who dialogues with him/her, constitutes the subject (in their unconscious) as a researcher of children’s language. In order to address the issues raised in this work, we will deal with speech acts in their paradoxical dimension both from Austin and also (and above all) based on the reading of the austinian performative analysis made by Shoshana Felman, in which she makes visible the intersection of this analysis with the psychoanalytic proposal, especially with regard to the relationship between body and language. Thus, considering that this intersection proposal could shed light on some questions that arise in the field of investigation of language acquisition, we chose the question of the researcher in his/her relationship with children’s speech, which we will seek to base empirically with the analysis of speech records of a child in spontaneous dialogues with her mother.

L'asymétrie dans les dialogues de l'enfant avec l'adulte. Entre faits de langue et effets dans le discours

Panel contribution

Dr. Rosa Figueira¹

1. *Universidade Estadual de Campinas*

Dans la perspective ouverte par ce *panel*, parmi les enjeux propres aux domaines de la Clinique et de l'Acquisition du Langage, les chercheurs ont l'occasion de discuter, conforme leurs documents, des dialogues qualifiés comme *asymétriques*. Notre contribution consistera à faire connaître des exemples de l'asymétrie dans le parcours de l'enfant avec la langue, selon une approche sémantico-pragmatique, consacrée au *dictum* et aux effets de *dire*. Nous cherchons à évaluer comment les concepts et les principes de la pragmatique (Austin 1962) sont utilisés dans l'analyse, sans perdre de vue des aspects du fonctionnement linguistique, dans la trajectoire des enfants brésiliens (âgés 2 à 5 ans) avec le portugais-langue maternelle. Le *corpus* est constitué par des notes prises dans un journal et des enregistrements audio, auxquels nous ajoutons quelques données sur l'acquisition du français (*Les Jeux de Mots de l'Enfants*, Aimard 1975). Les occurrences enregistrées, en touchant les limites consolidées de la langue, provoquent chez le destinataire, en raison de leur caractéristique particulièrement divergente de l'usage adulte, une étrangeté, voire le rire. Des effets, intégrés à la description, permettent d'exploiter quel est le fait linguistique dont ils sont issus, dans une approche théorique cherchant à valoriser la *singularité* de la parole de l'enfant, face à celui qui l'interprète ; pour reprendre un terme de De Lemos (2002), il s'agit de faire attention aux *vicissitudes* de la parole de l'enfant. En voici quelques-unes. Il existe (i) des *répliques* (*non, ce n'est pas X, c'est Y*), (ii) des *jeux sonores* entre des éléments phoniques purs, qui résonnent dans une cascade de substitutions, auxquelles l'interlocuteur peut rester indifférent, ou il peut, au contraire, partager avec l'enfant le moment ludique du jeu – domaine auquel il faut considérer les notions de *figure vocale* et *forme*, du manuscrite *De l'Essence Double du Langage* (Saussure 2002). Nous utilisons également la réflexion saussurienne pour (iii) les innovations de vocabulaire, fondées sur le jeu ouvert du *mécanisme linguistique* (*Cours de Linguistique Générale*, Saussure [1916] 1971) ; celles-ci affectent les échanges verbaux, parfois sujets à l'interprétation divergente de ce qui est dit. Nous ajoutons des questions à propos de (i) *l'homonymie occasionnelle*, source de non-coïncidences du dire. Que se passe-t-il lorsqu'un élément homonymique émerge dans un acte de langage ? L'enfant est-il sensible à la duplicité de significations ou en est-il indifférent ? Un thème surgit dans ce scénario : le circuit d'interaction entre les interlocuteurs révèle la zone de *l'équivoque*, affectant, de différentes manières, l'enfant et l'adulte (ou le patient et le thérapeute). Les exemples s'attachent à contempler l'espace empirique qui se tient sous une base théorique commune (De Lemos 2002 ; LierDeVitto et Carvalho 2008). Les trouvailles enregistrées montrent la *position* du sujet par rapport à la langue et à l'autre, ses vicissitudes dans une interaction qui se présente *hic et nunc*.

Les asymétries du dialogue: que peut-on dire sur l'argumentation entre l'adulte et l'enfant ?

Panel contribution

Prof. Maria Fausta Pereira de Castro¹

1. Universidade Estadual de Campinas- UNICAMP/CNPq

La linguistique moderne attribue à la Pragmatique l'étude du langage à partir du point de vue des sujets parlants, de leurs choix, mais aussi des contraintes qui leur sont imposées lorsqu'ils utilisent la langue dans une interaction sociale (Mondada 1997, Parret 1988, Crystal 2008). Dans la foulée de cette question suivent - parmi tant d'autres éléments de l'univers de la pragmatique - les principes qui régissent la communication, le problème de l'intention des interlocuteurs et leurs capacités mutuelles à interpréter le point de vue de l'autre. Dans cette perspective et en harmonie avec le thème de ce *Pannel*, notre travail porte sur l'argumentation en jeu dans l'interaction entre l'adulte et l'enfant. L'argumentation dans la langue est un point sensible dans l'étude de l'asymétrie entre les participants au dialogue. Milner (1978: 101) précise le mode de communication en affirmant que « deux êtres parlants sont nécessairement et réellement distincts et que d'aucun point de vue leur différence ne peut être comblée. ». C'est ainsi que un tel modèle fonctionne comme un masque qui appose à la relation de la conjonction impossible le principe de la symétrie: la non-conjonction devient ainsi l'espace de la communication entre paires. S'il est vrai que la non-conjonction se maintient à l'arrière-plan de la mise en scène, il est tout de même possible de la nier par le biais de certaines démarches. Dans ce contexte de discussion notre but est d'explorer la relation adulte-enfant, tout en tenant compte du fait que, malgré l'extrême asymétrie entre la parole de l'un et de l'autre, la langue, par sa dimension performative (Austin, [1962]1990) soutient le dialogue entre la mère (ou l'adulte) et l'enfant. Dans cette perspective et à partir de notre lecture de la formulation de Ducrot et Carel (s.d.) sur l'argumentation dans la langue, nous la posons comme contrepoint ou contention de la dérive d'un énoncé. De la sorte, comme parole toujours dirigée à un autre, l'argumentation instaure dans le dialogue des effets de conversion de la disparité en nivellement de la différence, en oblitérant « la topologie de la non-conjonction » (pensons, par exemple, à l'incorporation d'arguments de l'adulte par l'enfant). En revanche, en tenant toujours compte sa présence en sourdine, nous signalerons dans la structure du dialogue l'irruption de la non-conjonction, animée par la singularité de la parole de l'enfant. Des extraits de la parole de l'enfant en relation avec l'adulte constitueront la base empirique de cette étude.

Symptomatic speech and debility: intriguing problems concerning asymmetric interactions

Panel contribution

Dr. Luciana Carnevale¹

1. *Universidade Estadual do Centro-Oeste*

This study focuses on a specific phenomenon concerning *nonsensical dialogical occurrences* motivated by speech productions which systematically frustrate the interlocutors' expectations. The first inquiries on the subject matter arose from the speech therapy clinical care of a 22-year-old boy, Mário, diagnosed with Down Syndrome. His speech was often disturbing because it unexpectedly deviated from the ongoing dialogic direction or monologic narrative construction. One can understand why the boy's parents said that they could not hold a conversation with him and also that they had difficulty making sense of what he was saying. These complaints were responsible for their demand for therapeutic care. Up-to-date studies found in the areas of Language Pathology and Language Therapy generally refer that subjects with Down Syndrome are "quite sociable" and "cooperative" from a communicative point of view. The authors argue that, although there may be some impairment in "speech intelligibility", communication "repair strategies" include the production of gestures that end up "compensating" for this deficiency and enabling the interlocutor to "capture" communicative intentions and infer meanings during a "conversation" (CHAPMAN, 1997). Dialogical problems, when present, are due to the inability of these subjects to offer referential clues that can facilitate the understanding of what they say. (ABEDUTO & MURPHY, 2004). It is stated here that the pragmatic aspects mentioned above have not received due attention. Mario's utterances, to be presented and discussed in this paper, do not fit or match the descriptions and explanations found in the literature. Mario does not make use of communicative "adjustments", he does not reformulate his speech, nor do gestures appear to "facilitate" understanding. Mario's performance could be seen as an "exception to the communicative cooperation rule" attributed to subjects with Down Syndrome. In this paper, we intend to present an alternative theoretical and clinical approach to the asymmetrical dialogue involving patients with the aforementioned syndrome. We intend to shed light on the research program called Clinic of Language, proposed by Lier-DeVitto (2002/2006 among others), based both on European Structuralism (Saussure, Jakobson, Benveniste) and on Psychoanalysis (Freud, Lacan).

“I don’t interview Blacks”: (anti)racist narratives, Blackness and Whiteness in the corporate context.

Panel contribution

*Ms. Cleide De Mello*¹

1. Pontifícia Universidade Católica do Rio de Janeiro (PUC-Rio)

This research began in 2016, when I was working at a non-profit institution that prepared Black youth in the favelas in Rio de Janeiro - thus, from very low-income families - to enter the job market. I soon realized that despite our efforts as Social Educators to provide participants with educational resources so that they could apply for jobs in companies, they were hardly ever called for job interviews. My suspicion of racism echoed when a White businessman posted a clearly racist occurrence on the LinkedIn social network in 2017. He had recommended a highly qualified Black acquaintance of his for a job opening, but when the recruiter saw the skin color of the candidate, he immediately refused to talk to him, saying: “I do not interview Blacks”. This post generated more than half a million views and made me realize that it is not enough to qualify Black youth to work in companies, if companies are not qualified to receive them because of corporate racism. The businessman who posted the complaint became an activist for greater diversity in companies and also part of a group called “CEOs Legacy” with 30 other executives, who created the “Impact Movement-CEOs for Diversity and Inclusion (D&I)”, hitherto unprecedented this way, with the involvement of top business executives. As of May 2020, due to the vertiginous increase in anti-racist protests around the world over the brutal murder of George Floyd in the USA and of Alberto Freitas in Brazil, there has been growing interest from companies, many of them global, in hiring and promoting Black professionals, and in anti-racist education programs as well. This interest in D&I among White executives raised the following research questions: 1) What beliefs and ideologies of Whiteness and Blackness are in conflict in the corporate environment? 2) How do these CEOs create and grow their engagement in anti-racist movements? 3) How do narratives of engagement, defense and action for racial inclusion in companies support and strengthen (or not) these anti-racist movements? To answer these questions, I have created data corpora based on in-person interviews and on the launch live of the Impact Movement. With an interpretative qualitative methodology and the epistemological support of intellectuals - mostly Black - on Narrative Analysis, Race and Racism, Whiteness and Blackness, Diversity and Inclusion, I have analyzed the narratives of three CEOs of the aforementioned Impact Movement and three representatives of the Black Movement who were invited as consultants for this D&I project. The results so far are showing that CEOs are very concerned about hiring Blacks and using “politically correct” language, for fear of having their companies “canceled” from the market. Although the end of racism, which has lasted for five centuries in our society, cannot yet be seen, any pro-change movement is welcome, as it allows the rise of a generation of Blacks who, until now, even with academic and professional qualifications, is out of the labor market or underemployed, in a country where 56% of the population is Black.

Black resistance through oral narratives in Brazilian universities

Panel contribution

*Mrs. Natália Felix*¹

1. Pontifícia Universidade Católica do Rio de Janeiro (PUC-Rio)

The present research is part of my thesis and aims to approach the identity construction forged from the orality of young black students in the academic context. To fulfill this purpose, we appropriated the analysis of the narratives in their individual and collective construction of themselves and their peers, through the meetings held at the Coletivo Nuvem Negra (PUC-Rio). In the context of the consolidation of a black collective that includes the trajectories, experiences and challenges experienced by its participants, we are interested in deducing, through oral narratives, how these young people construct themselves and are constructed in the collective. Moreover, our research is anchored in the way in which the construction of these narratives and the movement of the aforementioned collective move the racial and territorial tensions involved in a mostly white academic context and how these tensions reinforce the structural racism (ALMEIDA, 2018) very strong and present in the Brazilian conjuncture. This research presents as theoretical key the Narrative Analysis (BASTOS AND BIAR 2015; MOITA LOPES, 2006; RIBEIRO AND GARCEZ, 2002), from intersections that deprecate the racial point of view of Language (FANON, 2008; NASCIMENTO, 2019; SILVA SOUZA, 2011), besides serving as a highlight for the reverberation of southern voices (BOAVENTURA SANTOS, 2009; GONZALEZ, 1984).

Thus, we are interested not only in language/discourse as an instrument of communication and viability of meaning, but also, and mainly, in the negotiation of social and identity constructions that are made from interactional contexts. Through the participant linguistic exchange, we believe it is possible to deduce the relations established between the identity construction that the subject makes of itself and the endorsement received by his interlocutor in the creation of this self. In this sense, identity would be revealed from the interactional discursive practices (MOITA LOPES, 2002).

This research analyzes the narrative of a former student of PUC-Rio. The narrative in question stems from the data generated in my thesis and seeks to deduce, through a Labovian perspective, how his speech reinforces places of conflict and reaffirmation of whiteness (SOVIK, 2009), as well as the importance of aquilombing spaces, such as the 'Nuvem Negra' collective, built by the students of the institution itself. It is also worth noting that in addition to functioning as a space for the construction of identities and presentation of new social practices, they point to new pedagogies woven through a critical racial literacy (FERREIRA, 2014) and reverberate marginalized voices, the voices of the South.

Keywords: Narratives; Race; Identity; Resistance; Literacy.

Brazilian social movements and their narratives as a tool in the fight for change

Panel contribution

*Dr. Etyelle Pinheiro de Araujo*¹

1. Pontifical Catholic University of Rio de Janeiro

Contemporary social movements have been studied from different perspectives, and particularly in terms of the various strategies they use to denounce problems in the public sphere. The main purpose of this paper is to observe how storytelling has been used as one of the most important discursive strategies of social movements in the Global South. To do so, I analyze how narratives shared by Black Brazilian mothers engaged in social movements speak to wider issues of structural and structuring racism, as well as to the banalization of violence against Black communities. These are women who have lost their children to police brutality as part of the so-called “war on drugs,” which largely takes place in Rio de Janeiro’s favelas. This study draws on Narrative Analysis (BASTOS and BIAR 2015) and is underpinned by an interpretive qualitative research methodology. The corpus includes narratives told by Black Brazilian mothers at events and demonstrations held in 2018/2020 and organized by movements such as the “Rede the Comunidades e Movimentos contra a Violência” and the “Mães de Manguinhos.” Guided by an understanding of narrative as a device which organizes human experience (Linde, 1993; Bruner, 1997) and as a powerful tool operationalized by social movements to pressure the State (De Fina, 2020), initial findings suggest the existence of a prototypical narrative, here called engagement narrative, which organizes the suffering over the loss of a child. While widespread among mothers who participate in such social movements, these narratives can be seen as atypical insofar as they disrupt the Labovian canon in a very particular manner. When all the mothers’ narratives are taken together, a parallelism can be seen according to which tragedy is repeated, pain is collectivized and the racialization of Brazilian police violence is foregrounded. On the one hand, their narratives frame the events that led to the death of their children as individual experiences. On the other, such narratives connect the painful shared experience of losing a child to a wider context of violence and structural racism. It is my understanding that these narratives actively dispute long-standing racist discourses and practices which organize police and legal practices, demanding that the State introduce effective, transformative measures. The circulation of such narratives in public spaces and social media platforms may help other activists, as well as family members of those victimized by police brutality, to join the fight for justice.

Discourses of perceived empathy: A sociolinguistic analysis of chronic patients' narratives of medical practices

Panel contribution

*Dr. Mariana Lazzaro-Salazar*¹, *Ms. Grimanessa González-Tapia*¹

1. Universidad Católica del Maule

The assessment of doctors' communication and interpersonal skills is a valuable and well-established method in medical education and counselling because it helps (often doctors in training) to shape the way they deliver diagnoses, initiate therapy, and establish a caring relationship with their patients. Whether evaluating doctors are assessing residents or fellow practicing doctors, some scholars would well argue that the power structures at play in such assessments may be somewhat horizontal as all parties involved share some degree of social and professional recognition in their professional community as well as in the society more generally. What happens, however, when it is patients of the Chilean public healthcare system (often from underprivileged and/or vulnerable backgrounds) who are asked to evaluate their doctors, who, in turn, are foreign and have different cultural backgrounds? In this case, while traditional (top-down) vertical power structures may be in place when patients reflect on formal aspects of the doctor-patient relationship, rather fluid (possibly bottom-up) vertical power structures may have a more crucial role when they reflect on cultural issues and preferences. All in all, this may work to mediate the way patients manage the potentially face-threatening task of assessing their doctors.

With this contextual information in mind, this study draws on seven in-depth audio-recorded interviews with chronic patients of public healthcare institutions of the central region of Chile, conducted by a psychologist using a protocol that involved a question guide and activities with visual cues. Viewing medical empathy as a fundamental pillar in the social construction of the doctor-patient relationship and as a sensitive one in intercultural communication, we analyse chronic patients' evaluations focusing in particular on their narratives of doctors' empathic communication in routine medical consultations in the public system. To this end, this paper builds on the work of Barone and Lazzaro-Salazar (2015, 2016) regarding the assessment of doctors' communication skills, and of Lazzaro-Salazar and Zayts (2021) regarding the role of narratives of personal experience (NoPE) and narratives of vicarious experience (NoVE) in intercultural clinical settings to: 1) identify the pragmatic resources that characterise patients' narratives of doctors' empathic communication; 2) to explore novel intersections of NoPE and NoVE as patients draw on them for multiple social purposes; and 3) reflect on the underlying culture order present in the construction of patients' narratives and the pragmatic resources that characterise them, as patients manage potentially face-threatening behaviour when evaluating their doctors. To conclude, we explore the findings for these three points to contest some of the often-taken-for-granted dichotomic ordering principles of vertical power structures in the doctor-patient relationship.

Marked-body Language in labour narratives

Panel contribution

Ms. Barbara Venosa¹, Dr. Liliana Bastos¹

1. Pontifícia Universidade Católica do Rio de Janeiro (PUC-Rio)

Key words: narrative; mothering; agency; body; affection, birth

This qualitative-interpretive study (Denzin; Lincoln, 2006) aims to analyse the construction and effects of hegemonic discourses (Foucault, 1988) regarding pregnancy and birth by analysing labour narratives of Brazilian mothers located in distinct social contexts.

In the narrative performances (Goffman, 2011) which emerge from three research interviews (conducted both on and offline), we observe how speakers build agency in relation to body/affect (Le Breton, 2004). The narratives of these women - from diverse social backgrounds (in terms of race, class, age, private/public health system users) - are analysed focusing on how these stories build intelligibility that governs social life and which can curtail bodies – leading us to reflect on the pervasiveness of medical discourse and its impacts on the experience of mothering and maternity. Our understanding of gender is based on Matricentric Feminism – a branch of feminism which aims to further mothers' visibility from an intersectional perspective (O'Reilly 2016). As part of an emerging tradition of “undisciplined”, Contemporary Applied Linguistics of Latin America (Moita Lopes, 2006), this study draws on Narrative Analysis (Mishler; 1984; Linde, 1997; Bastos e Biar; 2015), in order to further understanding of locally constructed identities and their relationship with the surrounding world. Our analysis examines the building of “evaluation” (Labov, 1972) - a narrative component which heightens drama, conveying the story's very “raison d'être” - in order to consider the discursive dimension of affect. Our examination of the relationship between culture, discourse, body and affect, enables us to identify the way these insidious discourses leave their mark on mothers; either through reprimands, constraints and the erasure of control over their own corporeality or otherwise by prompting autonomy and agency. Thus, by paying attention to these discursive scars both researchers and research participants are able to analyse, interpret, rework and reimagine the lived experience of labour.

Narrative Analysis and displacement processes: The case of Venezuelans in Brazil

Panel contribution

***Dr. Liana De Andrade Biar*¹**

1. Pontifícia Universidade Católica do Rio de Janeiro (PUC-Rio)

In this work, we reflect on some ways in which Narrative Analysis can contribute to the reception of refugees and asylum seekers in Brazil. The research is theoretically based on the idea that the 'refugee' category is produced performatively (Butler, 1990) in narrative practices in which asylum seekers, social actors in the field of eligibility, media representations and institutional frameworks participate. Here, we intend to observe at least two dimensions of this process.

The first one comes from fieldwork on the Brazil-Venezuela border, one of the critical points of the biggest exodus in recent Latin American history: The recent displacement of Venezuelans due to the massive impoverishment of the population. In 2020, Brazil became the Latin American country with the largest number of recognized Venezuelan refugees, with a total number of more than 46,000 people.

Throughout our ethnographic incursion, we conducted interviews with Venezuelans, state agents and NGO volunteers involved in the reception of migrants. Through the lens of narrative analysis, we identify the main discursive disputes emerging from the first contacts between Venezuelan asylum seekers and the Brazilian population. In this context, we could highlight in the narrative construction of their journeys and their process of insertion and adaptation in Brazil a constant tension between cordiality and hostility.

In the second dimension of the study, we focus on the formal process of determining refugee status in Brazil - a process that fundamentally depends on the applicant's narrative competence and his/her possibility of conforming his/her experience of displacement in a normative matrix about the refugee experience. Based on interviews carried out with different actors involved in the institutional eligibility process we observe, once more within the framework of Narrative Analysis, how linguistic ideologies especially the actors' beliefs about the nature of narrative construction, operate as protagonists of this institutional process. The research results point to the fragility of the category of refuge and the need to think about the discursive-interactive processes of labeling in this field.

Narratives of (re)discovery: perspectives of black Brazilian undergraduate students in processes of racial self-awareness

Panel contribution

Ms. Joana Gomes¹, Dr. Liana De Andrade Biar¹

1. Pontifícia Universidade Católica do Rio de Janeiro (PUC-Rio)

This paper aims to investigate Racial Literacy (FERREIRA 2015; TWINE 2004) and Pigmentocracy (TELLES 2014; DEVULSKY 2021) – one of the racist manifestations which considers skin color an important factor of social stratification. Pigmentocracy privileges light skinned people over darker ones -, and is a topic which emerges in the narratives of light-skinned undergraduates at the Pontifical Catholic University of Rio de Janeiro (PUC-Rio). In these narratives we focus on how the participants construct their racial identities, the meanings attributed to these, as well as how these develop in social interaction, in order to reflect on racial literacy development as a continuous presence at university. The theoretical framework draws on categories stemming from Narrative Analysis (MISHLER 2002; BIAR, ORTON and BASTOS 2021). This enables us to prioritize a micro social perspective, paying attention to the social encounters brought to life during storytelling. The interactions which develop as these story worlds unfold at once reinforce and disrupt settled social arrangements which become visible as a result of narrative practice. Moreover, we observe how the students' identity practices relate to discursive conflicts surrounding racism in a largely white elitist institution situated in Rio de Janeiro's South Zone: PUC-Rio.

Narratives of a “camelô-ambulante”: (Sur)vival on Rio de Janeiro’s commuter trains

Panel contribution

Mr. Douglas dos Santos¹

1. Pontifícia Universidade Católica do Rio de Janeiro

Up and down Rio de Janeiro’s commuter trains, the city’s working class buckles under the strain of latter-day capitalism. These commuters are predominantly made up of babysitters, maids, general services assistants, doormen, and salespeople more generally speaking. In the midst of this group, the salespeople who operate on the train itself are frequently recognized and recognize themselves as a highly stigmatized category of workers. Some of them call themselves “*camelôs-ambulantes*” (travelling salespeople), sellers of the most varied types of products who trade their products on their laps between train carriages and train stations. “*Camelôs-ambulantes*” epitomise a precarious workforce which sustains itself on the edge of neoliberalism. They are their own employers, acting on their own without the support of any legal framework — an undertaking that subsists in a legal grey area (PIRES, 2011). It is thus by analyzing narratives of their toil that the present study aims to identify some of the circumstances that lead “*camelôs-ambulantes*” who work/have worked on Rio de Janeiro’s commuter trains to seek a profession of little social prestige. Drawing on life stories (LINDE, 1993) — narratives, extracted from a semi-structured interview with a “*camelô-ambulante*”, Mr. Geraldo, the proposed analysis pays close attention to the meaning making practices in which he engages as he narrates his experience of work on the train. In addition to the theoretical-methodological resources of Narrative Analysis (LABOV; WALETZKY, 1967; LABOV, 1979; BAMBERG; GEORGAKOPOULOU, 2008) the study relies on *indexicality* (SILVERSTEIN, 2003) to etch out connections between Geraldo’s storytelling practices and the wider context of contemporary work and *pragmatic survival* (OLIVEIRA, 2019) to subsequently identify how “*camelôs-ambulantes*” create ways to exist and survive from their work. The analysis suggests that work for “*camelôs-ambulantes*” such as Mr. Geraldo is a survival strategy, under constant threat from both Rio de Janeiro’s railway system and neoliberalism — an economic system which exploits the poor and encourages competition —, which oppose their presence on the train, in the station, and in society in general. This study finds its social relevance in seeking to understand the facets that underlie the success of neoliberalism according to those who form its basis and, at the same time, are the most harmed ones. This research aims at collaborating academically with the understanding of the narrative as a semiotic resource for the production of meanings that uses evaluations to index an interactional order to social orders. And also, this research instigates the academic debates which have addressed work precariousness in times of uberization, as we understand that as the neoliberal discourse is expanded and naturalized, more stories of social injustice are understood as stories of resilience and personal success.

Narratives- the Weapon of the Powerless: Lay Witnesses’ Tactical Tool

Panel contribution

*Ms. Tasheney Francis*¹

1. University of Manitoba

“I had nowhere to stay,” says McLeod. “My house was . . .”, then following a slight pause “burnt down.”

“You saw your house . . . burnt-”

“Yeah.” Then McLeod adds with emphasis, “I watched it burnt down!”

The above extract is one of the many instances where resident witnesses of the West Kingston Truth Commission use narrative to transmit to ‘the courtroom reality’ (Gibbons, 2003), the lived ‘external reality’ of the deadly invasion of armed forces into their Jamaican, inner-city community. The joint-military operation was to arrest an alleged area-leader, instead, over 70 community members, family and friends died. A national outcry initiated the probe into what exactly happened.

While the overarching goal of a truth commission is to reveal the truth, there are competing communicative goals in courtroom discourse (Coulthard & Johnson, 2007). This paper explores the discourse strategies these traumatized residents employ to effectively participate in the ‘framing contest’ that ensue (Hedley & Clark, 2007). Using Dell Hymes’ (1972) linguistic-anthropological Speaking Grid to delineate the communicative components of the speech event, I examine 12 hours of resident witnesses’ televised interviews. The study reveals how these socially, institutionally and linguistically powerless resident witnesses employ storytelling to rekey the discourse, save face, reassign blame- amidst their institutional constraints, and facilitate role-taking. In doing the latter, particularly, resident witnesses establish agreement and initiate social action through empathy (Coulthard & Johnson, 2007; Bonds, 2009).

The study shows how these lay witnesses exploit the polyphonic nature of narratives by manipulating the production format through reported speech. This in turn facilitates embedded evaluation (Labov & Waletzky, 1967) which protects their positive face (Tracy, 2002), and then allows them to collectively resist cross-examining counsels’ attempts to dehumanize the incident and discredit their witness. Similarly, the data reveal how the multiplayer characterization of narratives allows these lay witnesses, using multimodal codes, to rearrange the participation framework at the intersecting planes of the courtroom and external realities. This way, the witnesses have the audience trade places, have an intersubjective experience of what they went through (Coulthard & Johnson, 2007; Bonds, 2004), and thus challenge the negative master narrative about them and their community.

Public health crisis or typical behaviour? Examining narratives of traffic violence in the Global South from a feminist perspective

Panel contribution

*Dr. Naomi Orton*¹

1. PUC-Rio (Pontifícia Universidade Católica do Rio de Janeiro)

Year on year, traffic violence leaves millions bereft of loved ones and yet millions more with life changing injuries. Although a global public health crisis, until recently, little scholarly attention has been directed to the ways in which such violence is discursively neutralised and thus rendered “typical”. Based on the assumption that public perceptions of traffic violence as an inevitable malaise of contemporary society may similarly be challenged in discourse, this presentation forms part of a broader, ongoing investigation which critically interrogates the construction and contestation of blame in the narratives this violence gives rise to.

Taking Brazil as a case study where - unlike in many parts of the Global North - the covid-19 pandemic has failed to bring about significant changes in the division of public space or attitudes towards its use, this paper draws on newsworthy narratives produced by traditional media outlets, as well as their textual trajectories: readers’ comments, as well as recordings of public debates held by a group of feminist bicycle advocates in Rio de Janeiro, of which I am a participant.

The narratives of resistance which unfold in these debates – disconcerting stories of everyday urban violence and misogyny featuring unconventional protagonists - frequently defy both narrative conventions and Brazilian norms of femininity which dictate that, on venturing beyond the domestic sphere, women should remain subdued and demure, while simultaneously adhering to crippling aesthetic standards. Moreover, since the acceptance of displays of physical prowess – including cycling in traffic – is largely contingent on their appealing to the male gaze, the “transgressions” which provide the impetus for the group’s storytelling practices are often met with specifically gendered sanctions, or forms of “bikelash”, from those who subscribe to conservative ideologies. Faced with such adversity, these stories act as a central force in the group’s reimagining of public space, as participants attempt to reconcile their experiences with common sense beliefs, re-signifying gendered slurs and confronting the territorial norms which simultaneously constrain their agency.

Despite these processes of resignification, discursive struggles over meaning which punctuate both narrated and narrative worlds highlight the tension between competing interpretations of gendered traffic violence and the “injurious signs” by which this is framed. Furthermore, the consistent framing of story protagonists as atypical, threatening members of society - by both hegemonic media and by the very victims who resist these master narratives - means responsibility for the perpetuation of systemic traffic violence fails to be levelled at the State or society more generally. This oscillation between acts of resistance and resignation to the sanitised violence which characterises their daily commutes suggests the study of atypical narrative practices in the Global South may be key to broadening debates on the inevitability of modern-day violence and the ways in which cities around the world may eventually be reconstrued as inclusive spaces.

South re(existences): Narratives of women in the face of gender violence in Rio de Janeiro

Panel contribution

*Ms. Alice Santos*¹

1. Pontifícia Universidade Católica do Rio de Janeiro (PUC-Rio)

This research is part of the production of my doctoral thesis in which we work with the narratives of women who suffer/have suffered domestic/gender violence and are/were assisted by the MMSG - Movimento de Mulheres, a philanthropic association which provides assistance to these women. MMG is located in the city of São Gonçalo – an underprivileged metropolitan region of the state of Rio de Janeiro, taking as a starting point the moment of reception of these women in the support group to the path they take to new forms of continuities in their lives. The generation of data follows an ethnographic and participatory perspective (MISHLER, 1986) and relies on interviews with subsequent transcriptions. The analysis is guided by the lens of Narrative Analysis, the concepts of ‘face work’ and ‘embarrassment’ (BASTOS, 2005; BASTOS and BIAR, 2015; GOFFMAN, 2009; BUTLER, 1990), based on the idea that identities are collectively constructed and that the hegemonic gaps, once reached, are agents of transformation in the world through language. Moreover, language/discourse is understood not only as a tool of communication and production of meaning, but also as a vehicle for the negotiation of social and identity constructions. (MOITA LOPES, 2016)

We consider that analyses of oppression and situations in which rights are imminently threatened are not intended to give voice to research collaborators, but rather to echo these participants in order to disrupt hegemonic discourses of subordination, which make society a favorable place for these violations to occur (hooks, 1989; HALL, 2003).

Therefore, in this analysis we try to understand the ways in which the narratives and identities that are constructed by the participants can be dialogically related to other dominant discourses and coherence systems validated in common sense about women who suffer gender and domestic violence. We further examine how their reception by MMSG is able to act as a turning point in their process toward (re)existence, as these women reverberate through collective resistance, rising up to create new paths from the South (BOAVENTURA SANTOS, 2019; FREIRE, 1992; GONZALEZ, 1984).

“You’re part of the family, aren’t you?”: Applications of narrative analysis to the critical racial literacy of health professionals.

Panel contribution

Dr. Clarissa Souza ¹, Dr. Liliana Bastos ¹

1. Pontifícia Universidade Católica do Rio de Janeiro (PUC-Rio)

The reported speech featured in the title of this abstract may be examined from at least two analytical perspectives: as a medical appointment, in which a white female professional and a black female patient participated, and as a manifestation of the structural racism (Almeida, 2019) that organizes interactions in contemporary Brazilian society. Taking this into account, we have analyzed segments of that consultation in order to further understanding of the construction of this social event from an intersectional feminist perspective (Crenshaw, 1989; Akotirene, 2019). This perspective includes the observation of race, class, and gendered markers, with a view to explaining the possible effects of the whiteness of a health professional who cares for a black patient. The analytical methodology is qualitative and interpretive (Denzin; Lincoln, 2006) and the selected excerpts contain interactional narratives (Labov, 1972; Mishler, 2002; Bastos; Biar, 2015), chosen for being a productive locus for the identification of identity performances (Bastos, 2005). In this case, the analysis of identity performances proves to be relevant as it enables the oppressive mechanisms of whiteness in discourse to be highlighted. Thus, the analysis speaks to critical whiteness studies and “narcissistic pacts” in racism (Bento, 2002) insofar as it denounces white privilege and the tendency to validate only topics that concern white people. Although no direct conflicts or racist slurs are identified in the interactions analyzed, the results suggest that structural racism can have a negative impact on interracial doctor-patient interactions—even those that take place between women. These negative effects include patronising black patients, disregarding their complaints and circumstantial statements, as well as the dismissal of the racially inflected power structures which still shape relations between domestic workers and their employers in a post-slavery society—as underscored in the reported speech selected for the title of this abstract. As such, our research suggests an urgent need for the implementation of critical racial literacy (Borret et al., 2020; Ferreira, 2014) for health professionals, in general, and physicians, in particular.

Constructing Stigma against the Socially Marginalized amid the COVID-19 Pandemic: As Seen in Re-narrated Stories about People with Mental Illness

Panel contribution

*Mr. Yingqian Zhang*¹

1. Osaka University

Since the outbreak of COVID-19, instances of various sorts of discrimination and exclusion have been reported to globally escalated as the numbers of cases and deaths grow. Existing studies have employed quantitative approaches to interrogate discrimination and exclusion based on racism and occupation; they report that people of Asian, in particular, Chinese, descent have become the target of racial discrimination, especially after Western politicians have racialized the virus as “China Virus” (He et al. 2020; Reny & Barreto 2022) and that medical workers and their families in Japan and Nepal are facing exclusion due to their high risk of exposure to the virus (Makino et al. 2020; Singh & Subedi 2020). To further explore the potential negative impact on the socially marginalized, this research employs qualitative approaches to interrogate the narrative of people suffering from mental illness amid the COVID-19 pandemic and aims to reveal how those people are stigmatized through re-narration and, thus, exclusion and discrimination against the socially marginalized are constructed and reproduced.

The data of this research comprise three episodes excerpted from an online one-to-one interview between the author and a middle-aged Japanese woman in 2021. Invited to share any experience about the COVID-19 pandemic, the interviewee talked about her acquaintance who had been suffering from mental illness for years and had claimed to feel “relieved” watching others suffer from the pandemic. This original story was re-narrated, respectively, by the interviewee and the interviewer throughout the three episodes. Using the positioning theory (Bamberg 1997) and the concept of small stories (Bamberg & Georgakopoulou 2008) as the theoretical framework, the current study analyzes the stories and discusses (1) How the interviewee and the interviewer differently re-narrate the original story about the interviewee’s acquaintance who claims to have a mental illness and (2) What sorts of identities are being constructed in the re-narrated stories, and, thus, what different attitudes against the socially marginalized are present.

By re-narrating the original story, the interviewee constructed her acquaintance as “distorted” and “glad to see others suffer.” Despite the interviewer’s attempt to invoke empathy and reconstruct the acquaintance as “desperate for company” and “comforted to know they are not the only one suffering,” the interviewee further compared her acquaintance to an indiscriminate murderer and, thus, constructed that person’s identity as a potential threat to the society and herself as a quasi-victim from such people. According to Becker (1963)’s labeling theory, people stigmatize others by labeling them as deviant based on behaviors distinct from socially accepted moral codes. This study reaffirms his theory by showing that marginalized groups, such as people with a mental illness, are labeled as deviant for holding “incorrect” opinions or emotions than others within a global context of an atypical situation, i.e., the COVID-19 pandemic. Having analyzed the process of constructing identities and conveying attitudes against the socially marginalized in narratives, the study revealed the retelling essence of a narrative and how such a narrative could contribute to the increase in stigmatization.

Discourses about Japan's position on nuclear weapons

Panel contribution

Dr. Akira Satoh¹

1. Osaka University

Russia's military invasion of Ukraine shows no signs of stopping. President Vladimir Putin has expressed his readiness to use nuclear weapons, and the world is now facing a very real nuclear threat. Meanwhile, China's modernization and North Korea's development of nuclear weapons has been upsetting the military balance in Asia. Under these circumstances, the first meeting of the States Parties to the UN Treaty on the Prohibition of Nuclear Weapons (TPNW) was held in Vienna, Austria in June 2022 to discuss efforts toward nuclear abolition. Hibakusha from Hiroshima and Nagasaki attended the conference as observers, but Japan, the only country to have experienced nuclear war, did not participate in the process at all. Why doesn't Japan join this treaty? Or more generally, what is Japan's position on nuclear weapons?

In this paper, I investigate the rhetoric in discourses about Japan's position on nuclear weapons, paying attention to the words of Japan's Prime Minister Kishida, whose constituency is the atomic-bombed city of Hiroshima and whose lifework is to realize a world without nuclear weapons, and the criticism against his words.

As the Foreign Minister of Japan at that time, he decided not to participate in the negotiating conferences of TPNW held in 2017, saying that the negotiation could be counterproductive in that it would deepen the conflict between nuclear weapon states and non-nuclear weapon states. He concluded that Japan should act as a "bridge" between the two sides through the framework of the Nuclear Non-proliferation Treaty (NPT) Review Conference, which includes both nuclear weapon states and non-nuclear weapon states, and should give priority to advancing nuclear disarmament in a realistic manner. But critics say his approach is not realistic, since he says that extended deterrence including U.S. nuclear umbrella is indispensable.

In his book published in 2020, he claims that being the only country to have been exposed to atomic bombs in a war is Japan's soft power or "trump card" in appealing to international public opinion for nuclear abolition, and that he will make maximum use of its "moral authority" to mediate between nuclear weapon states and non-nuclear weapon states. But critics say he is too optimistic, idealistic, and complacent about peace. I will examine what the word "realistic" means to Prime Minister Kishida and his critics, and how they represent the position Japan should take with regard to nuclear weapons.

How to survive in atypical situation as minority people: A comparative study of immigrants' narratives in Korea and the UK

Panel contribution

*Ms. Hiroe Takemura*¹, *Prof. Kaori Hata*¹

1. Osaka University

The purpose of this study is to examine how immigrant women, who have been turned to be identified as 'discriminated' by some social transformations, survive in the country they are living, by applying positioning theory (Bamberg 1997, 2004) and small stories (Georgakopoulou 2007).

Georgakopoulou defines the small stories as "an umbrella term that captures a gamut of frequent and salient narrative activities in conversational contexts, such as tellings of ongoing events, future or hypothetical events, shared or known events, also allusions to previous tellings, deferrals of tellings, and refusals to tell" (2012:396). Thus, this study will focus on the small stories to reveal the messages conveying during the interaction in here and now situation.

Firstly, this study analyses how Japanese women deal with the situation amidst the growing anti-Japanese sentiment towards Japan when a boycott of Japanese products took place in South Korea due to the worsening of relations between Japan and South Korea. In the case of Japanese women in South Korea, it was observed that they felt uneasy and uncomfortable when their Korean husbands criticised Japan in South Korea, where bad feelings towards Japan/ese have become apparent. However, in cases where the husbands were neutral between Japan and South Korea, the women accepted their husbands' criticisms of Japan objectively, and appeared to separate their husbands' comments from their husbands' personal intentions. In contrast, when the husbands unilaterally condemned Japan, the women were seen to tolerate their husbands' comments and pass them over, based on the understanding that it is difficult for them, as minorities in Korean society, to express their opinions to the majority. Furthermore, the husbands were not conscious that their comments discriminated against their wives, suggesting that the unconscious comments of the husbands may have caused emotional trauma to the Japanese women as well as giving them the perception that they had been discriminated against by their husbands.

Second is how Japanese women as Asians survive amidst the manifestation of discrimination against Asians during the COVID-19 pandemic. These will be illustrated by analysing the semi-structured interviews that have been conducted as longitudinal studies, and how the identities are represented in the narratives. As well as the Korean cases, the Japanese women living in the UK chose whether they tell their experiences facing discrimination against Asian people. Some told it from the Asian side, as one of the Asian; and some tried to avoid telling the experiences by moving away from the subject. The significant point is that the decision was made how they positioned themselves. The participants who divide Asia into two parts, discriminated/not discriminated, they reveal their unconscious discriminatory way of thinking against the other Asian people, especially China.

For the presentation, actual scenes will be examined by analysing their pragmatical discourse markers, such as overlapping, laughter, filar, silence and so on.

Implicatures in Russian regional news media in atypical situation

Panel contribution

Ms. Anastasia Semenova¹

1. Osaka University

The present study aims to investigate the discourse of regional news media in the Republic of Sakha (Yakutia), a Russian Far Eastern region, during an atypical situation, namely the “special military operation” announced by the Russian government on February 24th, 2022. The law imposing a jail term of up to 15 years for spreading “fake” news about the military and the suspension of independent media (e.g., Ekho stolitsy, Dojd TV, Meduza) indicate a critical discourse moment (Chilton, 1988). Prior research on news discourse during atypical situations has primarily focused on coverage by nationwide media outlets in Russia (i.e., Рябченко Н.А. и др., 2021; Brusylovska & Maksymenko, 2022). However, little attention has been given to Russia’s regional media during critical discourse moments, which could provide valuable insights into the discourse (re)production in territories far from Moscow.

Moreover, this project aims to bridge the gap between studies of top-down relations of dominance and bottom-up relations of resistance, compliance, and acceptance in discourse (van Dijk, 1992; Negm, 2015). This study focuses on regional-level mass media in Yakutia, located in the Far East from Moscow and the Russian-Ukrainian border, which has been colonized by Russians in XVII. By focusing on media coverage in this particular region, the study aspires to offer a deeper understanding of media discourse in a republic that is ethnically and culturally diverse, where communication plays a crucial role in uniting the sparse population of the world’s biggest administrative and territorial subdivision.

The data for the study comprises articles from Republic-wide internet news outlets ysia.ru (1067 entries), ykt.ru (271 entries), sakhalife.ru (642 entries), and the weekly newspapers “Yakutsk Vecherny” (3 issues), “Yakutia” (3 issues) and “Vsyeyo dlya Vas” (3 issues), published in the period from February 24th to March 10th, 2022. The study is aligned with the multidisciplinary approach to media discourse analysis (Lams, 2010), which argues against the exclusive use of linguistic analysis as a method. Therefore, the materials will be analyzed using a combination of methods from critical discourse studies (Chilton, 1998; van Dijk, 1995, 2008) and multimodal discourse analysis (Kress van Leeuwen, 2006) to investigate textual and visual data in Yakutian mass media in relation to the context.

The results indicate that the coverage during the first two weeks after the announcement of the “special military operation” was mainly regular in terms of complying with the state guidelines. However, a few cases were found to be irregular, as they employed implicatures to communicate the atypicality of the situation to the readers. For instance, implicatures were made using visual tools, such as an edited Soviet poster to promote peace and the crossed-out phrase “No to war!” which was censored in a given critical situation and made it impossible to distribute the periodical after publication. Additionally, the study discusses an example of the closing statement of the major media portal in Yakutia in reaction to enhanced censorship in order to preserve its reputation. The findings reveal that although implicit, an irregular approach to addressing the atypical situation is possible.

Resonance in Agreement/Disagreement Process in Japanese Discourse: A Case Study of Multi-party Conversation in Atypical Situation

Panel contribution

Ms. Mugiho Kojima¹

1. Osaka University

This study investigates how “resonance” (Du Bois, 2007; 2014) occurs in multi-party conversation among Japanese women. Specifically, it demonstrates how resonance relates to agreement/disagreement between the participants when they share their thoughts about an atypical situation – the COVID-19 pandemic. Resonance is “the catalytic activation of affinities across utterances” (Du Bois, 2014; 372) in any form, such as words, prosodic structures, pragmatic functions, and so on. Based on this, Takanashi (2020) and Hata (2020) analyzed Japanese conversation and found that resonance occurs during bonding between the participants. Previous conversation analysis works found that “agreement” is preferred over “disagreement” – therefore, manifestation of disagreement is usually delayed or avoided (Sacks, 1987; Pomerantz, 1984; Gruber, 2001). Reviewing these studies, relations between resonance and other interactional acts have not been explored enough. Therefore, this study examines resonance by focusing on how the participants establish agreement and avoid disagreement in conversation among Japanese women in the COVID-19 pandemic. By analyzing resonance, this study aims to reveal participants’ perspectives toward the situation.

As a theoretical framework, this study employs diagraph (Du Bois, 2014) to investigate resonance as an analytical tool to observe connections across utterances. The data was collected January 2021 on Zoom as part of a longitudinal study that the researcher has been working on since 2018 targeting approximately 30 Japanese women. This study analyzes one Zoom recording, a conversation among close friends in their mid-twenties in Tokyo. During the 20-minute recording, the researcher’s camera and microphone were turned off, enabling the collection of casual conversation.

It was found that resonance occurs differently when the participants agree and disagree. When they agree on the possibility that they have COVID-19 with no symptoms, dialogic resonances occurred actively while their utterances overlapped with each other. Dialogic resonances such as “*un* (yes)”, “*sou* (yes)” and “*ne* (interactional particle)” showed participants’ mutual agreement. On the other hand, when “disagreeable” emerged between them as one of them revealed that she feels unsure about the vaccine, no resonance occurred until one of the listeners slightly changed the point of discussion by saying that she doubts that vaccines will be accessible to them. After listening to that statement, the participants showed partial agreement along with some resonance such as “*a*: (oh)” and “*tashikani* (good point)”.

These findings show that the participants engaged in rapport-oriented interaction, and their strategies for agreeing and disagreeing with resonance helped them accomplish that. Though the active resonance, the participants confirmed that they have similar opinions toward their possibilities of having COVID-19. On the other hand, by choosing not to discuss the safety of vaccine, they successfully avoided a conflict over something they might disagree on with each other. At the end, they found something they can mutually agree on – the accessibility of the vaccine for young adults. In sum, this study enabled close understanding of these interactional acts and capture of the participants perspectives toward COVID-19 in an atypical situation.

Stereotype and Code-Switching: A case study of interactions among young people who have had the experience of studying abroad

Panel contribution

Ms. Satsuki Inaba¹

1. Osaka University

The Japanese government has encouraged more university/college students to study abroad to become “global human resources” (MEXT 2022, translation mine) even under this atypical situation. However, the image of students who have studied abroad is broadcasted negatively in Japan. One of the specific features of the students in the media is “code-switching”. Bucholtz (2010) and Sierra (2019) have examined the language ideologies and stereotypes which are born by media references. People use various media every day; therefore, when an ideology or stereotype is spread by the media, and people conduct the language practice in their daily life, the stereotypes are reproduced and reinforced among them. In Japan, people who study abroad who are in the media, such as YouTube or TikTok, are treated as an object of ridicule and with criticism; hence, the representation of these people is shown negatively.

According to Gumperz (1982: 59), conversational code switching is “the juxtaposition within the same speech exchange of passages of speech belonging to two different grammatical systems or subsystems”. Code-switching is generally a common language skill among bilinguals or multilinguals used to communicate with each other, and it is used in various ways depending on who they talk to. In addition, Ahearn (2021: 146) explains code-switching as “[t]he sorts of shifts from one language variety to another that occur in a single social setting”. Code-switching allows people to index not only the context, but also social relationships and meanings.

This presentation focuses on the discourses among the students who have studied abroad, especially when they produced code-switching about COVID-19, and discusses the stereotype of Japanese students who have the experience of studying abroad from the perspective of code-switching.

The participants in the data are five Japanese students who have studied abroad for more than six months in America or Canada, including the presenter. They had several online meetings on Zoom and shared their stories of studying abroad in Japanese. In the data, when they were talking about their experience of COVID-19, the participants code-switched, for example using “positive” and “negative” for the results of COVID-19 Tests and “booster” for a vaccine booster shot.

COVID-19 had a great impact on the students who studied abroad under the atypical situation. Particularly, the situation and the experience which related to COVID-19 affected their language use. The participants spoke English with their professors and friends, and COVID-19 was a popular topic among them. In addition, they were required to correct information about COVID-19 in English during their studying abroad. Therefore, it is considerable that the Japanese words referring to COVID-19 were replaced with English, because they often used the English words in their everyday conversation. Thus, they switched the words into English in the discourses. Contrary to the image of people who have studied abroad which the media produces, code-switching has proper context and it relates the language use in interactions. This presentation also contributes to understanding why people use code-switching and how stereotypes about those which are made by media are broadcasted inappropriately.

Telling or Not Telling Stories of Mental Illness? A Socio-linguistic Approach to a Japanese Woman's Self-Disclosure Narrative

Panel contribution

Ms. Bingzhu Zhou¹

1. Osaka University

This study aims to analyze how experiences of self-disclosure are told in the narrative of a Japanese woman with mental illness by a socio-linguistic approach and then clarify social norms of mental illness in Japanese society. To this aim, this study will address the following research questions.

- What are linguistic/non-linguistic resources used in the narrative of self-disclosure?
- What are social norms about mental illness represented through narrative?

Self-disclosure refers to “the act of making yourself manifest [and] showing yourself so others can perceive you” (Jourard, 1971, p. 19). In this study, I use the word to tell others about one’s characteristics and attributes, especially those that may be the ‘reason’ for discrimination or oppression but which have not been revealed before.

The data was collected as a part of a longitudinal study, including semi-structured interviews with ten persons with mental illness. The interviews were conducted between November 2019 and August 2022. In this study, I will focus on two conversations conducted through Zoom in May 2022 from the above data. The interviewee, SZ, works as an office worker and serves as a volunteer in a group for people with depression. During the interview, SZ disclosed that she is a cane user, revealing her complicated positioning as a person with mental and physical disabilities.

In Data 1, It can be seen that SZ is drawing a clear line between disclosing (“*shitteru* (knowing) ,” “open”) and not disclosing (“*shiranai* (not-knowing)” “close”) her illness when in relationships. She chose to disclose romantic relationships and relationships between people with mental illness. In the case of friendship, it can be seen that SZ is carefully judging and selecting the targets of self-disclosure while contacting with others, quoting her own voice “a(.) *konohitonara syabette mo heikidana* (Oh, maybe this one is okay)”. Meanwhile, the selection process revealed the social norm implicitly working behind this narrative, that it may not be “okay” for a person who discloses their mental illness.

In Data 2, SZ described her mental illness as something that “I just can’t say it (*doushitemo, iinikui*) .” Then she disclosed that she is a cane user and brought up his physical disability to explain the difficulty of self-disclosure of mental illness. As for her physical disability, she used the sentence structure “I must ~ (*nakyaikenai*)” to advocate the necessity of disclosing her physical disability to others. In contrast, it was found that SZ regards mental illness as a disability that she can choose to disclose or not. Thus, we can conclude that SZ’s disclosure/non-disclosure of disability is connected to whether there is visible impairment or not. At the end of Data 2, SZ said that mental illness is not understood at all, suggesting that the level of social understanding of disability may be a hidden social norm intertwined with visible impairment.

The unspoken language of exclusion: family discourses on a leprosy victim during past wartime within their family

Panel contribution

Dr. Ritsuko Izutani¹

1. Mukogawa Women's University

The study aims to clarify the existence of discrimination against leprosy patients in Japan, in unspoken words or silence in discourse among their families on past wartime.

In 1996, Japan's Parliament abolished the Leprosy Prevention Law, which had long resulted in the forced hospitalization of leprosy patients. The government was held responsible for this legislative inaction by the Kumamoto district court in 2001. However, a 2003 local news article reported a hotel in Kumamoto refusing residents of leprosariums, indicating that the stigma surrounding leprosy still persists in Japan.

In this presentation, atypical events are forced life-long residence and confinement in the leprosarium of the grandfather and exclusion from his family due to separation, discrimination, and broken relationships. The researcher investigates how these events are talked about among family members and whether they invite discourses that identify him as an atypical, threatening member of society.

The data analyzed are part of a recording of naturally occurring conversations among the great-aunt, her niece, and her daughter. The site of surveillance is the question of why the grandfather had never returned to the family despite being clinically cured. Atypical language is detected through the expression of grief over exclusion from family graves, attempts to locate responsibility, and responses of silence or avoidance of the topic. Discourses that identify individuals as atypical, threatening members of society are reflected in the avoidance of directly mentioning the grandfather, his pseudonym, or the place and in the use of euphemisms to describe his situation. Conventional discourse explains the past situation by using the words "jidai"(old days) or "toshi"(aged). Protest discourses avoids the use of terms such as "discrimination" or "prejudice".

Why is ‘Listen to the Bell Ringing’ no longer screened?

Panel contribution

Prof. Takeshi Hashiuchi¹

1. St. Andrew's University, Osaka

In December 2020, a newly made independent movie of Niirada¹, a prefectural high school for Hansen's disease patients, was screened in Setouchi, Okayama, Japan, for the first time. The screenplay focused on the four-year residential school attached to Aiseien Leprosarium², whose students came from all 13 national sanatoria. Written and directed by Mr. Mamoru Yamamoto, this film entitled “Listen to the Bell Ringing”³ aimed at creating a society devoid of discrimination and prejudice against the patients. In July 2021, the Ministry of Education, Culture, Sports, Science and Technology recommended this as an excellent cinema for human rights enlightenment. However, after five public screenings, it has been put in storage.

Why did the screenings stop? This paper uncovers the serious hidden risks in filmmaking discourse under the sites of lepra ex-patient alumni surveillance, reported below.

The filmmaking was planned in 2018 by several former Niirada teachers. Incooperated with these teachers, a committee was established with the cooperation of selected local volunteers. Both staff and casts were local nonprofessionals. Apart from Aiseien Leprosarium, there was not much support from other organizations. However, the independent film committee earnestly wished to inform the general public that there was a high school solely for Hansen's patients in Aiseien, founded in 1955 and shut down in 1987.

Unfortunately, there were various unfair discriminatory rules at the stigmatized institution. For instance, the teachers in preventive clothes were allowed to enter classrooms and dormitories, but the patient students were not allowed to enter the teachers' room, as nonpatients were terribly afraid of contracting lepra infection. As the film title suggests, a student must ring the call bell to meet the teachers outside their room. After several discussions between the two bodies, however, the rule was withdrawn. Finally, the students could enter the teachers' room for consultation. They were thus liberated from the notorious school regulation.

Apart from financial shortage, the hardest challenge to filmmaking came from a group of Okinawa alumni. They said, “A screenplay focused on Niirada should neither be made nor be shown publicly, because the education there was terribly discriminatory and because its graduates and their families have still been suffering from indescribable prejudice.” They feared that a movie based on this unusual school might further promote the unfavorable image of the alumni into the public.

The film committee repeatedly negotiated with the alumni group to screen this film for those interested, but in vain. The opponents persistently appealed to the filmmakers that the screenplay be banned. Finally, they arrived at a consensus that the movie shall only be screened once at Setouchi City Hall Auditorium and four times at Aiseien Leprosarium. No subsequent screenings were held.

Notes

1 Niirada High School accommodated 30 students per class, with a gradual decline in enrollment until its closure.

2 Aiseien Leprosarium is the first national lepra sanatorium established at Nagashima, an island in the Setouchi Inland Sea, in 1930.

3 This movie is 90 minutes long.

Adult Pragmatic Individual Differences and Adolescent Audience Design: Neural and Developmental Evidence on a Partial Segregation from Theory of Mind

Panel contribution

*Dr. Julia Udden*¹

1. Department of Linguistics and Department of Psychology, Stockholm University

Interpretation of Gricean speaker meaning builds on an understanding of the underlying intentions of utterances. As intentions (alongside beliefs and desires), are unobservable mental states, meaning interpretation in dialog would thus fall under the scope of Theory of Mind (ToM) processing. However, ToM can no longer be referred to as one domain-general function, as recent meta-analyses of neuroimaging research indicate that different categories of ToM tasks result in different activation patterns. In the following two studies, we tested for partial segregations between pragmatics and ToM.

In the first study (Bendtz et al., 2022), 199 young adult participants were assessed on their mentalizing (or ToM) ability using a *non-verbal* test (Reading the mind in the eyes, RMET). Based on two novel pragmatic tests (a prosodic test and the same audience design test used in the second study), we selected two groups of participants: (1) a “high scoring” (HS) group vs (2) a “low scoring” (LS) group (potentially representing a more literal processing style). From these groups, we recruited participants for an fMRI session (N = 57) using an established fMRI-task of indirect speech act processing. The HS group showed higher “Indirect vs Direct” activity than the LS group, in two brain regions outside core language and ToM regions. The performance on the ToM task (RMET) did not correlate with any of the pragmatic tasks and none of the two regions reported were modulated by individual differences in RMET, suggesting segregation between this specific non-verbal ToM task and the pragmatic processes we measured.

The topic of the second study (Arvidsson et al., 2022) was the development of audience design during adolescence. Our results show that 11-12 year olds do not utilize relevant ToM information during audience design, to the same extent as 15-16 year olds. The development of AD that we observe cannot be explained by measures of how typical participants individual ToM judgements were. Typical ToM judgements on what we can assume that an interlocutor knows (based on age and gender, i.e. *knowledge attribution*), were already present and ready to be accessed around age 11-12. However, this aspect of ToM seemed to be accessed only when adolescents were specifically prompted for this information. We are left with a view on adolescence as a period of significant growth specifically with respect to the ability to utilize ToM during online communication. This could be viewed as a pragmatic audience design process segregated from ToM representations of knowledge attribution.

Taken together, these results suggest a potential partial neurocognitive and developmental segregation of domain-specific communicative inference and audience design processes, from aspects of domain-general ToM, such as complex emotion recognition and knowledge attribution.

Empirical study on face-threatening acts in autism: relationship between social cognition and pragmatic aspects of politeness

Panel contribution

*Ms. Regina Mezőlaki*¹, *Dr. Lívía Ivaskó*²

1. PhD student, 2. associate professor

In an interaction, participants manifest their intentions applying rationality (e.g. being efficient) and interpersonality (e.g. maintaining one's face to any degree) motives (Németh T., 2004; Nemesi, 2011).

Face-threatening acts (FTAs) intrinsically run contrary to the face wants of the speaker or of the hearer. One minimizes these threats, unless their main want is to be efficient and urgent. According to Brown and Levinson (1987), mutual knowledge of interactants' face, and the social necessity to orient oneself to it, are universal features of facework.

Therefore, facework requires perspective-taking and emotion-attribution involving cognitive and affective mindreading abilities, as well as (meta)pragmatic abilities.

Studies have shown that autistic people might favor honesty, and might be less concerned about others' and their own face (Koskinen et al., 2021), and self (Williams & Happé, 2009) than non-autistic individuals.

As follows, we formulated the following research hypotheses.

1. Autistic people might prefer verbal strategies along the principles of rationality rather than of interpersonality. Thus, autistic people might not necessarily minimize the threat of their FTAs in a face-threatening situation.
2. There might be a relationship between subjects' verbal facework and their ToM abilities.
3. Emotion-attribution ability may be related to the subjectively assessed severity of the face-threatening situation.

Adult non-autistic and autistic individuals requiring support (level 1) participate in this study. In-person sessions take 1,5-2 hours on average, involving Faux Pas Detection task (Baron-Cohen et al., 1999), Autism-Spectrum Quotient (Baron-Cohen et al., 2001), and a self-developed pragmatic task focusing on FTA-related verbal strategies. Currently, the corpus involves data from 14 subjects.

Depending on affective and cognitive theory of mind abilities, what similarities and differences are present between the results of non-autistic and autistic individuals on the above-mentioned socio-cognitive and socio-pragmatic tests?

As a conclusion, findings might contribute to the understanding of the relationship between intentions, metapragmatic and mindreading abilities.

Infants' earliest pragmatic abilities: Social interaction and pragmatic development in the first year of life

Panel contribution

Dr. Gideon Salter¹, Dr. Danielle Matthews¹

1. University of Sheffield

Infants' first display pragmatic abilities in the context of social interactions with their caregivers. Using facial expressions, vocalisations and gestures, infants are able to refer to the world around them and establish joint attention to targets of interest. These early pragmatic abilities are argued to be the foundation on which later language abilities are built. Understanding these early abilities is therefore crucial for our understanding of the pragmatic mechanisms involved in communication and language. However, there are still a number of key questions regarding infants' earliest pragmatic abilities and the experiences that give rise to their emergence. The first question is: when do infants first display pragmatic abilities? Addressing this question, we present a longitudinal study that examined the very beginnings of infants' capacity to initiate joint attention through "joint attention looks"; a look, coordinated with a smile and/or vocalisation, used to communicate about a referent. Following a cohort of 25 infants monthly from 6 to 10 months, a novel elicitation procedure was developed in order to elicit joint attention looks. In contrast to previous claims regarding the emergence of joint attention at 9 to 12 months, it was found that infants as young as 6 months were capable of such behaviours, with the majority of infants producing a joint attention look by 8 months.

The second question is: what sort of social experiences during infants' first year shape infants' pragmatic development? To address this question, we report on a randomised controlled trial with families from diverse socioeconomic circumstances (SEC). The trial was developed to mitigate differences in early language abilities due to SEC that have been found to emerge as young as 18 months of age. Families were assigned to either the intervention condition in which they received video resources with educational video content promoting responsive caregiving, or an active control in which they received content promoting dental health and nutrition for infants. Infants' communicative behaviours and caregivers' responses were coded from home video recordings. It was found that the intervention led to caregivers producing more semantically contingent responses-verbal responses referring to the activity of the infant- with particularly large increases in lower-SEC families. Infants in the intervention condition produced more communicative behaviours, suggesting that promoting caregiver responsiveness influences infant communication.

These studies demonstrate that infants' first year is a crucial period for the development of pragmatic abilities. Our research shows that early pragmatic abilities are already starting to emerge from as young as 6 months, and that the way caregivers respond to their infant's communication across the first year influences the development of ever more mature abilities. We discuss both the theoretical significance of these findings, and the practical implications regarding the development of interventions that can mitigate early-emerging SEC-based differences in language development.

Interplay between pragmatics and Theory of Mind in autistic adolescents: What the Cognitive Pragmatic Treatment (A-CPT) suggests

Panel contribution

Dr. Ilaria Gabbatore¹, Prof. Francesca M. Bosco¹

1. GIPSI Research Group, Department of Psychology, University of Turin

Core difficulties in the autism spectrum include communication and social interaction [1]. The pioneering proposal [2] to consider Theory of Mind [ToM, 3] a primary difficulty in autistic individuals has been supported by several empirical evidences. Indeed, a fully developed ToM appears necessary to communicate effectively [4] and may be considered conducive to the ability to use language and other expressive means in a given context, i.e., pragmatics [5]. Autistic people may fail understanding the communicative intention of an interlocutor when the literal and implicit meanings do not match and when contextual cues need to be considered for full understanding [6]. Nevertheless, the nature of ToM-pragmatic relationship is still quite debated [7], and [8] recently argued that despite its contribution to a person's communicative ability, ToM does not fully overlap with communicative-pragmatic competence.

It is noteworthy that programs to improve communicative-pragmatic skills have not received much attention and that most studies have focused on children [9] neglecting other age groups, like adolescents. We recently developed a 15-session group training program, Cognitive Pragmatic Treatment for Adolescents [A-CPT,10], and tested its feasibility and ability to specifically improve the communicative-pragmatic performance of autistic adolescents. Since difficulties are not limited to language use but also extend to the nonverbal, i.e., gestural, and paralinguistic domains [11], we targeted all these components with the A-CPT. A group of verbally fluent autistic adolescents participated in A-CPT and were assessed pre- and post- training, and at three-month follow-up, using the equivalent forms of the Assessment Battery for Communication [ABaCo, 12], a tool designed to assess a variety of pragmatic phenomena expressed through several expressive means. In addition, tasks assessing ToM and other cognitive domains such as attention, memory, executive functions were performed.

Results showed an improvement in participants' performance in all ABaCo scales - linguistic, extralinguistic, paralinguistic, contextual - persisting at follow-up. No improvement was observed in ToM and cognitive domains, with the sole exception of expressive vocabulary.

These findings have theoretical and clinical implications. First, comprehensive programs for autistic individuals specifically designed to improve various facets of pragmatics could be effective and increase their social interaction skills in the longer term. In addition, the results support the specificity of pragmatics in relation to ToM, as highlighted by the observed pragmatic improvement that is not accompanied by an improvement in ToM skills.

Metaphors, pragmatics and theory of mind: A developmental perspective

Panel contribution

***Prof. Serena Lecce*¹, *Prof. Valentina Bambini*²**

1. University of Pavia, 2. iuss

What is the nature of the relationship between pragmatics and theory of mind? This question has been addressed through a variety of approaches, from brain imaging to studies on atypical populations. Here we will tackle this issue from a developmental perspective, focusing on a specific aspect of the pragmatic competence, namely metaphor understanding and on typically developing children. We will present a series of studies on metaphor comprehension in middle childhood indicating that children's ability to interpret metaphors matures hand in hand with mindreading skills, yet the two domains are sufficiently distinct. In particular, capitalizing on a novel task including different types of metaphors (the Physical and Mental Metaphors task), we showed that the link between theory of mind and metaphor understanding is specific, being greater for metaphors with mental content compared with metaphors with physical content, and varies depending on the children age, being greater for younger rather than older children (Lecce *et al.* 2019; Tonini *et al.* submitted). Furthermore, when addressing the direction of the relationship between metaphor skills and theory of mind via longitudinal and training designs, we showed that the two abilities are bidirectionally connected over development, but the effect of metaphor on ToM seems larger, i.e., extending to different aspects of ToM, whereas the effect of ToM on metaphor seems to be more specific to some metaphor tasks (Del Sette *et al.* 2020; Del Sette submitted). Collectively, these findings confirm the relevance-theoretic view of metaphor as involving interpreting how another person sees the world, while at the same time acknowledging the specificity of the role of theory of mind in metaphor development. In discussing these theoretically relevant aspects, we will also highlight the impact of metaphors on school achievement and social life at large (Del Sette *et al.* 2021, Tonini *et al.* 2022).

Pragmatic processes vs typologies of outputs

Panel contribution

***Prof. Mikhail Kissine*¹, *Prof. Napoleon Katsos*²**

1. Université Libre de Bruxelles, 2. Cambridge University

Much of experimental research in pragmatics focuses on determining to which extent this or that pragmatic process involves Theory of Mind, with many researchers questioning whether all pragmatics is necessarily rooted in the ability to represent other people's communicative intentions. Independently of one's favourite model, however, this research paradigm presupposes that pragmatic processes map on a typology of pragmatic outputs, such as implicature, metaphor, indirect speech act or irony. This way thinking conflates the rational reconstruction of pragmatic processing as an inferential link between two syntactic strings—what is said and the putatively derived meaning—with the actual interpretation process. We will present experimental data that supports the alternative view, according to which pragmatic processes and the contextual resources on which they are based depend on contextual demands and individual characteristics, in a fashion orthogonal to typologies of pragmatic outputs.

Realist irony: Two empirical studies

Panel contribution

***Dr. Yolanda García-Lorenzo*¹, *Ms. Elise Clin*², *Prof. Mikhail Kissine*²**

1. University of the Basque Country, 2. Université Libre de Bruxelles

Attributive theories of irony like the *echoic account* (Sperber and Wilson 1986/95; Wilson 2006, 2009; Wilson and Sperber 1992; 2012) and the *pretense theory of irony* (Clark and Gerrig 1984) defend that the ironic speaker attributes an utterance/thought to someone else (or to herself at a different time), and that by means of this attribution, she criticizes the attributed utterance/thought and (possibly) its addressee. If that were the case, irony understanding would require 2nd order ToM, ability that has been reported impaired in autistic people (Happé 1993). That would explain why autistic people have difficulties understanding irony (Happé 1993) and why ironic speech is more difficult to understand than literal or other non-literal speech (Bryant 2012; Colston and Gibbs 2002).

Notwithstanding, arguably, irony isn't always attributive. It can be about a state of affairs/event. In those cases, the speaker mocks/criticizes the state of affairs/situation the utterance is about, and, if any, the person she holds responsible for it. We call this type of irony realist irony.

We present data from two empirical studies (one with autistic participants —38 autistic and 38 neurotypicals— and other with neurotypical participants —414— in Spanish, French and English —138 participants each) that support the existence of realist irony. Both studies consist in 36 stories including a chat-like conversation. Depending on the final remark, stimuli is either Direct criticism, Direct praise or Ironic stimuli —12 stories each. Ironic stimuli can be either Attributive belief, Attributive assertion or Realist stimuli —4 stories each. After each story, participants are asked whether the speaker of the final remark really thought the content of the utterance; and whether the speaker of the final remark was criticising/mocking their interlocutor (answered in a 5-point Likert scale).

Results were analysed in R using different generalised multilevel models with respect to the nature of the dependent variable. The results of both experiments support the existence realist irony. Also, the answers to the two questions are influenced by different factors in both studies. Surprisingly, in the first study, autistic participants rated ironic instances as highly negative despite not being able of determining the thought of the speaker. This points to partial understanding of ironic instances.

Slowdowns in scalar implicature processing: Isolating the intention-reading costs in the Bott & Noveck task

Panel contribution

*Dr. Camilo Rodriguez Ronderos*¹, *Dr. Ira Noveck*²

1. University of Oslo, 2. Université Paris Diderot-Paris 7

An underinformative sentence, such as *Some cats are mammals*, is trivially true with a semantic (*some and perhaps all*) reading of the quantifier and false with a pragmatic (*some but not all*) one, with the latter reliably resulting in longer response times than the former in a truth evaluation task (Bott & Noveck, 2004). Most analyses attribute these prolonged reaction times, or costs, to the steps associated with the derivation of the scalar implicature. In the present work we investigate, across three experiments, whether such slowdowns can be attributed (at least partly) to the participant's need to adjust to the speaker's informative intention. In Experiment 1, we designed a web-based version of Bott & Noveck's (2004) laboratory task that would most reliably provide its classic results. In Experiment 2 we found that over the course of an experimental session, participants' pragmatic responses to underinformative sentences are initially reliably long and ultimately comparable to response times of logical interpretations to the same sentences. Such results cannot readily be explained by assuming that implicature derivation is a consistent source of processing effort. In Experiment 3, we further tested our account by examining how response times change as a function of the number of people said to produce the critical utterances. When participants are introduced (via a photo and description) to a single 'speaker', the results are similar to those found in Experiment 2. However, when they are introduced to two 'speakers', with the second 'speaker' appearing midway (after five encounters with underinformative items), we found a significant uptick in pragmatic response latencies to the underinformative item right after participants' meet their second speaker (i.e. at their sixth encounter with an underinformative item). Overall, we interpret these results as suggesting that at least part of the cost typically attributed to the derivation of a scalar implicature is actually a consequence of how participants think about the informative intentions of the person producing the underinformative sentences. To formulate it in more current psychological terms, our account calls for addressees to consider a speaker's mental states (specifically, their intentions and beliefs) when interpreting the critical underinformative items (see Grice, 1989). In other words, we view the slowdowns linked to Bott & Noveck's critical items as due to *Theory of Mind* (Baron-Cohen, Leslie, & Frith, 1985).

ToM and social pragmatics in dementia: Do patterns of neurodegeneration and language profiling matter?

Panel contribution

*Dr. Olga Ivanova*¹

1. *Universidad de Salamanca*

Deficits in the cognitive ability known as the *Theory of Mind* (ToM) can play an important role in pragmatic disorders of different etiology, including dementia (Cuerva et al., 2001; Cummings, 2013). Different dementias, however, trigger different profiles of pragmatic impairment due to deficits in ToM. Across dementia spectrum, behavioral variant of frontotemporal dementia (bvFTD) is usually rated as the most vulnerable clinical picture to the disruption of ToM and pragmatics based on social cognition (e.g., lies or humor) (Shany-Ur et al., 2012). In most cases, such deficits in ToM and social pragmatics are linked to the pattern of neural degeneration in the right hemisphere supporting both abilities.

In this study, we explore two questions of importance for understanding the relationship between deficits in ToM and pragmatics. On the one hand, we pay attention to deficits of ToM and social pragmatics (mainly, understanding of verbal lies and humor) in dementias with neurodegenerative patterns affecting social cognition to a lesser extent (mainly, occurring in left hemisphere and frontal lobe). On the other hand, we focus on the role specific language profiling (for example, more semantic in the case of Semantic Dementia (SD) or more phonological in the case of Alzheimer's disease (AD)) can play in predicting ToM and pragmatic deficits. In doing so, we rely on a systematic review of data provided by experiment research on processing and comprehension of verbal lies and humor in speakers with bvFTD, SD, AD, Parkinson's disease (PD) and progressive supranuclear palsy (PSP).

Our results suggest that (i.) impairments in specific cognitive abilities (for example, working memory) and (ii.) impairments in specific language functions (for example, naming), can predict the degree of impairment of ToM and pragmatics across dementia spectrum. We discuss the implications of these results for the cognitive theory of pragmatics.

Weighting the neurocognitive correlates of pragmatic disorder in schizophrenia, between theory of mind and executive functions: a systematic review and meta-analysis

Panel contribution

Mr. Federico Frau¹, Dr. Chiara Cerami², Dr. Alessandra Dodich³, Dr. Marta Bosia⁴, Prof. Valentina Bambini¹

IUSS Cognitive Neuroscience ICoN Center, University School for Advanced Studies IUSS Pavia/IRCCS Mondino Foundation, Pavia, 3. Center for Mind-Brain Sciences-CIMeC, University of Trento, Trento, 4. School of Medicine, San Raffaele University/IRCCS San Raffaele Scientific Institute, Milan

Introduction. Pragmatic impairment is considered a hallmark of schizophrenia.^[1,2] Nonetheless, the neurocognitive underpinnings of pragmatic impairment are still largely debated: while some studies tend to conflate pragmatic deficits with social cognition (SC) problems, others highlight the role of executive functions (EF),^[3,4] and yet others view pragmatics as independent from other cognitive skills.^[5-7] This debate challenges the *status* of pragmatic ability within the architecture of the mind and brings relevant implications for the remediation of pragmatic impairment in schizophrenia. This study aimed to collect and weigh the strength of the associations between pragmatic skills, SC and EF in schizophrenia via a systematic review and meta-analysis.

Methods. Following the PRISMA guidelines, we conducted a systematic review on PubMed/Medline and Scopus databases to collect research papers describing a correlation between pragmatics and both SC and EF in schizophrenia. Afterwards, we used these correlations to fit a meta-analysis, aiming at quantifying the absolute association between pragmatics and SC and between pragmatics and EF. Then we fitted a multivariate mixed-effects model with correlation type as moderator to compare the strength of the association between pragmatics and SC vs. pragmatics and EF.

Results. After extracting and assessing for eligibility 2,668 records, 16 papers were included in the systematic review. Included studies assessed different facets of pragmatics (i.e., discourse, conversation, and figurative language), EF (i.e., working memory, planning, inhibition, and cognitive flexibility), and SC (i.e., emotion recognition and theory of mind). Ten papers reported effect sizes and could be included in the meta-analysis. The analysis showed that SC had a moderate-to-strong association with pragmatic skills ($R=0.49$, $CI[0.33-0.66]$), while EF had a weak-to-moderate association ($R=0.33$, $CI[0.20-0.46]$). The multi-variate model confirmed that, relative to EF, the association with SC was stronger ($F(3,27)=27.20$, $p<.001$; post-hoc: $t(27)=3.47$, $p=.005$).

Discussion. The results of this work point to the joint impact of SC and EF on pragmatic disorder, with the former having a greater role. In particular, the results support the idea that SC is especially linked to pragmatics, but not in an exclusive fashion. Furthermore, a closer look at the weight of the correlations revealed that the role of these cognitive skills in pragmatics – even in the case of SC – is rather moderate. This points to the specificity of pragmatic impairment, which cannot be fully accounted for solely in terms of other neurocognitive domains.^[6,7] These findings have relevant clinical implications for schizophrenia and suggest that, while socio-cognitive and neurocognitive interventions may also strengthen pragmatic abilities, more specific treatments targeting specifically pragmatic impairment are needed.^[8]

“You are so clean!”: ToM, Irony production and affective relationships in school-aged children

Panel contribution

Prof. Francesca Ervas¹, Ms. Roberta Cocco¹, Dr. Sara Congiu¹, Dr. Cristina Sechi¹, Prof. Natalia Banasik-Jemielniak², Prof. Roberta Fadda¹

1. University of Cagliari, 2. Maria Grzegorzewska University

Understanding an ironic utterance, such as “You are so clean!” pronounced by a schoolmate when someone fell down in a mud puddle, is a complex process. Previous research suggests that an advanced theory of mind, typically emerging in middle childhood, is responsible for the relatively late irony understanding (Winner 1997; Keenan-Quigley 1999). Irony might also be considered as demanding precisely because it involves an implicit evaluation of the speaker, charged with an affective attitude (Barrett 2006; Moeschler 2009; Yus 2015). The abilities required in the production of irony have been less studied, especially compared to irony understanding in the developmental age (Filippova 2014). Some studies showed that a positive interaction of children with their parents and the use of irony in the family context favor both irony understanding and production (Pexman et al. 2009; Whalen-Pexman 2010).

The empirical study we aim to present is part of a wider research project, based on a previous longitudinal study, which has been extended by further testing the (N=40) families who were enrolled in the research program. The longitudinal study aimed to investigate the relationship between parental Mind-mindedness (the ability to recognize the mental and intentional states of the child) and Theory of Mind (ToM) abilities in children from early-infancy to school-age. Mother-infant interactions during feeding (Chatoor et al. 1997) and play (Chatoor 2006) have proven to be important experiences in the development of children’s early social abilities (Stern 1995; Biringen 2000). The longitudinal study showed a stable relationship over time between the dyadic interactions and children’s social and communicative abilities also in extra-dyadic interactions. We generally expect that the quality of parental interactions influences not only social-communicative abilities in general but, more specifically, pragmatic abilities. Therefore, the project aims to investigate the pragmatic abilities of school-age children in relation to the development of their abilities of Theory of Mind (ToM) and parental Mind-mindedness.

For the aims of this study, we expect that parental Mind-mindedness especially influences the pragmatic abilities that most involve an affective component (McHale 2007; Simonelli 2010), as in the case of irony. We expect that a more developed affective ability in a familiar context helps the child to distinguish whether the speaker’s intention is nice or mean (Mascaro-Sperber 2009; Wilson 2009; Sperber et al. 2010), especially in the case of sarcasm, that is directed toward a person, the “victim” of an ironic remark (Gibbs 1986; Giora 2003). The material was a set of 12 stories already validated (Banasik-Bokus 2019). Children were presented with 6 literal remarks and 6 ironic (3 ironic + 3 sarcastic) remarks at the end of the stories, and asked on a Likert scale whether they would have produced such a remark, whether it was nice or mean and it might hurt the listener. Preliminary results show that participants avoid producing remarks hurting the listener, especially when sarcastic. This correlates with ToM and parental Mind-mindedness abilities.

A cross-cultural study of hedging in academic spoken discourse

Panel contribution

*Ms. Yuxiang Duan*¹, *Prof. Liesbeth Degand*²

1. UCLouvain, 2. UC Louvain

As a type of indispensable metadiscursive strategy in academic communication, hedges have been studied for several decades after Weinreich (1966) first described them as *metalinguistic operators*. The present study sets out to discuss the distribution and linguistic features of hedges based on Hyland's model (1998) including Varttala's (2001) additions; and reveals how hedging tactics are realized in Mandarin Chinese and two varieties of English (L1 English and English as a lingua franca - ELF) within academic spoken genres from a cross-cultural perspective. The analysis was based on a collection of 63 scientific presentations in the fields of education, sociology, psychology, and linguistics distributed as follows: The first corpus consists of 23 transcripts totalling 58,434 running words of L1 Chinese academic talks; Likewise, 21 transcripts (58,386 running words) of L1 English scientific speeches were selected from the same domains. In addition, 19 transcripts (52,929 running words) of academic talks were extracted from the English as a Lingua Franca in Academic Settings Corpus (2008). Each of the six types of hedges was retrieved independently by two well-trained coders with a computer-assisted software program on the ground of a modified framework. To this end, both "close-ended" lists and "open-ended" lists were adopted to detect target devices. Finally, a rigorous analysis was conducted taking the functional meaning into account, and statistical tests were run to assess significant differences between the languages concerned. Notwithstanding that the current procedure may not cover the whole hedging potentials, we believe that it proposes a well-ordered and reliable delineation from lexical-grammatical and usage-based aspects.

Results indicate the predominant presence and functional diversity of hedging conventions in Anglophone cultures as compared with ELF and Mandarin Chinese and take on a colloquial tendency. Owing to the differences in language and academic norms between English and Chinese, although both have similar pragmatic categories, there is no exact correspondence in terms of distribution and individual structure, particularly regarding epistemic nouns and non-lexical hedges. As such, a unique hedging model based strictly on Chinese rhetorical characteristics is created for further discourse analysis and scholarly peer communication. As far as rules of appropriateness vary by culture, hedging techniques in ELF represent a distinct variety from L1 English. More precisely, the framework and potentials reported supply a preliminary listing of hedging devices that may be used by non-native speakers of English and Chinese scholars and students to retain information on how it works in the academic context. Future research could be expanded to a more in-depth discussion of comparison and/or contrast within spoken and written registers.

Are you human? AI-human intercultural communication which scams the scammer.

Panel contribution

Prof. Rosina Marquez Reiter¹

1. The Open University

Natural language bots permeate our everyday lives offering a wide range of services from customer support, friendship and coaching, to name but a few (McTear & Bond, 2020). Research has shown that users engage with AI-generated bots as if they are social actors. For these interactions to be successful the bot must be designed to enhance user trust by exhibiting human-like characteristics associated with competence, benevolence and integrity (Zhou, Gao, Li, & Shum, 2018). To date, research on user engagement has predominately used quantitative methods (Rapp, Curti, & Boldi, 2021), although there is an emerging literature using interactional studies (e.g., Chaves, Egbert, Hocking, Doerry, & Gerosa, 2021; Dev & Camp, 2020). However, no research has been conducted into how bots, designed with malevolent intent, act to undermine user trust and what impact this has. This paper outlines an interactional pragmatics analysis of a corpus comprising recordings of unsolicited telemarketing calls responded to by an automated answering system, deployed to simulate an interested customer. The analysis extends the intercultural communication metaphor to explore the features of communication between the bot and user which serve to break human users' trust. The analysis also identifies the users' emotional and behavioural responses towards the bot which indicate distress. The research offers a novel perspective on the power configurations that artificial intelligence brings into communication, whereby the human user naïvely assumes they are the controlling party by virtue of their human condition and the distressing consequences of this.

Danish and German folk conceptions of ‘hate speech’ framing talk with / about the cultural other on Twitter

Panel contribution

***Dr. Eckhard Bick*¹, *Dr. Nicole Baumgarten*²**

1. *University of Southern Denmark*, 2. *University of Sheffield*

The paper presents results from an investigation of current folk conceptions of ‘hate speech’ and the pragmatic value of the term ‘hate speech’ in framing talk about the cultural other. The study is based on two data sets: A large-scale bilingual German-Danish Twitter and Facebook corpus of 3.2 billion words (Baumgarten et al. 2019) and 36 semi-structured interviews with German and Danish native speakers about experiences and perceptions of hate speech online. The corpus has been linguistically annotated at the morphosyntactic and semantic levels (Bick 2020).

The data were collected in the aftermath of the so-called European migration crisis and during the first wave of the coronavirus pandemic during which perceptions of cultural difference both within and across linguacultures were at the centre of public discourse.

The data were analysed through a combination of quantitative corpus linguistic methods, focusing on structural and semantic features, and qualitative contrastive content and pragmatic discourse analysis, focusing on contextual meanings of the term ‘hate speech’.

We propose that similar to the expressions ‘politeness’ or ‘civility’, the English load word ‘hate speech’ in Danish and German (and to a different degree related German and Danish expressions such as ‘*Hassrede*’, ‘*Hetze*’, ‘*had(e)tale*’, ‘*had*’) has developed into a metapragmatically significant expression in the two linguacultures, which functions as a pragmatic evaluative token, framing device, and silencing speech act. In these functions, the expression ‘hate speech’ can be used in metapragmatic assessments of one’s own and other’s talk as well as in the creation of variously defined fault lines between cultural in- and outgroups (e.g. left-rightwing, progressive-conservative, native-foreign, native-‘anti-native’), which are then made to clash in antagonistic intercultural encounters online. The comparison of the two data sets suggests that the ‘performative’ usage of the term ‘hate speech’ online is ahead of informants’ explicit reasoning about the phenomenon. We discuss implications of this disconnect between popular usage and popular reasoning for the identification and regulation of ‘hate speech’ in intercultural contexts.

Evaluations related to the pointing with a finger in a request: a multi-method, cross-cultural pragmatic analysis of an intercultural encounter

Panel contribution

Dr. Johanna Isosävi¹

1. University of Helsinki

In everyday interactional encounters, it is rare that politeness or other relational aspects are explicitly commented on by the interactants. Although one may assume that such comments are more frequent in intercultural encounters where problems are more likely to occur, my dataset of 12 hours of discussions in French between Finnish and French speakers in private and professional settings (recorded in 2016-17 in Helsinki, Lyon and Paris) show that they are extremely rare (cf. also Spencer-Oatey & Kádár 2021: 327-328). Due to this rarity, it was a salient feature when the pointing of a finger of a Finnish interactant was commented by a French interactant, and it merited a closer study.

In this study, I do a multi-method qualitative analysis. First, using multimodal conversation analysis, I analyse the transcriptions related to the actual pointing of the finger of a Finnish woman, the comment of the French man, the discussion that these two people have after the comment, and the re-initiation of the discussion on the matter by the French man after his brother comes to the room. Second, I analyse a post-interview made with the Finnish interactant in 2022 to find out how she felt during the interaction. Post-interviews have been used in a relational analysis of face-to-face interactions (e.g. Ogiermann 2019), and the time gap between the original interaction and the post-interview enabled the Finnish interactant to have a broader perspective on the intercultural interaction. Third, to further examine cross-cultural evaluations of the pointing with a finger, the transcriptions were shown to a group of (mostly) Finnish students and will be shown to a group of French students in autumn 2022 who filled/fill a questionnaire (cf. Chang & Haugh 2011).

My results show, first, that due to different language skills, the native speaker has a dominant role, and the non-native speaker may not have fully understood what was the “problem” in her behaviour commented. Second, the evaluations of the Finnish group showed that there is not a one cultural interpretation of the pointing with a finger, but the informants took into consideration also factors related to the situation and the fact that a non-native speaker may have wanted to clarify her request. As a conclusion, I propose that a multi-method approach is fruitful for a cross-cultural pragmatic study of intercultural encounters.

How Learners of Chinese Misunderstand Politeness and Impoliteness – A Speech Act Point of View

Panel contribution

***Prof. Juliane House*¹, *Prof. Daniel Z. Kadar*²**

1. University of Hamburg, 2. Dalian University of Foreign Languages & Research Institute for Linguistics

In this talk, we present a framework for capturing misunderstandings relating to politeness and impoliteness in situations of study abroad where foreign learners of Chinese first enter their target country. This framework is centred on the study of interaction from a bottom-up and speech act-anchored angle, which we outlined in detail in two recent monographs (Edmondson et al., 2023; House and Kadar, 2023). As a case study, we zero in on examining intercultural encounters where misunderstanding occurs in relation to the speech acts Greet (and its lack), Extractor and Congratulate. We argue that a key advantage of the strictly language-anchored and bottom-up inquiry presented is that it allows us to go beyond sweeping intercultural overgeneralisations.

Questioning the East/West politeness divide by language-anchored regrouping: A psycholinguistic LIWC clustering of 55-country 51-year of United Nations General Debate (1970-2020)

Panel contribution

*Ms. Lin Shen*¹

1. Beijing Foreign Studies University

The East/West divide in politeness has been an important subject of cross-cultural research. The previous theoretical studies, however, mostly feature cultural pre-grouping. As the empirical, non-essentialist analysis into the complex, naturally-occurring linguistic data draws more scholarly attention for politeness research, the contrastive cross-cultural pragmatics is considered as a promising approach for the East/West politeness debate.

To conceptualize cultures through linguistic patterns, this study uses a language-anchored bottom-up approach. Instead of testing differences between two presumed cultural groups, this study categorizes 55 countries' political speeches into two clusters according to the linguistic use of politeness and see how the linguistic grouping relates to the East/West cultural divide. Also, although the cross-linguacultural politeness divide in political language has been examined with many synchronic studies, less diachronic analysis is seen. This study compares the politeness difference between two linguistically-determined clusters from 1970 to 2020.

For the markers of politeness, this study uses a psycholinguistic tool (Linguistic Inquiry and Word Count, LIWC), which is updated with a "politeness" category in its latest LIWC-22 version, to quantify the instances of politeness use. Based on the United Nations General Debate Corpus (UNGDC) that comprises comparable multi-cultural political speeches, a linguistic regrouping is conducted for the 2,518 speeches (altogether 7,090,221 tokens) of 55 countries from the cultural East (East, South, and Southeast Asia) and West (European Union, North America, and Australia) on the normalized frequencies of politeness use and visualized as a heatmap with ggplot2 in R (by complete linkage and euclidean distance). A 51-year diachronic comparison is then made for the two linguacultural groups identified by linguistic clustering. The statistical tests of cross-group difference in politeness are also performed for each of the 51 years with R.

The clustering heatmap and the diachronic test results can be accessed through <https://doi.org/10.7910/DVN/UM6JIB> on Harvard Database. The language-anchored regrouping relates weakly with the East/West divide, with Group 1 (showing generally less politeness use) comprising 20 Western cultures and 9 Eastern cultures and Group 2 (showing generally more politeness use) comprising 11 Western cultures and 15 Eastern cultures. This linguistic regrouping questions the applicability of the East/West cultural divide for politeness in political settings.

The diachronic analysis displays that from 1970 to 2020, Group 2 shows significantly more use of politeness at the UNGD on 39 years, while the cross-group difference is insignificant on the other 12 years (1970, 1982, 1983, 1985, 1986, 1987, 1991, 1995, 2000, 2005, 2007, and 2014). This diachronic contrast points to a dynamic view of cross-linguacultural politeness in political settings.

A contextualized analysis of the politeness markers identified by LIWC-22 is also conducted to explore the potential drivers behind the changing cross-linguacultural politeness differences in the UN setting. It is hypothesized that the cross-linguacultural political communication and unstable international relations may contribute to the changes. As all the texts in the corpus are English-translated speeches to ensure comparability in LIWC-22, the impact of translation may be further investigated with more source-text data.

Work in progress: biculturalism through bilingual policies in professional contexts

Panel contribution

*Prof. Janet Holmes*¹, *Dr. Bernadette Vine*², *Prof. Meredith Marra*²

1. Victoria University of Wellington, 2. Victoria University of Wellington

Biculturalism is a complex concept; understanding and appreciating these complexities always involves some degree of contrastive pragmatic analysis. What is meant by biculturalism differs in different countries, in different contexts, and for members of different linguacultures. Focussing on biculturalism as a process and drawing on ethnographic observations, interviews, and recordings of meetings of the senior management team in a bicultural (Māori and Pākehā/European) organisation, we explore the dynamic nature of biculturalism in interaction. Moreover, in this organisation our analysis of meetings and interviews, involving members of the multicultural senior leadership team over a two month period, indicate that for them biculturalism is perceived as inextricably intertwined with bilingualism.

This presentation will explore some ways in which a Māori perspective differs from a Pākehā/European perspective on this complex process. Our theoretical stance is represented in a model developed through years of close analysis of naturally-occurring workplace talk: Discourse indexes and is constrained by a number of contextual layers, from the interactional norms of the particular discourse activity, through those of the community of practice or team to which we belong, and the workplace, organisation or institution within which the interaction takes place. These in turn are embedded within industry sector and wider societal norms, including, but not limited to large scale social structures represented by hierarchies such as the gender order and the culture order. The focus of our research, an organisation committed to biculturalism, provides a paradigmatic case for exploring the challenges entailed in the constraints of such embedded contexts and in the effective management of potentially contrasting pragmatic norms.

A Contrastive Study of Face Threats in Historical Chinese and Japanese Memorials: A Speech Act Point of View

Panel contribution

*Ms. Mengyao Liu*¹, *Prof. Fengguang Liu*¹, *Prof. Dániel Z. Kádár*², *Prof. Juliane House*³, *Mr. Iori Ohashi*²

1. Dalian University of Foreign Languages, 2. Hungarian Research Centre for Linguistics, 3. University of Hamburg

In this talk, we present a contrastive pragmatic study of face threatening-acts in historical Chinese and Japanese memorials written in the early 19th century. Such memorials are particularly relevant for the study of face-threatening acts because they represent a genre in which in the context of negative news an official is ritually expected to provide a report for their emperor, and also to suggest a necessary course of action. While language use in this genre – which existed in various East Asian cultures using Chinese writing – followed strict ritual conventions (Kadar, 2017), it was nevertheless dangerous for an official to fulfil his duty and inform his ruler about problems and provide suggestions as messengers of bad news. Interestingly, to date little research has been done on face-threatening acts in memorials because most scholars have studied ancient Chinese ‘admonishing’ rather than the newer political genre of memorial (see e.g. Chen and Shen, 2019; Kadar et al., 2021). We aim to fill this knowledge gap.

In our research, we propose a bottom-up and speech act-anchored approach through which we can tackle face-threat in the genre under investigation without resorting to sweeping cultural overgeneralisations. We follow the contrastive pragmatic approach of House and Kadar (2021), by analysing the genre of memorials with a finite and interactional typology of speech acts. We contrastively examine Chinese and Japanese data, which provide an excellent *tertium comparationis* because a) the two countries were in a comparable historical situation in the early 19th century, and b) memorial was a standard genre in both linguacultures.

Chinese and German political discourse in contrast: An analysis of speeches at UN meetings on climate change from the perspective of Cross-Cultural Pragmatics

Panel contribution

*Dr. Chiara Bertulessi*¹, *Dr. Nicolò Calpestrati*²

1. University of Milan, 2. University for Foreigners of Siena

United Nations (UN) meetings are pivotal moments in international relations, during which world leaders come together to discuss topics of global relevance and that raise issues of often sensitive nature. In these contexts, speeches are delivered by the participants to the meetings (e.g., world leaders or their representatives) within a specific and ritualised framework. As a genre of political communication (Cap and Okulska 2013), speeches at UN meetings can be analysed to identify the recurrent linguistic patterns and their pragmatic functions that operate in the construction of the discourse on a specific topic. This appears to be particularly interesting when the analysis is carried out in a contrastive vein, and, specifically, when investigating, from the perspective of Cross-Cultural Pragmatics (House and Kádár 2021 and 2022), how these recurrent patterns and functions are realised by speakers of typologically distant linguacultures.

Based on these premises, the present paper explores Chinese and German political discourse on climate change in the context of UN meetings from a contrastive and cross-cultural pragmatic perspective. Specifically, it provides an analysis of a corpus of speeches delivered by China's and Germany's representatives during meetings held to discuss issues concerning climate change within the framework of the UN (e.g., the Conference of Parties, the Climate Ambition Summit, etc.).

The objective of the paper is thus to analyse the conventionalised expressions employed in the standard situations in which the speeches under scrutiny occur, the different speech acts these expressions realise and observe them in their discourse context, also contrastively highlighting differences and similarities between the Chinese and German texts. From a broader perspective, the paper also aims to contribute to the understanding of the different discursive and pragmatic strategies employed by the political representatives of China and Germany to present to the international community their country's endeavours in contrasting climate change, which, as a global matter of major importance, intertwines with issues related to image-building and consensus gathering on the part of the different countries, both domestically and internationally.

Chinese and U.S. American Official Conflictive Discourse - A Contrastive Pragmatic Analysis

Panel contribution

Mr. Sen Zhang¹

1. Dalian University of Foreign Languages

In this study, I contrastively examine Chinese and U.S. American conflictive discourse in the context of the Sino-US trade friction. By so doing, I aim to examine a highly loaded and very recent (ongoing) international encounter, relying on contrastive pragmatics which allows one to look at such intercultural political encounters through the cold eye of the researcher. In the spirit of contrastive pragmatics, I follow a bottom-up and data-based approach, and interconnect contrastive pragmatics with interaction ritual theory (Kádár, 2017). The current research aims to fill a knowledge gap in the contrastive pragmatic study of language and politics, considering that Sino-American encounters – and similar large scale political intercultural encounters – have received little attention in previous contrastive inquiries into political language use.

Comrade Little Vegetable, we believe you are real: atypical humor as motivated rudeness on presidential candidates' FB walls.

Panel contribution

*Dr. Jennifer Wei*¹

1. English Department, Soochow University

We see the use of non-standard Chinese characters for homophonic puns as motivated rudeness on the Facebook walls of presidential candidates when it involves an attack on the candidate's social and personal identity. Puns can be employed as (in)formal terms of address, nicknames, or remarks in a high-stakes presidential election to gain political points for ingroup cohesion. Atypical humor on social media can be used as an alternative way to talk about politics. This is made possible by technologies that blur the lines between spoken and written language and between belonging to a group and not belonging to a group. This contrasts with incongruities, superiority, and release as motivations for engaging in humor. This presentation investigates how unusual written characters are used in Facebook wall comments as puns to attack the candidate's personal and social identity to get the upper hand and show who is in and who is out of the group. It also looks at how puns can be used with social and linguistic elements to make a political point about a certain politician or subject.

Data are collected from the Facebook walls of the candidates in the 2016 and 2020 Taiwanese presidential elections. We use Morgan et al. (1979) taxonomies, which include both social and linguistic traits, to judge comments that make puns with unusual Chinese characters. There are many important linguistic factors, such as homophones, homonyms, and metonyms. However, personality is the most important social factor. Internet users can instantly obtain homophones and homonyms at the keyboard and create homophonic puns with sociopolitical variables, citing reported incidences and character faults to criticize a targeted candidate. By using marked terms of address, nicknames, or comments to create contradictions, a controlled public persona is made. This controlled public persona is used as a scapegoat by netizens to express conflicting values and challenge ideologies in funny comments. We've concluded that the unusual characters used in puns can stay known and lively because of how social media works. The deliberate incongruities in the linguistic and socio-political variables enable face attacks on opponents, scoring political points and bolstering ingroup solidarity. The results will help us learn more about how language-specific features can be used in funny and aggressive ways to talk about politics on social media.

Evasive Responses in Chinese and American Political Interaction: A Speech Act Point of View

Panel contribution

***Mrs. Shiyu Liu*¹, *Prof. Fengguang Liu*¹, *Prof. Dániel Z. Kádár*², *Prof. Juliane House*³**

1. Dalian University of Foreign Languages, 2. Hungarian Research Centre for Linguistics, 3. University of Hamburg

In the present talk, we examine the phenomenon of evasive response in Chinese and U.S. American political interaction. Evasive response behaviour is an interactional strategy, adopted by politicians and spokespersons when they encounter questions which they perceive as ‘threatening’ or unpleasant to answer. We approach evasive response behaviour through a contrastive pragmatic angle, and by using a finite and interactional typology of speech acts (Edmondson & House 1981). By so doing, we fill a knowledge gap because the phenomenon of evasive response in language and politics has not received sufficient attention in contrastive pragmatics in particular, even though conventions of interactional evasion tend to significantly vary across linguacultures. Along with a contrastive and speech act-anchored approach, we also use interaction ritual theory to interpret recurrent pragmatic patterns of the phenomenon under investigation, which also allows us to unearth differences between realisations of evasion in Chinese and U.S. American political corpora. Our data is based on transcribed data drawn from press conferences with a total of 23,000 tokens.

Framing in Chinese and American Media Editorials about the Sino-US Trade Conflict: A Cross-Cultural Pragmatic Analysis

Panel contribution

*Prof. Lutgard Lams*¹, *Ms. Ying Xu*¹

1. KU Leuven Campus Brussel

Any exploration of meaning generation in media discourse involves opening the researcher's gaze not only to the wider context of the discourse but also to implicit messages, even absent content. A comparative analysis of various corpora, drawn on the basis of geographical, social, or temporal variation (House & Kádár, 2022), is a superb methodological approach to reveal the gaps, differences, or convergences, and to distance the researcher from 'personal political stances and emotions' (House & Kádár, 2022: 134). This study examines linguistic aspects of media framing practices, such as presuppositions and lexical or syntactical choice-making, which accumulatively generate latent meanings in media discourse. In particular, it is explored how such meaning-generation strategies are used in Chinese and American editorials about the protracted US-China trade conflict. The cross-cultural pragmatic approach thus contrastively examines presumed political stances and instantiations of these in the framing of the issue and the main stakeholders.

In an interdisciplinary venture, we make insights from Communication Science, such as framing theory, meet with notions from Pragmatics, like presuppositions and lexical/syntactical variability (Verschueren, 1999). Based on the cumulative effect of linguistic choices on various structural levels of a text or speech, a pattern of ideologically invested meaning can gradually emerge. It is at this crucial point that Pragmatics meets Communication Science with the latter's frequently analyzed concept of framing, which denotes the construction of a meta-message about an event or actors. Ideological preconceptions can be the source of the framing process and vice versa. Since national interests play a crucial role in covering foreign news, this comparative analysis of the linguistic mechanisms underlying the framing process in editorials of the two countries involved in the US-China trade conflict may uncover frames revealing diverging political and economic interests.

Data were retrieved from the online editorial archives of the Chinese official newspaper *Renmin Ribao* and the US economic daily, *The Wall Street Journal*. The period of analysis ranged from 1 January 2018 to 31 December 2019, including the most heated discursive moments. With the choice for 'zhōngměi-màoyì-chōngtū 中美贸易冲突 China-US trade conflict' as keywords, *Renmin Ribao* and *The Wall Street Journal* yielded 18 and 31 editorials respectively. Methodologically, in following the analytical procedures of empirical cross-cultural pragmatic research (House & Kádár, 2022), the study maps and compares the linguistic devices that lead to the dominant frame about the conflict and the protagonists in each editorial. Preliminary findings indicate that the framing practices and their functions are similar in both corpora, but the presupposed messages are powerfully different. In a sensitive context of geopolitical tension, the nexus of language and politics becomes evident in media framing practices, which can exert a strong influence on audience uptake.

Keywords: cross-cultural pragmatics; meaning generation; framing; political stance; Sino-US trade conflict

Politeness in Historical Diplomatic Exchanges – A Contrastive Pragmatic Approach

Panel contribution

***Prof. Daniel Kadar*¹, *Prof. Juliane House*²**

1. Dalian University of Foreign Languages & Research Institute for Linguistics, 2. University of Hamburg

In this study, we report on the initial results of a large-scale project dedicated to the systematic study of politeness and impoliteness-related phenomena in language and politics. By so doing, we aim to contribute to this panel through an overview of the methodological challenges the study of politeness and impoliteness triggers when it comes to research on language and politics in general, and diplomatic exchanges representing intercultural interaction in particular. We argue that traditional interpersonal approaches to politeness and impoliteness are difficult to apply to the study of language and politics because such data does not allow the research to access various interpersonal features of language use in a rigorous and replicable way. This is why we suggest the need of relying on strictly language-anchored, bottom-up and corpora-based methodologies. Such methodologies are typically cross-cultural and contrastive pragmatic in scope (see House and Kadar, 2021). They are particularly useful for the study of historical diplomatic exchanges representing intercultural interaction where it is generally problematic to speculate about intentions, motivations, evaluation and other interpersonal pragmatic factors. As a case study for illustrating the framework proposed in this talk, we investigate historical diplomatic exchanges between Japan and the US in the 19th century.

Politics and cyber-activism: mediating law across time, space, and genres

Panel contribution

Dr. Monika Kopytowska¹

1. University of Lodz

Thanks to its near-instantaneous, decentralized nature and interactivity, the Internet has become an ultra-attractive site for the socio-political debate and citizen participation. With its potential to foster like-minded communities (Mazzoleni and Braciale 2018: 3), “affective communication” favouring highly personalized and emotional content (KhosraviniK 2017: 63; Engesser et al. 2017: 1284–1285) as well as “disintermediation” process (political actors directly addressing citizens), it has substantially transformed political communication and the resulting salience of issues on the public agenda. The objective behind the present paper is thus to outline an integrated cognitive-social-pragmatic approach to these new communication dynamics within “the networked public sphere” in the Habermasian sense, along with the role of social media in enhancing the dialogic impact of contemporary political discourse.

We start from the assumption that while language enables attribution of status functions, deontic powers, positioning of social actors within discourse space, and thus legitimization of political ideas, decisions, and actions (Berger and Luckmann 1991/1966; Searle 1995, 2005, 2010; Chilton 2005, 2014; Cap 2013, 2017), cyberspace, with the semiotic affordances it offers, or what KhosraviNik (2017, 2018) refers to as “techno-discursive design”, creates conducive environment for expanding the dialogue between political figures and their audiences across time, space and genres, thereby enhancing the impact and visibility of political messages. Following the tenets of the Media Proximization Approach (MPA, Kopytowska 2013, 2015, 2018, 2022), we assume that key in this process are distance-related operations on the level of discourse as product and process. Technology-enabled discursive practices, along with verbal and visual strategies, help to reduce temporal, spatial, axiological, epistemic, and emotional dimensions of distance, both between selected aspects of reality and the audience (representational dimension) and between members of the audience (interpersonal dimension), which in turn impacts on how social relations are constructed, and how, more generally, certain phenomena, groups or individuals acquire their axiologically and emotionally imbued representations, often with real-life implications, within the sphere of collective consciousness.

The data analysed includes online discourses concerning restrictions on the anti-abortion law in Poland and the ensuing protests in 2020-2021. Proximization triggers, strategies and (possible) outcomes within discourse as product (texts consisting of verbal and visual elements) and process (practices of prosumption and distribution) are identified and discussed.

Refusing in Chinese and English Political Language Use: A Contrastive Pragmatic Study

Panel contribution

***Mrs. Dan Han*¹, *Prof. Fengguang Liu*¹, *Prof. Dániel Z. Kádár*², *Prof. Juliane House*³**

1. Dalian University of Foreign Languages, 2. Hungarian Research Centre for Linguistics, 3. University of Hamburg

Abstract: In this study, we examine the phenomenon of refusing in Chinese and U.S. American political language use from a speech act point of view (Edmondson, 1981; Edmondson et al., 2022). By ‘refusing’ we refer to the interactional move of refusing to answer a question which the speaker interprets as inappropriate or intrusive. Failure to realise refusing in an acceptable manner in political language use can trigger controversies. Considering that a significant variation tends to exist between how Chinese and U.S. American language users realise refusing in ordinary interaction, we believe that it is also worth to study this phenomenon from a contrastive angle in the realm of political language use.

In our study we pursue a bottom-up approach to refusal, by defining it as an interactional move rather than a speech act. By so doing, we follow a different route from a body of previous studies, which defined refusing as a speech act. Approaching refusing as an interactional move allows us to capture recurrent pragmatic features of this complex interactional phenomenon with a finite and replicable set of speech acts. This approach also allows us to unearth recurrent differences between realisations of refusing in Chinese and U.S. American political corpora. Our corpora consist of instances of refusing realised by spokespersons in press conferences and instances of refusing in political debates in the media.

Speaker-audience intercommunication in political speeches: A contrast of cultures

Panel contribution

Prof. Peter Bull¹, Dr. Maurice Waddle¹

1. University of York

Speaker-audience interaction needs to be understood in a cross-cultural context. This paper is based on a series of studies of political speeches conducted in the UK, USA, Japan, South Korea, Norway and France. Whereas audiences in Japanese political speeches typically responded together (Bull & Feldman, 2011; Feldman & Bull, 2011), in American presidential speeches, there was a constant flurry of asynchronous and uninvited individual remarks, typically expressing attentiveness, support, or encouragement for the speaking candidate (Bull & Miskinis, 2015).

In Anglo-American political speeches, implicit rhetorical devices are the norm (e.g., Atkinson, 1984a; Bull & Miskinis, 2015; Bull & Wells, 2002; Heritage & Greatbatch, 1986). The use of implicit rhetorical devices as applause invitations is also characteristic of both French (Ledoux & Bull, 2017) and Norwegian speeches (Iversen & Bull, 2016), suggesting that the use of such rhetoric is not just a feature of English language use. In contrast, in Japanese and Korean election speeches, rhetorical devices used for inviting applause are typically explicit (Bull & Feldman, 2011; Choi & Bull, 2021; Choi et al., 2016; Feldman & Bull, 2012).

Audience responses are culturally variable. In the study of the American 2012 presidential election (Bull & Miskinis, 2015), the most frequent response was cheering, whereas in Japanese general election speeches, it was applause (Bull & Feldman, 2011; Feldman & Bull, 2012). Another distinctive feature of presidential speeches in both the USA (Bull & Miskinis, 2015) and in France (Ledoux & Bull, 2017) was invited booing. This was not reported in previous analyses of British speeches (Atkinson, 1984a; Heritage & Greatbatch, 1986; Bull, 2006); it was almost entirely absent from Norwegian general election speeches (Iversen & Bull, 2016). No form of booing was ever observed in the two analyses of Japanese general election speeches (Bull & Feldman, 2011; Feldman & Bull, 2012), nor in the analyses of Korean speeches (Choi & Bull, 2021; Choi et al., 2016).

In negative naming, a speaker may ridicule or criticise a political opponent or a rival political group. In the UK, negative naming is typically used as a rhetorical device to invite applause (Bull & Wells, 2002), whereas in both the USA and France, it is used as a rhetorical device to invite booing. Negative naming was never observed in either of two studies of Japanese political speeches (Bull & Feldman, 2011; Feldman & Bull, 2012).

These differences in political speech-making may be explained in relation to the following cultural distinctions (Bull & Waddle, 2021). In Western nations, a leading politician can enhance their reputation in the eyes of the electorate by attacking opponents (e.g., Waddle et al., 2019). Such adversarial behaviour is unlikely to generate the same admiration or support in Japan, where this form of behaviour tends to reflect badly, and could cause far more reputational damage to the speakers themselves than to their opponents (Bull & Feldman, 2011).

You lefties, you pickles, you Bibush: The strategic use of address terms across Hebrew and British discourse genres

Panel contribution

***Prof. Elda Weizman*¹, *Prof. Anita Fetzer*²**

1. Bar Ilan University, 2. University of Augsburg

This paper examines the forms and functions of address terms in two discourse communities – Israeli Hebrew and British English – and in two sub-genres of mediated political talk – comments on online newspapers, as well as comments on politicians’ Facebook posts and speeches. The focus of analysis lies on discursive strategies and their intended perlocutionary effects for the discursive construction of ordinariness as an object of talk in mediated public talk, through the positioning of self and other speakers as ordinary and non-ordinary.

In line with Brown and Gilman (1960), Bull and Fetzer (2006), Weizman (2008), and Anchimbe (2011), we consider terms of address as indexing power and solidarity. In terms of the construction of ordinariness, commenters use terms of address strategically to position themselves, their interlocutors or third parties on a scale of ordinariness and by doing so refer indexically to the interconnectedness between private and public spheres of life, and to social, political and communicative accountability. We thus investigate the ways reflexive positioning is constructed between the parties, focusing on the negotiations of ordinariness and non-ordinariness through the use of address terms. In particular, we distinguish three super-strategies: (1) references to the comment’s addressee (e.g. the writer of the article/Post/speech, fellow commenter, specific group and generic addressee); (2) address type (e.g. family name, tagging, title, role, naming); and (3) co-occurring supportive cues (e.g. politeness formulae, attention getters, expressions of affiliation, irony).

The analysis relies on dedicated corpora which consist of leading journals for each discourse community (*Ha’aretz*, *YNET*, *Calcalist*, *Globes* in Hebrew, and *The Guardian* and *The Daily Telegraph* in British English), as well as the official Facebook pages of four party leaders for each discourse community: Benjamin Netanyahu, *Likud* party, Benny Gantz, *Kachol Lavan*, Yair Lapid, *Yesh Atid*, and Moshe Kachlon, *Kulanu* party in Hebrew; and Theresa May, *The Conservatives*, Vince Cable and Tim Farron *Liberal Democrats*, and Jeremy Corbyn, *Labour Party* in British English.

Our analysis reveals differences and similarities between the use and functions of these strategies not only as regards frequency, but also as regards co-occurring supportive cues. These will be discussed and interpreted in terms of discursive context.

The research has been supported by a grant from the German Israeli Foundation for Scientific Research and Development (GIF Grant I-153-104.3-2018).

Co-constructed and multifunctional feedback in face-to-face tandem interactions

Panel contribution

*Dr. Céline Horgues*¹, *Dr. Sylwia Scheuer*¹, *Dr. Loulou Kosmala*¹

1. Université Sorbonne Nouvelle

Tandem learning – where two native speakers [NSs] of two languages learn each other’s language and culture through regular interactions – presents different characteristics from instructed classroom language learning. It gives a complex perspective on the concept of “hierarchy” as the novice/expert relation is relative, contextual and reversible (Brammerts & Calvert 2003; Vassallo & Telles 2006). In principle, the NS is expected to be the provider of feedback to correct their partner’s L2 output (negative evidence, Gass 2003) but also to engage in smooth communication (backchannelling, Bertrand et. al 2007).

In practice, how does this feedback work in actual spoken tandem interactions? In this paper we explore the SITAF corpus (Authors 2015) to study feedback in spoken, real-time, face-to face video-recorded conversations held by 21 French/English tandem pairs. We draw on previous quantitative studies on the corpus (Authors 2020 and 2021), which identified a considerable amount of corrective feedback, especially on the part of the French NSs. This paper now adopts a qualitative approach, to reveal the defining features of such feedback:

- the two main functions (didactic, discursive) of feedback by the NS are often interdependent (sequential and/or intertwined)
- feedback provision requires a subtle equilibrium between the NS’s role in supporting the NNS’s linguistic development but also in saving their partner’s face in the process
- feedback is not just the prerogative of the NS, as its initiation and management are co-constructed
- there is multimodal alignment in feedback strategies within the pairs
- cultural affiliation partly determines feedback patterns in the two language/culture groups concerned.

Constructing feedback through talk and text in corporate performance appraisals

Panel contribution

Ms. Fien De Malsche¹

1. Universiteit Antwerpen

In this paper, I examine spoken and written language use at a Belgian company, focusing on the ways in which feedback is de/recontextualized (Park & Bucholtz, 2009) throughout the company's performance appraisal process as information travels discursively from text to talk and back to text. The interview is a key interaction in the appraisal process, where the topics of discussion are based on a preparatory document and the discussion itself is noted down in the form of a report. As such, the full process can be considered a 'discursive pathway of linked speech events' (Wortham & Reyes, 2015) structured around the interview. Previous research on this type of encounter has shown that written texts permeate and shape the spoken interaction in significant ways (Van De Mieroop & Carranza, 2018; Van De Mieroop & Vrolix, 2014). However, little is known about the specific processes of discursive change that occur from text to talk and talk to text throughout the feedback process.

The dataset consists of (i) 15 video-recorded performance appraisal interviews between managers and sales agents, (ii) two versions of the evaluation form for each interview: the filled out version which is used as preparation for the interview, and the finalized version which is completed after the interview, and (iii) two follow-up research interviews with the managers about the performance appraisal interviews and process to contextualize the dataset with their emic perspective. The analysis focuses on two things: the transformation of feedback as it moves from written to spoken mode and spoken to written mode and the discursive changes (e.g. selection, deletion, summary, addition, substitution) this involves, i.e. the practices of reporting, and the reasons why the discursive transformations occur, i.e. the norms of reporting. In the latter case, the analysis topicalizes the (institutional) power and authority of the different interlocutors involved in the appraisal process as differentiated between the spoken and written discursive events, as well as the ways in which the identity of the 'model employee' (Van De Mieroop & Schnurr, 2017) is interactionally (co-)constructed and subsequently codified in written form. As such, this paper aims to shed light on the complex discursive mechanisms at play in the corporate categorization of employee assessment throughout the performance appraisal process.

Constructing heterosexual desire as assessable affect: a corpus-assisted small stories approach to male clients' reviews of female sex workers on PunterNet

Panel contribution

Mr. Christos Sagredos¹

1. King's College London

In this presentation, I examine a corpus of 510 online reviews authored by reviewers of female sex workers on PunterNet. Drawing on the small stories research paradigm (Georgakopoulou, 2007, 2015), I take such reviews as a hybrid kind of storytelling that falls between 'big' and 'small' stories, and such storytelling as an interactional resource that is rich in (affective) identity work. More specifically, I draw theoretical and analytical insight from the sociolinguistic theorization of affect-as-desire (Mortensen & Milani, 2020, 2021) as well as the concept 'affective positioning' (Giaxoglou, 2020) in its connections with the small stories research paradigm (Giaxoglou & Georgakopoulou, 2021). From this perspective, I explore how heterosexual desire is constructed as an assessable kind of affect and how clients-as-reviewers position and legitimize themselves as experts with the authority and ability to assess themselves and others as subjects and objects of heterosexual desire (Kulick, 2003). Key findings suggest that clients-as-reviewers often position themselves as the object of sex workers' desire by orienting to heteronormative discourses through which hetero-masculinity and male heterosexual desire are constructed as mutually constitutive.

Hotel responses to feedback on TripAdvisor: An experimental study on consumer perceptions of face-work

Panel contribution

*Dr. Irene Cenni*¹, *Dr. Rebecca Van Herck*², *Prof. Bernard De Clerck*¹, *Dr. Sebastian Sadowski*²

1. Ghent University, 2. Radboud University Nijmegen

Over the last decades, there has been an exponential increase in studies investigating the language and pragmatic features of consumer reviews and service provider responses posted on business-oriented platforms such as TripAdvisor, Airbnb or Amazon (e.g., Vásquez, 2014). More recently, some studies have started to focus on these digital genres from a cross-linguistic and cross-cultural point of view revealing different discourse habits between writers with different linguacultural backgrounds (e.g., Cenni & Goethals, 2020; Morrow & Yamouchi, 2020). In particular, different face-work and pragmatic strategies have been detected across texts written in different languages.

In the present study, we aim at going beyond the detection and description of discourse-pragmatic features of businesses' public responses to consumer feedback written in different languages, linking these genres to audience perceptions. More specifically, the aim of this study is to examine to what extent the various face-work and discursive strategies written by hotel employees on TripAdvisor influence users' pragmatic interpretation and their perception of politeness. This research objective will be answered through an experimental design, using participants with two different linguistic backgrounds (L1 Italian, L1 English). Based on previous research on the perception of politeness and professionalism in business communication (e.g., Decock et al., 2021; Jansen & Janssen, 2010; Van Herck et al., 2021) participants will be introduced to a managerial response to a negative review, followed by a series of questions which will assess their perception of face-related discursive strategies (e.g., politeness) and their intention to book the hotel. Different discourse strategies that are typical of Italian managerial responses to reviews (based on a previous qualitative corpus study: Cenni & Goethals, 2020) will be presented to participants. Specifically, the study comprises a between-subjects experiment with a 2 (linguacultures: Italian/English) x 3 (dismiss the complaint: deny failure/shift responsibility to the guest/control version) design. The results of the experiment will be obtained in February 2023.

Elaborating on the different discursive preferences detected cross-linguistically in online (responses to) review feedback (e.g., Cenni & Goethals, 2020; Napolitano, 2018), we expect to find variation in the pragmatic perceptions among users of different linguacultures. For example, Italian users might find the defensive style more appropriate than English speakers. This study will give us a better understanding of the actual impact of discursive preferences for potential customers with different linguacultural backgrounds.

This type of research is relevant since TripAdvisor does not allow guests or other users to react to hotels' responses, preventing us from verifying perceptions of businesses' responses among consumers on the platform itself. Second, results will indicate which types of responses to feedback are more appreciated by different language users, which is relevant considering TripAdvisor's global and highly multilingual audience. In addition, these new insights are of particular interest for service providers and social media managers who need to develop cross-cultural and multilingual communication strategies in digital settings.

On the ‘creative’ language of bias in appraisals: metaphors and gendered identities in corporate performance reviews

Panel contribution

Prof. Sylvia Jaworska¹

1. University of Reading

Taking as the starting point the argument that acts of evaluation are productive sites for the discursive positioning of selves and others and might therefore involve unexamined biases, this contribution explores the constructions of professional identity of female and male employees in a large corpus of corporate performance reviews. It is particularly interested in assessing the extent to which stereotypical gendered expectations around masculinity and femininity influence the feedback and explores in detail language choices through which that kind of gendering becomes manifest.

To this end, a specialised corpus of written performance reviews (104,955 words and 1,054 reviews) was collected in a large multinational organisation and from employees who work at the same level of organisational hierarchy having similar responsibilities and tasks to perform. The corpus was divided into reviews written about male and female employees following the gender categories specified by the employees themselves. Using a corpus-assisted discourse analysis supported with WMatrix, the contribution explores the differences and similarities in the language used to evaluate female and male employees. The results offer unique insights into the ways in which stereotypical gendered expectations are routinely perpetuated in high stake evaluations; specifically it shows how through the use of diverse metaphors from the source domains of SPORT, MACHINES, CRAFT, CLOTHES, and BODY, the gendered differences are constructed in ‘creative’ ways hypermasculinizing the discourse of white-collar work in a neo-liberal economy, but only for men. The paper finishes with some reflections on the ‘complicit’ role of the language of feedback in perpetuating gender biases and how those biases could potentially be minimised through a more reflective language work.

Positive and Negative Stance in MOOC Reviews

Panel contribution

Dr. Hatime Çiftçi¹

1. MEF University

Evaluative feedback is one of the commonly practiced social acts in many communicative events in both face-to-face and online settings. One such form of feedback for evaluation purposes in digital contexts is the Massive Open Online Course (MOOC) reviews. Even though these online course reviews might seem like traditional student evaluations, they have the potential as an emerging genre of evaluative feedback because of the nature of such digital learning platforms as well as the purpose and expectations of users. Thus, being informed by previous research on online reviews (Vásquez, 2011, 2014), my research aims to examine online course reviews that are publicly available on the *Coursera* website. More specifically, I focus on these two research questions: 1) What are the linguistic resources used for positive and negative stance in online course reviews on *Coursera*? and 2) What are the other discourse features surrounding (or co-occurring with) positive and negative stance acts in online course reviews on *Coursera*? Drawing on and utilizing Biber's (2006) framework of stance, I have been analyzing (the most frequent) lexico-grammatical features of positive and negative stance (e.g., modals, stance verbs, adverbs, nouns, and adjectives, etc.) in a dataset of 200 online course reviews to answer the first research question. Additionally, I have been examining some discourse-level features or strategies (e.g., speech acts) that are concurrently taking place with positive and negative stance. To collect data, I chose a specific domain/discipline on *Coursera* and then picked the most favorite 2 courses in that domain to obtain a total of 200 online reviews of these two courses. In doing so, I used certain filtering options for my purposeful data collection process and stored my data both as screenshots in pdf and a copy-paste text on the Word document (Kreis, 2022; Sayers China, 2018). The dataset in my study equally involves the most recent positive and negative reviews by having 5-starred as well as 1- and 2-starred course reviews. Drawing on discourse analytic approaches (Gee & Handford, 2012; Schiffrin, 1994; Schiffrin et al., 2001) and research on digital discourse (Vásquez, 2022), my preliminary analysis indicates that adjectives and adjectival phrases are one of the predominantly utilized items for both positive and negative stance in online course reviews. Additionally, online course reviewers use stance verbs *I feel* and *I believe* very often to express their (positive or negative) attitudinal evaluations. Finally, both positive and negative stance acts co-occur with thanking and gratitude as well as expression of satisfaction, expectations, and disappointment.

Self-presentation in the discursive construction of YouTube “small reviews” through evaluative feedback.

Panel contribution

Prof. Alejandro Parini¹

1. University of Belgrano

Online participatory environments have become saturated spaces in terms of the opportunities that they offer for the display of different viewpoints and identities. YouTube, as a popular video-sharing and networking site, constitutes a new media space that invites both individual and collaborative stance-taking by participants who gather, virtually, to address a particular topic, issue or event depicted visually and discussed textually through the comments that are posted on the site (Androutsopoulos 2011; Tur-Viñez and Castelló-Martínez 2019). Online product reviewing constitutes one of the most popular acts of sharing on YouTube through which users seek to exchange their personal experiences with a particular product by engaging in both harmonious and conflictual exchanges that position self and others. YouTube reviews are somehow different from other online reviews (See Vásquez 2014) as they are co-constructed on the basis of the evaluations expressed and negotiated through feedback activity in the form of text comments and in a polylogical interactional context. In these comments, conceptualised as secondary or small reviews (Parini and Fetzer 2019), participants contribute to the act of reviewing not only by assessing the product's technical specifications but also by constructing and maintaining loyalty to the brand or product through identity work involving acts of self-presentation and impression management. Against this background, and viewing identity as being socially constructed in interaction (de Fina, Schiffrin and Bamberg 2006; Bodinger-deUriarte 2019), this work reports on a case study of the way participants foreground different aspects of self in the discursive construction of 50 smartphone reviews posted on YouTube between January and March 2022. More specifically, the study centres the attention on how small reviews are constructed in the form of evaluative feedback that includes affective stances towards the products being reviewed, and that is manifested through discursive work involving acts of self-disclosure in the textual comments posted in Spanish on the sites.

There is amazing feedback and then there is just feedback: Exploring discussions of feedback in online corpora

Panel contribution

*Dr. Ursula Lutzky*¹, *Prof. Andrew Kehoe*²

1. Vienna University of Economics and Business, 2. Birmingham City University

Today, interactions between businesses and their stakeholders take place in the online sphere to a significant extent. The steady increase in digital business communication has entailed two developments. On the one hand, these technological changes have triggered an increase in complaint behaviour, with consumers often voicing their dissatisfaction publicly on social media. On the other hand, companies increasingly take a stance on socio-political issues, such as diversity and inclusion. While this is partly motivated by stakeholders expecting businesses to demonstrate engagement with these issues, it also leads to the polarisation and politicisation of organisations (van de Meer and Jonkman 2021).

In this paper, we aim to address both of these developments by adopting a corpus pragmatic approach. We begin by exploring companies' framing of customer dissatisfaction and complaints as feedback by assessing the use of the term *feedback* in a large corpus of customer service interactions. Our analysis is based on the Trains and Airlines Twitter Corpora, comprising almost 25 million words in total. Lutzky (2021) has already shown that the term *feedback* is 'key' in these corpora (i.e. it appears more frequently than expected) in tweets that British and Irish train operating companies and airlines addressed to their customers. Building upon this finding, the present study will carry out an in-depth analysis of how the term is used in corporate tweets, exploring the specific contexts in which it occurs and the words with which it frequently co-occurs (its collocates) to gain new insights into the discursive construction of speech acts such as complaints as feedback.

While the first part of our analysis focuses on the framing of customers' messages as feedback, the second part examines tweets in which companies take a clear stance on a socio-political issue and customers' reactions to and feedback on those tweets. A company that has adopted a highly polarising approach in its external communication in recent years is the Irish airline Ryanair. As initial analyses have shown, Ryanair successfully generates user engagement through its controversial tweets on topics such as vaccination and British politics, but it also alienates parts of its client base in the process. By studying the 2.8-million-word Ryanair Twitter Corpus, we aim to uncover further insights into users' feedback on Ryanair's social media strategy, which they voice in their replies to the company's tweets (e.g. *Why don't you focus on becoming a less wank airline rather than trying to be clever on social media?*). Our study thus adopts a dual approach, analysing how companies and their customers respond to and offer feedback on one another's discursive practices on social media.

User feedback in response to self-praise on Chinese social media

Panel contribution

***Ms. Yaping Guo*¹, *Prof. Wei Ren*¹**

1. Beihang University

This study investigates a particular genre, internet users' feedback in response to online self-praise. Self-praise is a very common practice on social media and has attracted researchers' attention in recent years (Dayter 2016; Matley 2018; Ren & Guo 2020, 2021, 2022; Rüdiger & Dayter 2020; Tobback 2019). In contrast, how interlocutors respond to other netizens' self-praise on social media has rarely been explored, even though a few studies examined people's attitudes towards certain translanguaging practices involved in self-praise (Ren, Guo, & Li 2022). This study investigates user feedback to self-praise by examining a dataset of 300 self-praise responses collected from Chinese social media platforms (e.g., Weibo, WeChat and Little Red Book). In addition, the self-praising blogger's responses to interlocutors' feedback in response to their self-praise are also collected and analyzed. That is, the study will examine two levels of feedback: users' feedback in response to bloggers' self-praise, and the bloggers' responses to the users' feedback. First, the study analyzes the pragmatic strategies of the feedback posted in response to self-praise. The preliminary analyses showed that netizens comment on the blogger's self-praising behaviors with various compliment strategies. Second, the study examines whether the netizens' self-praise responses differ with respect to whether the initiating self-praise is explicit or implicit. Finally, the study also examines the blogger's response to the interlocutors' responses to his/her self-praise. The preliminary analyses showed that the self-praising bloggers employ mainly three major strategies to respond to the self-praise feedback they have received: that is, accepting, evading and rejecting (in order of decreasing frequency). By examining the above discursive practices, the study discusses the possible factors motivating the various strategies, identity construction and relational work involved in self-praises, feedback in response to self-praise responses, and responses to feedback on self-praise.

Verbal feedback in the workplace : Observations on forms and functions within team meetings

Panel contribution

*Ms. Céline Gousse*¹, *Dr. Ludivine Crible*¹

1. Ghent University

Speech is never a solitary act; it is rather the result of collaborative creation. Hence, verbal interactions are marked by the constant adjusting of speakers to the context of communication (Hymes, 1972) and to the various outputs of their interlocutors. It has been shown that listeners play an important role in conversations (e.g., Bavelas et al., 2000; Bavelas et al., 1995; Clark & Wilkes-Gibbs, 1986; Schober & Clark, 1989). These Listener's outputs have been termed "feedback" (Fox Tree, 1999) or "commentaries" (Pickering & Garrod, 2021). Verbal feedback is not only a trace of collaboration between participants, it also is a linguistic cue enabling this collaboration.

In this paper, we focus on feedback in its capacity to contribute to conversational alignment. Alignment is a cognitive process through which the speaker's mental models align during an interaction (Clark, 1996; Pickering & Garrod, 2004). This happens through information sharing and meaning negotiation. In this context, feedback plays an important role as it can communicate a mismatch in conversational alignment ("negative" feedback) and therefore helps speakers bring the dialogue "back on track" (Pickering & Garrod, 2004) by asking questions (e.g. *what project are you talking about?*) or expressing misunderstanding (*huh? I don't follow*). Alternatively, feedback can also confirm alignment of mental models and converging opinions ("positive" feedback, e.g. *mhm, okay, I agree*, etc.). Thus, feedback can take on many forms (repetitions, questions, discourse markers, disfluencies) and many functions. This study explores the various feedback devices that are used in the specific context of business meetings and investigates the factors that may explain their formal and functional variation.

For this study, we use Divoux's (2020) corpus of fourteen hour-long team meetings collected in the carpentry section of a French company. The speakers differ in profession and status, with 8 managers and 7 labour workers (all male). In this data, we identify and code all instances of feedback in terms of positive vs. negative and generic vs. specific (cf. Bavelas et al., 2000; Crible et al., *forthc.*) under EXMARaLDA annotation software (Schmidt & Wörner, 2012). The speaker's hierarchical status will also be taken into account.

With this dataset, we address the following research questions: How is feedback used in team meetings? Is there an effect of power and hierarchy? Preliminary observations suggest that verbal feedback is directly linked to defusing tensions, strengthening the feeling of belonging to a group, reinforcing cohesion and carrying out work tasks. Feedback thus performs both social and operational functions. Complete findings are pending and will reveal whether specific types of verbal feedback are systematically associated with different functions of feedback, different interactional activities and different speakers statuses. We will compare our results to previous findings on feedback in everyday conversation (Pöldvere et al., 2021) and in task-oriented non-professional interaction (Crible et al., *forthc.*).

“Tell Us Everything!”: Online and offline solicitations for customer feedback

Panel contribution

Prof. Camilla Vasquez¹

1. University of South Florida

We are inundated with requests for feedback in nearly every realm of our daily lives. Businesses solicit consumer feedback using a variety of media ranging from email messages asking for ratings or reviews, public signs prompting a response, store receipts with links to customer satisfaction surveys, and “send feedback” messages embedded into mobile device apps or pop-up windows on websites. While such requests for feedback are often framed as essential to improving products or services (*In order to improve our offer...*) – or in more altruistic terms (*Your feedback helps fellow travelers...*) – these banal, yet ubiquitous, texts ask us to invest our time and to engage in free labor that is intended, above all, to benefit the businesses who solicit such data.

The aim of this study is to describe the pragmatic variation that exists in diverse forms of feedback solicitations, by taking into account their textual structure, their linguistic formulations, and their use of modal resources. Via opportunistic sampling, 300 instances of consumer feedback solicitation were collected from the residents of one household and its closest social network for a period of 6 months. The primary focus of the analysis addresses the persuasive tactics used to by businesses as they try to gain users’ compliance with their requests, for instance by exploiting strategies of relational work – conceptualized, depending on one’s perspective, as either “synthetic personalization” (Fairclough, 2001) or as “conversational human voice” (Kelleher, 2009) – to appeal to the consumers on the receiving end of their messages. The analysis considers the larger communicative moves as well as the pragmalinguistic strategies used in the formulation of these requests (Blum-Kulka, 1984). In addition, the analysis further considers what modalities and materialities are involved in the construction and distribution of these texts, as well as the different ways in which consumers are positioned by them. Finally, the analysis reveals that these texts are “doing” much more than merely gathering user’s evaluations of experience, with the ostensible solicitation of feedback serving as a pretext for collecting a wealth of other types of information from consumers.

From divergent to joint foci of visual attention

Panel contribution

***Prof. Anja Stukenbrock*¹, *Dr. Angeliki Balantani*²**

1. University of Heidelberg, 2. University of Lausanne

This study investigates the achievement of joint attention in the face of potential “conflicts of interest”. When participants summon their co-participants’ attention on a phenomenon or object, the preferred response is to reorient themselves and share their visual attention on the phenomenon. However, addressees may not follow the invitation to jointly attend to an object that their co-participant wants to share – for various reasons. One of the instances in which addressees do not (immediately) respond to the summoning speaker by reorienting, is when they are themselves perceptually and cognitively involved with something and disprefer to give it up for the sake of attention sharing. We will present a collection of cases where participants are not attending to the same objects and one of them invites the other to share attention on a phenomenon they find interesting. Using the methodological principles of Conversation Analysis and a corpus recorded with external video cameras and mobile eye-tracking glasses (Tobii Pro Glasses 2) worn by the participants in naturally occurring interaction, the study investigates the achievement of joint attention in cases of divergent foci of attention. In particular, it focuses on how deictic and embodied practices are deployed when participants are in an open state of talk and attempt to (re-)focus their co-participants’ divergent attention on an object or activity they are currently involved in. The purpose of the current study is therefore twofold; firstly, to uncover the practices, verbal and embodied, that participants resort to when intending to direct another participant’s visual attention to an activity or entity in the face of divergent foci of attention, and, secondly, to examine how the choice of different attention-summoning practices shapes the way in which participants collaborate in the joint action of attention-sharing. Preliminary observations suggest that there are different verbal and embodied practices that participants employ in order to resolve divergent foci of attention that range on a continuum from less to more response mobilising.

Gaze and its functions in atypical f-formations

Panel contribution

*Dr. Elisabeth Zima*¹, *Ms. Barbara Laner*¹

1. University of Freiburg

This paper introduces the panel's topic and discusses recent studies in interactional gaze research which have focussed on the role of gaze in atypical spatial formations such as side-by-side or mobile settings. In these settings, the bodies of the participants are prototypically directed into the space before them and unless they turn their heads, their gaze is averted from each other. Thus, their transactional segments usually only peripherally overlap, or at times, there is no shared o-space (Kendon 1990: 233ff) at all, i.e. whenever the participants gaze to their sides. As a consequence, gazing to the other participant in a side-by-side constellation, and even more so mutual gaze is rather infrequent (as compared to vis-à-vis setting or other typical F-formations, cf. Auer & Zima 2021).

This raises the question as to when and for which interactional purposes, participants in atypical F-formations and mobile settings such as walking or cooking together do indeed gaze at each other. More specifically, we focus on the functions of gaze in question-answer sequences, word searches, and during laughables (Auer & Laner, submitted), etc. We show that the functionality of gaze as a resource to mobilize response (cf. Goodwin & Goodwin 1986, Stivers & Rossano 2010, etc.) is in fact highly dependent on participants' spatial arrangement and the average frequency of gaze shifts and mutual gaze (as argued by Auer & Zima 2021). This is due to the fact that gaze shifts can only be interpreted as interactionally meaningful cues if they constitute marked activities that deviate from the default gaze constellation. We aim to encourage an in-depth discussion on the functions of gaze in atypical f-formations to enhance further research of other f-formations: One major question in this regard is whether we can and need to differentiate between gazes that are used to mobilize responses and gazing at the other person to monitor the other one's reaction to some prior talk.

Gaze in music making: functions of gaze in orchestra rehearsals and chamber music lessons

Panel contribution

Dr. Monika Messner¹

1. University of Innsbruck

This contribution investigates the role and functions of gaze in two different musical settings: orchestra rehearsals and chamber music lessons. The focus is on the link between the (institutional) setting, the participants' orientation in space, the presence of objects (score, instruments) and specific functions of gaze. In orchestra rehearsals, the conductor stands in front of the musicians, faces them and alternately looks at the score for upcoming instructions; the musicians sit in a semicircular arrangement around the conductor. The musicians' gaze is directed at the conductor and the score, they rarely look at each other. The musicians orient their gaze behavior towards the conductor's instructions: when the conductor addresses them (verbally, gesturally or also by gazing in the direction of a specific musicians' group, e.g. the strings) for an upcoming instruction, they display engagement by gazing at him/her and by looking at the score to compare the conductor's instructions with what is written in there. Here, different types of gazes (conductor: at the orchestra, at the score; musicians: at the conductor, at the score) come into play and manage interpersonal rapport and address (cf. Stöckl/Messner 2021: 205). Stöckl & Messner (2021: 206) also refer to gaze as an "independent transitioning device" between actions (e.g., from evaluating to justifying), i.e. gaze facilitates a smooth transition between (instructional) actions.

Gaze shifts between participants and the score are also constitutive for the interaction in chamber music lessons. In this second musical setting, the participants enter in a circular, but static spatial arrangement and divide a joint transactional space (Kendon 1990: 211). Part of this o-space (cf. Kendon 1990) is also the score as it becomes the object of interpretation and interaction between the professor and the musicians. The professor, for instance, shifts their gaze from the score to the musicians for addressing a participant and/or for communicating to another participant which musical part is important for understanding the instruction. Similar to the musicians in orchestra rehearsals, the music students in chamber music lessons display their readiness and cooperation by directing their gaze at the professor when addressed. Gaze, thus, functions as a social activity (cf. Rossano 2012), i.e. gaze is used to achieve joint attention and simultaneously attention is drawn by gaze to specific objects (e.g., the score, cf. also Stukenbrock 2018).

The aim of the present paper is to examine also other types and functions of gaze when used during instructional activities in orchestra rehearsals and chamber music lessons. The following questions will be considered: How strong is the role of gaze as a contextualization resource for participation roles (conductor vs. musicians, professor vs. music students)? Can gaze also be employed to demand feedback signals from the recipient and to monitor the recipient's reactions (cf. also Rossano 2012)? Is there a default gaze pattern (e.g., gazing at the score)? Are some gaze shifts more salient than others? And what impact does the epistemic constellation (cf. Heritage 2012, Auer/Zima 2021) have on the ways in which gaze can be (functionally) used?

Interactional space and gaze: an overview

Panel contribution

***Ms. Barbara Laner**¹, **Prof. Peter Auer**¹*

1. University of Freiburg

This paper gives an overview of how the spatial orientation of the co-participants results in the joint construction of an interactional space. We discuss in particular how Kendon's notion of the F-formation contributes to the construction of interactional spaces and their on-going transformations in the course of an interaction encounter, and how this approach has inspired, but also differs from later approaches to interactional space in conversation analysis, for instance in the work of L. Mondada. A special focus will be on the relevance of gaze in interactional settings in which the interactional space is constantly reshaped or in which its boundaries are vague and fluid.

The relationship between gaze and *hm_hm* in dyadic and triadic interactions

Panel contribution

*Ms. Johanna Masuch*¹, *Dr. Elisabeth Zima*¹

1. University of Freiburg

This contribution investigates the relationship between gaze and the recipient token *hm_hm* in German dyadic and triadic interactions. Bavelas et al. (2002) report a statistically significant relation between recipient feedback and the so-called gaze window pattern in dyadic interactions. This specific gaze pattern consists of three phases: while speaking, the speaker shifts gaze to a recipient, entering a brief period of mutual gaze. During this eye contact, feedback is given by the recipient. Soon after the elicited response is produced, the speaker closes the gaze window by looking away and continuing to speak. However, studying triadic interactions, Zima (2020) contests the prevalence of this pattern and shows that the picture is much more complex there.

Both studies took a broad view on feedback behavior, studying verbal and nonverbal feedback tokens such as continuers, acknowledgement tokens, change of state tokens and nods. In contrast, this contribution focuses specifically on *hm_hm*, which is often considered a *continuer* (Schegloff 1982, Gardner 2011). Although we can confirm that speaker gaze plays a role in mobilizing recipients' *hm_hm* in both dyadic and triadic constellations, our mobile eye tracking study reveals that the temporal relationship between the two elements is more complicated than anticipated. We show that the occurrence of *hm_hm* as recipient tokens is indeed related to a preceding phase of eye contact between speaker and recipient. However, *hm_hm* is most often not embedded in a mutual gaze phase but gazed-at recipients wait until a 'backchannel relevance space' (Heldner et al. 2013) is reached, i.e. the end of the ongoing intonation phrase, to deliver the feedback token. The temporal relationship between a phase of mutual gaze and the feedback token *hm_hm* is thus looser than previously claimed. Nonetheless there is evidence that gaze does elicit or at least invite feedback, most notably in side-by-side constellations where mutual gaze is rather infrequent. Therefore, gaze shifts towards the recipient are more likely to get interpreted as an interactionally meaningful signal, i.e. a request to give feedback (cf. Auer & Zima 2021) whereas in triadic interactions, the power of gaze shifts to elicit feedback is more limited.

The role of gaze in everyday multiparty interactions: Building participation framework during dinners in signing and speaking families

Panel contribution

Prof. Diane Bedoin¹, **Dr. Stéphanie Caët**², **Dr. Christophe Parisse**³, **Mrs. Pauline Beaupoil-Hourdel**⁴,
Dr. Claire Danet¹, **Mrs. Sophie de Pontonx**⁵, **Prof. Aliyah Morgenstern**⁶

1. University of Rouen, 2. University of Lille, 3. INSERM-CNRS-Paris Nanterre Université, 4. INSPE-Sorbonne University, 5. CNRS-Paris Nanterre University, 6. Sorbonne Nouvelle University

Family dinners constitute ritualized and ideal loci for the study of F-formation (Kendon, 1990).

Different arrangements may be observed in the kitchen and in the dining room. Within a family some participants may face each other, others may sit side-by-side and they also may move during dinners. Despite these variations, family members orient themselves for an amount of time both towards a space and towards each other.

Family dinners involve several simultaneous activities, among which eating and languaging are central. In this multi-activity setting (Haddington et al., 2014), the different body parts and the gaze of the participants can be oriented either towards objects or towards others. In family dinners particularly, participants call on those very same resources to conduct multiparty interactions and dynamically build various participation frameworks (Goffman, 1981). Among verbal and non-verbal resources, gaze plays an important role to (dis)engage others or oneself in a conversation. This study aims at investigating the functions of gaze in such a challenging context in both signing and speaking families.

We analyzed data from dinners in four families composed of two adults and two children. Two families used French and two families used French Sign Language (LSF). The participants often switch to discourse that spans beyond the dinner time and talk more specifically about school (Morgenstern et al. 2021). The data was systematically coded for 1) audible or visible languaging or acting produced by all participants, 2) which participants the acting or languaging was oriented to, and 3) gaze orientation of all participants (towards participants or objects).

We focused on talk about school which is characterized by question and answer sequences and the emergence of word searches. Children bring to the table topics and related notions that can be new to them, and parents actively participate in the construction of the discourse about past events. In this context, gaze interactions fully participate in the parent-child interactions.

Our quantitative and qualitative analyses underline differences in gaze distribution patterns according to the varying status of the participants, as they conduct eating actions that require moving objects and bodies. We highlight differences according to whether the participants use a spoken or a signed language and we show how parents adapt to and scaffold their children's management of gaze as they need to orient their visual attention. We discuss the impact of spatial and social arrangements as well as children's age and discursive topics on the distribution and functions of gaze in family dinners.

When gaze is not available – The role of the avatar in gauging partner’s orientation during interaction in Virtual Reality

Panel contribution

*Ms. Liliana Lovallo*¹

1. University of Heidelberg

As digital technologies become more and more present in our everyday lives, so too grows the impact they have in shaping the way people communicate with one another. The latest developments in the creation of digital spaces connected in a Metaverse accessed through a Virtual Reality headset, made specifically with the aim of providing digital experiences analogous to the real world, suggest even more ambitious directions for the future of communication technologies. Studies focusing on interaction practices are beginning to address these new developments and engage with the questions arising from them.

Although one the goals of VR is to create immersive experiences that allow users to engage with each other and the environment in ways that simulate behaviour in the real world, it is evident that many of the resources participants rely on in face-to-face communication are in fact not available in VR. The most obvious of these is access to gaze direction: most VR headsets don’t allow eye-tracking and thus make the gaze conduct of the participants unavailable to each other. The functions of gaze in managing different aspects of interaction have been studied extensively (Auer 2018, Brône/Oben 2018; Stukenbrock 2018; Stukenbrock/Dao 2019, Rossano 2012). Nonetheless, participants still have visual means at their disposal that help them gauge where their interaction partner is looking and, specifically, to determine whether they are oriented towards them (i.e., towards their avatar) at a given time.

The participants’ VR avatars move and act in accordance with the users’ bodily movements, captured through the sensors on the VR devices the participants wear. The avatar thus functions as a proxy for embodied action (Goodwin 2000) in VR and allows the users to not only navigate the digital world and interact with the elements it contains. The reproduction of the participants’ bodily conduct on the VR avatar provides the participants with useful resources for interaction as well. The goal of this contribution is to show the specific ways in which participants orient to the bodily conduct of the avatar and its positioning in space while interacting in VR. The analysis aims at showing the role of the avatar in VR interaction, focusing especially on the orientation of the head of the avatar as a resource which allows participants to draw conclusions about what the interaction partner is looking at. This allows for moments of “visual contact” between the participants’ avatars, during which the avatars “look” at each other. Different types of F-formations (Kendon 1990) in mobile as well as static side-by-side settings will be taken into consideration.

The data used for this study stems from recordings of multiplayer gaming sessions at VR-arcades in Germany. Participants were recruited on the premises. The players’ first-person perspective in VR was captured directly from the computer feed generated by the VR headsets. Two external cameras placed in the gaming area allowed to monitor the participants’ bodily conduct in the real world. The transcription and analysis of the data follows a multimodal conversation analysis approach.

“Kannst Du ja mal ausprobieren”: How space, object manipulation, and participation role influence the role and function of gaze and gestures*

Panel contribution

Dr. Jana Bressemer¹, Prof. Ellen Fricke¹, Prof. Wolfgang Einhäuser¹, Mrs. Inka Schmitz¹

1. Chemnitz University of Technology

* This work was funded by the German Research Foundation – Project-ID 416228727

Behavioral cues such as gestures and gaze are a “gateway to understanding a person’s mental states, including attention, intentions, and goals” (Huang et al., 2015, p.2) and thus are important devices for coordinating interaction and constructing joint attention. Speakers design their gestures in reference to the listener’s location, gaze direction, and shared space (Furuyama, 2000; Özyürek, 2002). Pointing gestures are regularly accompanied by gaze in the same direction (Fricke, 2007). During collaborative tasks, gaze may help to coordinate actions between participants (Tomasello, 1995), mark areas as the focus of next actions (Metzloff & Brookes, 2001), and may signal planned and intended actions leading to particular movements (Johansson et al., 2001). Sequences of gaze pattern and displays of interleaving gaze (e.g., gaze toward the target, then partner, and back to target) may serve as an intentional signaling strategy, highlighting the relevance of the intended object of reference and directing the partner’s attention (Huang et al., 2015; Stukenbrock & Dao, 2019).

Using video and eye-tracking data from an experiment, in which 15 dyads of participants interacted with different exhibits in a museum in Frankfurt/Main, Germany, it is shown that the use and function of gestures and gaze are influenced by a variety of aspects. In one of the experimental settings, participants interacted in groups of two with an interactive wooden labyrinth. Interactant A, who was familiar with the handling of the labyrinth, had the task to explain its use to interactant B. Interactant B then freely explored and played with the exhibit. First, our data show that the interactional setting and the F-formation influences gaze patterns and the perception of gestures. Secondly, the task at hand has an effect: Even the use of verbal deictics along with a pointing gesture by interactant A might be disregarded by B because of the more pressing task of object manipulation. However, there are examples in which the head is oriented in such a way that the task-relevant device can be fixated and the gestures can be attended to in the periphery of the field of view. This incongruence of gaze and head direction might be an indicator for multiple attentional targets. Thirdly, the participation role shapes the use of gaze and gestures: A, for instance, often visualizes the use of the exhibit through representational gestures, even if B is oriented towards and focusing on the exhibit. Fourthly, our data corroborate previous results showing that the combined use of gaze and gestures depends on the position: Standing configurations lead to more local deictic expressions, less feature-based description of objects, and less gaze overlap because referential domains shift and movement in space can be used as a coordination mechanism (Gergle & Clark, 2011). Similar effects can be seen in our data.

With this focus, our research underlines the manifold ways by which task and setting influence how and when speakers use bodily resources to construct joint attention and provide quantitative means for their description.

Blended Origo – Deixis in Virtual Reality

Panel contribution

Dr. Karsten Senkbeil¹

1. *University of Hildesheim*

Pragmatic studies on communication in Social Virtual Reality (SVR) have shown that the immersive qualities of VR technology – the *sense of presence* and a *sense of embodiment* through increasingly realistic motion tracking and avatars (Kilteni et al 2012) – have a strong impact on verbal interactions in this new medium (Stukenbrock & Auer 2022). While using VR, our minds experience a virtual space as (almost) real, while our bodies remain in the physical world, which instantaneously doubles our possibilities for communicative and bodily interactions with people in our virtual and physical vicinities. Misunderstandings and moments of linguistic creativity are observable, and many of them revolve around ambivalent locations, doubled ‘bodies’, and issues while coordinating attention. In other words: they concern deixis.

This paper presents the analysis of the usage of deictic terms in authentic communication recorded in SVR (in English and German) by speakers involved in a multilingual ‘escape-the-room’-style multiplayer game. It demonstrates that the unusual communicative circumstances in immersive VR directly affect a speaker’s *origo*, the deictic zero-point of orientation in space and time (Bühler 2011, Stukenbrock 2014). While existing deixis theories have implied that a person’s mind and body are naturally and always present in the same location in space-time, VR technology undermines this *default case* originally observed in analogue settings (Meyer & Jucker 2022). The data shows that hybrid and blended forms of deictic referents are observable regularly.

As speakers adapt to new communicative circumstances in a new medium, the pragmatologist’s methodological toolbox needs to do the same, so this paper concludes in proposing the term *blended origo* to understand the cognitive state brought forward by communicatively interacting in two ‘realities’ simultaneously. It unites the theory of embodied cognition with current pragmatological perspectives on deixis in multimodal and technology-mediated communication (Turner 2019; Auer & Stukenbrock 2022).

Beyond the concrete use case of (Social) VR, this conceptualization is intended to contribute to the discussion on the intersection of cognition, body, and increasingly immersive technologies, particularly concerning the growing impact of the (digitized) body as an authentic and potent substrate of communication in the digital realm.

Human, smartphone and territories of the self

Panel contribution

***Dr. Andreas Candefors Stæhr*¹, *Prof. Lian Malai Madsen*¹**

1. University of Copenhagen

In this paper, we approach the pragmatics of body, mind and technology through an investigation of the scope and explanatory power of existing theoretical perspectives. Our focus is how the social psychological perspective of territories of the self (Goffman 1972) can be applied and possibly – still – enlighten and explain the impact of the smartphone on human social life. According to Goffman, some of the aspects of individuals' behavior in social and public life relate to how we claim, patrol and defend territories. The smartphone creates new conditions for, in particular, egocentric territoriality. Based on empirical observations in data from a linguistic ethnographic study of language and social media in family life (*SoMeFamily*, e.g. Stæhr & Nørreby 2021; Madsen 2022; Ag 2022), we argue that the smartphone involves intersections of the possessional territory, the information and conversational preserves. The smartphone is not merely a physical object we carry along to occasionally use for making contacts. Since it contains personal information, it also involves concerns of the individual's control over the content of mind accessible through the artefact of the smartphone with, for example, saved communications, contacts, pictures and notes. Finally, the smartphone, in principle, makes it possible to control and guard the conversational preserve, but it can also be the medium of its violation.

Taking into consideration reflections in informal interviews and well as recordings of everyday interactions, we illustrate how Goffman's thoughts about the territories of the self, are useful to apply to explain the concerns and experiences of violation and preservation of egocentric territoriality articulated and enacted by the participants in our study. Based on this, we argue that to a large extent the occupation with territorial preservation involves human agency and how individuals (choose to) act in relation to another's smartphone or relate to their own smartphone – with all its associated territorial concerns. But what is new is that the device itself – with its technological affordances – plays an active part in the preservation and violation of territories of the self: Since 1) It is an information and conversational preserve in a material form; 2) It makes available new ways of crossing territorial borders (through e.g. tracking apps); and 3) It violates conversational preserves through its technology (e.g. through appearance of notifications and news feeds, which sometimes leads to individuals unwillingly receiving particular information or becoming conversationally involved without active human agency). We discuss these insights in relation to the more recent theoretical 'posthuman' perspective with its emphasis on the intersection of body, mind, technology and materiality, which deconstructs the divide between human and machine in various ways (e.g. Pennycook 2018; Clark 2008), and we reflect on the relationship between impact, mediation and agency.

Mediating social and informational serendipity

Panel contribution

Dr. Jackie Militello¹

1. School of English, University of Hong Kong

During the more socially isolated, work-from-home period of COVID-19, people were compelled to become acquainted and network in a digitally mediated manner. This change has perdured as face-to-face acquaintancing and networking have declined with remote work and online conferences, so that professional life for many has become a much greater digitally mediatized sphere. While a degree of strategic goal orientation and intentionality have always existed in acquaintancing and acquiring information (seeking to meet a particular person for a particular reason or intentionally eliciting particular information), there has also been a degree of serendipity—an unintentional beneficial meeting of a person or information, premised on embodied proximity. And serendipity has been seen as a social good – decreasing echo chambers, bursting filter bubbles, leading to fruitful collaborations, and engendering important innovations. Serendipity has been theorized as having three broad affordances (Björneborn, 2017): (1) diversifiability, the ability to meet heterogeneity; (2) traversability, the ability to explore; and (3) sensoriability, the ability to perceive through the senses. Face-to-face networking at events like conferences or after-work drinks are stereotypical serendipitous acquaintancing and information gathering events that have these affordances. Multiple individuals from diverse industries, organizations, professional roles, or hierarchical levels provide the diversifiability; self-determined movement (‘mingling’) the traversability; and haptically perceivable handshakes, audibly perceptible speech, and visually perceptible physical performance the sensoriability.

Building on previous research of professional acquaintancing during COVID-19 (Militello, 2021), this study explores the question: How has social serendipity developed, transformed, or been discarded in professional networking communicative practices that were once in person and are now digitally mediated? Using screen recordings, interviews, and field observation, a linguistic ethnographic approach is applied to study the role of serendipity in participating professionals’ digitally mediated acquaintancing communications. Findings include 1) new, atypical ways of pursuing serendipity that are not digital iterations of in-person ways; 2) the adoption (or lack thereof) of new platforms or new features developed during COVID-19 that incorporate the traversability and sensoriability affordances of serendipity; and 3) (de) emphasis of serendipity as a beneficial trait. These findings are then considered and discussed for how they intersect with previous theorizations of serendipity in acquaintancing and information gathering.

Post-digital pragmatics: the conversational rhythm of situated mobile interaction

Panel contribution

Dr. Caroline Tagg¹

1. The Open University

This talk explores an approach to theorizing and analyzing interactions in a post-digital world in which digital technologies are ceasing to be a salient or disruptive element of social life but are instead an inherent part of being human (Tagg and Lyons 2022). Existing pragmatic perspectives on language and communication tend to assume a ‘focused encounter’ between interlocutors with a shared understanding of the situational context (Jones 2013) who cooperate in a rhythmic ensemble (Scollon 1982), sharing the same beat as they respond to each other and take turns (Tannen 2007). Digital and mobile communication technologies challenge established concepts such as physical co-presence, shared communicative resources, and joint focus of attention. Post-digital communication involves what Blommaert (2005: 126) calls ‘layered simultaneity’ – the combining of resources with different historicities and speeds of change, and thus different indexicalities, into one set of synchronic meanings. Jones (2013), for example, shows how participants in a gay chat room participate simultaneously in multiple chat threads, with different conversational partners, which unfold at varying speeds: what he calls ‘polychronicity’. Understanding the pragmatics of post-digital communication thus involves an appreciation of the polychronous conversational rhythms of multiple simultaneous encounters and activities across online and offline spaces.

In this talk, I explore the intertwining of mobile conversations and offline interactions by expanding the concept of conversational rhythm to encompass the layered simultaneity of post-digital communication. I draw on a new approach to digitally mediated interaction by analysing how individuals’ conversations unfold through multiple messaging apps including WhatsApp, SMS and Facebook Messenger within the immediate context of the physical settings in which they take place. This innovative approach to digital pragmatics combines mobile messaging data with interviews and time-use diaries to explore how mobile conversations shape, and are shaped by, the offline activities and encounters in which interlocutors are engaged. Participants aged 18+ were interviewed before and after keeping a three-day diary and submitting all mobile messages sent and received during that period. Quantitative analysis of the mobile messaging and diary data of each individual focused on plotting the conversational rhythms of multiple simultaneous threads against the individual’s reported daily schedule. This was complemented by interactional analysis of key moments which drew also on reflections by the participants elicited through interview. The findings point to the importance of relational concerns in shaping the conversational rhythm of intertwining mobile conversations, and the importance of timing and pace in signalling attentiveness, intimacy and distance. The study highlights the insights that can be gained through the adaptation of existing analytical concepts to new forms of interaction transformed by digital technologies.

Texting in Time: Approaching temporalities of smartphone-based interactions

Panel contribution

Prof. Florian Busch¹

1. Universität Bern

By the rise of the smartphone as central communicative device in everyday life, linguistics has developed a growing interest in text-based mobile communication (cf. Baron 2020; Tagg/Lyons 2021). Until now, most of this research has focused primarily on static text log files, although this comes with two methodological limitations: First, log files obscure the temporal dynamics of the production of individual text messages as well as the sequential unfolding of message exchanges as perceived by participants on their screens. Second, log files do not provide any information about the ways in which participants are simultaneously involved in interactions with different interlocutors (probably using different software applications). However, both aspects seem crucial to the everyday practices of smartphone communication, which characteristically features overlapping of simultaneous interactions—and thus overlapping of interactional temporalities and rhythms in which these various interactions unfold (cf. Prommer 2019).

The paper addresses this desideratum by focusing on temporalities of smartphone interactions based on authentic screen capturing data. In doing so, it builds centrally on the studies of “digital CA” (cf. Meredith/Potter 2014), which have already methodically adapted screen captures of computer-based chat interactions. By opening up this data type for smartphone communication, the proposed approach aims to reconstruct the sequential organization of simultaneous interactions through the “eyes” of the participant, thus accounting for the everyday experience of smartphone communication and illuminating blind spots in previous research.

To this end, the paper draws on data collected in the early course of the Bernese “Texting in Time” project. German and Swiss participants documented their own smartphone communication during a period of 14 days. Additionally, interviews were conducted with all these participants. Grounded in this empirical basis, the findings are presented at two levels: On a macro level, the paper illustrates how participants establish different interactional rhythms with various interlocutors during their two-week capturing period and how this rhythmization is also linked to the temporal distribution of linguistic resources. On a micro level, the study outlines how screen captured data can be used to analytically uncover moments of interactional multiactivity and achieve a deeper understanding of communicative practices in simultaneously unfolding interactions. Accordingly, the paper argues for a new methodological approach to smartphone-based interaction that adopts the temporality of mediatized everyday life the pivot of analysis.

Digital Disinformation and Rumor-Busting: Diverse Interpretations of 'Beiou Feng' (Nordic Style) on Chinese Social Media.

Panel contribution

Dr. Heidi Hui Shi¹

1. University of Turku

Social media platforms have evolved into a significant conduit for propagating consumerist values and boosting consumption (Linden & Linden, 2016; Milner, 2015). Media language plays a crucial effect in enabling and inhibiting consumer behavior (Lee et al., 2014; Pezzuti et al., 2021; Stephen, 2016). This study employs the notion of “contradictory digital narratives” to investigate how excessive, inaccurate misrepresentations of ‘*beiou feng*’ (Nordic style) are continually generated and debunked in Chinese cyberspace. We studied corpus data extracted from 11,978 WeChat subscription account posts with ‘*beiou feng*’ in the headlines and found inconsistent semantics regarding Nordic style in Chinese social media. On the one side, the Nordic style is typically defined with positive language, with an emphasis on promoting its simple, monochromatic, and eco-friendly qualities. This quasi-worship dissemination even includes eye-catching phrases that appear to be negative, such as ‘*xing leng dan*’ (sexually apathetic). On the other side, the widespread consumer-oriented narrative has been repeatedly clarified and discredited online by other parties. They aim to facilitate internet users’ comprehension of the authentic presentation of the Nordic style through art-based introductions. We address the findings in the context of the discrepancy between Chinese commercial media (*shangye meiti*) and self-published media (*zi meiti*) in terms of their distinct communication methods and operational objectives. We suggest that the cycle of deception and refutation is generated by two media-based online practices: digital narratives aiming to influence consumer perceptions and dialogues intended to attract online attention.

Telling (about) the same: Quoting practices in Spanish political hoaxes

Panel contribution

*Ms. Anastasia-Ioana Pop*¹, *Dr. Agnese Sampietro*²

1. University of Valencia, 2. University Jaume I

The spread of false or misleading stories through social media is a widespread concern for modern societies (see, for example, Lewandowsky et al., 2017), as social media have facilitated the spread of rumours, spam, and misinformation (Freelon and Wells, 2020). This phenomenon is especially salient in political communication. Indeed, according to Freelon and Wells (2020, p. 145), disinformation “is *the* defining political communication topic of our time” (original emphasis) and, therefore, an essential topic for political communication research in the latest years.

Spreading false or inaccurate claims is one of the social media’s most common forms of mis- and disinformation. This phenomenon can be considered a form of quoting. As Kirner-Ludwig (2020, p. 103) explains, the practice of quoting stretches along a continuum “from truthfully intended references [...] to intentionally misleading references.” The present contribution aims to study the types of quoting practices (excluding simple retweets) used in fact-checked hoaxes that have circulated both in mainstream and lay political discourse on social media in Spain in 2021 and 2022. To do so, it draws on a corpus of debunked false claims concerning politicians or spread by political organisations, associations, and affiliates, on social media (primarily Twitter, but also Telegram and WhatsApp), retrieved from trustable Spanish fact-checking sites. The analysis follows Kirner-Ludwig’s (2020) classification of referring and pseudo-referring practices.

Preliminary results show that one of the most common quoting practices that give origin to hoaxes is fake quoting, i.e., “presenting what someone else supposedly said as genuinely theirs and doing so with the intent to deceive” (Kirner-Ludwig, 2020, p. 104). Another common form of referring was misquoting, i.e., unintentionally misrepresenting original utterances.

The results of this study can have important implications for the study of mis- and disinformation. Research on fake news detection can especially benefit from identifying quoting practices involved in spreading false claims different from simple retweets.

‘I did my research’: The role of celebrities in disinformation dissemination and the performance of a public apology

Panel contribution

*Ms. Dominika Beneš Kováčová*¹

1. The University of Ostrava

While the impact of digital media on the way (dis)information is produced, distributed and consumed is now largely uncontested, the research into the role of internet users in its dissemination still deserves closer attention. This particularly concerns the spread of disinformation by celebrity users of social media who – as recent research shows (Bruns et al., 2019) – have the capacity to act as ‘super-spreaders’ of disinformation and thereby expose a large group of people to fake news websites and accounts. In response to the public outcry that often accompanies such incidents, celebrities typically resort to deleting their social media content promoting disinformation, which makes this data difficult to analyse. What may, however, remain accessible is the public apology issued by the celebrity to make amends for having shared false information; the analysis of such apologies is thus expected to represent one of a few ways to learn about the celebrities’ own understanding of and attitude towards their role in disinformation dissemination.

With this in mind, the aim of the present paper is twofold: 1) to examine the performance of celebrity apologies on social media through the lens of speech act theory; 2) to investigate their audience’s perception of the apology. To achieve this, firstly, a small-scale dataset of apologies shared by celebrities (e.g. Joe Rogan, Kyrie Irving) on Twitter and Instagram as a reaction to the accusations of disinformation dissemination by the given celebrity was collected. Given the fact that apologies – from the perspective of Brown and Levinson’s (1987) theory of politeness – represent face-threatening speech acts that directly damage the speaker’s positive face, the analysis demonstrates that the performance of the apologies in the dataset is accompanied by certain mitigation strategies oriented towards saving the celebrity’s face. These strategies include, for instance, the re-definition of certain terms (e.g. *liberal*, *antisemitism*, *research*) and the act of positioning oneself as ‘the seeker of truth’, the adoption of which nevertheless questions the authenticity of the apology issued by the celebrity. Secondly, to ascertain the public perception of such apologies, this study further explores the user comments/replies which accompany the collected apologies and examines the users’ responses to the positionings the celebrities engage in. The preliminary results of this analysis show that affirmations defending the celebrity’s conduct and dismissing the need for any apology in the first place prevail in this data. This arguably results in the enhancement of the celebrity’s positive face and may, in some cases, serve to re-distribute the original disinformation.

Alexa in multilingual polymedia environments: A case study on the role of smartphones in speech assistant interactions

Panel contribution

Ms. Didem Leblebici¹

1. Europa Universität Viadrina, Frankfurt (Oder)

Current pragmatic research mostly rely on transcribed interactions to analyze engagement with speech assistants (e.g. Mavrina et al., 2022) with some exceptions (e.g., Alač et al., 2020). In this presentation, I argue that such approaches do not allow to investigate human-machine interaction comprehensively. Thus, rather than studying speakers' engagement with voice assistants in isolation, I propose a holistic approach that takes a speaker's lived experience (Busch, 2015) as a starting point of the analysis.

In an ethnographic case study of a multilingual speech assistant user who has recently migrated from Turkey to Germany, I show how social meaning in interaction with speech assistants also emerges through the entanglement of practices with smartphones. The data consists of a techno-biographical interview (Lee, 2014), transcriptions of a week's interactions with Alexa, participant observation and social media video produced by the participant. Based on Tagg's and Lyon's (2021, p. 728) conceptualization of smartphones as "an integrated environment of communicative opportunities – a polymedia environment", I show how the participant engages with his smartphone to connect various activities with the voice assistants across different platforms. Thus, he uses the possibility of "fluid" navigation between platforms and apps (Madianou, 2014).

The findings allow me to argue that the language biography of the individual structures the multi-layered multilingual environment in the smartphone. I trace the techno-biography of the participant through the interfaces, where different language settings come together to form a personal multilingual polymedia environment. The user not only navigates through the social media apps, Alexa app and the embedded speech assistant but also engages these different interfaces in different languages on the same device. This case study is particularly interesting for the pragmatics of human-machine interactions, because the findings implicate that the role of social relationships, techno-biographies, language biographies and media ideologies (Gershon, 2010) are crucial in engagement with conversational agents and therefore must be considered in pragmatic research.

Old wine in new bottles – politeness and affectivity in voice assistant use as co-constructing traditional forms of personhood, family and gender roles

Panel contribution

Prof. Britta Schneider¹

1. Europa Universität Viadrina, Frankfurt (Oder)

In this talk, I give insight into pragmatic strategies of users of digital voice assistants with a particular focus on how these engage in polite and affective forms of talk. The data on which I ground my discussion stems from a collection of qualitative interviews with German-speaking users of Alexa, Siri and Google Assistant. In these, the interviewees describe their experiences with using voice assistants in the private spaces of their home. They partly also engage in talking to the device during the interviews.

While the devices have been mainly (but not only) designed for referential communication, the interview data brings to the fore that the human interlocutor frequently engages in forms of phatic talk. These phatic, non-referential types of communication include, for example, markers of politeness, greeting rituals, naming practices or intonation patterns that index social closeness.

I argue that these pragmatic strategies show that users construct social relationships to the devices and attribute agency to them. At the same time, the respondents thus perform their private and personal construction of self, including their gendered and family identities. Even though the data set is too small to draw general conclusions, it shows that engaging in a friendly and sociable tone with digital assistants may be part of family language policies and educational, child-rearing practices in performing oneself as a particular type of mother or father. In addition, there seem to be gendered patterns, as female respondents showing stronger tendencies of engaging in polite and affective talk. Male respondents often emphasize their understanding of human-machine interaction as ‘merely technical’ in meta-talk but nevertheless display forms of phatic communication in practice.

Taken together, the presentation aims at discussing human-machine interaction as a continuation of traditional, ‘typical’ cultural patterns of identity performance and gender orientation, which are reproduced in rather novel media-technological culture.

Robot mediation: facilitating participation in multiparty interaction

Panel contribution

***Mr. Ali Asadi*¹, *Prof. Kerstin Fischer*¹**

1. University of Southern Denmark

Previous research shows that participation and engagement in communicative activities have a positive effect on learning (see, for example, [1] – [3]). However, in multiparty situations that involve co-present and telepresent participants, the remote person is more likely to participate less than collocated members, and, worse, they may be considered less trustworthy [4]. In this study, we examine whether mediations from a social robot can facilitate engagement of collocated and telepresent participants in a communicative activity and whether it can encourage equal amount of participation for all members. In our experiment, groups of three participants – i.e., two collocated and one using a telepresence robot – are instructed to interact with each other to complete a language-related task. In one condition (C1), the participants do the task on their own, whereas in the second condition (C2), a social robot mediator facilitates communication and participation of participants via verbal and nonverbal cues in a between-subject experimental design. We use the wizard-of-Oz technique [5] to operate the robot and make interventions such as head turning, pointing, selecting addressee, and asking directed questions. After the activity, each participant fills out a questionnaire on co-participants' trustworthiness and suspected personality traits. Our results suggest that robot mediation has an effect on participation of telepresence robot and/or less vocal participants. Furthermore, we collected data on what kinds of cues were most effective in facilitating engagement and equal participation and when the robot should intervene. To conclude, robot mediation evens out participation of all members and prevents a participant from holding the floor for an extended period of time.

Semantic coherence and topic continuity in multi-turn HCI

Panel contribution

Dr. Netaya Lotze¹, Mrs. Anna Greilich¹

1. WWU Münster

System-, chatbot-, robot-, computer, or machine-directed speech has left the laboratory settings and entered humans' daily life. However, voice user interfaces and chatbots still usually do not expect more than a short command, e.g. "Alexa, turn the lights on," or the keywords, e.g. "Zucchini pesto recipe", to perform a specific action the user requests. Since conversational A.I. is blooming and natural language understanding technology is bringing new potential to the systems' capacities, **multi-turn HCI** can soon become more widespread.

In the present talk, we aim to shed more light on multi-turn HCI, focusing on semantic coherence and topic continuity which are among the key characteristic aspects of multi-turn communication in humans. We base our analysis on the data sets providing users' interactions with chatbots and Amazon Alexa in the German language. In our mixed-methods studies, including corpus analysis, conversational analysis, and production experiments, we cover the following research questions:

1. To what extent are dialogues between humans and chatbots coherent?
2. Are topic continuity features in multi-turn HCI follow patterns similar to human-human communication?

The data of the user-chatbot interactions show that users are likely to change their behaviour throughout the interaction with the chatbots because of the interplay between dialogue-external factors (user type, system architecture, system Persona, pragmatic context) and dialogue-internal factors (dialogue design, dialogue phase). For HCI, we distinguish between the following types of *coherence*:

- **Actual logical coherence in user's utterances:** Users, following the human-human communication patterns, aim at coherent linguistic behaviour in HCI, in case the system allows it.
- **The successfully created illusion of topic continuity in the system's utterances:** These are the instances when keyword parsing was successful, and the system provided an adequate response.
- **A relatively recent phenomenon, which we exclusively find in HCI, namely "quasi-coherence":** The system uses cohesive markers in its utterances, but they are no cohesive or relevant reaction to the users' previous turn (e.g. default-answers, failed anaphoric reference, repetition of a user's keyword without successful parsing of the utterance as a whole).

The data of the Amazon Alexa-directed speech, where we analyzed the topic continuity features in users' utterances on the level of referring expressions, syntax, and prosody, shows that users formulate utterances belonging to one discourse situation as isolated requests for information. Users anticipate a lack of shared knowledge accumulation from the side of the system and prefer to keep the utterances explicit, e.g. avoid pronominalisation or deaccenting of previously mentioned referents.

Lack of logical coherence and inconsistency in the system's/chatbot's utterances directly influences users' linguistic behaviour. In the talk, we will provide a comprehensive overview of possible user linguistic behaviour in multi-turn HCI which can be beneficial for dialogue-design practices. Establishing logical coherence throughout the interaction presupposes access to world knowledge and context and the ability to trace logical relations between dialogue turns. While that is still not possible from a technical perspective, dialogue design for conversational A.I. remains a necessary solution.

Synthetic voice: Can sympathy be constituted? Vocal attractiveness and its utility for human-machine interaction

Panel contribution

*Ms. Florina Züllig*¹

1. Department of German Studies University of Zurich

Initial sympathies are formed within a short moment. Based on only a few pieces of information, we form a first impression about our counterpart and evaluate them as likeable or not. A potent information carrier in this process is the voice: even without additional visual stimuli, it can convey internal and external characteristics about a person, such as sex or indications of the other person's mood (Zheng et al. 2020, Weiss/Möller 2011). A person's voice even allows us to draw reliable conclusions about the appearance and character of the person speaking (Stern et al. 2021, Neutze/Beier 2006). Thus, the voice is not only an individual means of expression but also a social tool that significantly influences our daily interactions with others. This makes it an attractive area of research for robotics.

Especially for robots used in social contexts, such as nursing, sympathy is an important criterion. Studies have shown that the human-machine interaction benefits significantly if the robot is perceived as likable, an effect that can be achieved, for instance, by adding a smiling face to the robot's face (Trouvain/Weiss 2020, Fink 2012). Additionally, if sympathy could also be constituted or enhanced by a modified synthetic voice, this would have a positive effect on the interaction with non-humanoid machines, such as voice assistants, as well.

In order to construct sympathetic synthetic voices for robots and voice assistants, it must first be investigated which types of voices are perceived as sympathetic. Current research indicates that there is a first preference for female voices and a second one regarding their pitch. To test this, I designed an exploratory study (N=105) to investigate whether female voices with high frequency ($F_0 > 220$ Hz) are perceived as more sympathetic than female voices with lower frequency (H_1). In a next step, it will be tested whether this hypothesis can also be verified for synthetic voices (H_2). For this purpose, the fundamental frequencies (F_0) of three female synthetic voices with different pitch (*low pitch* 173 Hz, *average pitch* 200 Hz, *high pitch* 278 Hz) are increased by 25 Hz each, resulting in the two variations SV_{norm} and SV_{high} for the respective voice, which are then judged by subjects in an A/B test for likability. The leading hypothesis is that both human and synthetic female voices are perceived as more sympathetic at a frequency of >220 Hz, but that this effect is not linear and regresses from an inflection point at 280 Hz (H_3).

The discussion concludes by summarizing the findings of this study and projecting potential areas where the pragmatic utilization of a congenial synthetic voice could enhance human-machine interaction. Nevertheless, additional research is necessary for practical examination and a more thorough understanding of the characteristics of sympathetic synthetic voices.

The heterogeneity of the speaker: How context is distributed in human engagement with smart speakers

Panel contribution

*Dr. Marie-Theres Fester-Seeger*¹

1. Europa Universität Viadrina, Frankfurt (Oder)

What enables ‘communication’ with speech-enabled AI-systems? Often compared to human-human communication, some scholars treat a speaking device as a communication partner and foreground the establishing of ‘mutual understanding’ (e.g., Beneteau et al. 2019). Bender and Koller (2021), however, clarify how big language models do not perform understanding but urge to view such models as only manipulating linguistic form. Adopting their position, I argue that engagement with smart speakers needs to be understood as human coordination with statistical patterns based on data produced by real living people.

In this talk, then, I am concerned with “heterogeneous spheres of human activity and life (Bakhtin, 1986:72) – from the side of the user and the ‘machine.’ Following Mey’s (1993) understanding of pragmatics as “the science of language in relation to its users,” I consider users of smart speakers as well as the people who label training data and create such language models as “real, live people” with “their own purposes” (p. 5).

Concerned with what enables meaning-making, I present a case where a person demonstrates to his partner the translation function of their smart speaker (Google home nest mini). Using a detailed multimodal analysis, I investigate how the participant through changes in gaze, speech and body posture draws on their immediate environment, their own lived experience and their engagement with other people when in the meaning-making process of ‘talking’ to a machine.

Introducing the language model MINTAKA (Sen et al., 2022), I emphasise how such models depend on workers who label and create data on which speech-enabled AI systems are trained. Here, I give importance to the diverse linguistic communities and situations in which the speakers ‘in’ the machine are embedded (Shotter, 2017).

Viewing context as “an environment that is in steady development, prompted by the continuous interaction of the people engaged in language use” (Mey, 1993: 10), I argue the engagement with speaking machines cannot be taking place in the same ‘context.’ The prompting of interaction between people is distributed across different situations and immediate environments in which the speaker in front of and ‘in’ the machine is embedded.

The pragmatics of human-machine interaction: how traditional methods and approaches from cross-cultural pragmatics and intercultural pragmatics help?

Panel contribution

Dr. Doris Dippold¹

1. University of Surrey

Cross-cultural, interlanguage and intercultural pragmatics are long established research traditions within pragmatics research, as indexed for example through relevant journals dedicated to the field (e.g. *Intercultural Pragmatics*, ed. by Istvan Kecskes), recent handbooks (e.g. *Handbook of Intercultural Pragmatics*, 2022), or monographs (e.g. *Cross-Cultural Pragmatics*, 2021, ed. by Juliane House and Dániel Z. Kádár). Yet, except for Fischer's (2020) work using robots to simulate a conversational partner in different politeness conditions, there is no sign yet of these research traditions being used to systematically investigate the pragmatics of human-machine interaction, in particular with an emphasis on the user's production of speech acts.

This is surprising, given that there is a rising awareness of linguistic and cultural bias in these systems which have the potential to systematically disadvantage specific user groups (see e.g., Sun et al., 2020). These have been attributed to a lack of adequate training data for AI-based systems, with training data often based on written records, or on data originating from inner circle English varieties (Shearer et al., 2019). Moreover, many minority languages are under-resourced with respect to their coverage through AI systems (Besacier et al., 2014). In addition, recent research on second language speakers with spoken dialogue systems has shown that L2 speakers experience additional challenges in interactions with intelligent personal assistants due to differences as compared to native speakers due to differences in language use (Wu et al., 2022).

In this presentation, I will ask whether and how the established methods and approaches from cross-cultural, interlanguage and intercultural pragmatics can be mapped across to research on the pragmatics of human machine interaction. The central questions I will pose are:

1. To what extent, and how, does existing research on human-machine interaction already draw on cross-cultural, intercultural and interlanguage pragmatics research?
2. To what extent can existing data collection methods (e.g., role-plays, discourse completion tasks) fill gaps in developing training data for conversational AI systems (e.g., to improve intent recognition)? How do these methods have to be changed to make them (more) suitable?
3. To what extent can coding schemes, such as the CCSARP (Blum-Kulka, 1989) be applied in human-machine interaction research, e.g., to code user turns for improved intent recognition?

The presentation will start with a short overview of cross-cultural, interlanguage and intercultural pragmatics research and its established methodologies, as well as an overview of the challenges of developing speech- and text-based spoken dialogue systems. By drawing on the example of a current project focusing on the development of a medical appointment chatbot for GP surgeries a linguistically and culturally diverse area of London, I will further illustrate these central ideas and questions. This presentation is not designed to provide all the answers to the above questions, but to gather ideas, further develop this set of central questions and pave the ground for future research.

Walking with Robi

Panel contribution

Dr. Jakub Mlynář¹, Dr. Déborah Gaudin¹, Mr. Benjamin Nanchen¹, Mr. Randolph Ramseyer¹

1. HES-SO Valais/Wallis University of Applied Sciences and Arts Western Switzerland

In summer 2022, a mobile robot “Robi” was tested in “street trials” [1] in a mountain ski resort as a means for transportation of tourists’ luggage. For most of the time, Robi was operating in the “follow-me” mode, i.e., the user/client walks the street and Robi follows her or him along the path. This paper is grounded in video-ethnographic materials collected on five occasions and systematically analyzed from the perspective of ethnomethodology and conversation analysis [3]. The analysis allows us to explore how novice users learn to walk with Robi – in other words, how they adjust the everyday practices of walking (e.g., [2]). In part, this adjustment consists of following instructions, given in advance as a written text (an instruction sheet), as well as spoken advice and guidance provided during the course of the journey by the operator (e.g., “You are too fast”).

In our findings, we identify and describe in detail three main features of walking with Robi that users have to master to use the mobile robot properly and efficiently. Each of these features can be seen as a digression from the taken-for-granted, ordinary praxis of walking (i.e., walking without Robi). First, users must learn the proper pace of walking, which has to be such that the robot can “keep up”, and the user does not disappear from the sensor-able field of the machine. Second, they need to learn the positioning of their walk trajectory in space with regard to potential obstacles that could disrupt Robi’s movement. Third, they have to establish visual and/or auditory monitoring practices to continuously ensure that Robi is moving forward with them in a proper pace, distance, and position (e.g., check by looking back over one’s shoulder).

In sum, competent users embody in their walk a particular understanding of the environment, based on assumption of a version of Robi’s machinic practical perception of the world. For a nonproblematic operation and use of the service, the user and Robi must establish a mobile gestalt that is also possibly recognizable as one unit by other members of the traffic system. The results presented in this paper contribute to the growing field of research in mobile social interaction, as well as research on AI-based vehicles tested “in the wild”, and they provide grounds for examination of further pragmatic implications, impacts and effects of the use of novel technology. The paper also details the nature and extent of human involvement required for a proper operation of automatic and semi-automatic machines.

What's wrong with Alexa? Analyzing the narratives of users in a discussion forum

Panel contribution

*Dr. Nadia Gauducheau*¹, *Dr. Michel Marcoccia*¹

1. *University of Technology of Troyes*

This study aims to analyze the narratives of users about their interactions with the voice assistant Alexa. Voice assistants, such as Alexa or Siri, have penetrated people's everyday lives, and the opportunity to interact with such devices is growing. Such voice-based human-machine interaction devices ask specific questions about communication and the relationship to machines. Indeed, the accompanying advertising discourse describes a relationship between the user and the voice assistant marked by a social and intimate dimension playing on the illusion of interpersonal communication.

This study has two objectives. (1) The first one is to investigate users' perceptions of the voice assistant Alexa. How do users categorize the system? Do they perceive the voice assistant as a machine or a humanoid entity? (2) The second one is to define the type of communication problems that users report having with Alexa. This makes it possible to identify the rules and principles of communication that seem necessary to users for satisfactory communication. These questions are addressed by analyzing the comments and narratives produced by the users of Alexa in a discussion forum. The analysis focuses on a sample of 496 messages posted in the forum of the French-speaking website *Journal de la voix* [Voice Journal] (<https://www.journaldelavoix.com/>), in the "Alexa and Echo speakers" section, "Alexa & Echo discussion" sub-section.

The messages are analyzed using methods of discourse analysis and content analysis. We analyzed the terms used by people when designating Alexa and the terms used to refer to Alexa in their discourse. In addition, a content analysis allows identifying the statements in which the users discuss a communication problem posed by Alexa. People's comments about poor communication with Alexa are indicative of their perceptions of satisfactory communication.

Results indicate that users of the voice assistant Alexa employ, as expected, the model of interpersonal communication to interact with the system. In particular, they expect the system to adhere to different principles that facilitate mutual intelligibility and mutual adjustment: rules of politeness, Gricean cooperative principles, intelligibility of the participation framework, contextual appropriation, etc. However, these principles are incongruent with the real abilities of the system, resulting in user dissatisfaction.

“Alexa, please now stop, I want to ask you something else” – Questions and requests in natural interactions with a voice assistant

Panel contribution

Dr. Miriam Lind¹

1. Johannes Gutenberg University Mainz

Voice-based interaction happens increasingly not just between human interlocutors but also between humans and artificial entities such as voice user interfaces (VUIs). Even though these interactions are becoming more and more common in everyday life, research on them largely takes place in experimental lab settings and only rarely focuses on naturally occurring communication sequences (exceptions are e.g. Porcheron et al. 2018, Siegert 2020). According to experimental and questionnaire studies, politeness strategies such as indirectness, greetings, and expressions like *thank you* and *please* are used significantly less often than in human-human interactions (e.g. Bonfert et al. 2018, Burton/Gaskin 2019). Beyond these findings, relatively little is known about the actual ways users of VUIs phrase their questions, requests, and orders to these devices and about the similarities and differences between them and the according speech events between humans.

This paper provides an analysis of approximately 30.000 natural utterances directed at a voice assistant that were recorded at an interactive science exhibition on board the ‘floating science center’ “MS Wissenschaft” in Germany and Austria in 2019. The aim is to provide an overview on the pragmatics of human-machine interaction by investigating how human interlocutors engage linguistically with VUIs, which topics are raised, and whether we can establish specific form-function relations in VUI-directed speech.

Evaluative anaphoric encapsulators as manipulative presuppositions in political discourse

Panel contribution

*Ms. Claudia Coppola*¹, *Dr. Federica Cominetti*²

1. Università Roma Tre; La Sapienza Università di Roma, 2. Università dell'Aquila

Presuppositions serve the primary purpose of sparing the addressee's cognitive effort on processing already shared or marginal information. Among the presupposition triggers, definite descriptions and anaphoric indefinite descriptions (Lombardi Vallauri et al. 2021) presuppose the univocal identifiability of a referent. This primary function can be manipulatively exploited to convey non *bona fide* true (e.g. false or not agreed upon) contents, decreasing the addressee's epistemic vigilance and, therefore, their critical judgment (Givón 1982; Sbisà 2007; Sperber et al. 2010; Reboul 2011; Schwarz 2015, 2016; Maillat-Oswald 2016; Lombardi Vallauri 2016, 2019).

Anaphoric encapsulators (D'Addio 1988; Simone 1990; Conte 1996) represent a particular case of presuppositions by (in)definite descriptions that refer back to a previously introduced longer portion of text which was nevertheless not established as a referent, thus creating *de facto* a new referent. It has been shown (D'Addio 1988; Caffi 2009) that this can be done not only through neutral encapsulators (e.g. *this situation*), but also by means of evaluative NPs (e.g. *this scandal*). This textual device is therefore prone to manipulative uses, because subjective or even tendentious contents can be smuggled as identifiable and agreed upon information through a presuppositional encoding. This manipulative effect can be even enhanced when occurring in anaphoric chains, where evaluative content is increased (Pecorari 2015, 2017).

In this contribution we investigate the frequency of the manipulative use of presuppositions by definite descriptions and anaphoric indefinite descriptions as evaluative anaphoric encapsulators in the currently available section of the IMPAQTS corpus of Italian political discourse (846 speeches, 3.205.433 tokens). This diachronic, multimodal corpus is representative of the Italian Republican political discourse (1946 to present) and is annotated per implicitly conveyed non *bona fide* true contents, including presuppositions (Cominetti et al. 2022).

In the following example, the speaker refers to the possibility of two parties forming the new government as *il patto della poltrona* ('the seat pact', referring to the two parties only trying to secure the best seats of power):

1) Per Fratelli d'Italia, l'unico sbocco possibile di questa crisi di governo è [...] il ritorno alle urne. Abbiamo chiesto al Presidente Mattarella di valutare questa eventualità, anche nel caso in cui M5S e PD confermassero la loro volontà di procedere verso **il patto della poltrona**, che stanno trattando in queste ore.

'Fratelli d'Italia believes that the only possible solution to this government crisis is [...] new elections. We have asked President Mattarella to consider this possibility, even in case M5S and PD should confirm their willingness to go forward with **the seat pact** they are discussing in these hours'.

In the remainder of the speech, the speaker builds an anaphoric chain in which the evaluative content is progressively increased (e.g. *questo osceno baratto di poltrone* 'this obscene barter of seats').

The analysis shows the high frequency of the phenomenon in the Italian political discourse and proposes a classification of the examples according to textual and pragmatic parameters, including the type of encapsulator and the *communicative function* performed by the presupposition (Garassino et al. 2019, 2022).

Inferring gaps of knowledge from anaphoric expressions in detective stories

Panel contribution

***Prof. Anna Bonifazi*¹, *Ms. Pinelopi Ioannidou*¹, *Ms. Zala Salarzai*¹**

1. University of Cologne

Anaphoric choices may reflect different degrees of referent activation in one's consciousness (e.g. Chafe 1996), continuity or discontinuity in narrative structure (e.g. Van Vliet 2002), conversational recipient-design choices (e.g. Betz 2015), and sociolinguistic norms (Allerton 1996). All these accounts assume a receiver-friendly attitude of speakers or narrators, which facilitates anaphora comprehension: a referent that is already in focus gets a lexically light recall; the beginning of a new narrative episode hosts lexically heavier co-references; the co-presence of multiple conversation participants invite anaphoric choices that are interactionally efficient.

Our contribution spotlights anaphoric expressions countering this cooperative attitude by communicators, at least partially. We hypothesize that a gap of knowledge inferable from an anaphoric expression – that is, an asymmetry in the epistemic standpoint of one or more characters, or of readers, about a certain referent – hinders or misleads anaphora resolution.

Data come from a study considering 3.842 anaphoric expressions with individuals as referents in 6 short detective stories (by Conan Doyle, Chesterton, and Christie), and Webanno annotations regarding, among other information, the referent, the type of anaphora (whether regular or associative), the grammatical form, the utterer, and if a specific viewpoint seems to be conveyed. The genre favors a large spectrum of possibilities regarding anaphora comprehension: on the one hand, understanding who is who without efforts is a key factor of the reading process; on the other hand, coreferences can generate implicatures advancing the characters' and the readers' knowledge about referents, and even misleading them (in line with the rhetorical strategies shown by Emmott and Alexander 2019).

Our research questions are: which anaphoric expressions in which contexts do imply gaps of knowledge between characters about a certain referent? In which of these cases do writers make readers align with (some of) the characters?

Instances to look at include, for example, “that amazing target” used by Conan Doyle in *The Adventure of the Empty House* to refer to what the murderer (wrongly) believes is Sherlock Holmes in person, whereas Watson, Sherlock Holmes and the readers know it is a bust in wax resembling the detective; “the criminals” uttered by Miss Marple in *The Bloodstained Pavement* at a moment where characters and readers have no clue about the referents, whereas Miss Marple does.

Reference and reflexivity: the metafunctions of the discourse marker “in other words” in written English discourse

Panel contribution

Dr. Milica Radulović¹

1. University of Niš

The paper examines the metalinguistic and metapragmatic functioning of the discourse marker *in other words* in written English discourse. Discourse markers, which belong to the explicit level of metapragmatic awareness (Mey 2001:198), demonstrate “how speakers and hearers jointly integrate forms, meanings, and actions to make overall sense out of what is said (Schiffrin 1987:49)”. Furthermore, these forms indicate reflexive awareness, which can be defined as “the capacity of the mind to bend back upon itself, to be aware of its own experiences as residing in a self that is situated in a social context of interaction (Verschueren and Brisard 2009:33)”. Discourse markers can be found in various planes of talk: exchange structures, action structures, idea structures, participation frameworks and information states (Aijmer & Simon-Vandenberg 2011:224-225, Schiffrin 1987:315). Specifically, the marker *in other words* is a metalinguistic form which demonstrates that the speaker is aware that comprehension may misfire. Therefore, by adapting some sections of the speech, the speaker attempts to avoid wrong reference and inference and to improve salience in discourse. Following Schiffrin’s (1980:202) assertion that “Meta-linguistic referents, operators, and verbs are all embedded in a linguistic context that provides them with talk on which to focus,” the research aims to determine the boundaries of the focal context of the marker *in other words* in written English discourse. This qualitative corpus-driven analysis includes 50 examples from the corpus of *Global Web-based English* (GloWbE). Also, the research highlights the relevance of the relation between reflexivity, salience, and clarity in presenting ideas and propositions.

Reference construction in German regulatory signs in public spaces. An exploratory study

Panel contribution

Ms. Charlotte Eisenrauch¹, Prof. Rita Finkbeiner¹

1. Johannes Gutenberg University Mainz

Pragmatic approaches to reference pursue the question “how speakers – by using a particular expression [...] – succeed in picking out their intended referent [...], and how the use of different types of expressions in different contexts affects addressee interpretations” (Gundel & Abbott 2019: 2). Under this view, the process of reference construction is a highly context-dependent matter. While this insight has been at the center of many interactional studies on reference (Sidnell & Enfield 2017), other discourse domains and modalities are still underrepresented in pragmatic work on reference.

A pertinent, but widely neglected case is reference construction in public signs regulating people’s behavior. In this discourse domain, text producers heavily rely on the ability of recipients to include perceptive knowledge of the physical situation, alongside assumptions about the absent text producer’s intentions, into their interpretation.

(1) *Ausfahrt freihalten*

gateway free-keep

‘Keep gateway free’

(2) *Privatgrundstück*

private lot

‘Private lot’

(3) *Plakate ankleben verboten*

bills prt-glue forbidden

‘Do not post bills’

In (1), by using the bare singular count noun *Ausfahrt*, the text producer intends to refer to a particular gateway which can be visually perceived in close proximity to the sign (roughly ‘Keep this gateway free’). Obviously, bare singular count nouns are not typical referring expressions. Still, recipients are likely to be able to understand the reference in context. In (2), in contrast, the bare singular count noun *Privatgrundstück* is not used to refer to a particular private lot, but to assign to a particular, visually perceivable area the property of being of a certain kind (roughly ‘This area is a private lot’). In order to understand the difference in the referential potential between the bare nouns in (1) and (2), recipients need to grasp the meaning of the linguistic constructions and enrich the expressions by appropriate situational knowledge. Finally, in (3), the text producer also refers to an area in proximity to the sign, but not by using a noun denoting this area but by using a particle verb (*an+kleben*) selecting a local argument which has to be saturated in context (roughly ‘Do not glue bills on this wall’).

In this talk, we present the results of a pilot study investigating the linguistic and pragmatic factors that determine reference comprehension in German public signs of verbal and verbal-iconic modality with regulatory function. Based on a corpus of signs documented in the city of Mainz, we systematize the linguistic expressions used by the text producer to refer to various elements of the extralinguistic situation and relate the findings to current pragmatic models of deixis and reference. We argue that regulatory discourse in public spaces can provide valuable new insights into the interplay between linguistic expressions, contextual factors, and pragmatic inference in reference construction.

Referring as a joint-action in natural discourse

Panel contribution

Ms. Emilia Calaresu¹

1. *University of Modena and Reggio Emilia*

In this presentation I would like to discuss the interactional process of reference in real discourses. Reference is a context-dependent notion and a negotiated process between speakers (e.g., S1, S2, etc.) (Auer 1984; Brennan & Clark 1996; Jucker et al. 2003; Clark & Bangerter 2004; Schegloff 2007; Calaresu 2019, 2022). Not only all knowledge deemed already shared but also style, related to different discourse genres, plays a role in choosing one referential expression over another (Hedberg et al. 2019; Scott 2020).

Reference is *in primis* an act of the speaker: “it is the speaker who refers (by using some appropriate expression): he invests the expression with reference by the act of referring” (Lyons 1977: 177). This means that when faced with a referential expression Y in spoken or written discourse, the most appropriate question is not ‘What does expression Y refer to?’ but ‘What does S1 refer to by using expression Y while addressing S2?’ (cf. Lyons, 1977: 177, 180). Another crucial aspect is that, on the basis of her knowledge, her memory of previous interactions, of contextual clues, etc., S2 will often have to choose a referent resolution of Y among a range of possible interpretations (Wilson & Sperber 2012: 263-264).

Only by working on real discourse data (and not on short, isolated, or invented examples) is it possible to see that the whole process of referring usually consists of three main stages: i) S1 introduces a referent X in discourse by means of an expression Y; ii) S2 acknowledges or does not acknowledge X, providing tacit or verbal acknowledgement, or asking for further explanation; iii) reference to X is maintained (not necessarily by means of the same expression Y) or is dropped in the subsequent turns of speech.

Each act of reference therefore calls into play many variables: a linguistic expression Y, used by S1 addressing S2, in a specific kind of discourse D, in order to refer to a certain entity X (the referent). In traditional semantic accounts, referring is often regarded as a relation with only two variables, i.e. a two places- relation (Y, X). In more pragmatically oriented studies, they amount to three (Y, X, S1) or, at best, four (Y, X, S1, S2) (cf. Abbott, 2010: 2-3). However, partly because of well-known characteristics of natural languages and real speech (semantic indeterminacy, vagueness, arbitrariness, etc.), partly because of specific context conditions, referential resolutions of the same expression Y made by two different human interactors can never *a priori* be called identical. This is more likely to happen if S1 refers to referents which are not contextually present, or already familiar to S2, or deemed universally known. Or, viceversa, if S1 uses unexpected expressions to refer to an otherwise easily identifiable referent.

To conclude, we should consider at least six variables: 1 linguistic expression, 2 (or more) human interpreters, 2 (or more) referential resolutions that are not necessarily identical, and, lastly, the important variable of the discourse genre.

Situational definites and inference from stereotypical situations in languages with definiteness splits

Panel contribution

*Dr. Ulrike Albers*¹

1. *Structures Formelles du Langage*

It is usually assumed that general stereotypical knowledge, shared by both speaker and receiver, is the base for weak definites such as *the train* in *I took the train* (Carlson & all 2013; Beyssade 2013; Zwarts 2014). One defining feature of definite descriptions like these is that they do not denote a particular referent: the speaker might have taken several trains; and the addressee is not aware of any particular train. So-called “situational definites”, on the other hand, are assumed to denote a referent that is unique in the situation; it is proposed that they might rely on knowledge of the situation but cannot rely on stereotypical knowledge (Zwarts 2014; Lyons 1999).

This talk deals with different kinds of situational definites in typologically distinct languages with definiteness splits, i.e., languages displaying different expressions encoding different types of definiteness[1]. Such languages usually have a weak form and a strong form. The strong form is used for context-dependent types of definites (mostly anaphoric and deictic reference); the weak form has other uses, including reference to globally unique entities such as *the sun* or weak definites such as *the train* in *I took the train* above.

Ebert (1971) showed that the split in Fering is operated between what Hawkins (1978) later called the “visible situation” use of definites (deictic reference) and all other situational uses. We will show that other languages also distinguish reference retrieval based on deixis, expressed by strong forms, from reference retrieval involving inference from stereotypical situations, expressed by the weak form.

1. Out of the blue:

{**Doktér** / #Doktér-la / #Lo doktér} la di amwin ou asiz tro ba.

‘The doctor told me you sit too low.’ *Reunion Creole, bare noun phrase (weak form)*

b. {**Da** / #Dea} Dokta hot ma gsogt i soi mi auskurian. *Austro-Bavarian[2], reduced article (weak form)*

‘The doctor told me to take care.’

c. Ich habe {**vom** / #von dem } Arzt einen Tipp bekommen: ich soll mich nicht so niedrig hinsetzen. *Central German, contracted form of article (weak form)*

‘I was given an advice by the doctor: I should not sit so low.’

We will also suggest that these kinds of situational uses of definite NPs (partially) rely on cognitive frames[3], on a par with weak definites; that they may receive sloppy readings even when they figure in subject position; and that they cannot be contrasted.

[1] We will use data from existing analyses (Fering and other languages) as well as new data from Reunion Creole, Austro-Bavarian, and Central German. Our own data mostly consist of examples based on utterances found in oral corpora and judged for felicity by native speakers.

[2] The variety used here concerns a local dialect from Saigahans (Austria).

[3] Approaches in terms of frames have been proposed for weak definites (Zwarts 2014, Löbner 2015, Oda 2015). A frame is a stereotypical situation abstracting away from particular situations.

The recalibration of the referent through the reformulation in spontaneous spoken Italian

Panel contribution

Ms. Roberta Cicchirillo¹

1. Department of Humanities (DipSUM), University of Salerno

The aim of this paper is to explore in a corpus-based study the role of the recalibration of the reference (1) (Lerner et al. 2012) through the reformulation in the Italian spontaneous spoken language. The reference recalibration reformulation (RRR) highlights the multi-step dimension of the introduction of the referent (Shor 2019), thereof intended as “a semantic relation between linguistic expressions and things, abstracting away from speakers and addressees” (Abbott 2010:3). From a syntactic point of view, reformulation is considered as a syntagmatic concatenation constituted by at least two elements of the same kind on the same level, from the semantic-functional side, instead, the reformulation accumulates several suitable denotations among different possibilities for a unique referent (Pietrandrea & Kahane 2012); in this sense RRR causes a delay in the progression of the turn due to the substitution, in a lexical searching practice. In (1), in bold, the RRR introduces the referent *something*, related to what it has been eaten, then, it is recalibrated along a direction that improves the specification, namely *a sandwich*. *Something* and *sandwich* lay on the same syntactic level depending on *we stopped on the way to eat*.

(1) ci siamo fermati pure per strada a mangiare **qualcosa** ho capito

B: **qualcosa**

A: ah

B: **insomma un panino** e quindi il tempo non era tanto

(1) we stopped even on the way to eat **something** I understood

B: **something**

A: ah

B: in short **a sandwich** and so the time was not so much

RRR may be considered a multi-step process that permits to integrate interactional and functional aspects and semantic and trajectory features of the conjuncts, which express a reinforcement or a decrease of the referent. Hence, the referent may occur not only with a single linguistic contribution (Clark & Bangerter 2004), but it may be realized by different stages, composed of functional and interactional factors, to support the activity in which the speaker is engaged (Lerner et al. 2012; Calaresu 2018).

The current paper aims to analyze 50 RRR, taken from spoken corpora, VoLip (De Mauro et al. 1993) and KiParla (Mauri et al. 2018). It intends to explore the functional features relating to clarification, conceived as the expansion or the explanation of a referent, to paraphrase which expresses the equivalence among the items involved in the reformulation, and to correction, intended as the lack of the equivalence between the reformulation elements (Bazzanella 1986; Fiorentini & Sansò 2017).

At first glance the recalibration reveals that RRR is related to nominal items, which may be a word or a phrase, expressing primarily a clarification function. Further, in the referentiality practice, at least two trajectories are deployed revolving around the precision of the formulation, which in one direction allows the gain of the referential specificity and on the contrary in the other, the speaker expresses a well-suit formulation but then, due to the recalibration, it occurs a referential downgrade that reduces the certainty about the referent (Lerner et al. 2012; Bonvino et al. 2018).

Viewpoint building and referential interpretation with three defocusing constructions in Spanish digital news discourse

Panel contribution

*Dr. Miguel A. Aijón Oliva*¹

1. *Universidad de Salamanca*

The grammatical constructions usually characterized as *impersonal* (e.g. Siewierska & Papastathi 2011) have the intuitive function of leaving the identity of certain human participants underspecified, either because the events described are *irrealis* and applicable to a collectivity, or because of an intention not to attribute *realis* facts to specific people. The pragmatic defocusing of a referent is often correlative with its syntactic-semantic demotion (Solstad & Lyngfelt 2006). It is however interesting to observe that defocusing constructions tend to co-occur with contextual elements apparently aimed at enabling referential identification. These can be approached as mental space builders (Fauconnier's 2014) and include locative and temporal adjuncts with a demarcating function (e.g. De Cock 2014: 213-215). To them we can add verbal semantics and aspect, as well as the contextual presence of other referential elements, all of which entail the configuration of discourse viewpoints (Serrano 2022) and can have important pragmatic repercussions.

The present study aims at investigating the connections between viewpoint building and referential interpretation with three defocusing constructions in Spanish news discourse. The analysis will be based on a corpus collected during the years 2021 and 2022 from three digital newspapers based on the Peninsular city of Salamanca. We will quantitatively and qualitatively analyze the co-occurrence of different space builders with non-phoric plural third persons (3PL), passive and impersonal reflexives (SE) and the impersonal modal construction formed with *haber-que* plus an infinitive (HQ).

The results show that 3PL is mostly restricted to specific references in news headlines, where it helps the writer put the focus on the facts rather than their actors. SE and HQ display wider contextual possibilities and referential readings, specific ones usually requiring perfective verbal aspect. All this contrasts with the findings of a different investigation on digital opinion pieces (Aijón Oliva, forthcoming) where 3PL is typically associated with institutional references as opposed to the citizenry, while SE promotes an integrated view. This suggests that the very mechanisms aimed at guiding referential interpretation constitute a matter of sociopragmatic variation across textual sequences and communicative situations.

An Event Approach for the Analysis of Interpersonal Trust in HRI

Panel contribution

Dr. Glenda Hannibal¹

1. Ulm University

Trust in robots and their perceived trustworthiness has been studied and promoted in human-robot interaction (HRI) research as an essential factor for how willing people are to interact and collaborate with them (Lewis et al., 2018). Deliberately designing robots to have apparent agency, have also motivated HRI researchers to go beyond an understanding and analysis of trust as mere reliance to that of interpersonal trust (Law and Scheutz, 2021). However, speaking about interpersonal trust in the specific context of HRI requires careful discussions about the metaphysical and epistemological underpinnings, which are often left unchallenged in the HRI community. By using the philosophical method of conceptual analysis, I will first show that the standard paradigm for studying interpersonal trust in HRI rest on its conceptualization as either a property of the human or the robot counterpart. Rooted in this property approach, human-centered studies tend to focus on identifying the factors influencing human trust attitudes towards robots, while robot-centered work often aim to determine the factors influencing what makes robots appear trustworthy (Hancock et al., 2020). Drawing on insights from philosophical discussions about the nature of trust (Faulkner and Simpson, 2017), I argue that studies on interpersonal trust in HRI must extend the analysis of trust by adapting an event approach. By conceptualizing interpersonal trust in HRI as an event it is now possible to highlight how trust between humans and robots result from the situated and dynamic interaction. Moreover, embracing this shift from a property to an event approach also calls for fundamental methodological discussions about how to study interpersonal trust in HRI. I will conclude by considering in which way it might be possible to empirically study the situation of interpersonal trust in HRI by taking into account human experience of vulnerability as one of its preconditions (Hannibal et al. 2021). As such, my overall aim is to present how theory-driven research is beneficial to future research on interpersonal trust in HRI.

Being Transparent about Competence: Using Transparency in Trust Calibration

Trust is an essential part of human-robot interaction. For smooth and safe interactions, a calibrated level of trust – a state in which a human’s level of trust matches their robotic counterpart’s level of capabilities – is needed. While an obvious way to correct possible miscalibration is transparency about the system’s capabilities, previous studies are inconclusive: In some cases, the use of transparency led to an increased level of trust, in other situations, the level of trust dropped significantly. Our approach aims at creating a framework for regulating various forms of perceived trust. Our assumption is that the degree of downward evidence (Clark, 1996) for a capability of the robot influences the effectiveness of transparency as a trust regulating strategy.

In an online experiment, we tested three different verbal approaches toward trust calibration. Conditions differ regarding different aspects of capability the robot is transparent about: One condition uses transparency about low level of capability, another condition uses transparency about high level of capability. The baseline condition tested a robot demonstrating a higher level of capability with no additional transparency. The experiment was conducted as an online survey, with participants evaluating videos of three different robots, each in one of the three different conditions. We used the Multi-Dimensional Measure of Trust scale (Ullman & Malle, 2020) to capture the perceived level of trust and its effects on different trust factors. Altogether 100 subjects, approached using Prolific, participated in the experiment.

The experiment confirmed our assumption that it matters whether the robot is transparent about its capabilities. Further, we confirmed that the perceived level of robots’ competence is affected by the transparency strategies used. In addition, our results open new possibilities for implementing the strategies outlined in real-life scenarios: for both trust-dampening and trust-repair.

Believe you me, I'm a button: Nonverbal and verbal affordances of trust in artificial others

Panel contribution

*Ms. Michal Pauzner*¹, *Dr. Bracha Nir*²

1. SHENKAR Engineering, Design, Art., 2. University of Haifa

This presentation examines the ways trust may be negotiated through the concept of affordance as a relational notion (Gaver, 1991), highlighting the interaction between human and non-human entities. Employing perspectives from two disciplines, design and linguistics, we analyze the concept of affordance for trust building in the context of digital environments. Specifically, we look into how both nonverbal and verbal clues can be related to building trust and how change of context influences trust dynamics as we are more and more detached from the natural world and engage in mediated, artificial environments.

The concept of affordance describes the action possibilities provided to the actor by the environment (Gibson, 1986). Gibson's non-dualistic theorizing of affordances argues, for example, that every object has specific material properties offering possibilities and constraints for actions, but those are relative for the observer and the situation (Stendal et al., 2016). In the context of design this can be illustrated by the use of a button: for most people a button affords fastening together two sides of a garment. Still, it does not offer the same action possibilities to children that might use it for playing, or to people who may use it for decoration or art. From the point of view of social theory, affordances are the action possibilities and constraints provided to people by other people: for example, when a mother talks to her child, the child talks back. In terms of the use of technology, each technology provides the user with different affordances (Hutchby, 2001), among other things those affordances related to interaction design when interaction involves artificial others (Kaptelinin, 2014).

The concept of affordances is critical for trust, particularly in the context of digital environments. People mostly trust things they immediately recognize and know how to use. However, in digital environments our perceptual understating of affordance becomes blurry, and our understanding of language is at risk, since it is highly decontextualized. In a digital environment trust is not inherently established but communicated through clues, which are embedded in the interface design and other modes of communication, such as choosing a metaphor for a particular function – as in the case of the interface button in a digital application.

We inquire into how change of context - from physical to artificial environments - influences the opportunities to build trust and highlight gaps that influence trust-building between humans and other-than-human actors. We follow Norman (1999) in emphasizing the role of designers as presenting affordances as well as their constraints appropriately and explore the difference between an affordance and the way it is visually and linguistically represented and perceived by people. We follow Gaver (1991) in considering also the hidden and even false affordances of digital environments, particularly in terms of language use. We conclude by highlighting the importance of the interaction between the perceived physical properties of an affordance and its communicative power over the user.

Building e-Trust: Effects of Reciprocity and Social Cues on Online Self-disclosure and Trust

Panel contribution

***Dr. Jaap Ham*¹, *Mr. Zhenyu Zhu*¹, *Dr. Jettie Hoonhout*²**

1. Eindhoven University of Technology, 2. Philips Research

Equipping technology (e.g., websites) with social influencing strategies (e.g., reciprocity) and social cues (e.g., a virtual face) to influence user behavior is becoming increasingly prevalent in e-commerce. Based on earlier literature of artificial social agents and persuasive technology, we argue that a social influencing strategy will be effective especially when the technology displays social cues and the user experiences the technology that uses the influencing strategy as a (an artificial) social entity. More specifically, in the current research, we investigated whether a website that uses reciprocity to entice users to disclose information about themselves by first disclosing some information about itself will be effective especially when that the website displays a human face as the agent it represents (and which discloses the information). To study this question, we conducted a 2 (website agent's social cue presentation: human-like face vs company logo) by 2 (reciprocity vs. no reciprocity) factorial between subject study (N = 200). The dependent variables were individual's self-disclosure and perceived trust towards the website company. Confirming our hypothesis, results showed the expected interaction of agent's social cue presentation and use of reciprocity on user's self-disclosure: When the website used reciprocity by first disclosing some information about itself, participants disclosed information about themselves more often only when the website displayed a human face (to represent itself as an agent that discloses the information). Additionally, results showed a main effect of reciprocity on trust: When the website used reciprocity, the participant trusted the website company more than when it did not use reciprocity. Results provided no evidence that an agent's social cue presentation (i.e., presenting a human-like face) independently influenced user self-disclosure or trust. Limitations of the study, implications for theory and e-marketing, and suggestions for further studies are discussed.

Designing Trustworthy Chatbots for Eating Disorders

Panel contribution

***Ms. Xin Shen*¹, *Prof. Kenny Chow*¹**

1. The Hong Kong Polytechnic University

Eating Disorders (EDs) are mental illnesses which result in various negative consequences. However, many individuals who suffer from EDs are not receiving valid help. Some of them refer to the internet for relevant information and/or advice. From our online observational study, one of the major reasons why people do not reach out for professional help is their lack of trust towards in-person communications with therapists. In order to deliver efficient and effective interventions for this population, we aim to establish a framework for designing text-based chatbots for ED patients.

Specifically, an identity-informed approach is adopted in this study to analyze user needs and explore design possibilities. This is based on previous research in the field of EDs which has indicated that patients' multiple identities interact with one another which crucially impacts the risk, diagnosis, and treatment of EDs. By taking an identity-informed approach, we intend to undertake a comprehensive analysis of the association between individuals' ED-related needs and their three types of identities (group identity, role identity, ED identity). We have applied this approach in case studies and conducted identity analysis on participants. Based on the results of the analysis, chatbot prototypes with different chatbot personas have been created for user testing to explore how to transform user needs into design elements. As a result, a preliminary design framework for chatbots delivering ED interventions has been built. The framework is composed of four dimensions, including content, persona cues, conversational cues and structure. We further investigate how these dimensions and factors under these dimensions influence users' trust towards chatbots with different personas. Based on quantitative and qualitative analysis of user feedback, the framework is enriched with components which improve user trust in chatbots. The final design framework draws implications for creating trustworthy chatbots in healthcare.

Distrusting self-driving cars, trusting Alexa. A discourse linguistic investigation of trust in Artificial Intelligence

Panel contribution

***Dr. Monika Hanauska*¹, *Prof. Annette Leßmöllmann*¹, *Dr. Nina Kalwa*¹**

1. Karlsruhe Institute of Technology

In the public discussion about Artificial Intelligence in German press texts, trust is often addressed literally, i.g.: *EU wants to strengthen people's trust in artificial intelligence* (Darmstädter Echo, 2021/04/27), *Why Artificial Intelligence (AI) has a trust problem* (WELT Online, 2020/12/24) or *Moreover, generally available AI that does not reveal itself could increase people's distrust in technology* (SPIEGEL Online, 2018/05/11) [Translation: NK]. These headlines and the respective articles seem to suggest that trust in AI appears to be the prerequisite for self-learning systems to be accepted by people in a wide variety of contexts. But is this the case for every kind of self-learning (i.e., AI) system?

Using a discourse-analytical approach, we examine the question of which AI systems in German public media discourse address trust and mistrust. We identify sub-discourses in which trust is overtly thematized in connection with AI and those in which this is not the case. Does the thematization of trust, e.g., in relation to machine translation play as big a role as in relation to self-driving cars? In which AI sub-discourses is trust often addressed? In addition, we are interested in the question of whether certain keywords such as *black box* reinforce trust/mistrust in connection with AI. The lexeme *blackbox* has negative connotations in public discourse, while the term *responsible AI* in turn acquires positive connotations through the positive-deontic adjective. In our contribution to the panel, we thus aim to map the discourse on AI regarding its thematization of trust/mistrust and at the same time pursue the question of which key words are involved in the linguistic constitution of trust/mistrust.

Do we really perceive and react differently to Embodied Artificial Intelligence than to “any other” technology?

Panel contribution

Dr. Astrid Weiss¹

1. TU Wien

Kiesler and Hinds (2004) noted in their Introduction to the Special Issue of Human-Robot Interaction in the Journal of Human-Computer Interaction that people seem to perceive autonomous robots differently than most other computer technologies. Similarly, Dautenhahn (2018) argued that human-robot interaction is very different from human-human interaction, human-computer interaction, and human-animal interaction. What was then primarily an assumption has since been substantiated with empirical evidence. Much research also tried to figure out what exactly makes the difference: is it the autonomy, the expectations, and narrations about robots, the “lifelikeness”? Especially in social robotics, the embodiment has received much attention. Deng and colleagues (2019) identified different notions of embodiment, with physical and social embodiment being the most relevant for socially interactive robots. In their review of 57 experiments where different embodiment aspects were investigated, they identified 43 that provide evidence to the assumption that “using a physically embodied agent is superior in improving user perceptions of the agent.” One of my recent works (Weiss et al., 2020) also points in this direction. We compared anthropomorphic language use in online forums about the Amazon Echo Show, Q.bo One, and Anki Vector. We expected to find the highest amount of anthropomorphism for Q.bo One due to its humanoid shape; however, findings suggested that the lifelikeness of the artifact was not pre-dominantly linked to the appearance but to its interactivity and attributed agency and gender. There is a high impact of perceived agency and voice design (instead of, what we expected, appearance). In this Panel, I want to share my recent thoughts on “trust” as a quality criterion to assess human-agent interaction and our lack of understanding of why people might react differently towards robots. As a physical object/ technological artifact, embodied AI is often only characterized by its function. As a result, the relationships humans hold with such artifacts are typically described in terms of usability and functionality. However, for human-robot interactions, parasocial interaction can be defined as a tendency to behave as if participating in a two-way conversation with a robot with cognitive and affective components present on the human side. The parasocial dimension of the interaction is typically studied as the human response towards robots addressing quality criteria, such as acceptance, affect, and trust. While these studies are relevant, they mainly reflect just one perspective on parasociality and fail to account for the inter- and intrasubjective variability in how people perceive and relate to robots; Shifting emphasis from the design of things (i.e. a robot with a specific embodiment, with a fixed set of design features and behaviors) to design of meaningful human-technology-world relations requires that we also adopt appropriate concepts that aid in the investigation of the structure and dynamics of such relations. Therefore, I suggest a more interactionist and process-oriented stance that focuses less on acceptance and trustworthiness as characteristics, but instead adopts the concept of “authenticity” as co-constructed and enacted in different configurations of human, technological, and other non-human factors (e.g., physical space of participants’ home).

Does lexical coordination affect epistemic and interpersonal trust? The role of conceptual pacts

Panel contribution

Ms. Mélinda Pozzi¹, Prof. Adrian Bangarter¹, Prof. Diana Mazzarella¹

1. University of Neuchâtel

The present study investigates whether humans are more likely to trust people who are coordinated with them. We examine a well-known type of linguistic coordination, lexical entrainment based on the elaboration of “conceptual pacts”, or partner-specific agreements on how to conceptualize objects. In two experiments, we manipulate lexical entrainment in a referential communication task and measure the effect of this manipulation on epistemic trust (trusting agents as sources of information) and interpersonal trust (trusting agents as interaction partners). Our results show that participants are more likely to trust a coordinated partner than an uncoordinated one, but only when the latter breaks previously established conceptual pacts.

We designed a computer-mediated referential communication task in which participants thought they were playing with two “partners” (in fact played by a computer), a coordinated partner and an uncoordinated one, and were then confronted with epistemic or interpersonal trust choices/judgements. In Experiment 1, we compared a lexically coordinated partner, programmed to establish 12/12 conceptual pacts with the participant, with a lexically uncoordinated partner, whose referential expressions differed at times from those of the participant (thus failing to establish 3/12 conceptual pacts). In Experiment 2, we created an iterative version of the same referential communication task (participants played two rounds with each partner) where we manipulated the breaking of conceptual pacts: both partners were coordinated in the first round (establishing 10/10 conceptual pacts), but one of them was uncoordinated in the second round. This allowed us to compare a lexically coordinated partner keeping all previously established conceptual pacts with an uncoordinated partner breaking 3/10 of them.

In Experiment 1, where the uncoordinated partner failed to *establish* some conceptual pacts, we did not find any effect of lexical coordination on binary measures of epistemic trust (51% coordinated partner, 26/51, binomial $p = 1.00$, Cohen’s $g = .01$) and interpersonal trust (53% coordinated partner, 27/51, binomial $p = .78$, Cohen’s $g = .03$). However, in Experiment 2, where the uncoordinated partner *broke* some of the previously established conceptual pacts, we found a positive effect of lexical coordination on the binary measure of interpersonal trust (69% coordinated partner, 34/49, binomial $p = .009$, Cohen’s $g = .19$), and on the continuous measures of both epistemic ($M = 3.90$, $M_d = 4$, $SD = 0.96$ for the coordinated partner, $M = 3.37$, $M_d = 4$, $SD = 1.03$ for the uncoordinated partner, $Z = 512.5$, $p = .013$, $r = .48$) and interpersonal trust ($M = 4.22$, $M_d = 5$, $SD = 1.14$ for the coordinated partner, $M = 3.33$, $M_d = 4$, $SD = 1.36$ for the uncoordinated partner, $Z = 461$, $p = .005$, $r = .55$). Although not significant, the results of the binary measure of epistemic trust also go in the expected direction (55% coordinated partner, 27/49, binomial $p = .57$, Cohen’s $g = .05$).

This study sheds light on the role of verbal coordination in trust and on how trust is shaped through verbal interactions with other (artificial) agents.

In disinformation we trust. Why we trust strangers online

Panel contribution

Dr. Lorella Viola¹

1. University of Luxembourg

Social media have democratised information but in their war for attention, they have confused news with entertainment. Spreading virally, ever more shocking content produces enormous amounts of disinformation which challenge our ***relationships of trust*** and represent a profound disruption of the information space, including institutional. Despite a rapidly growing body of scholarship in both areas, however, very little research has examined the link between online disinformation and trust, and to date, it is precisely the connection between the two phenomena that remains unclear. In this presentation, I introduce “**networks of trust**”, a notion that challenges the predominant view that disinformation is primarily believed by unwell or paranoid individuals within self-contained processes exasperated by mechanisms of echo chambers and filter bubbles (Alava et al. 2017; Johnson 2018; Reicher and Haslam 2016; Conway 2017; Mølmen and Ravndal 2021). Whereas filter bubbles and echo chambers are believed to leverage on a self-reinforcing, confirmation bias mechanisms which dislocate the agency from users to algorithms, I theorise Networks of trust as processes involving shared identities and social relations, humans, algorithms, compelling disinformation narratives, and networking processes that enhance a sense of community, normalise paranoia and even legitimise violence as necessary. Combining methods of data mining, network analysis, critical discourse analysis, and narrative network analysis, I first map the mechanisms of interaction between social media disinformation (i.e., Facebook, Twitter, Instagram, Reddit) and trust. I then unpack the micro-mechanisms of the online disinformation-trust process by zooming in on both the hyper-connecting nature of the Internet and the cognitive dimension of disinformation. Specifically, using CDA I analyse the narratives of disinformation in the accounts of the actors themselves helping unveil the assumptions and ideologies embedded in and circulated through these stories and the role of language, rhetoric, communicative strategies, psychological dynamics, and technology in establishing trust. The results will show that disinformation is a powerful cognitive force which first disrupts established relationships of trust; it then leverages on group dynamics to create new networks of trust. Across networks of trust, disinformation exploits the hyper-connecting nature of the Internet, and it uses compelling narratives to normalise paranoia.

This ***triple focus on trust, algorithms, and language*** adds a more nuanced and novel perspective to the range of representational strategies used to understand the endorsing of disinformation, for example as a response to a crisis of identity that reflect genuine concerns rather than isolated, pathological acts.

Prosodic cornerstones for building trust: Phrase-final pitch and tempo dynamics

Panel contribution

***Prof. Oliver Niebuhr*¹, *Mrs. Hilla Goren-Barnea*², *Dr. Vered Silber-Varod*³**

1. Centre for Industrial Electronics, University of Southern Denmark, 2. Computer Science Dept., Open University of Israel, 3. TAD Center for AI and Data Science, Tel Aviv University

The relationship between prosody and trust is far from being straightforward. For one thing, this is because the communicative functions conveyed by the voice are always encoded as bundles of prosodic features. For another thing, this is because trust itself is not a monolithic concept. For example, trusting another person not to harm us materially, emotionally or physically is a different kind of trust than trusting in another person's capability to push through specific activities or goals. The latter form of trust is one based on the attribution of competence, self-confidence, and power.

It is this charisma-related type of trust that we address here. Our starting point was an analysis of Barack Obama's acoustic charisma. A particular prosodic pattern emerged in this analysis: the absence of phrase-final lengthening before silent pauses in combination with a short but steep and extensive drop in voice pitch at the end of the phrase. In our ears, these abrupt endings with their change to low pitch constituted a central trigger of trust in Obama's way of speaking.

Examining this assumption, we performed a perception experiment in which we manipulated three phrase-final prosody features via PSOLA re-synthesis: (1) how low the pitch drop reached at the end of the phrase; (2) how steep the fall was at the end of the phrase (convex vs. concave fall as well as early vs. late fall onset); (3) how pronounced the final lengthening was, i.e. how much the speaking rate decreased over the last 3 syllables of the phrase. Each manipulation included three steps, and all manipulation steps of (1)-(3) were cross-combined. The base stimuli were simple one-sentence statements ending in the largely voiced target sequence "our country", extracted in the same setting from farewell speeches of US senators, one male, one female. A total of 108 stimuli were rated along five 7-point scales that concerned trust as well as charisma and its building blocks competence, self-confidence, and power. The experiment was carried out online with 50 participants. They formed two roughly equal samples: native and non-native listeners.

Results show that all manipulated prosodic features significantly influence the listeners' ratings. The degree of final lengthening is negatively correlated with trust and has the strongest effect on that speaker attribute. Among the pitch features, it is the steepness of the pitch drop that most strongly determined trust ratings, with shallower falls meaning lower trust. However, pitch features generally seem to have greater effects on self-confidence and power than on trust ratings. Trust ratings themselves correlated strongest with ratings of competency and weakest with ratings of self-confidence. As regards the two covariates of speakers and listeners, it seems that the effects of prosody on ratings were more pronounced for the female than for the male speaker, and that non-native listeners' rating levels were overall higher than those of native listeners.

We discuss our results in terms of their potential to resolve previous contradictions in prosody-trust relationships and their implications for public-speaker training, machine-voice design, and the framework of prosodic constructions.

Trusting robots throughout the technology acceptance process

Panel contribution

Dr. Maartje de Graaf¹

1. Utrecht University

A significant focus area in Human-robot interaction (HRI) examines the circumstances in which people do or should (not) trust robots. The trust-relationship is based on how the trustor perceives the trustee's competence, dependability, and morality^[13]. A similar trust dilemma has been used in HRI research discussions (e.g., functional savvy versus social savvy^[10], capacity trust vs moral trust^[21]). This abstract highlights research on the role of trust at different stages throughout the technology acceptance process.

Technology acceptance begins with users gaining initial knowledge of a technology, forming an attitude towards that technology, and making the adoption-decision^[4,6]. Trust had a significant role for initial acceptance (especially before exposure to the robot) in our 6-month's study involving 70 households^[4]. When people speculate about robots, beliefs about the robot's trustworthiness increases beliefs about its ability to interact socially^[7].

Robot use entails the implementation of the technology and adapting it to daily use routines^[4,6]. HRI research concentrates on first impressions during short interactions (e.g., lab experiments) or even hypothetical interactions (e.g., online surveys). A video-based online study^[unpublished] revealed that a virtual robot that uses affiliative non-verbal behavior was regarded as being more courteous, dependable, and trustworthy.

First impressions are affected by physical cues, which triggers social categorization^[1] and prompt stereotyping processes^[14,20]. An online study^[15] shows that trusting robots strongly correlates with its capacity (not its morality) and with the task it performs (not its gender). Regardless of gender, people believe robots are more capable of executing analytical (than social) tasks. Such predominant effects for task type, eliminating potential effects of gender cues^[2,9], are not necessarily surprising given that people hold more utilitarian perceptions of robots^[5,8,11,23] indicating a preference for executing instrumental tasks.

A lab study^[22] surprisingly found that people have higher trust in and are more willing to collaborate with a robot when it incorrectly blames itself for collaborative failures. This result contradicts previous HRI research showing that erroneous robot behaviors negatively influence trust^[12,16,17,19] which decreases willingness to collaborate^[24]. Our peculiar findings might be caused by a potential fun element when a robot blames the wrong target for losing the game, similar to a study in which a robot cheated during a competitive game^[18]. Future research on robot blame attribution should further explore the effect of task-type on trust assessments. Eventually, people continue the use of the robot and use routines have been created with a functional dependency^[4,6]. Our longitudinal home study^[4] shows that trust was relatively unimportant for the functional acceptance of that robot as most participant blindly trusted the information the robot provided. However, trust was one of the most crucial factors for emotional attachment since it led to self-disclosing more personal events to the robot.

Opposite findings were obtained in an exploratory study with older adults using a robot for three 10-day periods^[3]. Trust was a serious issue for them, especially when the robot raised privacy concerns or was behaving erratically. Yet, even these older participants had complete trust in the robot's integrity as well as the messages' content.

Why Overtrust in Social Robots Is Inevitable

Panel contribution

Prof. Kerstin Fischer¹

1. University of Southern Denmark

Trust is the glue of social communities, which is reflected in many pragmatic principles and mechanisms, like Grice's (1975) quality maxim, Cialdini's (2010) principle of reciprocity or Goffman's (1978) predictability. That is, for societies to work, people have to be able to rely on that what others tell them is probably true, that they give something back when they have taken something, and that they attend to social norms of the community in a predictable way.

When robots enter our social spaces, we may view them from three different perspectives (Clark & Fischer 2022): as machines, as artefacts with specific affordances (like 'seeing', 'speaking', 'dancing'), or as nonstandard characters, which people construct based on the features of the robot depicted, the way it is framed by others, and based on people's own needs and dispositions. People can switch seamlessly between the three perspectives (Fischer 2021), for example, offering polite assistance in one minute and turning it off for cleaning in the next. However, when they are construed as characters, robots become social actors, and with this sociality, also expectations concerning trust apply.

Even though robots generally depict nonstandard characters (i.e. it is clear that they are not real dogs, seals or people), there are just many aspects about social beings we take for granted, and hence we are very likely to assume them of robot characters. For instance, Cialdini (2010) argues that the principles of influence rest on subconscious shortcuts that are appropriate (from an evolutionary perspective) most of the time. For instance, according to the principle of consistency, if someone does something at one point in time, they are likely to do it at another point in time as well. This, unfortunately, does not apply to robots; they may not be able to recognize your face the third time, even though they recognized you correctly twice before. This is hard to imagine from a human perspective.

Similarly, all natural beings follow a developmental trajectory, which requires, for instance, the acquisition of simple actions before the complex ones. For robots, their capabilities do not develop, but are rather implemented by engineers; that a robot can exhibit complex capabilities while not being able to carry out simple ones is inconceivable for humans. A third example is norm violation: In humans, one can be quite certain that a person who recognizes another will not run into this person; this is by no means guaranteed in the case of robots. Lastly, while humans can switch roles easily – they can be a shop assistant in one moment and a mother in the next – this does not apply to robots, which are specialists for the role they are deployed.

All of these assumptions are likely to lead to overtrust in robots, simply because it is inconceivable to people that those mechanisms are not in place in the nonstandard characters that robots represent, and it will be very difficult to develop strategies to avoid overtrust in social robots.

From Collective to Individual Memories: Linguistic implications for Preserving and Revitalising Runyankore

Panel contribution

*Dr. Levis Mugumya*¹

1. Makerere University

Folklore has since time immemorial formed part of the oral tradition and a means of learning and transmitting language. The community collective memory has been the core repository and natural safeguard of culture and tradition. Among the Banyankore of South-western Uganda, legends, folktales, fairy tales, oral poetry (proverbs and recitations), folksongs, riddles, and tongue-twisters were recreated and transmitted from one generation to another via the oral tradition by community elders, parents, relatives, siblings or griots at the fire place or at marriage ceremonies. However, such narratives have been eroded by intercultural contact, modern religious practices, fast-sweeping wave of ‘modernisation’ information and communication highways. The new ways of living and practices have eroded the collective memory spaces, thus endangering the language, Runyankore [1] through which folklore was preserved and transmitted. Nonetheless, the demand for ‘usage’ of folklore at social functions and celebrations and the need for traditional performances as part of extra curricula activities in schools nowadays have prompted an enterprising re-imagination of collective memories by individuals or groups of individuals. Driven by a commercial sense, these individuals re-imagine and re-compose folklore and perform at social, religious, or political functions for a fee. Others are often hired to impart the intangible knowledge and skills to learners in different schools. Thus, the preservation and transmission of folklore has changed from being of a collective nature to an undertaking by individuals or ‘cultural groups’. Because these individuals aim to entertain their audiences, their compositions often entail a mixture of Western and other Ugandan cultures. Therefore, arguments that the individual performances are conducted in a perfunctory manner and removed from the cultural context prevail. Thus, there is an impression that the folklore has been invaded by neighbouring languages endangering further Runyankore. This paper, which is drawn from a research project, *From Collective and Individual Memories: An exploration of Methods of Preserving and Transmitting Banyankore folklore*, examines a corpus of archival material on Runyankore folklore focusing on folksongs and recitations to explicate the nature of linguistic trends in the collective and individual memories. It also explores the linguistic value entailed in the current folklore and what it implies for preserving Runyankore. It argues that despite the threat to the Runyankore folklore, the young and future generations can learn from the individual memories, which reflect the current themes and topics that normally impact the linguistic trends. The current forms of folklore equally provide a window into other cultures that allow young speakers/learners of Runyankore to reflect more clearly on aspects of their own culture and language. The paper demonstrate how the new genres of folksongs and recitations entailed in the individual memories exhibit the dynamism that is associated with culture, which ultimately impact language use.

Learning an Indigenous language as a political statement in Canada: new speakers of Inuktitut

Panel contribution

*Dr. Jennifer Hartog*¹

1. Centre for Research on Language and Culture Contact, York University, Toronto, Canada

Particularly since the Truth and Reconciliation Commission (TRC) report was published in 2015, descendants of settlers have asked what they could do “to help”. Murray Sinclair, the former chairman of the TRC, always answers “educate yourself”. This education ought not only to include history but also the acquisition of Indigenous languages.

In Hartog (2021) I suggested that settlers learn an Indigenous language, preferably the one of the Indigenous community closest to them, as a matter of “education” and as a political statement.

As the aim of the Indian Act (1876) was “to kill the Indian in the child” particularly by preventing children from speaking their language, many Indigenous people are now making the effort to reclaim their language.

This means that we have two kinds of new speakers, Indigenous ones and non-Indigenous ones.

I am interested in the situation of the Inuit in Canada and am a non-Indigenous new learner of Inuktitut. In my presentation I shall argue that new speakers have a role to play in strengthening the language although the situation is highly complex which I shall talk about.

At the moment, Inuktitut is not an endangered language and it is taught in school.

However, forced sedentarisation and increased contact with English due to media and fly-in services of various institutions are leaving their mark on Inuktitut.

Elders often find that the changes in Inuktitut sound unnatural and are not keen on non-Indigenous people trying to learn their language. They argue that language is more than a code and is a whole way of living. This is precisely what a theory of language as action takes into account as it reconstructs culture, not added on but inscribed in the very language. However, Inuktitut is very difficult to learn for a non-Inuit.

Young Inuit may also find it trendy to sprinkle in some English while being proud of their language.

All in all, I shall argue that trying to keep language in a purist cage, ends up stifling it.

In the efforts to strengthen Inuktitut and increase its prestige, there is an interesting tension between upholding a “pure” minority language and embracing language contact, inventing new words for new things or concepts and encouraging multilingualism between unequally powerful languages. Yet, this is the tension that will keep the language alive and furthermore open up space for creative uses of language such as literature.

Hartog, J (2021) Analysing practices of communication between Indigenous and non-Indigenous peoples in Canada: the key role of language in creating change. Lecture, IPrA conference Winterthur

New Speakers of Hawaiian in an English Dominant Society

Panel contribution

***Mr. Sebastian Ohara-Saft*¹, *Dr. Scott Saft*²**

1. University of Hawaii at Mānoa, 2. University of Hawai'i at Hilo

The movement in Hawai'i to revitalize the indigenous Hawaiian language has been praised as one of the most successful cases of language revitalization throughout the world. Despite an estimate of no more than 30 speakers of Hawaiian below the age of eighteen in the early 1980s (Kimura, Kamanā, and Wilson 2003), the subsequent establishment of a network of Hawaiian medium schools has led to a rise in overall number of speakers that has reached and possibly surpassed 15,000 in number (McCarty 2008, based on personal communication with William Wilson). Employing categories such as “young fluent speakers,” “new speakers,” “neo-speakers,” and “new native speakers,” researchers attribute this growth to the use of schooling, from pre-school through the university level, to focus specifically on children and younger speakers of Hawaiian (Brenzinger and Heinrich 2013; NeSmith 2005, 2019).

However, while this increase in speakers suggests optimism for the future, the language of newer speakers of Hawaiian has been scrutinized for being different from “traditional Hawaiian.” Making the observation that children in Hawaiian medium schools are influenced not only by the dominant societal language of English, but also by the speech of teachers who learned Hawaiian as a second language, some have suggested that the emerging Hawaiian language is closer to a “hybrid” (with English) than it is to the “traditional” language spoken by the Hawaiian ancestors of the children (NeSmith 2005, 2019). In particular, “neo-Hawaiian” is supposed to consist of differences in phonology, vocabulary (particularly neologisms), and grammar that set it apart from the language as it was traditionally used.

In light of these claims about new Hawaiian speakers, this presentation examines the participation of young Hawaiian speakers in a public theatrical performance of a play entitled *Ho'oulu* (“Growing Up”). These young speakers were all students at a Hawaiian medium high school at the time of the performance, and the play was written and performed by the students themselves. The play focuses on how students navigate various social issues, including bullying, lying, and stealing, that are faced as part of growing up in a complex, modern society. The analysis first notes the students' code-switching between Hawaiian and English within the play, particularly when the dialogue mentions modern American events such as the “Super Bowl” and when the students employ English emotive expressions like “aw brah” and “yessah.” At the same time, though, the analysis also emphasizes the depth and complexity of the students' Hawaiian grammar and vocabulary and describes how the students demonstrate and display their command of the Hawaiian language in the public context of the play. In concluding the presentation, the point is made that the students, by combining a strong Hawaiian competence with instances of English code-switching, are able to express their identities as fluent new speakers of Hawaiian living in a modern society dominated by English.

The roles of new speakers in the revitalization of” Uchinaaguchi”

Panel contribution

Ms. Seira Machida¹

1. *University of Hawaii at Hilo*

Uchinaaguchi has long been recognized as an endangered language, but efforts to revive the language in Okinawa have yet to succeed. Most of the native speakers of Uchinaaguchi are elderly people who were born before WWⅡ, and the domain of usage has become extremely limited. Uchinaaguchi was prohibited in pre and post-war education, and its psychological impact extends not only to native speakers but also to their children who are semi-speakers. There seems to be two major factors contributing to the reluctance to speak Uchinaaguchi in public for both types of speakers; one is that the language was previously “forbidden” to be used and another is that there is a great societal pressure for “using correct Japanese”.

Under these circumstances, the emergence of “new speakers” is extremely important not only because it increases the number of speakers of endangered languages, but also because it serves as an opportunity to reconsider the social recognition of Uchinaaguchi. The existence of “new speakers” who want to learn a language that is no longer functional in society leads to the question “Why do we need to learn the endangered language?” in a way that is easily understood by the general public. This presentation will focus on the recent efforts of the “Umui Project”, a language revitalization activity by “new speakers”, to which the presenter belongs. This project has just started activities with the aim of “passing on to the next generation the ‘umui’ (feelings or thoughts) that our ancestors have cherished in their language.” It began with project members sharing their feelings and thoughts and has expanded in recent years to assist in language transmission activities in the villages where the members are from. Then, after sorting out the achievements and issues so far, we consider the role of new speakers in the future of Uchinaaguchi and Okinawa.

The roles played by new speakers of the Ainu language: the case of Urespa Project

Panel contribution

*Dr. Yumiko Ohara*¹

1. *University of Hawai'i at Hilo*

Ainu people are indigenous to areas from Sakhalin, the Kuril Islands, Honshu, and Hokkaido crossing the current national boundary of Japan and Russia. The contact with wajin 'Japanese' began around the 13th century (Weiner 1997) and the oppression by the Japanese rule can be said to continue to this day. The most recent large-scale survey on life conditions of Ainu people (Hokkaido Prefectural Government 2017) indicates that disparities still exist in various areas between Ainu and non-Ainu residents. For example, despite reaching comparable achievement in secondary education, there is still a 12.5% gap concerning college enrollment rate even though a large percent of the parents, 63.5%, want their children to continue on to tertiary education. Likewise, discrimination has not seen much improvement since the survey conducted in 2006. 23.2% of the respondents indicated that they "have been discriminated against" and 13.1% answered "not against me, but I know others who have such experiences." The most frequent place of discrimination is school, with most believing that education is the key to eliminating discrimination.

This presentation focuses on the Urespa Project which aims to counter discrimination and assist Ainu in achieving higher levels of education. It is housed at Sapporo University which is located in Hokkaido and provides scholarships for Ainu students to study the Ainu language and culture in order to foster new speakers of the language and practitioners of their cultural tradition. Additionally, the project brings Urespa students together with other students and community members for activities focusing on Ainu traditional knowledge. It is supported by various enterprises that donate money and time to interact with the students and also possibly to hire them after graduation. Utilizing data obtained by the semi-structured interviews with the Urespa program participants concerning their experience, the presentation focuses on two of the observations made by the participants, namely that the Urespa Project provides 1) a safe place to be Ainu and 2) experience to explore and cultivate Ainu identity. After analysis of the interview data, the presentation concludes with the summary of what is working and what might be lacking in the project and at the same time, the need to rethink about revitalization from a local political and social perspective.

Covid-19 in Brazil: how were war metaphors useful?

Panel contribution

Dr. Heronides Moura¹

1. Universidade Federal de Santa Catarina

In this presentation, I intend to show that war metaphors are not necessarily bad for health communication. The meaning of this kind of metaphors depends on interactional and contextual factors. Metaphors of war may be useful, if they emphasize social bonds within a community and if they are inclusive and not divisive.

My aim is to show that war metaphors were useful both for experts and non-experts as a response to Covid-19 in Brazil. In a political context highly polarized, the war metaphors framed a united nation against the virus. This conceptualization worked as an instigation to appropriate behaviours, such as social distance and vaccination. Such Covid-19 metaphors can only be understood considering the larger social context in Brazil, in which various political voices, including the President Bolsonaro, tried to minimize the pandemic, and acted against the campaigns for vaccination and social distance.

My corpus is formed by metaphors about coronavirus from Brazilian newspaper *Folha de São Paulo*. Metaphoric sentences were extracted and codified manually. The results presented are from May 10 to Jun 10, 2020. 527 metaphors were found and analyzed.

Sontag (1979) famously pointed out the dangers of treating illness as metaphors and war metaphors particularly were regarded as pernicious. Hendriks et al. (2018) argued that framing a person's cancer situation within the war metaphor has the consequence of making the patient feel guilty. As an alternative to 'dangerous' war metaphors, Semino (2021) proposed supposedly more 'beneficial' frames to represent the Covid-19 pandemic. Studying a large corpus of tweets in English language about the Covid-19, Wicke and Bolognesi presented a more nuanced view of war metaphors, showing that this kind of metaphors may co-occur with words such as 'help', 'home' and 'people'.

In a similar vein, my conclusion is that words, emotions, and social values linked to war metaphors may attenuate the possible dangers of this kind of metaphors, making them a useful tool in health communication.

Embedding the Covid-19 pandemic in the Universal Church of the Kingdom of God's rhetoric

Panel contribution

Dr. Erik Miletta Martins¹

1. *Universidade Federal do Rio Grande do Norte*

In this communication, our objective is to ascertain how the Covid-19 pandemic impacts the Universal Church of the Kingdom of God (UCKG) rhetoric. In this atypical context, in which church members had restricted access to its temples and, therefore, its presential cults and meetings, our hypothesis is that the social impacts of this sanitary and economic crisis rescale the rhetorical projective *pathos* (Meyer, 2017), that is, the speaker's reading of this church target audience's interests and values. Given Michel Meyer's definition of rhetoric as the "negotiation of the distance between individuals, *ethos* and *pathos*, on a question (*logos*) which is more or less divisive, or more or less reductive of the distance between them" (2017: 225), we seek how UCKG leader, Bishop Edir Macedo, frames the questions surrounding the life risks of the Covid-19 with economic conspiracy theories as a way to infringe the imposed social distancing among the churches devotees. Our theoretical framework settles on the sociocognitive studies of the text, in which the reference, that is, the way we make the world known through language, is the central notion and organizer of the epistemological field. Thus, considering metaphor as an essential element of religious rhetoric, we pursue our objective by examining how this church's founding leader conceptualizes *via* metaphor references about the pandemic, embedding it to the rhetoric. In this path, we selected three audiovisual records, spaced approximately thirty days since the declaration of Covid-19 pandemic by the WHO, and raised thematically relevant metaphorical referential processes. In our analysis we have applied the dynamic notion of context brought to us by William Hanks (2006) to observe how relevant social, cultural, and political events to the church's life are embedded in the emerging referential processes. In our conclusions, we point how the data confirms our hypothesis. We also exploit the meanings of the Universal Church's reaction to the pandemic inside the neoliberal rationality (Laval, Dardot, 2013) spectrum.

Fake News in the Brazilian context of Covid-19 pandemic: textual construction of lethal knowledge

Panel contribution

*Dr. Anna Bentes*¹, *Mr. José Elderson de Souza Santos*¹

1. *University of Campinas*

In Brazil, as in other countries, the political sphere has been strongly influenced by digital practices and actions of different economic agents and stakeholders. Among such practices, fake news has gained prominence in recent years. In our perspective, fake news are texts that are born and circulate in a context of dispute (BOURDIEU, 1989) and negotiation (AZEVEDO, 2008) for the construction of an also disputed knowledge (ANTOS, 2005; 2015) about the social world. For political agents, fake news are important because regulating the knowledge that people share is also regulating how they interpret the world and act on it. In this communication, we discuss fake news about Covid-19 pandemic in Brazil, understanding that these texts contributed to the country's accumulating of more than 700.000 officially registered deaths by Covid-19. We analyze that even evaluated as false, these texts try to embody socially valid knowledge and values (BOURDIEU, 1983; HANKS, 2008; BENTES, 2017). The set of these texts, together with other discursive actions, enabled "[...] the anchoring and emergence of a common ground about the Covid-19 pandemic [...] assimilated by a large part of the Brazilian population [...]" (BENTES; MORATO, 2021: 24), which had the potential to support the formulation of context models (VAN DIJK, 2020). Considering these modeling processes, the virus had low or no lethality, the measures to combat the virus should not be followed and there were drugs capable of protecting people from SARS-Cov-2. In summary, these texts, when guiding agents' interpretations and actions, increased their chances of death during the pandemic. We will be presenting data collection and delimitation of our research about fake news produced and disseminated in Brazil, from June to November 2020. We also analyze a set of textual procedures that help to construct legitimate and valid knowledge about the pandemic and the social world in which it emerges.

Frames in political texts in favour of racial quotas at the University of Campinas (Brazil) in 2016

Panel contribution

Dr. Rafahel Parintins¹

1. Universidade Federal do Rio Grande do Norte

The aim of this preliminary study is to analyse the mobilisation of frames in political, public, institutional, argumentative texts supporting racial quotas at the University of Campinas (Unicamp, Brazil) in 2016, collecting initial cues about what is typical in terms of frames in those texts. In 2016, Black and anti-racist movements at Unicamp fought for the implementation of racial quotas in the University's selection process. The theoretical perspective of the study is the dynamic and text/discursive approach of frames (Croft; Cruse, 2004; Miranda; Bernardo, 2013; Morato et al., 2017; inter alia). This research comprises initial frame analyses of 4 (four) texts (03 public statements and 01 speech) that appear in the debate over racial quotas for undergraduate degrees at Unicamp. 03 (three) anti-racist and Black movements and 01 (one) Black politician produced the texts. The qualitative and quantitative analysis focuses on how referential expressions in the collected texts mobilise frames in the defence of racial quotas in Unicamp. Preliminary findings suggest that the texts tend to argue for racial quotas by mobilising frames associated with social equality meanings, such as Social Equality, Racial Categorisation, Social Inclusion, Diversity, and Racism frames. These findings lead to a better understanding of how social actors/text producers frame the debate for racial quotas in Unicamp not only as a matter of racial hierarchy, but also of the quantity and representativeness of Black people in legitimised social spaces.

Interpersonal cognition in simultaneous interpreters' discourse processing

Panel contribution

Prof. Hiroyuki Ishizuka¹

1. Hiroshima Shudo University

This study highlights the interpersonal cognition required by interpreters to establish communication in simultaneous interpreting from English into Japanese. Interpreting is bilingual communication between three parties: speaker, interpreter, and audience. Interpreters participate in this communicative setting as both listeners and speakers. Due to the nature of the task, their utterances in the target language are an instantaneous response to their understanding of the source language, demonstrating what content they have in mind at what juncture.

Since the onset of interpreting education at universities, interpreting trainers have emphasised the importance of grasping the source speaker's intentions. In her seminal study, Seleskovitch (1978/1998) maintains that dissociating the speaker's intentions from the corresponding verbal expressions is key to successful interpreting. Researchers have tried to give a theorised or scientific cognitive model of interpreting based on cognitive psychology (e.g. Kohn & Kalina, 1996) or cognitive pragmatics (e.g. Setton, 1999). Apart from few exceptions (e.g. Funayama, 2020), however, most have focused on the process taking place in individual interpreters' minds, while neglecting the role of the other participants' minds and the interactive nature of human communication. Recorded simultaneous interpreting performances provide empirical data useful for exploring the cognitive mechanisms at play during online discourse processing in actual settings. This study analyses authentic interpreting performances from the Japan National Press Club (JNPC) Corpus recorded at press conferences held at the JNPC between 2010 and 2017 (Matsushita, Yamada & Ishizuka, 2020). As a compilation of recorded press conference videos, the corpus includes multimodal data that can be analysed on ELAN, an annotation tool for audio and video recordings. For this study, the annotation layers of source and target language have been re-processed to visualise the temporal correspondence of delivery timing between source and target language. Interpreting is not simply code-switching between two languages: interpreters' utterances reflect their comprehension of the source language discourse. Superficial linguistic shifts between source and target language reveal their grasp of information implicit in the source language speech. These shifts are clues to the way interpreters apply interpersonal cognitive abilities when constructing the concepts needed to achieve successful communication in the given setting. Influenced by Grice's Cooperative principles (1975), Relevance theory (Sperber & Wilson, 1986/1995) has emphasised that comprehending a person's utterances requires the cognitive ability to infer what is going on in their mind. Tomasello's Theory of mind (Tomasello, 1999) suggests that a vital prerequisite for social interaction is the ability to attribute mental states to ourselves and others. Joint attention is one of the fundamental elements of social cognition required in an interpreting setting (Tomasello, 2019). This study uses interpreting as an example to analyse the role of interpersonal cognition in communication, and looks at linguistic shifts in referential expressions between source and target language: deictic expressions, points of view, and benefactives. From this perspective, the study traces the cognitive operations taking place in interpreters' minds beneath the surface of their linguistic transfer, focusing on the interpersonal cognition that enables them to communicate in their role as simultaneous interpreters.

Metaphorical conceptualization of aphasia and Alzheimer's disease: trends observed in neurolinguistic studies

Panel contribution

Prof. Edwiges Morato¹, Dr. Nathália Freitas¹

1. Universidade Estadual de Campinas

In this communication, we intend to discuss some aspects of social cognition from a neurolinguistic perspective, focusing on discursive studies of metaphor, more specifically, the metaphorical conceptualization of aphasia and Alzheimer's Disease, clinical situations that affect language and cognition.

Our analysis will focus on some anchoring phenomena of metaphorical meanings considering different discursive practices, such as guided or semi-directed interviews, spontaneous conversation between aphasics and non-aphasics, medical consultations, and support group meetings for family members of diagnosed individuals with aphasia or Alzheimer's Disease.

One of these anchoring phenomena is metaphorical categorization of aphasia as well as of individuals diagnosed with aphasia. Studies about this topic have been previously developed by the COGITES (Cognition, Interaction and Meaning) research group, at the University of Campinas, in Brazil.

Another anchoring phenomenon of metaphorical meanings are the consolidated, or emerging frames involved in the definition of aphasia. A study in progress (Morato et al., 2020) highlights the sociocultural embodiment of certain cognitive frameworks (such as biomedical, social, ecological), responsible for modeling the discursive practices mentioned above.

An epistemic confrontation seems to take place not only when one thinks that metaphorical categorizations related to pathologies itself and those related to diagnosed individual are conceptually distinct, as already observed by several researchers, but also when social meanings associated with the semantic frames of care (therapeutic monitoring, resilience, functional normality developed by the diagnosed individual, coping with social exclusion through support networks, public health policies, etc.) and cure (conceived either as eradication of the disease or restoration of health, or as a perception of welfare) emerge (CUIJPERS; van LENTE, 2015).

The categorizations produced in referential activities by expert and lay informants seem to indicate confrontations between current epistemic models; moreover, they seem to indicate a referential adequacy to diseases and diagnosed individuals; with an evaluative character, which may suffer more sociocultural restrictions than metaphors, as already pointed out by Apothéloz and Béguelin (1995). We discuss, therefore, if metaphor would imply different (socio)cognitive strategies for the designation of the referents in focus. We also discuss how they can gain a sense of epistemic change and even of social intervention (Kövecses, 2005; Semino et al., 2016; Steen, 2014, among others).

To give an example of the trends observed in our corpus, the use of metaphors of war (combat, fight, enemy, victim) and of weight are more recurrent in the conceptualization of Alzheimer's Disease, and the use of metaphors of consequence and alteration of bodily states is recurrent in relation to aphasia. In a somewhat different way to what happens in relation to Alzheimer's Disease, in which the disease is perceived as more fortuitous or without a very clear causal nexus, in aphasia, the neurological sequel or the invasion of the body uncontaminated by the brain lesion has its actions attributed not rarely to the aphasic person him/herself and his/her lifestyle. This may imply, among other things, varying degrees of empathy towards people diagnosed with one or another neurolinguistic condition.

Socio-cognitive processes in reading and writing academic texts

Panel contribution

***Dr. Kennedy Nobre*¹, *Dr. Anna Bentes*², *Mrs. Rafaely Carolina da Cruz*²**

1. Universidade da Integração Internacional da Lusofonia Afro-Brasileira, 2. University of Campinas

Letters Undergraduate Course of University of Campinas contemplates *Laboratório de Produção Textual II*, a discipline which is offered every second semester of the year. The purpose of this discipline is to make students work with academic and/or scientific genres, directing them to the most appropriate application of analytical devices developed by text studies, so they can master not only social technologies oriented to Portuguese language teaching, but also specialized languages, with special attention to the process of revision and rewriting of texts. The comprehension of academic textual-discursive practices and effective participation of subjects in a scientific community demand continuous reflexivity about discursive genres that circulate and characterize academic spheres of knowledge production, and such reflection permeates the issue of scientific writing. The social practices, the sociocognitive processes and the interactional activities of academic literacy are not continuous, and not reduced to the knowledge of textual superstructures. Considering a conception of language as interaction, we understand texts and discursive practices as historically located instruments of social intercommunication, fulfilling effective purposes, and being directed to certain segments of society. Our research aims more generally at focus on the main sociocognitive and discursive processes that enable the progressive autonomy of students in relation to academic literacy practices at university. The reflexive appropriation of sociocognitive processes and textual-discursive strategies inherent of academic genres and of scientific dissemination by first-year students of a language and literature undergraduate course results from the intense interaction among the students themselves, and among supervising teachers and students, which leads to the continuous incorporation of autonomous writing practices in academic-scientific and scientific-dissemination fields. The corpus consists of a set of written answers produced by students to a form composed by questions about sociocognitive processes associated to the various activities they were involved in, such as such as reviews, summaries, interviews and audiovisual products for scientific dissemination (videos or podcasts). Results show the fact that the main focus of students' reflexivity lies on (i) the perception for necessary joint and continuous work on their own written production and (ii) the self-perception of the limits and possibilities of academic language practices inside other social spheres. The self-assessment process carried out through forms indicates, finally, a close relationship between the main difficulties pointed out in the reading of the dissertation or thesis and the main difficulties pointed out in the writing of the review and in the production of videos and/or podcasts.

“People incorrectly correcting other people”: (Re-)Correcting comments as a means of stancetaking in digital communication

Panel contribution

Dr. Karina Frick¹, Dr. Dimitrios Meletis²

1. Leuphana Universität Lüneburg, 2. Universität Zürich

Literate communities feel strongly about ‘their’ orthographies, claiming ownership of them and demanding the right of co-determination. A context in which it becomes strikingly apparent that orthography is a form of social action (cf. Jaffe et al. 2012) is social media. On the one hand, everyday digital communication is itself often at the core of debates of linguistic criticism centering on, among other things, correctness and creativity, norms and deviations from them, and writing competence(s) or the lack thereof. Linguistics has made contributions through both the empirical study of linguistic phenomena (such as norm deviations) and the analysis of the mentioned debates. On the other hand, adopting a user perspective shows that norms are habitually negotiated within certain communities of practice: For example, comments on Facebook, etc. including deviances from linguistic norms are frequently corrected (by people sometimes colloquially referred to as grammar or spelling nazis) (cf. Hammel 2013; Albert/Hahn 2015; Bahlo/Becker/Steckbauer 2016). Interestingly, in such contexts, the development of entire chains of corrections can sometimes be observed as (incorrect) corrections are iteratively re-corrected or commented on. These chains reveal different speech acts or actions (including criticism or appraisal) and pose challenges in distinguishing between them. They also demonstrate an awareness of linguistic norms, which are made reconstructable through users’ implicit or explicit references to them. Pragmatically, corrections are often not performed neutrally but in a manner that degrades and invalidates (the opinion of) the person who made the mistake. We call this phenomenon orthographic shaming. At its center are people interpreting linguistic knowledge (primarily of orthographic norms) as power: knowing something others do not – and pointing it out publicly by displaying expertise – validates their superiority. Our talk focuses on the sociopragmatic aspects of orthographic shaming and resulting (re-)correction chains as we analyze how referencing linguistic norms can serve as a means of (often humorously framed) stancetaking (cf. Arendt/Kiesendahl 2014). In an exploratory approach, speech acts within orthographic shaming comments and reactions to them are identified. Conclusions are drawn as to the pragmatic behavior surrounding orthographic shaming as well as the stances towards this behavior, showing that orthographic shaming is a form of negotiating power through commenting, which points to a gradual change of discussion culture.

Assertion, normativity, and commitment at the minimalism/contextualism boundary: The case of commenting

Panel contribution

Prof. Kasia Jaszczolt¹

1. *University of Cambridge*

Every speech act of assertion can perform a range of different functions in discourse, beginning with conveying information, through revealing the perspectival stance of the speaker, their background assumptions and beliefs, to establishing common ground through dynamic co-construction of meaning (for a recent model see Elder and Haugh 2018). Assertion comes with different norms – among them are epistemic, linguistic, and ethical (e.g. Goldberg 2011, 2012, 2020). In this talk, I address the question of the commitments the speaker makes in performing an act of assertion with respect to these kinds of norms. The discussion is couched in the theoretical framework of the minimalism/contextualism debates concerning speaker liability and commitment (e.g. Borg & Connolly 2022; Elder 2021) where arguments are provided for and against distinguishing sentence-based, or ‘strict’ liability from overall conversational commitment. I demonstrate that when the above types of norms are considered, the arguments for minimal liability are weak. Next, I move to the proposal of a unit of analysis that captures the range of conveyed meanings to which the speaker – and, in the case of dynamically constructed meaning, the interlocutors – are committed, called dynamic functional proposition (DFP, Jaszczolt 2021, 2023; Jaszczolt & Berthon *in press*). For the purpose of this panel, DFP is put to use in the example of a ‘second-order’, so to speak, use of assertion, namely in the case of a commenting in *oratio obliqua* (an ‘assertion about an assertion’), in a context-shift scenario involving a shift in norms for assertion, where the importance of capturing the varieties of commitments is particularly salient.

Commentative *wenn*-sentences in German

Panel contribution

Dr. Robert Külpmann¹

1. Johannes Gutenberg University Mainz

Posner (1972) defines comments as expressions that introduce new information into discourse about an already known issue. From a pragmatic point of view, comments are illocutionary acts and, according to Posner, belong to the category of assertions. The central property of comments is that they can be used to make an assertion about discourse old information without the necessity to accept this information to be true. While there are a number of syntactic phenomena in German that have been examined with respect to their commenting function, such as parentheses or appositive relative clauses, very little is known about sentences such as *Wenn man seine Reifen bei Wish bestellt* ('When you order your tires from Wish') or *Wenn eine Folie zur Waffe wird* ('When a foil becomes a weapon') and their use as comments.

In my talk, I will pursue two goals. On the one hand, I will substantiate my claim that this type of *wenn*-sentence ('when-sentence') can be used as a comment. According to Weuster (1983), commentative *wenn*-sentences are characterized by three related properties. First, Weuster assumes an exclusive use of commentative *wenn*-sentences in headlines. However, with the advent of social media memes and tweets have to be added. Second, commentative *wenn*-sentences are usually used without an overtly realized matrix clause. This observation and the fact that commentative *wenn*-sentences cannot be embedded under explicitly performative verbs give Weuster reason to believe that this type of *wenn*-sentence is non-embedded, i.e. independent. However, examples with an overtly realized matrix clause as *Das passiert, wenn* ('This happens when ...'), which are subject to the same discourse conditions as their matrixless counterparts, give reason to doubt and suggest that commentative *wenn*-sentences are actually ellipses. Furthermore, commentative *wenn*-sentences fulfill a referential function. Weuster assumes that the conditional subjunction *wenn* ('when') refers to an unrealized consequence. I will argue that this consequence is grammatically realized by means of the elided matrix clause, semantically, however, by another unit of information such as an image, a tweet, or a text. It is the task of the recipients to establish a coherent link between them.

On the other hand, I will show that it is the properties mentioned above which make the commentative *wenn*-sentence particularly well suited as a comment. The obligatory presence of a further informational unit always makes it possible to trace the issue the commentative *wenn*-sentence refers to. This enables the broad use of commentative *wenn*-sentences in intertextual contexts. Moreover, the vagueness of the utterance resulting from the elliptical structure requires that recipients have to establish the link between comment and commented information themselves. Unaware of what information recipients are relating the comment to, writers need not commit to the truth of that information.

Commenting as an inherent function of because X constructions

Panel contribution

Mr. Martin Konvička¹

1. Freie Universität Berlin

The English *because X* constructions (Bohmann 2016; Bergs 2018; Okada 2020; Konvička & Stöcker 2022) (1a), unlike traditional *because* clauses (1b), as I argue in the present paper, have an inherent commenting function besides their core causal meaning.

Because X constructions (1a) lack a finite verb and are therefore formally less complex than *because* clauses (1b). The interpretation of *because X* constructions, however, is more complex than the interpretation of *because* clauses because they rely on the intersubjective knowledge shared by all interlocutors to a higher degree (Konvička 2019).

(1a) *I can't come out tonight because Skyrim* (Bailey 2012)

(1b) *I can't come out tonight because [I'll be playing] Skyrim [the whole night]*

The basic function of both *because* clauses and *because X* constructions consists of the expression of a causal link between the elements preceding and following the connector *because*. This link is either factual, expressing actual reasons, or epistemic, expressing the reasons for the utterance itself. In the case of *because X*, however, an additional layer of meaning is inherently present – namely the commenting function.

Although always present, the commenting function is not always primary. In some cases, such as (1a), the commenting function is only present in the implicit reference to the intersubjectively shared details of the causal link. The author of (1a) does not (or does not have to) explain what *Skyrim* is and why it is a valid reason for staying at home.

In cases such as (2), the commenting function can also be used for humorous effects (2).

(2) *I can ignore your emotions and opinions because...patriarchy!*

The commenting function in (3), unlike in (1) and (2), is dominant. The main function of *because reasons*, a lexicalised form of *because X*, is to communicate the author's comment about their inability or unwillingness to explain the causal meaning or about its unimportance. Such instances have been called *pseudo-causal* (Konvička 2019: 173–175).

(3) *I can't come out because reasons.*

In summary, while *because X* constructions share their core causal meaning with traditional *because* clauses, *because X* constructions differ in that they always also serve a commenting function. Which of the two functions of *because X* is primary and which ancillary (and to what degree), however, is subject to individual variation.

Not Just a Laugh: Multi-Functions of Graphic Markers

Panel contribution

*Dr. Pnina Shukrun-Nagar*¹, *Dr. Galia Hirsch*²

1. Ben-Gurion University of the Negev, 2. Bar Ilan University

Our talk will discuss the pragmatic-rhetorical functions of the most common Hebrew graphic laughter marker on Social Networks – “hhh”, composed of different repetitions of the letter *Heth*. The discussion will focus on readers’ comments to Facebook posts uploaded by the two contenders for the post of Israeli prime minister during the 2020 election campaign – Benjamin Netanyahu, then the Prime minister, and Benny Gantz, then the head of the Opposition. The comments provide a particularly turbulent dialogic arena, on which commenters from both political wings build solidarity and rapport inside their own group, while confronting the rival wing, criticizing, and mocking it (Shukrun-Nagar, 2020).

Graphic laughter markers are frequent in many languages (see Ho, 2018), and were already shown to fulfil diverse pragmatic-rhetorical functions, such as reflecting the joy of humor, showing empathy, softening threatening speech acts, and more (e.g., McSweeney, 2016; Vandergriff, 2013). In Hebrew, it was shown that generally laughter markers may be used in comments to politicians’ posts to convey both positive and negative stances, towards either the politicians or other commenters (see Hirsch, 2020); but so far graphic laughter markers have not been investigated systematically.

Based on an analysis of 100 occurrences of “hhh” in the corpus described above, we argue that in this discourse type, “hhh” bears three main functions: (1) *Contempt marker* – conveying contempt, ridicule or disgust, towards the post by the politician, or a previous comment by another commenter, including their authors and the entire associated political wing; (2) *Intention marker* – signaling that the commenters employ pragmatic strategies in their comment (e.g., irony, humor, softening strategies); (3) and *Interpretation marker* – indicating that the commenters decipher pragmatic strategies (mostly indirect meanings) that were used by the politicians in their posts, or by another commenter in a previous comment (Shukrun-Nagar & Hirsch, submitted).

Furthermore, it is suggested that while the function itself is affected by the markers’ co-text, and their textual position in the comment, the intensity of the function is affected by the number of repetitions of the letter *Heth* (ibid).

The speech action of commenting: Approaches and challenges

Panel contribution

Prof. Rita Finkbeiner¹, Dr. Robert Külpmann¹

1. Johannes Gutenberg University Mainz

Commenting is a kind of verbal behavior that is omnipresent in human communication. Comments can be made by speakers using a broad variety of linguistic forms, ranging from graphematic means (e.g., round brackets) to particular word classes (e.g., sentence adverbials) and sentence types (e.g., exclamative sentences), as well as non-linguistic means such as emojis or gestures. Comments may also take the form of whole genres, e.g., in legal, academic, or news discourse (Ehrhard-Macris & Magnus 2021).

Most scholars would agree that by commenting something, a speaker performs a kind of speech act (e.g., Posner 1972), or, more broadly speaking, speech action (Sbisà & Turner 2013: 1). Searle (1965: 221) mentions the verb *comment*, alongside verbs such as *assert*, *warn*, *order*, and *apologize*, to illustrate basic types of illocutionary acts. It is far from clear, though, how the presumed speech act(ion) of commenting is to be defined. While most speakers will be able to apply an intuitive, everyday notion of commenting, a common linguistic definition is lacking. On a Searlean account, comments in the form of declarative sentences share properties both with assertions and expressives. Meta-discursive comments, on the other hand, come close to Austin's (1962) class of expositives. Other approaches take comments to be higher-order speech acts (Grice 1989: 362), might treat them as one of multiple simultaneous functions of interactional turns (cf. Levinson 2017: 203), or as larger (inter-)actional patterns or communicative practices (cf. Sbisà & Turner 2013: 5).

In this talk, we outline current pragmatic approaches to comments, commenting, and related phenomena, pursuing the question how the speech act(ion) of commenting can best be defined from the point of view of linguistic pragmatics. Based on a sample of alleged comments from a variety of discourse types, we point to central characteristics of this ubiquitous speech act(ion), reflect on convergencies and divergencies between different types of comments and discuss controversial cases, in an attempt to sketch the main insights, but also the main challenges the speech act(ion) of commenting poses to pragmatic analysis.

The translation of I think as a speech act: A corpus based study in English-Turkish translations of TED Talks

Panel contribution

Dr. Aytaç Çeltek¹

1. Kırıkkale University

The phenomenon investigated in this study is the translation process of the comment clause parenthetical *I think* in relation to its pragmatic functions in English and Turkish. In English, *I think* (the most frequent I + verb collocations in American and British corpus data according to Baumgarten & House, (2010)) is a complement taking predicate and there are many studies indicating that this structure is no longer grammatical but lexical and even pragmatic (Heine & Kaltenböck 2021). *I think*, a parenthetical comment clause (Heine & Kaltenböck 2021: 11), achieves the speech act(ion) of commenting by fulfilling *attenuating* and *boosting* functions in discourse. It achieves the *attenuating function* which expresses probability and possibility or the *boosting function* which expresses certainty or necessity depending on linguistic context, i.e., co-occurring with various modality markers (Fetzer 2011: 265). According to Fetzer (2011: 265), *I think* intensifies the degree of epistemic commitment or non-commitment expressed through other epistemic devices. The grammatical equivalent of *I think* is a predicate structure that takes an infinite noun clause complement in Turkish: *-DiğİnI düşünüyorum*. In Çeltek et al. (Under review), an initial study conducted by a group of researchers, it was observed that the occurrences of *I think* are conveyed by other forms, as well, in the target language. It was revealed that lexical structures such as *bence* (*in my opinion*), or *bana göre* (*according to me*), or verbs that take finite complements such as *sanyorum* (*I am guessing*) or *sanırım/sanırsam* (*I guess*) are used sentence-initially as an equivalence for *I think*. Thus, the aim of this study is to determine whether these various structures used/preferred in Turkish translations of *I think* differ by considering the differences in how *I think* performs different speech acts. This study is guided by the following questions:

1. What are the various realizations of speech acts that the *I think* comment clause fulfills in the source texts?
2. How are these various realizations of speech acts conveyed in the target language?
3. Are the various forms used while conveying *I think* in the target language a reflection of the various manifestations of *I think* as a speech act?

In order to examine this issue, we look at the use of *I think* in a corpus of TED talks in the original language, English, and compare its use in Turkish translations.

To whom does this message address? Sisterhood construction through commenting by Chinese women

Panel contribution

*Ms. Bin Wang*¹

1. *University of Porto*

Based on daily observation, it has become a trend for Chinese women to complain about men's conservative behaviors via posting their chat history on a popular Chinese social media platform, *Xiaohongshu* ("Little Red Book"). Posts with similar content usually attract a plethora of responses. The present study aims to explore Chinese women's attitudes toward conservative propositions about gender and their tactics of fashioning counterarguments to dismiss such conventional value positions. This study has collected 511 comments (messages published by viewers in response to the content of the post) to a post consisting screenshots of a conversation where a woman (the post writer) and a man discussed about having children. The comments are analyzed using Searle's (1976) classification of speech acts. One comment is removed because it is merely a quote from the post, which shows no personal attitude but only draws attention to that particular phrase. Three incomprehensible comments are eliminated as well, which leaves 507 comments for examination in the end. The analysis shows that directives have exceptional power in commenting. The audience can immediately shorten their distance from the post writer through using imperatives, warnings, etc., and position themselves as close friends and sincere advisors rather than the outsiders and strangers to the conversationalists. Moreover, through using a wide range of speech acts, commenters unconsciously build a cooperative conversation space, where they take turns to establish, piece by piece, a characterization of a conservative type of Chinese men. This collaboration indicates that these comments are in fact directed to all women rather than the post writer alone, for the purpose of offering help, displaying emotional alignment, and building solidarity. As a result, this teamwork upgrades this disagreement between one woman and one man up to conflicts between two gender groups, where girls voice objections to tentative manipulations strongly, unitedly, and creatively. The findings also suggest that without gaze shift, touch, or other paralinguistic features, changes of footing (Goffman, 1981) can still be realized effortlessly in commenting and such comments remain comprehensible by viewers. Finally, another intrigue particularly concerning Chinese pragmatics has also emerged in the current study: due to (1) the null subject feature of the Chinese language, and (2) the absence of verbal conjugation based on the person, the respective speech acts can vary when the phrase alternates among different subject options.

“Momentos desagradables” – Linguistic triggers for speech action in social media

Panel contribution

Dr. Mailyn Lübke¹

1. Universität Osnabrück (Germany)

It is now typical of celebrities regularly to provide insights into their lives on social media. Failures, illnesses or bereavements may also be shared, and in this type of transparent (explanatory) post, the comment section is often not deactivated, thus allowing anyone to reveal their attitude towards such posts. This leads to an ongoing series of comments and reactions of various kinds, with people able to continue adding their thoughts on the posts, providing us with ever more data. As part of my research project on possible linguistic markers for empathy, I have analyzed different posts of celebrities on social media in the context of COVID-19, in conjunction with the comments their posts received. One is a statement of Rafael Nadal publicly announcing his COVID infection and another is the announcement by the comedian Gad Elmaleh of the cancellation of some of his performances due to health problems. Both posts were published on Facebook, Instagram, and in text-only form on Twitter. Through the cross-platform posts, inferences can be drawn about the use of different discourse types by commentators depending on the platform and even within the same platforms. In the section “The speech action of commenting across discourse types”, selected comments on the two posts will be examined to see whether differences between the languages (with particular emphasis on Spanish and French commentaries) can be detected. We will give an overview of illocutionary speech acts found in the comments and will present @replies and hashtags associated with certain speech acts. Moreover, we will see what the “triggers” for the respective speech action are. For instance, the commentators do not always provide empathetic responses (e.g. recovery wishes) to the celebrities’ health issues. On Twitter, for example, Nadal is asked by several followers about the expression “momentos desagradables” (‘unpleasant moments’) he used in his post and that is why the expression is found in some comments. These and other examples will be illustrated in the talk.

A Note on the Relation between Conversational Maxims and the Emergence and Disappearance of Communication Styles

Panel contribution

*Dr. Lina Ali*¹, *Prof. Masaki Ono*²

1. *Cairo University*, 2. *University of Tsukuba*

1

A Note on the Relation between Conversational Maxims and the Emergence and Disappearance of Communication Styles:

A Case Study of Recent Changes in Egyptian Arabic Conversation

Conversation participants are supposed to speak with a purpose in mind, and in their speech they try to convey as much information as possible that the hearer requires. However, the speaker tries to convey as much information as possible that is required by the listener, but he/she does not know what kind of information to convey or how to convey it. Grice (1975) proposed the Axiom of Conversational Coordination (CCC) to answer such questions as what information should be conveyed, how information should be conveyed, and so on. Grice (1975) proposed the Cooperative Principle of Conversation to answer such questions as what information should be conveyed and how information should be conveyed. In this paper, I will discuss the direct rejection of the paper examines the violation of the quantity axiom in the phenomenon of change from direct to indirect rejection in communication in the Egyptian dialect Arabic. The author proposed that the Co-operative Principle of Conversation (CoP) should be The author collected and analyzed data on refusals by young Egyptians in 2015. The author collected and analyzed data on Egyptian youth refusals in 2015, and found that direct refusals are frequently used, and that the author dares to use the quantity axiom in conversation for the purpose of maintaining good relationships with others. The author collected and analyzed data on refusals from Egyptian youth in 2015, and found that direct refusals were frequently used, and the axiom of quantity of conversation was violated in order to maintain good relationships with others. In contrast, the recent refusal strategies of young people have been used to avoid the “I’m sorry, I’m sorry” approach. On the other hand, the recent refusal strategies of the young people also violate the quantity axiom, but they tend to give more reasons than necessary. but often vague strategies are used without providing the necessary information. often without providing the necessary information. For example, “hashuf we aollak” (I will respond to you when I see the situation), “hashuf we aollak” (I will respond to you when I see the situation), and For example, “hashuf we aollak” (I will respond to your situation), “hafakkar” (I will think about it), or “sarcasm” are used to deny the request. Thus, in this study Therefore, the purpose of this study is to clarify how the phenomenon of a decrease in the amount of information provided to the listener is related to the maintenance of human relationships. The purpose of this study is to clarify how the phenomenon of a decrease in the amount of necessary information provided to listeners relates to the maintenance of human relationships.

Considerations in the Transition of Address Terms

Panel contribution

Dr. Qinan Li¹

1. Peking University

From a diachronic point of view, it can be said that language has a life of its own, words changing and disappearing over the long history of language use. This study explores the appearance or disappearance of the considerate expressions in Chinese and the reasons for their current or disappeared usage. The study will mainly focus on the usage of “Comrade”, “Miss”, “White Left”, and “Gong Zhi”.

In Chinese, the term “Comrade” is used as an address term in public occasions. In addition to referring to people who share the same aspirations or interests, or who fight for the same ideals or projects, it was also used as a mutual term of respect between adults, especially between adults who do not know each other. The term was particularly popular in the 60s and 70s of the 20th century, but seems to have fallen out of use in the 90s, especially in the 21st century. One reason is considered that the term “comrade” has come to be used exclusively in a narrower sense to refer to homosexuality.

The term “Miss” was once used to refer to women, especially young women, who shared the same fate as the term “Comrades”, yet it has become exclusively used to refer to prostitutes and women who provide sexual services in a narrower sense.

The above-mentioned causes have drastically changed the usage of the address terms from positive politeness, and it has become abhorrent terms shared by many people. It has to be said that these address terms have become a code in the past tense that has undergone a transition from politeness to impoliteness.

On the other hand, there has been a new usage of the term “White Left”, which began to be used in the mid-2010s. This term was coined in China and has been included in the Urban Dictionary, an English online dictionary that has been collecting online terms since 2017. “White Left” was originally used as an objective descriptive term, literally referring to the white left, but later came to refer to people who only emphasize political correctness, mainly to satisfy their own sense of moral superiority.

Another term “Gong Zhi” has been used as an abbreviation for “The Public Intellectual” on the Internet and mass media since 2011. In recent years, it has been recognized as a satirical way to refer to those who are also experts in their fields of expertise facing social issues with a sense of justice. Considering the speech function of criticism, it can be seen as a negative politeness expression.

The evolution of address terms is a manifestation of such cognitive characteristics of human beings, especially of things about human beings themselves, and it may also be a way of perceiving consideration.

Emergence and disappearance of Japanese Request Expressions and Proposed Formulas for Calculating

Panel contribution

***Prof. Masaki Ono*¹, *Prof. Yukino Yamashita*², *Dr. Hyunju Ju*³**

1. University of Tsukuba, 2. Jumonji university, 3. Mejiro University

A new request expression can be found in Japanese e-mails, such as, “Haaku no hodo yoroshiku onegaishimasu” Eg. Please take care of this for me. is a new request expression in Japanese e-mail. Previously, it would have been “Gohenshin onegaishimasu” Eg. Please reply to my inquiry. However, this expression seems to be a strong request for the hearer to confirm or reply to the message. In the Japanese language, NP has traditionally been considered to have developed mainly through face-to-face communication, but with the increase in online communication, more proactive request expressions for the listener have appeared, explaining the emergence and disappearance in linguistic communication. We propose a formula consisting of Japaneseness and understandability based on these changes. We will attempt to quantify the retention of the Japanese language in society in terms of the degree of use, comprehension, and empathy.

Indirect self-expressions in English

Panel contribution

Dr. Koichi Nishida¹

1. Yamaguchi Prefectural University

In English, first-person pronouns like *I* and *me* are the speaker's default way of calling himself/herself. However, there are other cases where the speaker chooses indirect ways of self-expression, such as *one* in "One may wonder why she had to resign suddenly." As they are used in formal documents, but not in conversation, such indirect self-expressions are contextually restricted and need to be supported by the addressee's inference, because he or she has to infer their referents by assuming them to be the same as the current floor holder. This study aims to identify the contexts in which the speaker chooses self-expressions and clarify why they are used in light of their group identity with normal people in public. It is argued that given indirect self-expressions of this type belong to the formal register, they are used to show consideration to a group of normal people to which the speaker considers himself/herself to belong, rather than to the actual addressee(s) with whom he or she talks. Since this choice of expressions is not motivated by direct communication with the addressee(s), the consideration involved is to be understood in terms of the contrast between formality and casualness, rather than that between positive and negative politeness in the sense of Brown and Levinson's 1987 Politeness Theory. While considerate expressions based on the latter serve to broaden the range of addressees with whom the speaker can interact, those based on the former serve to limit the range of people with whom he or she contacts, as they are also found in the deliberate choice (or avoidance) of jargon and technical terms. These observations lead to a hypothesis that consideration of positive and negative politeness invites emergence of new communicative expressions, but consideration of formality and casualness invites disappearance of once common expressions, because the more limits on the range of the speaker's contacts, the more likelihood of disappearance of the expressions involved especially when their formality excludes people who prefer casual communication.

Mechanisms of diachronic change of Aizuchi in Japanese: Aizuchi as a positive politeness

Panel contribution

*Prof. Tsutomu Makihara*¹, *Prof. Naomi Koda*²

1. GUNMA University, 2. Tohoku University

The purpose of this study is to investigate the mechanisms of diachronic change in aizuchi using politeness theory. In this study, aizuchi is defined as a short verbal utterance which shows the listener's responses to the primary speaker's speech.

Aizuchi functions in conversation as a marker of acceptance of information in the other person's utterance. In Japanese, "Un" and "Ee" are frequently used for this function. If these are positioned as unmarked forms in that they have only their original function and are used as neutral expressions, there are also marked forms that include PPS such as surprise and empathy. Maji ka□" is an example of such an expression commonly used by today's youth.

In the 1980s, when the presenters were university students, "Honto ka□" was often used among close young people. It is now used in a different form, "Maji ka□". At that time, too, this was sometimes extended to a wider age group and the aizuchi "Hontou desu ka□" was also used, but it has not taken root, as older people often feel uncomfortable, saying, "Do you think what I say is a lie?"

The purpose of this study is to examine why one expression declines and another becomes more common, by exploring how and why "Honoto ka□," which was commonly used about half a century ago, changed to "Maji ka□".

The change from "Honoto ka□" to "Maji ka□" can be roughly thought of as follows: "Honoto ka□" → "Maji ka□". "Honoto ka□" → "Honto□" → "Maji□" → "Majika□"

These changes can be thought of as occurring through the following process.

- 1) "Honto ka□" and "Maji ka□" function as PPSs to emphasize sympathy for the partner by expressing surprise.
- 2) "Honto ka□" is a form of questioning, which implies that the speaker doubts whether the other person's story is accurate, and thus violates the other person's NP in this respect.
- 3) Within certain groups, the use of the slang term "Maji" to "use in-group identity markers" increases to strengthen its function as a PPS.
- 4) The change to a non-questioning, descending intonation indicates that the listener has accepted and agreed with the information presented by the speaker.

A quantitative analysis showed that men used the newer form "maji" more often and women used conservative "honto" more often. Corresponding to the linguistic change in aizuchi, men showed innovation. These results offer the key to finding the relationship between the use of language by different genders and their achievements in the development of language.

From these changes, the following two points can be considered as patterns of change in expressions that have come to be accepted and customarily used in society to some extent.

- (1) Within a unique group, the expression changes to a form more suitable for use within the group.
- (2) Change to eliminate functions that conflict with the strategy of PPS.

The Emergence and Disappearance of Japanese Condolence Expression ‘Go-shusho-sama’

Panel contribution

*Dr. Masaki Yamaoka*¹

1. Soka University

In Japanese, when condolences to the family of a deceased person, the conventionalized condolence expression “Go-shusho-sama-desu” is well known. However, it is said that it is not used so often nowadays. We found 45 cases in the Balanced Corpus of Contemporary Written Japanese (BCCWJ). Among these cases, 16 cases were actually used as condolence expressions. The other 29 cases were used in contexts completely unrelated to condolences, such as metaphors for unfortunate situations or teasing.

- (actual condolence) 男性は〇〇と〇を〇わせた〇〇ミズ・ショーヴァン〇このたびはご〇〇〇です〇Go-shusho-sama-desu) 〇あなたのお〇さんは〇〇な〇〇でした〇〇ありがとうございます〇 (〇〇)
- The man made eye contact with her. “Ms. Chauvin, I’m sorry to hear that. Your father was a fine man.” “Thank you.” (Silence)
- (metaphor) 上場目指して〇〇〇〇に〇〇を〇〇してたの〇かも〇れず〇結果はま〇あ〇〇〇〇 (Go-shusho-sama) ということに〇〇〇〇Yahoo知恵袋)
- I don’t know if the stock was transferred to employees, etc. with the aim of listing. As a result, I am sorry to hear that. (Yahoo Chiebukuro)
- (teasing) 「・・・スーパーカマヤツ〇〇い〇〇して〇〇〇〇めてんの〇に〇〇〇〇あー〇そりゃ〇たんないよ〇ご〇〇〇 (Go-shusho-sama) 〇笑いながら〇〇する〇〇〇〇”... (〇ブタ〇プロデュース〇
- “I’m shopping at Super Kamayatsu and saving up lottery tickets!”, “Ah, that won’t work. Sorry for the inconvenience.” Morikawa laughed and put his hands together. (Produce wild pigs)

I think that the reason why its use in condolence scenes tends to decrease is that while condolence is unusual, the use of metaphors and teasing has become more commonplace, so it is conceivable that the solemnity of the expression of condolence is being lost.

Another reason is that in Japanese culture, it is preferred not to say things very clearly in the context of condolence, so even if you say something, it is better to use individual and natural expressions related to the person concerned rather than conventionalized phrases. It seems that there is an aspect that the feeling of condolence can be conveyed.

I am also planning to conduct a follow-up survey.

Gender and sexuality roles in *Grace and Frankie*: beyond sex for seniors and women entrepreneurs

Panel contribution

Prof. Janet Fuller¹

1. University of Groningen

Cameron and Kulik (2006) note that heteronormativity does not only assume heterosexuality and frame non-heterosexual relationships as deviant, but also includes a hierarchy of preferred types of heterosexual relationships. The most normative are monogamous relationships which are reproductive (implying that sexual relationships are the for the young and fertile) and conventional in terms of gender roles. Based on the example of the television series *Grace and Frankie*, we see that although while other normativities are challenged, the normativity of long-term monogamy is reproduced.

Briefly, the plot of the 7 seasons of this series is that Grace and Frankie's husbands, who were law partners, reveal in the first episode that they had been lovers for some time, and want to leave their wives to set up a household together. Although Grace and Frankie, age 70 at the beginning of the series, had never gotten along well, they were left with no alternative but to move in together. Over time they become best friends.

How does the portrayal of these two characters challenge the ideal of normative heterosexuality? First, *Grace and Frankie* portrays senior women who both openly discuss and enjoy sexual activity (Capelli 2019; Tortajada et al. 2018). Second, these characters also diverge from traditional gender roles of women being passive or dependent; they have had careers and pursue entrepreneurial enterprises (Gutierrez et al 2020; Periera and Gutierrez San Miguel 2019).

Further, Grace and Frankie ultimately forgo heterosexual romantic relationships, the cornerstone of the heteronormative hierarchy, in favor of living together. Murphy (2020) describes this as a positive portrayal of a couple which is not based on a romantic or sexual relationship, a narrative which goes counter to the trope of romantic love being necessary for fulfillment. Michoud (2018) further argues that this constellation queers the paradigm of compulsory heterosexuality and replaces heteronormative romance with a chosen family, in particular, a close female friendship.

However, what has gone unsaid is that this scenario reproduces long term monogamy as normative, with the only alternative a friendship which necessitates the same type of commitment. Grace and Frankie's interactions increasingly, throughout the seasons of the show, include verbal exchanges which construct their relationship as exclusive and committed.

The opposition to alternatives to monogamy is most clearly interactionally produced in a scene in season 7 episode 2, when Grace attends an arraignment hearing for her husband Nick. When Nick, instead of pleading 'not guilty' as instructed, pleads with Grace not to leave him, a discussion of re-defining their relationship ensues. The interaction clearly shows how alternatives to traditional marriage are dismissed and mocked, and the moment for challenging normativity is lost when Grace says she wants to give Nick another chance.

The focus on the normativity of traditional marriage opens the question for both theories about gender and sexuality as well as reproduction of discourses in media. These data show how other aspects of the heteronormative hierarchy are challenged, but options to monogamy are not valued.

The pragmatics of intimacy: A corpus perspective on First Dates Ireland

Panel contribution

*Dr. Brian Clancy*¹, *Dr. Elaine Vaughan*²

1. *Mary Immaculate College*, 2. *University of Limerick*

First Dates is a reality TV show, which features people on blind dates set up by the show's production team. The viewer sees the date itself, the participants discussing their previous romantic encounters, and, finally, the couples interviewed at the end of the date. A first date represents a high stakes initial encounter, and this is amplified by the setting and the situation, making *First Dates Ireland* (FDIrE) a rich site for the analysis of how participants negotiate the complexities of this encounter in their use of language. In contrast to the discourse of established, long-term intimate relationships, such as those present in family discourse, the origins of intimacy are often the stuff of anecdote. Reality TV shows, such as FDIrE, provide us with access to the beginnings of intimacy. This paper uses a c.70k word corpus of interaction from FDIrE, and explores the pragmatic features of nascent intimacy with a particular focus on the pragmatic markers that characterize this context. We bring these markers into relief by comparing them to naturally occurring, established intimate discourse such as that represented in the Limerick Corpus of Irish English. Findings show that the frequency of use of specific pragmatic markers such as *like* are indicative of this context of emerging intimacy. In contrast, other pragmatic markers that characterize intimate discourse in the family, for example, *shur* and *now*, are conspicuous by their absence. The argument is put forward that markers such as *like* are those responsible for the establishment, rather than the maintenance of intimacy. Questions of authenticity, the nature of performed intimacy and the harnessing of unscripted TV dialogue as a vehicle for pragmatic analysis in an intimate context are also addressed.

Who pays on the first date? Moral accountability in the linguistic and embodied negotiation of gender roles during blind dates on reality TV

Panel contribution

***Dr. Maximiliane Frobenius*¹, *Dr. Cornelia Gerhardt*²**

1. WWU Münster, 2. saarland university

The international TV format *First dates* shows two people on a blind date at a restaurant. The negotiation of the payment sequence, when the waiter brings the bill and the candidates discuss who pays, is in most cases shown completely and often subsequently commented on by both date partners individually in interview sessions. In the case of heterosexual matches, gender roles are usually cited as justification for the behavior on display: the dating partners state for example “The man pays”, “That’s how my parents raised me”, and “That was very kind, though of course I could have paid for this myself”. These comments perpetuate (or challenge) traditional gender roles and are instrumental in the reflection of underlying norms and expectations. As such, they are markers of moral accountability on display for a TV audience: the candidates both voice their expectations and act accordingly.

This paper investigates the verbal and nonverbal means used to display the individuals’ understanding of their roles and the resulting creation of accountable actions during these payment sequences. Besides verbal comments in the individual interview and at the table, other modes are also relevant. Gaze shift and a hand motion towards the purse, which is then halted when the date partner announces their intention to pay, for example, represent complex elements in this negotiation. Likewise, one candidate’s reaching out for the bill, accompanied by “you can give that to me”, is a multimodal instantiation of the understanding of gender roles.

Based on a corpus of about 500 minutes of the show *First dates* (Germany), this microanalytic investigation discusses the linguistic and multimodal resources available to participants of this particular reality TV format, and hence potentially in real life, to negotiate, act on, and explain their notions of chivalry and independence, and thereby double down on or depart from more traditional roles. It employs EMCA based multimodal analysis (Goodwin 1981, Mondada 2014) to explore the meaning making potential of the available semiotic resources in these televised dating situations. The particular focus on the interactants’ understanding of and co-construction of their roles as dating partners highlights how the multimodal behavior is used in the instantiation of gender expectations and norms on TV.

“I feel so emasculated”: Gender construction, discursive reproductions and payment negotiations in First Dates Ireland

Panel contribution

Prof. Anne Barron¹

1. *Leuphana Universität Lüneburg*

First dates represent critical turning points which may determine the further path of a relationship. Such interactions, and particularly the payment negotiation within such interactions, also represent important contexts for the interactional co-creation of gender roles. Psychological survey-based research on dating scripts in a heterosexual dating context suggests a high reproduction of traditional gender roles in payment negotiation (Eaton/Rose 2012; Cameron/ Curry 2020; Lamont 2021). Pragmatic research on payment interactions, and in particular on the co-creation of gender roles in payment interactions in a first dates context, is limited (Barron 2022). Likewise, research on the discursive reproduction of gender constructions in dating represents a research gap. The present paper explores gender co-construction as portrayed in the first date reality television program, *First Dates Ireland*. The data analysed includes the heterosexual payment negotiation interactions and the metapragmatic interview snippets making up the program. The analysis, both quantitative and qualitative in nature, focuses on the speech act sequences constituting the payment negotiation and on metapragmatic comments pertaining to these speech acts. Quantitative speech act findings on the sociopragmatic level reveal a general tendency towards traditional co-constructions of gender in *First Dates Ireland*, with offers to pay the complete bill generally co-constructed as and discursively reproduced as representing the role of the man. Suggestions to offer are rather the role of the woman. Triangulation with metapragmatic data supports this analysis. Challenges to these traditional gender constructions are analysed from a qualitative perspective, with particular focus given to face-threat and its negotiation in such encounters. Methodological challenges of the television data are also addressed.

‘Woke’: Corpus assisted discourse analysis of a stigmatising keyword in polarised society.

Panel contribution

Dr. Melani Schroeter¹

1. University of Reading

Over at least the last three decades, processes of polarisation between conservative and right-wing as well as liberal and left-wing political affiliations can be observed, and with it, the so-called ‘culture wars’ emerged in most Western societies. Just like any other discourse, ‘culture war’ discourses produce discourse keywords which can be understood as nodes in the lexical field of a thematic discourse. This contribution looks at *woke* as the most recent keyword in this context, taking the example of the UK, although the word has been borrowed by other languages as well, including French and German.

Following from the useful contextualisations of ‘woke’ as part of culture war discourse by Cammaerts (2022) and Sobande/Kanai/Zeng (2022), this contribution provides a more detailed and more systematic, corpus-based analysis of the emergence and current usage of the keyword ‘woke’ in UK newspaper discourse.

In a first step, the emergence of ‘woke’ as part of the culture war discourse will be traced in six UK national, daily broadsheet and tabloid newspapers, demonstrating that from the start, it was used to stigmatise politically opposing views. In a second step, a corpus-assisted discourse analysis of the keyword ‘woke’ will be undertaken. The corpus collected for this purpose includes all articles over a one-year time span from November 2021 to November 2022 containing ‘woke’ - excluding uses pertaining to waking up from sleep -, amounting to about 5,500 articles altogether. A detailed collocation analysis will be undertaken to show how ‘woke’ is used with regard to issues of societal relevance (such as social justice), how it is tied to positioning and in particular negative othering of left-liberal political stances, as well as the extent to which there is a metadiscourse about the word and its uses in public discourse.

(Re) contextualising the ‘anti-woke’ discourse: French and English attitudes towards gender-inclusive language within online discursive spaces

Panel contribution

Ms. Paige Johnson¹

1. University of Liverpool

This study examines the discursive negotiation of ‘woke’ as a prevalent keyword evoked by users discussing gender-inclusive language reforms on Twitter in French and English. From a feminist linguistics perspective, I compare how language reforms are politicized and problematised as a strategy that aims to raise awareness of the socially embedded role played by language in gendering activities, people, and societies. Specifically, I explore how ‘anti-woke’ discourse has been recontextualised and repurposed online by users to reject reforms and, by extension, sustain wider gender inequality discourses. I do so by drawing upon tools from *critical discourse analysis* (Fairclough, 1995), as CDA allows for complex relations of discourses, and thus attitudes and ideologies, to be more effectively explored cross-linguistically and cross-culturally.

I focus on a corpus of 13,000 French and English tweets collected using RTweet (Kearney, 2019). Tweets that were retrieved respond to specific search items relating to gender-inclusive language reform, including ‘gender-inclusive language’ and ‘écriture inclusive’ (en. ‘inclusive writing’). Responses were then imported into NVivo 12, a qualitative analysis software, where linguistic traces of discourses were manually identified, quantified, and analysed following Wodak and Reisigl’s (2017) DHA framework.

While ‘woke’ (cf. ‘wokeism’, ‘wokeness’) has previously been associated with solidarity and courage among individuals invested in challenging systemic racism, capitalism, and cultural oppression (Sobande, 2019), I observe that it is increasingly recontextualised by users to frame reform, as well as wider progressive attitudes, as politically extreme (Cammaerts, 2022). My analysis thus focusses on how ‘anti-woke’ discourse linguistically manifests and is diversely co-opted by users across both the French and English contexts to problematise reform, particularly in relation to wider notions of security and identity. Amid the resurgence of populist discourses in the European socio-political context, I also examine how ‘woke’ is recontextualised by users to symbolise political correctness ‘gone mad’, cancel culture, among other ‘censorship’ and ‘policing’ practices that are ostensibly mobilised by “social justice zealots” (Pilkington, 2022). I conclude by calling for attitudes towards reforms, among other social issues, to be understood as discursive struggles over word-meaning, with these conflicts underlined by discourses and ideological systems that contend, conflict, and co-construct each other. As such, these conflicts must be discursively engaged with to navigate and challenge how, in this case, marginalised genders are represented.

An Anglicism on the Foreground of Francophone Press. Combining Macro-diachronic and Enunciative Perspectives on the Metadiscursive Keyword ‘Fake News’

Panel contribution

*Mrs. Elise Schürgers*¹

1. Université de Liège

The notion of ‘fake news’ has flooded the contemporary public sphere and has become a polemic topic laden with social, political and epistemological issues. Questioning our relationship to information in democracies as well as the legitimacy and the trust to attribute to media and political institutions, it condenses a series of values concerning the problematic boundaries between truth, opinion, representation and knowledge. This work postulates that a critical comprehension of the problem also requires an analysis of those media productions that, so to say, *talk about fake news*.

Bodin and Chambru stated that “the ensemble of structures composing the social world has been set in motion, through discourse, via the formula ‘fake news’. Representation-based institutions (political, scientific, educational, security, media or cultural...) seem forced, in consideration to their symbolic needs, to position themselves through an order of ‘true’ discourse (Foucault, 1971).”[1]

To engage with this densely accurate and stimulating observation, I would like to study the word *fake news* as it reaches the status of *formula* [2] in the francophone public sphere (limiting myself to France and Belgium) and by following two complementary approaches.

As a first step, I wish to describe, on a diachronic and macro-discursive level, the possibility of establishing a trajectory of that formula by focusing on a specific linguistic context: the moments of high mediatization of the locution ‘fake news’ in 6 major daily newspapers between 2016 and 2019[3]. This first part will determine a few semantic, figurative, co-occurrence-wise, and argumentative landmarks on that trajectory to understand the key socio-political and discursive features of the circulation of the locution.

Building on that, if one pays attention to the fact that the entity designated by ‘fake news’ does not directly refer to economic or cultural realities (‘sustainable development’), a political event (‘Brexit’) or a group of people (‘gilets jaunes’), but to a form of discourse ; if one admits that this discourse is always attributed to an Other, can we make it a subtype of formula with specific pragma-enunciative features? Therefore, the analysis aims to understand, from a socio-discursive perspective, the phenomenon of labelling the Other’s speech via a more or less fixed signifier, to observe whether this identification of a heterogeneous discourse produces a knock-on effect on the very discourse that enunciates it.

[3] The corpus has been built through the data base *Europresse* and a quantitative study, which has identified 3 stages in the chronology of the formula and a sample of representative months within those : it gathers a total of 902 articles for 1490 occurrences of ‘fake news’ (newspapers selected: *La Libre Belgique, Le Soir, La Dernière Heure, Le Figaro, Le Monde, Libération*).

Constructing the meaning of sustainability through argumentation: locus from definition in the public controversy surrounding sustainable fashion

Panel contribution

*Ms. Chiara Mercuri*¹

1. Università della Svizzera Italiana (USI)

This paper adopts an argumentative perspective to examine how the meaning of sustainability is constructed in the public controversy surrounding sustainable fashion.

In this lively public controversy, misalignments arise among the different players involved, especially when it comes to defining sustainable fashion (Greco and De Cock, 2021): in fact, while all players claim to be advocates for sustainability, it is not clear what “being sustainable” means in this context.

Drawing on conflict resolution studies (e.g. Shmueli, 2008), the different players appear to hold *conflicting characterization frames* in respect to sustainability, i.e. conflicting ways in which they express their views about their own behaviour and that of others in respect to sustainability.

While scholars (Shmueli, 2008) agree on the importance of reconstructing the different parties’ conflicting frames in order to better understand the deep interests at issue within the controversy, these studies lack the discursive-linguistic tools to justify how such frames can be reconstructed, starting from discourse.

In this respect, argumentation under the Pragma-dialectical approach (van Eemeren, 2010) in combination with the Argumentative Model of Topics (Rigotti and Greco, 2019) appears a useful tool to investigate the implicit premises underlying these *conflicting characterization frames*.

Thus, by adopting an argumentative perspective to the study of *conflicting characterization frames*, this paper aims at explaining how conflicting parties in this controversy construct the meaning of sustainability through *arguments from definition* containing characterization frames.

To this end, I empirically analyze a multi-genre corpus composed of texts issued by conflicting players in the controversy, i.e. 400 social media posts published by activists, 10 sustainability reports and websites produced by global fashion brands and 2 public documents released by public institutions between 2020 and 2021. In the corpus, I first identify the *conflicting characterization frames* held by these conflicting players in respect to sustainability. Then, I perform an argumentative analysis to determine how these players employ *conflicting characterization frames* to justify their own claims of being sustainable by means of *loci from definition*. From this, the different meanings of being sustainable according to the conflicting players will emerge.

Preliminary findings reveal that *conflicting characterization frames* contribute to constructing underlying argumentative premises; in other words, that they contribute to constructing the meaning of sustainability as understood by conflicting groups of players.

Overall, this paper contributes to research about the specific mechanisms that construct the meaning of sustainability in the public controversy surrounding sustainable fashion, as well as bringing forward the reflection on the relationship between frames and implicit premises in argumentation.

Discussing the Boundaries of Science. “Scientific” as a Keyword in Politicians’ and Experts’ Discourses during the Covid-19 Crisis in Belgium

Panel contribution

Ms. Coline Rondiat¹

1. UCLouvain

In contemporary democracies, where evidence-based policy prevails, science has the rhetorical capacity to establish uncontested truths insofar as it allegedly “lets the facts speak” without being affected by external influences, such as political interests (Boswell 2008). Yet, what is acknowledged as “scientific” by the scientific community is *of* political interest. It indeed articulates the political debate: firstly by constituting in part the shared and undisputable truths upon which the discussion takes root, but also by occasionally being used to naturalize policy proposals, based on the premise that science is invested with a normative force *per se*. The spread of covid-19 greatly enhanced the appeal to science in political communication (Amossy 2022), and thereby its lexical salience in public discourse, including the integration of “scientific” into several syntagmas (e.g. scientific evidence, scientific fact, scientific truth, scientific proof). Without undermining the rhetorical strength of “scientific”, the numerous epistemic dissensions that emerged in the wake of the pandemic have, however, given rise to the problematization of its signified in the public sphere. The meaning of “scientific” has actually been the site of a more or less explicit struggle in which experts, but also politicians, took part to define what can be labelled “scientific” or not. By doing so, they (de)legitimized objects and hierarchized them as holding a greater or lower political relevance for the decision-making process. In this respect, “scientific” may be considered to have functioned as a political keyword (Schröter et al. 2019) during the pandemic.

Through a pragmatic lens, this presentation will tackle the use of “scientific” by Flemish and French-speaking politicians and experts to answer the following questions: *What do politicians and experts consider to be scientific or not? On what basis, if any, do they make such judgments? How do they (de)construct the notion of “scientific” in their discourses? In what context and for what argumentative purposes do they use this keyword?* To do so, the analysis will rely on several pragmatic tools (e.g. Verschueren 2012) applied to discourses produced during the first two years of the pandemic (Jan. 2020 - Dec. 2021) in three distinct areas of communication: on the social media Twitter, in 6 national newspapers (Le Soir, La Dernière Heure, De Standaard, Het Laatste Nieuws, Metro Fr, Metro Nl), and within the federal and federated entities’ Parliaments.

Empty or overloaded? A comparative analysis of the keywords populism(s) and populist(s) in Belgian, French, and Spanish media discourses

Panel contribution

Ms. Nadezda Shchinova¹

1. UC Louvain

Populism is a highly contested concept in academic and public debate, which has been discussed within various fields as being “exceptionally vague” and used “in different contexts to a bewildering variety of phenomena” (Canovan, 1999: 3). Recent studies that analyse the uses of the term in discourse from the perspective of linguistics (Kranert, 2020; Thornborrow et al., 2021) have provided empirical results that present a challenge to a common view on *populism* as “empty” or “floating signifier” (Laclau, 2005). These studies suggest that *populism* is not used randomly, neither can it be perceived as empty of meaning. More research on the pragmatic function of the term in discourse is needed to understand the plasticity of the term that can occur in both positive and negative contexts.

This paper presents some of the findings from the cross-linguistic analysis of the terms *populism(s)* and *populist(s)* in Belgian, French, and Spanish media discourses. Specifically, through the lens of sociopolitical keywords (Jeffries and Walker, 2017) and discourse keywords (Schröter et al., 2019), it compares the occurrences of the token *populis**—that is, *populism(s)*, *populist(s)*—in media outlets of French-speaking Belgium, Dutch-speaking Belgium, France, and Spain published in 2019. Using a corpus-assisted discourse studies approach, this paper analyses quantitatively and qualitatively articles containing at least one token of *populis**, collected from digital media sources including public-owned media, established media, serious-popular media, and free daily media in each country. By analysing different types of media discourse in the studied socio-political contexts, this paper aims to determine the features of discourse that allow to understand the pragmatic meanings and functions of the keywords *populism(s)* and *populist(s)* and hence to understand why people do use them the way they do.

Patterns of transphobia in English and German

Panel contribution

Dr. Berit Johannsen¹

1. University of Greifswald

The rights of trans people play a central role in current public discourse and sociopolitical debate in Germany, the USA and the UK. Among other terms, *transphobia* and *transphobic* can be considered keywords in such debates. While (queer)feminist theoretical writings provide clear definitions of *transphobia* (e.g. Serano 2016; Ewert 2021), its meaning is constantly negotiated in social media discourse in processes of political positioning. In the present study, which is inspired by methods from corpus-assisted critical discourse analysis (compare e.g. Partington, Duguid & Taylor's (2013: 194) analysis of *racism* and *xenophobia*), I seek to identify patterns in which the keywords *transphobic* and *transfeindlich* are used in English- and German-speaking discourse on Twitter. Using the Python tool Twint, I scraped all tweets containing *transfeindlich* and a structured subset of tweets containing *transphobic* (March and September of the past ten years). In my quantitative analysis, I analyse frequency of usage over time, collocates and n-grams, and conduct collocation analyses for identified patterns. For example, the most frequent trigram in German Twitter data is *ist nicht transfeindlich* 'is not transphobic', which is part of a pattern (*X ist nicht transfeindlich*), whose interaction with lexemes occurring in its slots (collexemes) can be analyzed. The quantitative analysis is complemented by qualitative analysis of the contexts in which the patterns are used, including the social actors, time, location, and larger discourse context. In further steps, I plan to take alternative terms and related concepts into account (*transhostile* in English, *transphob* in German, *cissexist(isch)* and *transmisogyn(istic)*) and to study the keywords in newspaper discourse, comparing it to social media discourse.

Revolution in Context: Vector Space Representations of Keywords in 20th Century Latin American Insurgent Discourse

Panel contribution

Dr. Isabelle Gribomont¹

1. KBR (Royal Library of Belgium)

The discourse of 20th century Latin American insurgent movements is traversed by a dense network of genealogical and intertextual relations. Many revolutionary actors of the twentieth century have identified explicitly with past and present activist groups. The Nicaraguan *Frente Sandinista de Liberación Nacional* and the Salvadoran *Frente Farabundo Martí de Liberación Nacional* both adopted the names of earlier insurgent heroes. Colombia's best-known insurgent army of the 1970s and 1980s, *M-19*, established its identity in 1974 by seizing the sword of Simón Bolívar. In the 1960s and 1970s, urban insurgents in Argentina chose the name *Montoneros* to link themselves with insurgents of the independence period (Chasteen 1993, 84). The contemporary Mexican *Ejército Zapatista de Liberación Nacional* takes its names from central American guerrillas from the 1980s as well as Emiliano Zapata, a leader of the Mexican revolution of 1910. Such choices highlight the “continuity and ubiquity of the discourse of insurgency in Latin America” but say little about the links and relations between the movements (Chasteen 1993, 84). Scholars who studied such relations identify “a pattern of cross-fertilization” which results in various “clusters” and insurgent trajectories throughout the continent (Wickham-Crowley 2014, 222–228).

This paper argues that these relationships can be identified and/or refined by modelling the semantic relations between keywords and concepts in the discourse issued by these movements (available in the digital archive of the *Centro de Documentación de los Movimientos Armados* (CeDeMA)). Using word embedding techniques (Word2Vec and BERT), statistically significant keywords which take different meanings in discourses from different movements—or in texts from different eras of the same movement—are identified. This subset of keywords are not only statistical keywords, but they are also semantic keywords. They contribute to highlight the differences in meaning construction between sets of texts which belong to a relatively codified form. By observing which terms have differentiated meanings and functions in a specific discourse, and how this difference is manifested in the texts, it is possible to analyse spaces of “semantic struggle” (Kranert, 2020) within the corpus, as well as the locations of semantic change.

More broadly, by identifying and analysing lexical patterns surrounding keywords which undergo a re-semanticisation process as they (re-)emerge in different contexts, this approach facilitates the study of narrative continuities and ruptures as well as processes of filiation and legitimation in the discourse from 20th century Latin American insurgencies.

What do they mean by polarisation? Usage and meaning in Spanish and British press.

Panel contribution

***Dr. M Dolores Porto*¹, *Dr. Manuela Romano*²**

1. *Universidad de Alcalá*, 2. *Universidad Autonoma de Madrid*

Polarisation is a buzzword in the media these days. As a metaphorical term, it describes strongly differing attitudes in terms of spatial distance, moving discourse towards more and more distant ideological extremes. The meanings of *polarisation* have spread far beyond its original use in the political arena and can now be traced in public opinion discourses within a wide variety of social and cultural domains, from economics to education, health, environment or even religion. Rather than an enriching plurality of views, polarisation is mostly perceived as a negative trend that hinders consensus and favours conflict instead, threatening welfare, peace and even democracy (Di Maggio et al. 1996, Iyengar et al. 2019, Fletcher & Jenkins 2019).

This paper examines the different uses of the word in English and Spanish broadsheet online press. To this aim, a specific corpus of four hundred articles has been compiled including one hundred articles from four widely read papers (*El País* and *El Mundo* in Spain and *The Times* and *The Guardian* in UK), all of them containing the word *polarisation/polarización* and published in 2021. A combination of Corpus Linguistics methods and Critical Socio-Cognitive approaches to Discourse Analysis has been followed in order to analyse the most common contexts and patterns of usage of the term in the press in these two countries. More specifically, we study its negative semantic prosody and collocational behaviour, as well as the underlying schematic conceptualizations created as the meaning evolves from one domain to another.

Preliminary results show that even though minor statistical differences have been identified, significant similarities predominate in both datasets, such as the negative evaluation associated to the term, related to expressions like *risk*, *instability*, *damaging democracy*, *crispación* ('tension') and *confrontación* ('confrontation'), and to its metaphorical use, projecting mappings onto target domains like VIRUS, WAR, or ROPE TENSIONING.

Conclusions suggest that *polarisation* has become a socio-political keyword (Jeffries & Walker 2012, 2017), that is, a term that shows unusual statistical frequency and takes on political and social significance in a short period of time in the media, acquiring an absolute value, negative in this case, which transforms the term into a distinct marker of ideology.

What is “sustainable development”? A contrastive keyword analysis of tweets about climate change in Norway, France and Belgium

Panel contribution

***Dr. Andrea Pizarro Pedraza*¹, *Dr. Louise-Amélie Cougnon*², *Prof. Kjersti Fløttum*³, *Dr. Øyvind Gjerstad*³**

1. Université Saint Louis-Bruxelles, 2. UCLouvain, 3. University of Bergen

‘Sustainable development’ is a crucial concept related to Climate Change that permeates a variety of discourses (Redclift 2006). Such a success has developed a vagueness in meaning that becomes evident when we observe its semasiological variation. As Krieg-Planque (2010) studied, depending on the user’s ideology or intention, the term can acquire different meanings. These meanings emerge in specific linguistic contexts, in the sense that the presence of particular expressions such as proper names or topoï (idem) surrounding the term contributes to varied meaning construals.

Our study is part of a bigger, interdisciplinary, European project that focuses on the scientific understanding of obstacles and disincentives to climate change mitigation through social media discourse, among others. In this occasion, we analyze the multiword expressions referring to the concept ‘sustainable development’ in French (*développement durable*) and Norwegian (*bærekraftig utvikling*) in three self-collected corpora of tweets from the participating countries (France, Belgium and Norway), dating from 2007 to 2021. The corpora are topically related to climate change and are automatically annotated with metadata such as date of the tweet and social segment of the Twitter account (population, media, politicians). The Belgian French corpus has 385 977 tweets, the French corpus has 529 099 tweets and the Norwegian has 445 338 tweets.

For this paper, our goal is to analyze potential differences in the meaning of ‘sustainable development’ in the three countries, as a way to unravel the values related to it (Wierzbicka 1997). For that purpose, we compare the relevance of the term in each corpus (keyword analysis) and then we analyze the differences in meaning within climate change discourse in Twitter, based on the linguistic context (collocation analysis).

When compared to general web corpora from SketchEngine, the terms reach different positions in their respective lists of multiword keywords: 25th for the Norwegian corpus, 41st for the French and 100th for the Belgian French. The collocation analysis for the expression (in examples such as *développement durable et environnement* ‘sustainable development and environment’) reveals the presence of a varied list of nouns referring to economy in general (*innovation, croissance* ‘growth’) and a variety of sectors (*énergie* ‘energy’, *sécurité* ‘security’), together with abstract notions such as *paix* ‘peace’ or *égalité* ‘equality’, among others.

In the next steps, the list of collocates of the three corpora will be compared in detail (in terms of presence/absence of certain collocates, and their ranking). Then, assuming that frequency is a measure of salience, the most relatively frequent collocates in each language will be manually analyzed in context to reach a better understanding of the meanings of the term in each country.

Elder, Eleni Kapogianni,
Isabella Reichl)**

(Un)intended offence: intentionality and scales in the negotiation of offensive humour

Panel contribution

***Prof. Michael Haugh*¹, *Prof. Rosina Marquez Reiter*²**

1. The University of Queensland, 2. The Open University

A frequent response to someone taking offence, or to inoculate oneself against that possibility, when joking in interaction is to construe that joking as ‘not serious’ (Skalicky, Berger and Bell 2015), and any offence arising from it as ‘unintended’ (Culpeper 2011). Yet in some instances a claim to have not intended to cause offence is construed as an inadequate or even irrelevant response to the offence that was (ostensibly) caused (Poggi and D’Errico 2018; Sinkeviciute 2019). In this paper we consider why that is the case. Building on an interactional pragmatics analysis of a dataset of 30 incidents in both private and public settings in which the ostensibly jocular teases and other related phenomena are construed as offensive through explicit or implicit claims that offence has been taken (or could have been taken), we propose that the offence is co-constituted within relationally- and morally-imbued discourse fields. It follows that offence is a fundamentally *scalar* phenomenon (Blommaert 2007, 2015): not simply in the sense of particular talk or conduct being open to evaluation as more or less offensive (Culpeper and Haugh 2021), but with respect to the morally ordered scope of that offence (Haugh and Márquez Reiter forthcoming). On that view, the degree to which (perceived) offences become impervious to claims that the joking was ‘not serious’ or that the offence was ‘unintended’ is a function of the scope of the spatial and temporal scales invoked by users (or observers) of the event in question. We conclude by considering the implications of this for the theorisation of the relationship between conversational humour and offence more broadly.

Accountability and its discontents

Panel contribution

Prof. Laurence Horn¹

1. Yale University

As is often observed (Carson 2010, Stokke 2018, Marsili 2021, among others), to lie one must assert (or promise), and to assert one must warrant the truth of what one says. Speakers are normatively accountable for what they are taken to have asserted, subject to modulation or negotiation (Haugh 2013). But if speaker S, knowing that *p* is false, utters *p* in a non-truth-warranting context—if S is joking or being sarcastic, if S is rehearsing, arguably if S is speaking under threat or duress—then (apparently) S makes no assertion, performs no insincerity, and utters no lie. Advocates of a commitment-based theory of assertion (from Peirce 1932 to MacFarlane 2011 and Geurts 2018) might take such a speaker to “uncommit” to the truth.

Speakers, including actors on the contemporary political stage facing pushback, regularly appeal to the sarcasm defense as a post-hoc get-out-of-accountability-free card, in many cases supporting this escape hatch by citing a purported insincerity marker accompanying the critical utterance. But proffered plausible deniability is often in fact implausible, resulting in legal or public disputes. What criteria can be applied to evaluate the credibility of the sarcasm or “only joking” defense, especially when made retroactively? In Grice’s terms, how do we distinguish what a speaker SAYS from what a speaker MAKES AS IF TO SAY? This presentation surveys, illustrates, and evaluates an array of devices associated with signals of insincerity across different genres—casual conversation, political speech, testimony under oath—employed from the 17th century (equivocation; the doctrine of mental reservation; crossed fingers) to our own times (winks; “mere puffery”; utterance-final “NOT”; the use of dedicated markers like <jk> and /s in social media posts). We will review a practice tacitly but crucially invoked by those engaged in (alleged) sarcastic speech, the DOUBLE AUDIENCE, wherein speakers intend different subsets of their addressees to interpret their message in different—indeed often opposite—ways (Clark & Gerrig 1984). We will also demonstrate that the explicit flagging of sarcastic intent when expressing a proposition has both social and grammatical correlates.

Deniable offenses - different ways of communicating controversial messages

Panel contribution

***Dr. Ellen Breitholtz*¹, *Dr. Vladislav Maraev*¹, *Dr. Christine Howes*¹**

1. University of Gothenburg

In the televised coverage of the Swedish elections of 2022 many viewers were surprised - if not shocked - by an utterance by Rebecka Fallénqvist, a representative of the right-wing Swedish Democrat party (SD). She celebrated their victory with the (non idiomatic) phrase “Helg Seger” (weekend victory), which sounds similar to the Swedish version of the Nazi salute “Sieg Heil”, “Hell Seger”. When asked about her behavior she first answered that she did it as a joke aimed at easily provoked leftist media. However, she later claimed that any similarity with the Nazi salute was accidental and unintentional. This is a somewhat spectacular example of how offensive thing can be hinted in a humorous (and a potentially deniable way) - just as a slip of the tongue.

In this work we contrast two ways of communicating offensive things: through hinting and through exaggeration. The Fallénqvist episode is a case of the former. In the latter case, offensive actions are made less offensive by making them harder to believe - for instance in the humorous episode where Sir David Attenborough suggested shooting Donald Trump as a way of influencing American elections. Attenborough’s utterance is supposed to be taken as a joke, while at the same time showing great displeasure with the situation at hand. Franzén et al. (2021) discuss how exaggerated taboo-breaking can bring rage, fear and pleasure in a conversation.

We look at these two ways of communication following the theoretical dialogical account of Maraev et al. (2021) who cast jokes in terms of topoi (as a granular resource to account for different ways of opposing joke scripts) and enthymemes (as an argument occurring in a dialogue or text, and involving one or more topoi; Breitholtz, 2020) that arise from specific interactional experiences. Additionally we claim that hinting share the same inference mechanism with dogwhistles (expressions that are used to communicate different messages to different groups), semantics and pragmatics of which were studied previously (Henderson and McCready, 2017; Breitholtz and Cooper, 2021).

Egocentrism and salience in stand-up interaction

Panel contribution

Dr. Ibukun Filani¹

1. Augustine University Ilara-Epe

Language and interaction with the audience are central to the performance of humorous intention in comedy venues. Within linguistics, scholars have approached stand-up comedy from three broad perspectives: conversation analysis (e.g., Scarpetta & Spagnolli, 2009; Rutter 1997), pragmatics (e.g., Adetunji 2013; Yus 2016), and discourse analysis (e.g., Ruiz-Gurillo & Linares-Bernabeu 2020). However, the central idea in these studies is that instantiating humour is based on common ground assumptions between comedians and their audience. In view of this, Adetunji (2013:2) notes that “the local linguistic and non-linguistic forms and background knowledge” are oriented to by both comedians and the audience. Besides, these studies argue that humour in stand-up comedy results from the joint act of performer-audience cooperation. Yet, recent occurrences where stand-up comedians have to apologise for their jokes in a post-mortem review or within a show challenge the assumption of common ground between the performer and audience. These occurrences also indicate that humour is not necessarily an expression of mutual community membership or joint action between the participants in comedy venues. My paper comes from a socio-cognitive pragmatics perspective, and it explores the place of individual beliefs and egocentric tendencies in stand-up comedy interaction. I argue that although generating humour in stand-up comedy requires cooperation, individuals in comedy venues could hold on to their private assumptions. Therefore, if the humorous intention of the comedian is to be successful, audience members must not reject the comedic representations of background assumptions. Similarly, the salient meanings in the comedians’ utterances should not be derived from the shared background knowledge of culture and language but rather from how they use the foregrounded assumptions in the context of the routines.

Hateful illocutions and humour

Panel contribution

Dr. Vahid Parvaresh¹

1. Anglia Ruskin University

It goes without saying that, despite all the efforts made over the years to tackle hate speech, it is still a prevalent phenomenon, especially in the cyberspace. This lack of tremendous success could be attributed to the fact that most of the approaches to description, analysis and prevention of hate speech are still “far from being able to [fully] grasp context or to detect the intent or motivation of the speaker, failing to recognise specific usages of certain words” (Dias Oliva et al. 2021: 702). Drawing on a corpus of Instagram comments directed at Afghan people, who have undergone “the largest displacement and refugee movements in modern world history” (Abbasi-Shavazi and Sadeghi 2015: 89), the present study investigates communication of hate through seemingly humorous remarks. In doing so, the study distinguishes between illocution – “performance of an act *in* saying something” – and locution – “an act *of* saying something” (Austin 1975: 91, original italics) – demonstrating how the former could be conveyed covertly and under the guise of humorous remarks.

Having a license for offensive humour. The case of emigrant Romanian stand-up comedians' discourse

Panel contribution

Dr. Mihaela-Viorica Constantinescu¹

1. University of Bucharest

The anthropological view about comedians is that they have a “traditional *license*” for a verbal (and also non-verbal and paraverbal) behaviour diverting from socially accepted behaviour, which is part of the public ritual of the humorous performances, a public ritual iconoclasm (Mintz 1985). Offensive humour perfectly illustrates this *licence* and hence could be exploited in various humorous public or private settings.

In a (mainly) sociopragmatic approach, this presentation focuses on the performances of two first-generation emigrant stand-up comedians of Romanian origin (Radu Isac, Victor Pătrășcan), acting in the UK, but also touring throughout Europe. Emigrant comedians belong to what is considered the group of marginal performers, who often resort to self- and other-deprecation in subversive acts (cf. Holmes and Marra 2002 *subversive humour*; Ruiz-Gurillo, Linares-Bernabéu 2020).

My claim is that deprecation is the main discursive strategy used by first-generation emigrant stand-up comedians of Romanian origin during their humorous performances; the analysis highlights the staging of the possible offensive remarks, exploiting sensitive topics like racism, religion, gender imbalance, ethnic discrimination, economic crisis, etc.; the way offensive remarks are inserted in the discourse is also illustrated in the analysis (the metacommunicative devices used by comedians to deny offensive intent: *it's a joke, I know you guys are sensitive*, or for self-appraisal: *that was disgusting*). The reaction/lack of reaction from the public is taken into account as a way to appraise the effects of derision.

Comedians create an *onstage persona*, a form of self-presentation which is highly important during the performances (Sinkeviciute 2019; Evans Davies 2019). As first-generation emigrants, the comedians whose performances are analysed present their *personae* as outsiders, with distinct marginality in the UK/Western Europe. The analysis reveals that they construct the *personae* of offenders (negative comic *personae*). Their negative comic *personae* (verbally aggressive, unsympathetic) are construed as simultaneously belonging to a stigmatised group (or assimilated to it), mainly challenging the dominant cultural representations in the UK, while reinforcing the cultural representations of the British majority about (new) minority groups, like the Romanians.

The offensive “episodes” offer the comedians the possibility to align or dis-align with/from other *personae*, from the mainstream or the marginal community. Thus, the audience is allowed to identify or des-identify with/from the comic *personae* according to the effect of the humorous discourse on their cultural representations (self- and other-deprecations represent a way to evaluate the audience's cultural representations, Yus 2004). Nevertheless, I consider that deprecation does not always manifest as “safe entertainment” and a “critique with impunity” (Gilbert 1997; cf. Mintz 1985). Regardless of the way this discursive strategy is perceived theoretically – as a form of *entertaining impoliteness* (Culpeper 2011), *jocular mockery* (Haugh 2010), or *mock aggression* (Dynel 2021) – its emic interpretation is instrumental for the humorous performances' success.

Implied offensive language on social media

Panel contribution

Dr. Tahmineh Tayebi¹

1. Aston University

One of the biggest challenges facing research on ‘taking offence’, particularly in online contexts, is that there are occasions in which there is a lack of explicitly offensive words. Drawing on a corpus of online hate comments flagged so by the targets, I will discuss examples of offensive language disguised by humour. In doing so I will focus on issues such as their complex pragmatic structure and whether and how the speaker could be held accountable for implying such offensive meaning. I will also focus on how in some examples the speaker’s accountability and intention tend to dissolve and it is the hearer who pursues further assumptions in search of an offensive meaning. I will argue why such examples of offensive language are difficult to report and why they are often ignored when tackling online hate.

Offensive humour and ‘only joking’ claims on Reddit

Panel contribution

Prof. Sanna-Kaisa Tanskanen¹, Ms. Ylva Biri¹

1. University of Helsinki

This paper contributes to the study of offensive humour and its negotiation by investigating ‘only joking’ claims made by participants in discussions on the social news and discussion website Reddit. A claim of jocular intent can be added to a Reddit post containing offensive or problematic humour pre-emptively or it can be offered later after a reaction by another participant (cf. Haugh 2016). In both cases, the participant making the claim tries to show that potential or perceived denigrating humour in their post is not meant to give offence, and that they should not be held accountable for such an intention. However, as Dynel (2021) notes, participants are accountable also for interpersonal pragmatic effects, such as amusing or offending. The interpretation of the post by other participants may differ from the initial intention (Elder 2021), which makes studying the reactions by other participants and the potential ensuing negotiation interesting.

We analyse ‘only joking’ claims on Reddit with a combination of corpus methods and close analysis drawing from approaches to digital interaction. Our corpus represents a sample of posts published on Reddit in October 2022. We use a Python script to identify n-grams containing “joke” or “kid” that are used as indicators of jocular intent (e.g. “just kidding”, “just a joke”, “take a joke”). Instances of the phrases are then analysed in their context to find out how offensive or problematic humour is presented, perceived and negotiated. The findings throw light on how participants in Reddit discussions commit offensive humour, how other participants react to it and how it is negotiated in the interaction, furthering our understanding of intentions and accountability.

The lifecycle of “edgy” stand-up jokes: from rhetoric to offended audiences

Panel contribution

***Dr. Eleni Kapogianni*¹, *Dr. Chi-He Elder*², *Dr. Isabella Reichl*¹**

1. University of Kent, 2. University of East Anglia

This paper examines explicitly offensive (often prefaced with terms such as “career ending”, “saying the unsayable”) stand-up comedy jokes, with the aim of distinguishing their various effects inside and outside of the comedic performance. The ongoing and divisive discourse regarding the limits of comedy is taking place both off-stage and on-stage: comedians like Jimmy Carr and Ricky Gervais use jokes that target sensitive characteristics (race, disability, gender identity etc.) with the ostensible goal of proving that no social group or topic should be “off limits”, while taking a stance against recent calls for a more empathetic comedic tradition that does not reinforce stereotypes and discriminatory beliefs (Perez 2013).

A matter of frequent debate is whether or not the “true” beliefs and intentions of comedians need to be taken into consideration when they are held publicly (and legally) accountable for the content of their jokes. The discussion will focus both on the jokes themselves (sourced from the aforementioned comedians’ most recent Netflix specials) and on the reactions of various audiences (user comments on social media platforms). Taking an interactional pragmatic approach to this debate, we begin by clarifying the following important distinctions:

- (a) the explicit target (“butt”) of the joke versus its rhetorical target (opposed “humour ideologies”- Kramer 2011)
- (b) the joke as “use” versus the joke as “mention” (Sperber and Wilson 1981)
- (c) the performer versus the comedic persona (a distinction that can, on occasion, become blurred)
- (d) the joke as part of the comedic performance versus the joke in the public sphere

We argue that jokes have a life-cycle which expands beyond their original performance and are thus able to carry offence outside the context of their production. Even though it is important to examine the birth and original context of an offensive joke, it is equally important to consider the issue of comedian accountability when it comes to producing jokes that are bound to enter the public sphere, given the modern format of video-recorded and social media-covered comedy sets.

Using humour to call out racism: political satire, the right to offend and take offence

Panel contribution

***Dr. Dimitris Serafis*¹, *Prof. Stavros Assimakopoulos*², *Dr. Anna Piata*³**

1. Università della Svizzera Italiana (USI), 2. University of Malta, 3. University of Neuchâtel

Satirical news shows have for long been recognised as venues where political journalism is being reinvented, with the relevant research underlining that they influence audience perceptions about current affairs in equal measure to traditional newscasting (Hoffman & Young 2011). Identifying humour as the main discursive strategy at play, “most literature expects that satirical news can persuade the audience to adopt a stance in line with the satirical message” (Burgers & Brugman 2022:972). Given this intrinsic aptitude to affect public opinion, while also taking into account their ever-increasing dissemination over social media, it is certainly not surprising that skits belonging to this genre have often sparked controversy, generating broader political discussions in the public sphere.

In October 2022, Trevor Noah, the host of *The Daily Show*, was heavily criticised by several public figures in the UK for suggesting that Rishi Sunak’s assumption of the Prime Minister position was met locally with racist backlash on the basis of Sunak’s ethnic origin. In this paper, we review this controversy with a view to assessing the role that traditional and social media have played in framing the original humorous monologue as offensive, leading Noah to eventually clarify that he never suggested that the entire UK is racist. In this respect, we attempt to shed some light on an aspect of humorous import negotiation that may be tied to a speaker’s plausible deniability, but also stands on the opposite side of it; that is, the classification of a humorous piece of discourse as offensive on the basis of a misconstrual of the speaker’s original intention.

After a close reading of the monologue under question that will help establish its humorous tone, we examine the kind of reactions that it generated on social media through the use of corpus linguistics tools, in an attempt to assess whether it was perceived as offensive on a broader scale. Following this, we turn to look at the ways in which this story was covered by four UK (broadsheet and tabloid) media outlets of distinct ideological orientations, with a view to identifying the role that such outlets have played in (re)framing the monologue as offensive or defending its antiracist stance respectively. Through this process, we find that more often than not the onus is placed on the credibility of the skit’s producer, in terms of his positioning in relation to the in-group that is allegedly being offended, rather than on the actual content of the humorous piece of discourse itself. We explain this noted pattern synthesising ideas pertaining to epistemic vigilance (Sperber et al. 2010) and the relevance-theoretic approach to context selection processes during verbal comprehension (Mazzarella 2021).

Lectures

“Brussels is in panic”. A relevance theoretical approach to political discourse.

Lecture

Dr. Ildiko Vasko¹

1. Eötvös Loránd University

Social media has a significant influence on society in general and politicians seem to demonstrate an increasing tendency to use this interactive form of interaction. Political discourse in the media has become a more and more dynamic platform offering challenging research topics for linguists. A growing academic interest has been developed in hate speech, offensive language, trolling and manipulation, just to name a few of them.

The present paper focuses on the pragmatic aspects of political discourse exploring the impact of social media. The study is based on a corpus collected from Hungarian online newspaper articles and from the social networking site, Twitter. The objective of political language is to affect audience opinion. A powerful means of achieving this is to apply strategies as an epistemic tactic for the manipulation of information. This investigation will shed light on the communicative functions of (figurative) language use that contributes to desired affects or guidance of attention. It will be argued that the relevance-theoretic approach helps to account how the choice of a linguistic device can contribute to the persuasive meaning and how utterance interpretation can vary in different communicative contexts depending on the reader's ideas, as according to Sperber & Wilson (1986) relevance is always relevance to an individual. The study seeks to explore the meanings that arise in specific contexts, revealing the speaker's intention and aims to demonstrate how these cognitive effects are constrained by the principle of optimal relevance. A major issue in this respect that there is the possibility that interlocutors might interpret the same tweet, one certain piece of discourse, in very different ways, making room for multiple interpretations.

According to Relevance Theory, linguistic expressions that encode conceptual (in contrast to procedural) meanings are semantically underspecified. The research aims to reveal that the potential meaning stemming from what is linguistically encoded in a tweet relies on the diversity of potential readers. The results so far, reveal that the digital discursive practices go hand in hand with or even reinforce political polarization and online hostility.

“Fear Allah”: (Im)politeness, Morality, and Religion.

Lecture

Mr. Ahmed Elgadri¹

1. Lancaster University

There has been an increasing number of studies investigating (im)politeness and the evaluative judgment of interactants in the last twenty years. Nevertheless, the focus on the role and the influence of religion on (im)politeness has not been thoroughly investigated, especially with respect to its relation to the moral order. Spencer-Oatey and Kadar (2016) briefly comment on the possible relevance of religious beliefs that could underpin people’s moral evaluation, and they recommend further research in that regard. The current study seeks to examine (im)politeness in relation to the moral order in the Libyan Arabic context.

The aims of this study are as follows: a) to improve the understanding of the role of religion and social norms (socio-religious moral norms) in constructing and understanding (im)politeness in the Libyan context, and b) to identify which moral grounds are invoked in order to evaluate a particular behaviour as a type of impoliteness/transgression/ *Haram*/ or *ʕeib*. To address the above aims, this study adopts Culpeper’s (2011) impoliteness framework supplemented by Spencer-Oatey’s (2008) rapport management.

The data under investigation is extracted from “social experiment” TV shows recorded in Libya and that are publicly available on YouTube. These shows also include retrospective interviews with the bystanders as well as meta-statements and comments in the comment sections of the YouTube channels of these shows. The idea of these TV shows is to observe and examine Libyan people’s behaviours and reactions when confronted with some ethical and social dilemmas that could possibly trigger their reactions. The data analysis is presented in two parts: socio-pragmatic analysis, and pragmalinguistic analysis. The initial analysis of the data has revealed the following: a) socio-religious moral norms represent the most dominant aspects in the evaluation of (im)politeness in the Libyan context, b) the breach of the socio-religious moral norms generates strong emotional reactions, some of which lead to physical violence, c) morality in the Libyan context seems to be grounded in religion and *ʕurf*, which represent and generate Libyans’ sense of identity and group membership, d) the maintenance and the preservation of the moral and social order is a religious and social duty.

ʕurf: refers to what is commonly approved by society as righteous or virtuous, accepted by reason (intellect) and pure human nature, passed on from one generation to another, and which does not contradict Islamic instructions.

Haram: This refers to acts and behaviours that are explicitly forbidden in the Qur’an and the Sunna.

ʕeib: This term is commonly used in Libya and the Arab world to describe behaviours that are socially disapproved.

“Just Like, Risking Your Life Here”: Envisioning AI to Bolster Women’s Communication Practices in Assessing Risk of Harm in Online Dating

Lecture

Ms. Isha Datey¹, Dr. Douglas Zytko¹

1. Oakland University

The upsurge of online dating usage has opened up additional avenues for infliction of harm, especially against women [1]. This study explores how women’s interactions with users and AI contributes and can contribute to respectively ameliorating decision making when choosing whether or not to initiate communication and whether to convert online communication to offline based on the degree of risk of harm either may pose. We evaluate how women envision AI supporting them in assessing risk of harm in online dating, and how this risk assessment AI could influence their current communicative practices.

The research, thus, presents an interview study in which twenty cisgender and transgender women participated in focus groups and one-on-one interview sessions, later open coded for qualitative analysis. Women produced explicit rule models for risk assessment AI, or: AI models augmenting women’s strategies for assessing risk of harm with communicating through online modalities (textual and otherwise) or meeting given users offline.

The AI implementation would influence primarily the communicative practices involved in determining whether to interact at all (online or in-person). Women foremost scrutinize profile content- incompleteness and improperness communicates insincerity or fraudulence, while other features communicate certain undesirable personality traits (discriminatory nature, aggression, purely intentions of sexual encounters) that could potentially lead to infliction of harm. Direct communication through app-provided chats is the preferred modality for first time communication and informational cues inspected are similar to profile content with the added advantage of dynamicity utilized to check for redundancy (an indicator of catfishing or bot behavior), reactions to, for example, rejection, and look for more user information to validate the users’ existence.

The decision to meet in-person or not is also influenced by communication with the participants’ “mutual friends” with users as well as people in the users’ interaction circles- current and otherwise, people who may be able to provide feedback (“reviews”). Reviewing social media communication history of users for problematic content or content that points towards aforementioned “risky” personality traits through the way users’ interact with other people online also influences communication practices.

This impression formation may also influence “where” an in-person meeting takes place and whether a suggested location is acceptable or not. How safe a person feels based on prior communication can influence not just whether or not to meet in-person but also the degree of “eject-ability” or walkability of the location needed to feel more secure.

Women envision interacting with AI as a supportive, information gathering entity that communicates the information and implications of risk of harm unique to each participant, and presents it in a way that is easy to skim for quick decision making, yet not in a manner that influences the participant towards, especially, a negative perception or actively engages in decision making beyond filtering profiles based on participant interests.

-To omou ('I think') utterances in L2 Japanese: testing the effect of user background in their interpretation

Lecture

*Dr. Mika Kizu*¹, *Dr. Barbara Pizziconi*², *Dr. Eiko Gyogi*³

1. Notre Dame Seishin University, 2. SOAS, University of London, 3. Okinawa University

The pragmatic functions of *-to omou* 'I think' have been discussed extensively, though not conclusively, in the literature (Nitta 1989, Ono 2001, Yokomizo 1998). As a modal expression, it marks information as fundamentally (inter)subjective, that is, relating to the speaker's stance vis-a-vis information, in relation to that of the hearer's. In context, *-to omou* appears to generate distinct meanings, such as the marking of information as (a) a speaker's personal opinion, (b) a speaker's lack of certainty, or (c) a 'mitigation' of the utterance's interactional force (e.g., Moriyama 1992). While the first two of these definitions are routinely used and clearly explained in pedagogical material of L2 Japanese, the latter is not (e.g., Three A Network 2012). The pragmatic multifunctionality of *-to omou* entails potential variability in the way users (lay users and professionals alike) assess the appropriateness and negotiate the meaning of this form in specific contexts of use.

Due to *-to omou*'s early appearance in the syllabus, a moderate amount of research is available on its use in L2 production, including comparisons of L2 production with L1 norms (e.g., Sasaki & Kawaguchi 1994; Iwasaki 2009; Okugiri et al. 2014). However, how such utterances are actually *received* has not gathered much attention, leaving observations about the supposed intended meaning of *-to omou* largely untested. To overcome the challenge of retrospective access to hearers' interpretations, we selected five instances of *-to omou* use from English speaking Japanese L2 users' production. We then submitted the L2 users' production to the assessment of users with different linguistic and social (both inevitably also cultural) backgrounds - L1 and L2 Japanese students, L1 and L2 Japanese language teachers - and tested their assessment of the L2 users' intended meanings and their degree of appropriateness.

Our preliminary analysis reveals distinct results with regards to 1) *judgments of naturalness* and 2) *meaning interpretations*. 1) *Judgments of naturalness* show remarkable agreement or remarkably similar distribution of agreement patterns both within and across groups. However, while 2) the *meaning interpretation* also shows similar distribution patterns across groups, we find very low levels of agreement within groups regarding attribution of the meanings (a), (b), and (c). This suggests that, as with the case of English 'I think' (Zhang 2014), and despite the transparent semantics, the pragmatic functions of *-to omou* are fuzzy, overlapping, and simultaneously available. It also suggests that while all groups can achieve a comparable intuitive sense of pragmatic appropriateness, the metapragmatic articulation of such competence (including in evaluations of NNS performance) remains challenging, regardless of expertise (i.e., proficiency levels or professional knowledge). These preliminary results prompt us to question the validity of analytical categories derived from scholarly accounts and underscore the importance of pedagogical practices that focus on indexical (that is richly context-dependent) rather than denotational meanings.

A case-study of affect display in HE institutional email discourse at Covid-19 times: exploring the interplay between politeness and empathy

Lecture

***Dr. Louisa Desilla*¹, *Dr. Angeliki Alvanoudi*¹**

1. Aristotle University of Thessaloniki

To date, there has been a number of studies focusing on the multilingual crisis communication raised by the COVID-19 pandemic (Zhang & Li 2020), its figurative framing on Twitter (Wicke & Bolognesi 2020) or the relational work of expressive speech acts on public signs during the pandemic (Ogiermann & Bella 2021). Yet, little is known about the collateral impact of the pandemic on computer-mediated communication (CMC), let alone its pragmatics. Moreover, to the best of our knowledge, there appear to be no studies within linguistics specifically designed to explore empathy in email communication or CMC in general. The rather nihilistic and absolute view of CMC “as emotionally barren, lacking the nonverbal channels necessary for intimate interpersonal communications” has been challenged by recent research on social networking sites which suggests that people can develop empathic relationships online; still, far too little attention has been paid to the nature and situational determinants of “digital empathy” (Powell & Roberts 2017: 137). Drawing on insights from politeness research (Brown & Levinson 1987; Bella & Sifianou 2012), as well as from research on empathy displays in interaction (Kupetz 2014; Herlin & Visapää 2016; Powell & Roberts 2017), the present paper primarily reports on some of the key findings of Alvanoudi and Desilla’s (2022) case study of politeness strategies and manifestations of affect in the context of email discourse between university students and teaching staff. The data obtained cover a significant period of the COVID-19 pandemic (March 2020 until January 2021) and comprise redacted excerpts from emails written either in English or in Greek by undergraduate students of the School of English, Aristotle University of Thessaloniki, addressing their lecturers. When English is chosen as the language of communication by two interactants who share Greek as their native language, we are dealing with a fairly idiosyncratic yet very intriguing communicative event which presumably allows for the collision or co-deployment of politeness norms from both languages. Interestingly, the data analysis shows that students use a variety and, often, a combination of positive politeness, negative politeness and self-politeness to achieve their communicative goals. The present paper will demonstrate the link between the aforementioned politeness strategies and affect display while shedding some light on the ways cognitive empathy can be used as a positive politeness device.

A cognitive model of discourse structure building: From the perspective of intonation units and cognitive grammar

Lecture

Dr. Tomoko Sakita¹

1. Doshisha University

Along with the criticism that cognitive linguistics tends to pursue static analyses of expressions in isolation, a growing number of studies have highlighted the significance of examining cognition in interactional discourse (e.g., Chafe 1994; Pickering & Garrod 2004; Verhagen 2005; Du Bois 2007; Deppermann 2012; Brone & Zima 2014; Zima & Brone 2015). In response, attempts have been made to produce an integrated view of structure, processing, and discourse (e.g., Langacker 2001, 2008, 2009, 2012, 2013, 2016), but more discourse-oriented studies are still awaited. The current study proposes a cognitive model of discourse structure building, from the perspective of intonation units and emerging utterances (Chafe 1994; Du Bois 2022).

The intonation unit (IU) is the basic unit of language from a prosodic point of view and a focus of attention and limitation – i.e., a cognitive burden – when it comes to information processing (Chafe 1994). The field of cognitive grammar adopted the IU as a window of attention encoded in an intonation group (Langacker 2001), hoping to have the current discourse space (CDS) model encompass a series of usage situations (Langacker 2008). However, Langacker's cognitive model has a limitation when it comes to following the flow of discourse. By improving the model, I analyzed authentic spoken interactional data from the Santa Barbara Corpus of Spoken American English (Du Bois et al. 2000–2005), which is based on the IU system.

Using a diagram, I will present the way in which the CDS is updated in a series of approximately 15 IUs, by stacking successive IUs along the development of cohesive and connected discourse. Specifically, each IU presents a conceptual cohesion for the CDS update; the composite semantic structure of the IU constitutes a focal frame with a profile and a minus frame that regulates the CDS. The diagram thus has two columns: the first is the CDS in successive stages of discourse, and the second performs the update, meaning that it represents the synthetic semantic structure. Each time the CDS is updated, the minus frame of the composite representation is matched with the existing CDS. When an existing CDS meets the requirements of a synthetic representation, a new CDS is created. The latter is matched with the minus frame of the subsequent CDS, leading to the next update. As the discourse progresses, a connected conceptual structure is constructed, and the CDS is updated endlessly while maintaining the cohesion of the discourse.

The diagram to which I refer above captures the dynamic nature of the discourse development and the process by which the speakers construct complex conceptual structures. The analysis of connected conceptual structures is well supported by the theory of given/accessible/new information (Chafe 1994). As the discourse progresses, new information is added, and when the structure is built while maintaining cohesion, the contents collated with the previous CDS are carried over to the minus frame. IUs are chained while conceptually overlapping with what has been presented. Discussion touches upon structural consolidation and its functioning with long-term memory.

A continuum approach to Politeness in Chinese courtroom discourse

Lecture

Prof. Meizhen Liao¹

1. Kashi University

Literature on politeness study is legion, but the focus is predominantly on politeness in everyday conversation or non-institutional settings (Leech, 1983; Brown et al. 1987; Gu 1996; Culpeper, 2010). Lack of adequate research on politeness in institutional settings on the one hand and criticism of existing models of politeness study for their failure to do justice to the complexity and the dynamics of politeness, as well as the synergy of interlocutors on the one hand and curiosity as to the nature and the patterns of politeness in Chinese courtroom discourse as an example of institutional discourse on the other motivate the present paper. Therefore, the aim of the research is to further promote politeness studies and research, particularly in institutional settings, and have more and better insights into politeness phenomena by a new and unique approach to politeness. Based on Leech's classification of illocutionary speech acts into four types (Leech, 1983), and also in response to Professor Robin Lakoff's remarks made about two decades ago of courtroom discourse as "limits of politeness" and a complex web (1998), we proposed a model of politeness in terms of a continuum of negative, neutral and positive politeness, which is meant to do away with or replace the traditional and popular dichotomy of politeness or impoliteness. The following three questions (in descending importance) are to be addressed: (1) What are the politeness patterns in Chinese criminal courtroom discourse as a typical representative of institutional discourse? (2) How are the patterns distributed among the trial participants? and (3) What do the peculiar or unique politeness patterns reveal about Chinese legal ideology and culture or provide as implications for politeness research in general? The study is data-based. transcripts of eight criminal trials of different types, jurisdictions and periods of time are used as data for analysis. It is found that politeness in Chinese courtroom is a complex web of positive, neutral and negative politeness at either the macro or micro level of discourse of interaction, with neutral politeness strategies predominant, negative ones ranking the second and the positive ones the least. More specifically, use of politeness strategies in Chinese criminal courtroom discourse is a continuum of three dimensions of negative, neutral and positive politeness, rather than a dichotomy of politeness or impoliteness and more importantly the three types of politeness strategies are not evenly distributed among the trial participants in their interaction. It is hoped that the politeness continuum model as applied to a minute examination of the authentic data out of the unique Chinese legal system and culture and the unique patterns identified will contribute to the further development and enriching or deepening our understanding of linguistic politeness as well as the diversity and inclusiveness in related studies. more importantly a call for a turn to neutral politeness and strategies either in institutional or non-institutional settings is proposed or due attention should be paid to neutral politeness so as to more a more comprehensive and better picture and understanding of politeness phenomena.

A corpus-based case study of human understanding of concepts and reality: Japanese “jibun” (‘self’) and “shiwase” (‘happiness’) modified by “hontou-no” (‘true’)

Lecture

*Dr. Yoko Mizuta*¹

1. International Christian University

Introduction

Our understanding of concepts and reality has been studied in terms of cognition and categorization (Austin, 1962; Lakoff, 1987; Neisser, 1987; Putnum, 1975; Rosch, 1978). However, little is known about how we deepen our understanding through experiences. For example, while we know the meaning of the word *happiness*, what does *true happiness* mean and refer to? This work aims to shed light on such aspects based on the pragmatics of Japanese *hontou-no* (‘real’/‘true’).

Method

The Balanced Corpus of Contemporary Written Japanese (BCCWJ) was used to locate examples of *jibun* (‘self’) and *shiwase* (‘happiness’) that are modified by *hontou-no*, with the preceding and following contexts (50 characters each). Then, cooccurring expressions were analyzed.

Results and Analysis

114 examples were found for *hontou-no jibun* (HN_J, ‘real/true self’) and 21 examples for *hontou-no shiwase* (HN_S, ‘real/true happiness’). Major cooccurring expressions are provided below in English translation under the following classification: (A) occurring with the subject HN_J/S, (B) occurring with the object HN_J/S, (C) related notions, and (D) contrasted notions.

HN_J: (A) *HN_J* {shows her face on such an occasion/ exists deep in our heart}, *HN_J* is {original/ one’s essence/ honest feeling}; (B) [currently] {don’t/want to} know *HN_J*, {cheat/hide/confine/deny/deceive} *HN_J*, [future expectation] {seek/find/come closer to} *HN_J*, should accept and express *HN_J* as it is, polish *HN_J*; (C) established, eternal, nonfragmentary; (D) {false /temporary/borrowed} self, replaceable, vanity, {appearance to/ evaluation of} others, empty efforts to camouflage, perform different personas.

HN_S: (A) *HN_S* {never breaks/ is hard to obtain/ can be found only deep in one’s heart/ is accompanied by suffer/ is obtained by making others happy/ requires others}, what is *HN_S*?; (B) don’t know *HN_S*, hard to get *HN_S*; (C) true wealth, “golden joy”, peace, feeling of accomplishment, impression; (D) selfishness, esteem, wealth, power, sacrifice others.

The data reflects human critical thinking and indicates the insight that HN_J/S contrasts with more familiar realizations of *jibun* and *shiwase*: Specifically, 1) HN_J exists deep in one’s heart vs. the pretended self or appearance; 2) One is expected to find and improve HN_J; 3) HN_S is internal in nature and involves consideration of others; 4) HN_S can be obtained only through continuous effort. Also, *hontou-no* can be viewed as a contrastive marker for the core concept vs. reality.

Conclusion

The corpus data sheds light on our deeper understanding of the concepts *jibun* and *shiwase* obtained through experiences beyond lexical and encyclopedic knowledge. It also indicates that *hontou-no* is a contrastive marker reflecting critical thinking. The proposed corpus-based analysis serves as an effective means for obtaining empirical data for philosophical issues and lexical semantics/pragmatics.

A Critical Multimodal Study of ‘Cute Language’ in Chinese Cyberspace and Beyond

Lecture

Dr. Feifei Zhou¹

1. Lingnan University

Derived from *moe* in Japanese, *meng* (萌, ‘cute’) in Chinese youth subcultures refers to affection towards cute, vulnerable objects or characters in pop culture and everyday life (De Seta 2014). *Meng* language (萌化语言, ‘cute language’), as a register originally associated with Japanese, and later, Chinese youth subcultures, is now widely used by various parties on the Chinese internet (and social media) for evaluative, affective, and identity-making purposes. It is noted that practices of ‘cutefication’ (萌化) constitute important features of *Chinese Internet Vernacular* (Nie 2018). The Chinese state also starts to exploit the political power of cuteness as a new form of governance strategy in online communications (Wong et al. 2021).

In this presentation, I will offer three case studies to illustrate ‘atypical’ applications of ‘cute language’ in both online and offline settings: on a medical app, in urban (and rural) semiotic landscapes, and in state-run online news accounts, respectively. I will examine the (re)appropriations of ‘cute language’ in these emergent ‘atypical’ contexts beyond the original subcultural ones. Drawing on a corpus of various ‘cute’ elements such as visuals, memes, emoji stickers, shop signages, language objects (Jaworski 2015), and other online texts, in this study I seek to broaden the scope of ‘cute language’ to include ‘multimodal cute resources’. The purpose is to highlight the prominent role of *digital technologies* in facilitating and intensifying the creation, circulation, re-semiotization and commodification of ‘cute resources’, which often encompass visual, audio, typographical and other material features. The contextual, pragmatic, and indexical meanings and functions of these multimodal resources will be analysed through a range of notable examples drawn from the mentioned cases. I will explore what makes these ‘cute resources’ a popular ‘currency’ in Chinese cyberspace and beyond, against the backdrop of China’s rapid social changes, an emergent ‘experience economy’, and a distinctive internet culture. The impacts of such resources in various communication modes and settings on the involved participants, and Chinese society at large, will also be discussed. Overall, with three case studies cutting across commercial, professional, and political sectors, I hope to shed light on the rich affordances and indexical values of ‘cute language’ in the Chinese ‘market’ and the complex political economies of language, play and affect in China.

Notes:

Data collection and analysis for all three case studies are now completed. In the presentation I may focus on one or two of the case studies due to time limits.

A new perspective on interpersonal relations: a triadic alternative to in/directness and imposition mitigation

Lecture

Dr. Isabella Reichl¹

1. University of Kent

This paper examines informal future-actions negotiations and proposed an alternative, systematic analytical approach to the negotiation of interpersonal relations which goes beyond the established (but flawed) notion of in/directness. Drawing on Stevanovic & Peräkylä's (2014) study which shows that deontics, epistemics, and affect are 'omnirelevant' in social interaction and key resources for action recognition, I argue that this triad also provides an effective lens for the analysis of interpersonal dynamics. Rather than focusing on the level of in/directness of proffers (i.e. requests, suggestions etc.) and refusals, I examine whether (and how) utterances express deontic, epistemic, and affective stances. The aim of this paper is to demonstrate this approach's two major advantages: first, it moves away from viewing deontic rights as the key explanatory domain for interpersonal implications in future-action negotiations. Ever since the classic politeness theories of Brown & Levinson (1987) and Leech (1983), power has been considered a main factor for determining how im/polite an utterance is. More recently, various conversation-analytic studies have argued that proffer formats can be put on a 'deontic scale' (e.g. Couper-Kuhlen & Etelämäki 2015; Landmark, Gulbrandsen & Svennevig 2015) based on the degree of deontic rights they express. According to such accounts, an imperative 'Have some soup' claims strong deontic rights, whereas 'hints' such as 'There's some soup' expresses weak deontic rights. By incorporating the epistemic and affective domains, by contrast, my approach demonstrates that, while some utterances do indeed foreground the speaker's lack of deontic authority (e.g. 'Would you like some soup?'), many others actually foreground an epistemic stance (e.g. 'You should have some soup, it's good for you') or affective stance (e.g. 'This soup is delicious'). The second advantage is that this explains why so-called indirect utterances can cause interpersonal offence. A speaker making a suggestion by claiming epistemic authority (e.g. 'You should have some soup, it's good for you') may, for instance, be perceived as overstepping their epistemic rights and can be sanctioned for it by the addressee. The data examined in this paper consists of future-action negotiations extracted from the subset of face-to-face conversations of *SPICE-Ireland* (Kirk et al. 2011).

A Pragmatic Cultural Analysis of Multilingual Linguistic Landscape in Cyprus

Lecture

*Dr. Sviatlana Karpava*¹

1. University of Cyprus

Linguistic Landscape (LL) research deals with the way of how languages are presented and interpreted in public places based on their functional and symbolic values (Shohamy, 2015). Landry and Bourhis (1997, p. 25) defined LL as ‘the language of public road signs, advertising billboards, street names, place names, commercial shop signs, and public signs on government buildings combined to form the linguistic landscape of a given territory, region, or urban agglomeration.’

There is a close relationship between LL items and people who create, own and interact with them, their attitudes and perceptions (Aiestaran et al., 2010; Garvin, 2010), identities on individual, collective and national levels (Curtin, 2009; Kallen, 2009; Trumper-Hecht, 2009), ideologies associated with the shared public space and different discourse communities (Kramsch, 2002; Shohamy, 2015). LL researchers try to reveal and analyse the patterns of language use in public spaces in a systematic way, taking social, pragmatic, political, economic, ideological factors into consideration. Public signage can have different types and levels of texts and semiotic modes (Shohamy, 2015).

The aim of this study was to implement pragmatic and cultural analysis of public signs in Cyprus (LL) regarding speech acts (Austin, 1962; Searle, 1969; Black, 2006; Sharndama, 2015), pragmatic cultural schemas and pragmatic devices (Sharifian, 2017; Mey, 2001, 2010; Kecskes, 2010) and politeness strategies (Brown and Levinson, 1987). The researcher implemented an in-depth qualitative and quantitative landscape analysis of visible semi-otic signs in public space, by visiting geographical areas of the Republic of Cyprus, rural and urban: Larnaca, Agia Napa, Nicosia, Limassol and Paphos as well as Troodos, mountain area, and collecting photographic data of advertising billboards and commercial shop signs (Huebner, 2006). The focus was on the main shopping streets and highway/street billboards. Overall, 4,200 signs have been photographed, documented and analysed.

The findings suggest that the most common types of politeness strategy were bald on record, positive and negative politeness, which conveyed direct and precise meaning, lack of imposition on the customers as well as attracting their attention. The sign makers try to engage readers/viewers directly by using imperatives or requests with negative politeness markers, expressing gratitude. The analysis of public signs in terms situated speech acts, pragmemes, or generalized pragmatics acts, and practs, or concrete pragmatic acts, substantiations of pragmemes, revealed that many signs aim to emphasize the focus of the business by mentioning the products or services together with the target customers and words of collective implications. In addition, there is an emphasis on the access to the business, via mentioning the products or services together with the business owner’s identity, the nearby places. It is obvious that private signs in Cyprus show international qualities, trends and identities by using multiple languages and ensuring the reliability of quality standards, expressing credibility, referring to home-made and famous brand origins, year of business establishment, family, care and ethics, showing outstanding qualities of the products and services and providing favourable treatment.

A Study on “Mounting”: A New Interactional Concept Related to Im/politeness in Japanese

Lecture

***Dr. Seiko Otsuka*¹, *Dr. Ryogo Yanagida*²**

1. Osaka Institute of Technology, 2. Jissen Women's University

In Japanese, a new concept called “mounting,” which refers to a specific interactive behavior, has been gaining citizenship in recent years. “Mounting” is essentially the physical act of a primate mounting an opponent in order to show his/her superiority. This primate physical act was metaphorically brought into the context of human interactions. Interactive mounting differs from mere “boasting” or “showing off one’s superiority” in that the participants cooperatively engage in an interaction that on the surface appears to be pleasant and “smooth” in progress while actually hurting each other. The interactional behavior itself, labeled “mounting,” must have existed for a long time, but there has been no concept to describe it. With the advent of this new term, we now have another way to understand what is going on and why it is uncomfortable in interaction.

While “Mounting” is a new concept that first emerged in 2014 in Japan and has therefore received little academic attention as yet, it is related to the negotiation of relationships over the positioning of self and others. It can be an important research perspective especially in im/politeness studies that deal with the construction, maintenance, and disruption of relationships. In particular, it includes important themes that have been pointed out in im/politeness research since its discursive turn in the early 21st century, such as emotion and demeanor (Goffman, 1967), and face balance between self and others. In this study, we examine what is going on in “mounting” interactions in terms of im/politeness, analyzing role-plays in an essay on mounting (Takinami and Inuyama, 2014) and an actual LINE group communication.

In our analysis of the LINE interaction, we have found instances of participants’ facework in which a mounter (Participant A) positions his self-face higher than the other’s (Participant B) face, but in order not to appear to do so, switching between two opposing values in the Japanese society: one that endorses being busy and hard at work, and the other that endorses having a fulfilling personal life separated from one’s work life. A values being busy at work and brags about it, but compliments B by saying that B’s work has time to spare by contrasting himself with B. That is, by praising B’s life, A is displaying that B is not as busy as he is and undermining B’s face in A’s own value system, pretending as if he values a life with time for personal life. This is arguably a kind of mock politeness, in which A places his own face higher than that of B, but by praising B, he avoids taking responsibility for threatening B’s face.

By examining speaker’s intentions, linguistic forms and the actual effects of speech acts, this study investigates the strategies used in mounting interactions.

Acquisition and use of ‘poder’ and ‘conseguir’ among Hispanic learners of Brazilian Portuguese

Lecture

Dr. Cristina Perna¹, Ms. Martha Porto¹

1. Pontifical Catholic University of Rio Grande do Sul

This ongoing study presents some ideas on the acquisition and on the use of the verbs ‘poder’ and ‘conseguir’ among basic-level Hispanic learners of Brazilian Portuguese (BP). This study is inserted in a semantic-pragmatic perspective and takes into account the previous studies by Kratzer (1977; 1981; 1991; 2008; 2012), Vendler (1957; 1967), Dowty (1979), Abusch (1985), Smith (1997) and Taguchi (2015), Cabrelli et al. (2020). Commonly used interchangeably among BP learners, these verbs can convey different meanings: while the verb ‘poder’ (‘can’) is traditionally a modal verb in BP, assuming different modal roles according to the context (deontic, epistemic), ‘conseguir’ (‘be able to’) has a variety of meanings and functions that might pragmatically mislead non-native speakers due to its a quasi-modal deontic role (Quaresma et al., 2014). The pilot study used in this research was collected in BP classes with Hispanic students during a University term. These findings have shown that a non-facilitative transfer from Spanish to Portuguese occurred. Since the BP and the South American Spanish language pairs differ in several aspects, our hypotheses are: (1) non-facilitative transfers from Spanish to Portuguese would be repeated among the controlled groups, (2) the quantity of non-facilitative transfers would be reduced among the tested groups and (3) the effectiveness of the pragmatic acquisition of the words may depend on the approaches adopted for teaching. Further data in this ongoing research will be collected during the first term of 2023 to check our hypotheses, by means of questionnaires with the Hispanic students learning Portuguese as L2. Regarding cross-language transfer, other structures will be taken into account in the data collection, such as: ‘yo no puedo con esto’(‘I can’t stand it’), ‘I can’t help it’ and ‘I couldn’t make it’. It is expected this study may prove the need to raise metapragmatic awareness to help develop pragmatic competence among these foreign language learners (Takahashi, 2012; Taguchi 2015; Timpe-Lauglin, 2021). The study suggests the possibility of adopting different practices to raise metapragmatic awareness and pragmatic competence regarding these differences between BP and Latin-American Spanish so that learners can use these forms appropriately according to their context of use.

Advertising in Pedro Almodóvar's Films: A Multimodal Analysis

Lecture

Mr. Rui Pedro Vau¹

1. School of Arts and Humanities

Advertising, in view of its persuasive rhetoric and pragmatics, is a common feature in Pedro Almodóvar's cinema, with special reference to *Pepi, Luci, Bom y Otras Chicas del Montón* (*Pepi, Luci, Bom, and Other Girls like Mom*, 1980), as well as to *Todo sobre Mi Madre* (*All about My Mother*, 1999), and to *Madres Paralelas* (*Parallel Mothers*, 2021). Due to their imaginative parodic subversion as a mark of the visual style of the director, ads aim at criticizing the cultural and sexual behavioural practices in Spanish society biased by the catholic creed. Based on the theoretical and methodological assumptions applied to a multimodal analysis of adverts (Forceville, 1996, 2002, 2009, 2012, 2017; Urios-Aparisi, 2009), we will reflect on the mechanisms of production and reception of these ads, which, by using the techniques of cinema and television, enhance the "cognitive involvement" (Sperber & Wilson, 1995; Forceville, 2020) of the public by simulating daily experiences lived by the spectators (Messaris, 1997: 266). Special attention will be dedicated to the context and functions of the different modes of representation (Kress & Leeuwen, 2006 [1996]: 33; Forceville & Urios-Aparisi, 2009; Urios-Aparisi, 2010a, 2010b, 2020) with the purpose of unveiling how image, words, and sound, as narrative strategies, contribute to meaning creation of the adverts.

Keywords: Advertising; Cinema; Pedro Almodóvar; Multimodality; Metaphor.

Ageing in a foreign land: loneliness among Mauritian Chinese migrants in the UK

Lecture

*Ms. Xuechun Xiang*¹

1. Queen Mary University of London

This research explores ageing in a transnational social field. Growing old in a foreign land is part of the late-life experience of many elderly adults (de Jong-Gierveld et al., 2015), who may encounter the challenge of combating loneliness (Victor & Yang, 2012) due to the intersectionality of immigrant status, language/culture differences (Keating & Scharf, 2012).

In the UK, public perceptions have consistently ignored the heterogeneity of the British Chinese community, in terms of their migration pattern, and language use habits (Li, 1994). Drawing on the life stories of Mauritian-Chinese migrants in the UK as a paradigmatic example of ethnic-Chinese migrants who do not speak the lingua franca (Cantonese: the lingua franca of the British Chinese community), this research examines the loneliness experience of six participants from this group of ageing migrants.

Using Levitt and Glick Schiller's transnational social field framework, this research first focuses on participants' ways of being and belonging in the context of migration. With particular attention to the positioning and indexicality in the small stories narrated in individual semi-structured interviews with each participant (Bamberg, 2004; Georgakopoulou, 2006), the analysis revealed how participants constructed their identities as migrants not speaking lingua franca; the stance they take with respect to the transnational mobility, and how the feeling of loneliness interplays with their identity construction and their understanding of transnationalism and their integration.

Keywords: Mauritian-Chinese migrants; Ageing; Loneliness; Identity Construction; Language Repertoire; Transnationalism

Aging metaphors in Chinese advertisements: A multimodal analysis

Lecture

Dr. Shuping Huang¹

1. National Sun Yat-sen University

Aging is a social and psychological issue in current society. Existing studies have pointed out that the descriptions of ageing and the elder population show the public's fear and resistance to getting old, which hinders a positive and healthy mentality for the elderly (Biggs, 1997; Fitzgerald, 1999; Rozario & Derienzis, 2009). To learn how the ageing process is conceptualized in the Chinese society, 200 advertisements of anti-ageing products have been collected, including cosmetics, nutrient supplements, etc. Multimodal metaphorical expressions are identified and tagged with Atlas.ti, with special focus on the integration of texts and images. In addition to metaphors identified in previous works – AGEING IS A MASK, AGEING IS GOING GREY, AGEING IS GOING DOWNHILL, AGEING IS AN ENEMY, and AGEING IS A DISEASE – some metaphors such as AGEING IS DARKNESS and AGEING IS WITHERING have also been popular in our database. Compared to governmental propaganda, which is conservative in using metaphors, commercials are loaded with figurative images that show unfriendly attitude toward ageing and elders, particularly rejection. Also, by analyzing how images and texts are integrated in metaphors (Forceville, 2002, 2016), we found in our data that it is usually the text that characterizes more unfriendly attitudes. By multimodal metaphor analysis and critical discourse analysis, we gained a more systematic understanding of Chinese aging metaphors and uncovered the culture-specific values about ageing, which could decide the ways people cope with getting old.

An analysis of business closure signs during the Covid-19 pandemic in Korea

Lecture

Prof. Hye-Kyung Lee¹

1. Ajou University

This paper aims to investigate the structures and functions of business closure signs in Korea. Specifically, it will examine signs shown on the doors of closed businesses in Korea during a couple of lockdown of the Covid-19 pandemic (Ogiemann and Bella 2021). For this study, business closure signs posted all around Korea are sampled chiefly from Google images and other multiple available sources. The collected data are then modified and converted into text files for the ease of managing and searching the data. The refined data are analyzed in terms of their structures and functions, especially with reference to discursive moves and the speech acts (Austin 1962; Searl 1969) they are intended to impart. The analysis results are compared to relevant previous research such as Ogiemann and Bella (2021), in which closure signs in Athens and London were comparatively examined. The preliminary research for this study reveals that closure signs in Korea also feature heavy use of relational speech acts such as greetings, apologies, thanks, and wishes. At the same time, Korean closure sign texts are relatively shorter in length and contain less lexemes, employing fewer numbers of discursive moves, than the reference texts. The speech acts found on the signs are assessed in terms of the conventions expected from the genre of closure signs (Watt 2003; Sifianou 2013). This study then investigates conventions related to the expression of emotions and practiced formulae in different countries and unravel culture-specific norms the functions of expressive speech acts carry.

An analysis of grammatical elements in conversation repairs: case markers and second language acquisition.

Lecture

*Ms. Kaori Doi*¹

1. Institute of Technologists

This study investigates repairs in Japanese learners' conversations focusing on the syntactic elements of repair and second language acquisition. Most of previous studies about "repair" have analyzed the types of repair, the organization of it and its position in interaction. Relationships between repair and syntax have received relatively little attention except for the study by Fox, Hayashi and Jasperson (1996) that focuses on the relationships between syntax and repair and demonstrates the difference of repair between languages that can be attributed by syntax of both languages. However, most of previous research on repair have not studied the relationships between repair and language acquisition. This study focuses on the syntactic features of conversation repairs comparing interactions by basic level Japanese learners and by advanced level learners. The study also investigates how learners acquire the second language observing the grammatical elements of conversation repairs. The data in this study consists of conversational interactions videotaped and transcribed in detail in which pairs talk about given daily topics freely. Japanese conversation data in which English native speakers have to communicate only in Japanese are analyzed. This study divides learners' levels of Japanese proficiency by experience of studying Japanese and the period of living in Japan and into 'advanced' and 'basic' level. The study analyzes conversational interactions by mainly "basic level" learners of Japanese comparing advanced speakers. This study also uses conversation data of Japanese native speakers in order to compare with data of learners of Japanese.

This study focuses on case marker as one of grammatical elements in conversation repair and investigates the frequent occurrence of repairs by the marker by basic level learners. The study also analyzes how learners acquire the case markers comparing conversational interactions by both basic level and advanced level Japanese learners. Furthermore, this study shows the difficulty in acquisition of grammatical elements by basic level learners of Japanese comparing the strategies in conversation and the grammatical features of conversation repair used by advanced level Japanese speakers. This study reveals how the pragmatic acquisition of second language occurs by analyzing not only syntactic elements of repairs but also how to use them in second language.

An experimental approach to the production of criticisms and replies to criticisms in a work environment

Lecture

*Mr. Baptiste Bersier*¹, *Prof. Sandrine Zufferey*¹, *Prof. Diana Mazzarella*², *Dr. Sandra Schwab*¹

1. University of Bern, 2. University of Neuchâtel

Since the birth of the speech act theory (Austin, 1962) this central theoretical notion in pragmatics has been discussed by many different scholars, both within discourse-oriented (e.g., Kerbrat-Orecchioni, 2016) and cross-cultural perspectives (Blum-Kulka & Olshtain, 1984). However, fewer contributions have analyzed speech act production using a controlled experimental methodology. Moreover, most of the studies on speech act production tend to focus solely on the speech act itself, omitting the verbal response to it, whereas the latter constitutes an integral part of a conversational sequence from an interactional perspective.

To fill this gap, we ran a controlled experiment in French, involving the speech act of criticism as well as the responses to criticisms in a work environment, in order to assess the factors that lead people to formulate an act more or less directly. In this task, French-speaking participants from France (n=80) had to complete a written DCT (Discourse Completion Test) in which 20 scenarios were presented to them in four different experimental conditions, forming of a 2x2 design with 5 different scenarios in each condition. The first variable tested was the power relation between participants (equal vs. unequal) and the horizontal distance between them (close or distant). We also analyzed three interindividual variables likely to influence participants' formulation of criticisms and their responses to them: gender (male or female), age (below or above 30) and their position at their work place (junior vs. senior position). Half of the participants (N=40) were asked to formulate criticisms, and the other half to answer criticisms already formulated in the task (N=40).

Results from a logistic regression analysis of the data indicates that age, gender and work position were not strong predictors of participants' tendency to formulate criticisms in either a direct or an indirect manner, nor did it influence their propensity to answer criticisms more or less directly. However, the two manipulated variables did have a significant impact on the results, as participants tended to formulate more direct criticisms when they were themselves in a powerful position at work, and they also tended to be more direct with a distant person compared to a closer colleague. A more detailed analysis of the data also revealed that participants use different modifying strategies depending on tested variables, with softeners being significantly less used in a distant-superior relationship whereas intensifiers (threats) being significantly more used than in the other experimental conditions. We conclude that the expression of criticism at work depends principally on the power-distance relationship whereas individual differences have minor effects for the formulation of this speech act, and also discuss future avenues of enquiry for experimental research on criticisms.

An interview of a victim of repression in Argentina. Negotiating the topics and the sense of the past

Lecture

Prof. Alejandra Vitale¹

1. Universidad de Buenos Aires

This paper arises from a research project directed by myself and funded by the University of Buenos Aires. It examines the so-called archives of repression in Argentina and an oral archive with the voices of the victims. It takes a rhetorical approach to discourse analysis (Amossy, 2000; Vitale, in press). Archives of repression are documentary collections produced by repressive bodies of the security forces. One of the most important archives is that created by the Intelligence Directorate of the Police of the Province of Buenos Aires (Dirección de Inteligencia de la Policía de la Provincia de Buenos Aires, DIPBA). It started in 1956, a year after the coup d'état that overthrew Juan Domingo Perón in 1955, and it was closed in 1998. The DIPBA archive is preserved by the Provincial Commission for Memory. In 2008, the Provincial Commission for Memory created the so-called Oral Archive. This happened during Cristina Fernández de Kirchner's first presidency. Kirchner served two consecutive terms, from 2007 to 2011 and 2011 to 2015. The Oral Archive, with its testimonies from the victims, encourages dialogue and confrontation between the point of view of these victims and that of the perpetrators. Among the different sections of the Oral Archive, one consists of interviews with victims of political and ideological surveillance by the DIPBA. This paper focuses on the testimony of Jorge Rulli, a leading figure in the Peronist resistance. This movement fought for the return of Juan Domingo Perón to Argentina and the lifting of the electoral ban on Peronism. Peron had been in exile since 1955. Rulli's testimony was recorded in an audio-visual interview conducted in his home by two Provincial Commission for Memory members on 11 May 2009. In this regard, I will only consider the verbal dimension of the interview, as recorded in the transcript by the Commission. My objective is to describe the negotiations between the interviewee and the interviewers on the issues raised for the interview and the meanings granted to the past. The methodology is based on the French pragmatic approaches (Johansson & Suomela-Salmi, 2011) and particularly on Kerbrat-Orechioni's proposals on verbal interactions (Kerbrat-Orechioni, 2005, 1990, 1992, 1994, 1997). Furthermore, I consider the use of interviews in Oral History (Portelli, 2018).

An Investigation of Chinese Adult English Learners' Comprehension of Sarcastic Tweets in English

Lecture

Mr. Xuan Li¹

1. *Queen's University Belfast*

Xuan Li (PhD Student in Linguistics)

Queen's University Belfast, UK

xli42@qub.ac.uk

Sarcasm is frequently utilized in individuals' daily life for expressing offensive humor. However, this kind of tricky language, sarcasm is much more difficult for non-native speakers (NNS) than native speakers (NS) to comprehend (Kim, 2014). Therefore, this research was conducted under the relevance theoretical framework proposed by Sperber and Wilson (1986). It aims to investigate what kinds of cues and strategies Chinese adult English learners use to comprehend sarcastic tweets in English and what kinds of difficulties they have in comprehending sarcastic tweets in English. The data set consisted of concurrent think-aloud protocols (TAP) and semi-structured interviews from 20 CAELs and 10 native speakers (NS) studying in the UK. In the TAP and the semi-structured interview, they were asked to verbalize their thoughts while comprehending 35 tweets (25 sarcastic and 10 non-sarcastic) and to answer some follow-up questions. Analysis revealed that CAEL used certain L1 schemas in their L2 comprehension process of sarcasm and different strategies, and cues were utilized by CAEL and NS. In addition, the result showed that the difficulties in comprehension of sarcasm did not only result from their language ability and lack of context knowledge.

This study provides an insight into the different strategies, cues and challenges involved in NS and NNS' comprehension of sarcasm on Twitter and it will offer a new method for pinpointing and collecting sarcastic tweets online, which could be applied in further studies. Besides, the research results could provide some pedagogical inspirations for L2 pragmatics teaching, especially on sarcasm.

Analysis of interaction features of high-school English textbook: A conversation analysis perspective

Lecture

Dr. Esmael Abdollahzadeh¹

1. Iran University of Science and Technology

Abstract

Conversations play a significant role in learning a language as they are mostly the main artefacts through which learners in second language learning contexts practice and learn language and develop their communicative competence. Language teaching materials produced in textbooks need to promote authentic features of communication should they be used for language instruction purposes especially in English as a foreign language (EFL) contexts. Course books often possess a plethora of conversations with different themes. Yet, there seems to be a number of challenges in the teaching procedures and the purposes behind them. The aim of the present study is to investigate interactional features of conversations presented in Iranian eleventh grade English textbook Vision 2. To this end, the conversation section of each unit was investigated. The examples of the interactional practices and the sub-strands were obtained. Consequently, the frequency and the percentage for each interactional practice was tabulated. The findings revealed that turn-taking as well as sequencing practices are presented in the conversations while overall structuring and repair practices are missing in the conversations in this textbook. In addition, lack of overall authenticity is noticeable in both the conversations and listening and pronunciation sections. This absence in the application of interactional practices is not justifiable considering that the eleventh grade English textbook is supposed to be presenting an intermediate level of English language in schools and make students ready to move on to the last year of high-school and enter university. Interactional competence is of great importance in English language instruction and is currently neglected in high-school textbooks. Implications for language teaching purposes will be discussed.

Analysis of Pronominal Choices in African Suicide Notes

Lecture

Dr. Yunana Ahmed¹, Mr. Daniel Danladi¹

1. Gombe State University

Suicide as an act of deliberately killing oneself is a universal problem and a global public health concern that cuts across cultures. Eighty percent of suicides occur in developing countries (WHO 2021) and, according to the World Health Organization, Africa has the highest rate of suicide in the world, with Nigeria having the leading number. Yet, most of the efforts to examine the phenomenon of suicide come outside of Africa (e.g., Shneidman and Farberow 1957, Osgood and Walker 1959, Gregory, 1999, Shapero, 2011). Most especially, the examination of suicide notes from linguistics/pragmatics perspectives is sparse. The suicide note is discursive and therefore needs serious linguistic attention. Drawing on Chilton's (2004) legitimization and proximization framework and computational linguistics, this work examines the pragmatic implications of pronominal choice in suicide notes collected from Nigeria. Selected extracts are presented here:

1. I am highly indebted that I cannot afford to pay it. I decided to kill myself (commit suicide), please (in the name of Allah (God)), take-care of our children.
2. I told you it is Bawa I want to marry, but you said I would not marry him except Alhaji Modi. You are the one who put me in this situation.

In example one, the person says he is highly indebted but cannot tell the audience who he owes. Also, there is no reference to the exact amount owed, the amount is glossed as 'it'. There is a certain vagueness associated with this lack of information that leaves room for any judgement on whether or not the suicide is justified. In this text also, through the use of "I" the speaker takes responsibility for his action but recognizes that the consequences of his action extend beyond him creating a rhetorical structure in which the writer makes a direct contrast between "I decided to kill myself" with "take care of our children." In the second example, the writer shifts from the use of "I" in reporting the reason for the suicide to using the second person "you" as a responsible party for the suicide which shows that the act of committing the suicide rests on some forces beyond the writer. One obvious force in this text is the cultural practices of forced marriage by the family that take off the agency of the suicider in deciding on whom to marry. From the two texts, it is not an accident that the circle of communality is larger than the individual in the suicide texts as both writers, through the use of pronouns, shift the responsibility and the consequences of the act of suicide from just an individual agency to group responsibility of family or community. Thus, instead of viewing the Self as an independent, self-contained, and causative force guiding events when working with people with suicidal thoughts in Africa, the collective must be paid attention to in curtailing such situations. Insensitive to this African sense of experiencing reality will cause problems in our understanding of suicidal ideation, and thus limit efforts to prevent it.

Analysis of Social Media Posts Emanating from Selected Doxxed Actresses in Nigerian Kannywood Movie Industry

Lecture

Ms. Ummi Ibrahim¹

1. Gombe State University

The widespread adoption of social media platforms such as Instagram, Facebook, Twitter, and TikTok by Nigerian netizens has led to positive developments like community formation, information discovery, image, and video sharing. However, social media platforms have become an enormous source of online violent acts, including bullying, hate speech, trolling, and doxxing. While considerable works have focused on examining some of these social media-facilitated violence (Adediran 2021, Ayansola 2021), there is a paucity of studies on doxxing in the Nigerian academic context, particularly from pragmatics perspective that pays attention to the gendered nature of doxxing. Drawing on van Leeuwen's legitimation strategy and Lazar's (2018) feminist critical discourse analysis (FCDA), this paper examines social media comments emanating from the doxxing of four selected female actors from the Nigerian Kannywood movie industry. The analysis begins by examining the intertextual connection between the desire to harm and the deeply entrenched ideology that tries to control one gender at the expense of the other. The study identifies two legitimization strategies from the data collected: rationalization and the construction of the negative- other. The social media users' comments on doxxed female actors use language that focuses on rationalizing the motives of the doxxers, which is achieved by framing the action of the doxxer in terms of a morally acceptable act. They also engage in negative-other construction of the female Kannywood actors treating the doxxed women as nonconformists and social deviants using excessive vitriolic online abusive language. Such construction has multiple effects on the victims' offline lives and can inflict irreparable emotional, professional, and physical harm onto already marginalized groups. Since these women are perceived as nonconformists and social deviants, they are more likely than men to experience doxxing. Doxxing is therefore not a random act of hostility in the Nigerian Kannywood movie industry but a product of the existing intersecting layers of structural, systemic patriarchy and misogyny that aim at maintaining unequal power relations and dominance

Animal metaphor as a co-joint enterprise of blame, categorization, and emotional interaction on social media

Lecture

Dr. Ying Jin¹, Prof. Dennis Tay¹

1. The Hong Kong Polytechnic University

This study investigates blog comments about the management of donations during the coronavirus pandemic in Wuhan, China. Rather than understanding animal metaphors as a cognitive process, we consider their usage as a co-joint enterprise of categorizing and blaming. We downloaded anonymized user comments on *Sina Weibo* during the first wave of the Coronavirus outbreak in China (December 1, 2019, to April 20 2020) using a Python web crawler. In total, we collected 14540 comments containing 292253 Chinese characters. Invoking Conversation Analysis (CA), with its focus on sequential organization (Schegloff, 2007b) and societal membership (Sacks, 1972; Schegloff, 2007a), we show that animal metaphors like horses, maggots, dogs, etc. operate as a rejection of a proposal, an evaluation of an action, and a curse on others. Most importantly, by assigning others to a certain category, the text producer makes visible the relationship between the target's actions, moral accountability, and category-associated attributes. The use of animal metaphor, with its derogative connotations, almost always reflects the expression of anger. In online typed interactions, this display of anger is typically composed of an animal metaphor and the emoji of an enraged face. The emoji functions as an anger token that invites agreement, affiliation, and elaboration of the blame. We, therefore, argue that CA emphasizes the interactional dimensions of metaphor research which complement predominant cognitive approaches.

Apologies in “Entrevías” and “Vivir sin permiso” – a test of pragmatic competence for learners of Spanish

Lecture

Dr. Marianna Chodorowska-Pilch¹

1. University of Southern California

Various studies have analyzed the linguistic encoding of apologies within the framework of speech acts (Blum-Kulka & Olshtain, 1984; Blum-Kulka & Levenston, 1987; Escandell Vidal, 1995; Meier, 2010; *inter alia*). Contrastive studies have demonstrated only a partial equivalence of use, function and frequency of apologies (Davies, 1987; Márquez Reiter, 2000; González Cruz, 2012; Bella, 2014).

Following the line of research proposed in Chodorowska-Pilch (2019), this study analyzes the usage of *lo siento* ('I'm sorry' in English) and other expressions of apology produced by native speakers of Spanish in the Netflix series “Entrevías” (‘Wrong side of the tracks’) and “Vivir sin permiso” (‘Unauthorized living’) and compares them with English-speaking learners of Spanish. For this reason, excerpts from the movie will be used to survey English-speaking students, testing their pragmatic competence in Spanish.

While applying concepts of *positive* and *negative politeness* by Brown & Levinson (1987), it will be shown to what extent the use of *lo siento* and other apology expressions invoke the use of politeness strategies. Although Blas Arroyo (2005: 313) considers apologies as strategies of negative politeness, Wagner & Roebuck (2010) give examples of apologies that invoke both positive as well as negative politeness strategies.

This paper will show that the former and the latter proposal are partially corroborated illustrating the contrast and differences in pragmatic competence of university students. While comparing native and acquired uses of apology expressions, the final objective of this study is to offer possible recommendations for instructors who are interested in improving the pragmatic competence of English-speaking students using apologies in Spanish.

Apology in the discourse of Japanese Olympic Athletes

Lecture

*Dr. Chie Yoshinaga*¹, *Dr. Ryo Takamura*²

1. Sanyo gakuen university, 2. Rissho University

An apology has often been studied in the level of speech acts and cross-cultural pragmatics. However, sociolinguistic factors have little been considered. Therefore, this paper addresses the apology in the context of sports. As some sports have a strong connection with a nation such as judo or karate, the people's expectation for the sports are relevant to the athletes' apologies when they miss out on a medal. Besides such a nationwide factor, the more individuals are featured in media, the more chances they need to apologize in Japan, because they feel they betray the people. In this paper, we investigate the post-game discourses of the five Japanese athletes who participated in the Olympic Games held in Tokyo and Beijing in 2021 and 2022, and study their apologies in relation to the social factors.

We use their interviews and posts on Instagram as data for the analysis of the five specific athletes' discourses. They are divided into three categories. The first category is the case where the athletes missed out on a medal. For instance, a ski jumper, Sara Takanashi who was disqualified for violating suit regulations apologized on her Instagram by expressing *mooshiwake arimasen deshita* 'I'm sorry'. Kohei Uchimura, a gymnast, expressed *dogezashite ayamaritai* 'I will kneel down on the ground and apologize'. Because they were the most prospective athletes to receive a medal, they were nearly forced to express an apology. The second category is the case where the athletes obtained a silver medal but still expressed an apology. For instance, although a Greco-Roman wrestler, Kenichiro Fumita obtained a silver medal, he said *mooshiwakenai* 'I'm sorry' for his result. A Judo practitioner, Shoichiro Mukai also expressed *mooshiwakenai kimochi ga aru* 'I feel sorry'. Fumita and Mukai's apologies drew the attention from *The New York Times* (Cf. Yamane 2011). By contrast, a Japanese world-famous figure skater, Yuzuru Hanyu did not apologize even though he missed out on a medal. With his right ankle injury, Hanyu tried a quad axel, only to fail. Such an attempt under an unfavorable condition did not call for an apology. This is referred to as the third category.

The athletes' apologies function as a remedial work (Goffman 1971). To apologize in public remediates their offensive to the expectation of their spectators and teammates. The goals of this paper are 1) to describe how apologies are made, 2) to find the discourse patterns for an apology and 3) to consider the social factors upon the Japanese athletes.

Asymmetrical talk: an argument for the conjoint co-constitution of asymmetry in doctor-patient interaction

Lecture

Dr. Ahmad Izadi¹

1. *University of Bayreuth*

This presentation argues for the conjoint co-constitution of symmetry and asymmetry (hereafter both written as asymmetry) in interaction, using empirical data from doctor-patient interaction to support the argument. A conjoint co-constituting model of communication (CCMC) proposes that interaction is shaped by the confluence of utterances in at least three positions. This three-position architecture of communication also applies to relational phenomena. Interactional pragmatics provides significant insights into the ways a central account of human relationships, namely, relational connection and separation, or face, is conjointly co-constituted in talk-in-interaction. Such a view is consistent with a central stance of Conversation Analysis and (more generally) ethnomethodology that relationships are endogenous to talk. Arundale (2020) foregrounds the study of relationships in human interaction by arguing that ‘relationships are created, sustained, and changed as participants engage resources for interacting in constituting interpreting of turn taking, action, meaning and many more’ (p. 289). And, asymmetry, being essentially a relational account, can best be investigated in a relating theory that is consistent with methods and premises of CA and provides a comprehensive set of both theoretical presumptions and analytical tools to explore the delicate and often elusive nature of asymmetry in interaction. This paper, therefore, contextualizes the omni-relevant account of asymmetry in interaction in the conjoint co-constituting model of relating, and more specifically in Face Constituting Theory, proposed by Arundale (2010, 2020). Furthermore, the study argues that asymmetry can best be investigated in view of the underlying moral order of social action formation by speakers (Schegloff, 2007) and social action ascription by recipients in conversation (Levinson, 2013). The moral order refers to a set of rights and responsibilities with regard to epistemics (Heritage, 2012), deontic, (Stevanovic and Peräkylä, 2014; Stevanovic and Svennevig, 2015) benefactive (Heritage and Maynard, 2014) and emotional (Peräkylä, and Marja-Leena Sorjonen, 2012; Stevanovic and Peräkylä, 2014) backgrounds. The data come from detailed transcriptions (based on Jefferson’s transcription conventions) of 20 hours of naturally occurring talk between 10 specialized physicians and 50 patients in medical consultation visits in the private sector in Iran. The analyses are informed by Conversation Analysis and Face Constituting Theory (Arundale, 2010, 2020) and show how accounts of symmetry and asymmetry are conjointly co-constituted along the conjoint co-constitution of relational connection and separation. The study hopes to offer theoretical contributions to the elusive (although well-researched) endogenous account of asymmetry in talk and its correspondence with the exogenous account of power.

Keywords: asymmetry, conjoint co-constitution, doctor-patient interaction, Face Constituting Theory, conversation analysis, moral order

Behind the scenes of remote teaching in the pandemic context and the new face-to-face in public schools: digital hope or a necropolitical education?

Lecture

*Ms. Viviane dos Santos Cavalcanti*¹

1. SEEDUC-Rio

The present research in progress results from the narratives of teachers who work in public schools in Rio de Janeiro and aims to understand the backstage of remote teaching and our conditions of realization in the context of a pandemic through narrative constructions and positions (Bamberg, 1997, 2002). The study is, therefore, qualitative and interpretive (Denzin & Lincoln, 2006), besides it proposes an analysis of an autoethnographic bias, given that, its author is also part of the teaching staff of public schools. The data presented in this research are generated in interactions in qualitative semi-structured interviews and recorded in audio (Mishler, 1986; De Fina, 2009) and through *whatsapp*. In addition, the interviews in this study are analyzed based on the theoretical perspective in Narrative Analysis (Labov and Waletzky, 1967; Labov, 1972; Riessman, 2008; Bastos & Biar, 2015), more precisely in the conception of non-canonical narratives, micronarratives (Bamberg & Georgakopoulou, 2008) and life stories (Linde, 1993), focusing on life experiences and micro order positions that dialogue with macro discourses. The research is situated in the context of Contemporary Applied Linguistics (Moita Lopes *et al.*, 2006; 2013) with the advent of the pandemic outbreak, which directed this research theme to dialogues with the concepts of affective equality (Apple, 2017), hope (Crapanzano, 2003; Miyazaki, 2004; Silva, 2021; Cortella, 2014) and necropolitics (Mbembe, 2016) linked to the digital path of unofficial tools opposing the official ones as an attempt to reach and survive teaching and learning in the public network.

Bú kèqì (不客气 Don't be polite) and Yào yǒu lǐmào (要有礼貌 You need to be polite) – Understanding Chinese Politeness

Lecture

*Dr. Qing Li Kinnison*¹

1. Wofford College

Bú bié kèqì is a formulaic response to *xièxie* (谢谢 thank you) in Chinese, like “You’re welcome” is to “Thank you” in English. *Kèqì* is often translated as *polite/politeness*, so the literal translation of this phrase is “Don’t be polite.” Chinese parents often instruct their children: “*Yào yǒu lǐmào*,” (You need to be polite), as *lǐmào* is another word translated as *polite/politeness*. So, what is Chinese politeness? To be (polite - *lǐmào*) or not to be (polite - *kèqì*), that is the question. Researchers on Chinese politeness choose one or mix them, but they fail to explain the discrepancy in Chinese behaviors: respectful, deferential, and humble with some people and then disrespectful, blunt, and rude with others. This study aims to explore the differences between the two lexemes because, the author contends, knowing the distinction is the answer to understanding Chinese politeness. First, neither of these two lexemes is equivalent to English *polite/politeness*, nor do they designate Chinese politeness by themselves. They are distinctive both in etymology and usage. *Lǐmào* derives from Confucian *lǐ* (ritual propriety), a guiding principle for Chinese social conduct in respecting hierarchical social orders (Cua, 1983). In contrast, *kèqì* was used first in *Zuǒ Zhuàn* (左传), an ancient Chinese narrative history describing a feigned act of a warrior in a battle during the Warring Period (520BC). Examples of different usage of the two words are found in over 800 sentences with *lǐmào* and over 750 with *kèqì*. These sentences were selected from stories, novels, newspaper articles, speeches, blogs, etc., and listed online as samples for composition. The data shows that *lǐmào* and *kèqì* are by no means synonyms as they are used in different contexts and are unexchangeable in many cases. *Lǐmào* is often used together with civility or civilization (文明 *wénmíng*), indicating it is related to civility and civilization (Sifianou 2019:54). It is used as a criterion of morality (道德标准 *dàodé biāozhǔn*). It denotes one has self-cultivation (修养 *xiūyǎng*) and a good upbringing (有教养 *yǒu jiàoyǎng*), etc. But these positive attributes are not used with *kèqì*, as it often implies fakeness and insincerity, as a blogger states: “In many cases, *kèqì* is not applied to express self-cultivation or *lǐmào*, but to create [personal] distance.” The author argues that *lǐmào* and *kèqì* are the two ends of a spectrum of Chinese politeness. Unlike the Anglophone culture believing, ideally, that everyone should be treated politely, regardless of social status or relational distance, Chinese politeness, however, is conditional and selective based on hierarchical orders and relational distance. It is more outward performance and formality with those high in the hierarchy or with acquaintances, i.e., colleagues, to observe social harmony, but not with strangers or insiders. It is frowned upon as *kèqì*, fake or insincere, if performed to kins and family because it destroys intimacy and solidarity.

Call-takers impoliteness in Estonian emergency calls

Lecture

Mr. Tiit Hennoste¹, Mrs. Andriela Rääbis¹, Ms. Piret Upser¹, Ms. Kirsi Laanesoo¹, Ms. Andra Annuka-Loik¹

1. University of Tartu

The topic of our presentation is call-takers linguistic impoliteness (rudeness, face attack) towards callers in Estonian emergency calls. Our research questions are (a) in what social actions (speech acts) impoliteness occurs, (b) what triggers it, and (c) how the callers respond to impoliteness.

Our data consists of audio-recorded calls from the emergency call corpus of the University of Tartu. When defining impoliteness, we are based on reactions of interactants, in which rudeness is assessed by the interactants themselves, and linguistic markers of impoliteness found in previous studies (Bousfield 2007, Culperer 2011, Taylor 2011), including those used in emergency calls (Tracy & Tracy 1998).

Preliminary results reveal that there are two groups of impolite social actions. One group consists of reproaches to the caller, which are themselves impolite actions. Some of the reproaches concern the information provided by the caller (e.g., providing insufficient or incorrect information), some of the reproaches criticize the making of an emergency call if the incident does not deserve it. These are often accompanied by patronizing comments about the caller. Another group consists impolitely formulated questions, requests, refusal of help and unilateral closing of calls by call-takers.

The analysis shows that impoliteness is mostly triggered by the caller. These dismissals can be divided into three. The largest group includes drunk or rude callers, and those who do not follow social norms of interaction (e.g., do not answer repeated questions). The second group consists of cases where the information provided by the caller does not meet the standards of the call-takers or the Emergency Response Center. Only in a few cases the call-takers initiate an impolite social action without the influence of the caller.

Callers rarely respond to rudeness: the analysis showed only three cases of explicit response by callers to the call-takers' impolite actions in our data.

Celebrification and viewer interaction in microcelebrities' product promotion videos

Lecture

Prof. Chi-hua Hsiao¹

1. Tunghai University

This study adopts digital ethnography and discourse analysis to investigate celebrification in product promotion videos created by microcelebrities based in Taiwan. To explore the communicative functions of celebrification practices, in particular how product features motivate novel practices, I focus on three interrelated levels of analysis on videos and viewers' comments collected from the microcelebrities' YouTube channels. First, I examine how microcelebrities use multimodal resources to describe products and advertise them. I then analyze how microcelebrities present themselves via celebrification practices to project images suitable for product brands. I also examine viewers' comments in response to microcelebrities' self-presentation and celebrification strategies. I argue that celebrification in product promotion videos constitutes a creative means of communication for microcelebrities to craft a "self" according to product features (Goffman 1959). Furthermore, this analysis shows that celebrification is not just about making oneself stand out and become famous. Celebrification contains one's capability to express the salient aspects of oneself that match product highlights and to endorse products while maintain some sense of "authenticity" perceived by viewers. In product promotion videos, using celebrification delicately to customize self-presentation for products and to provide viewers with genuine opinions is a media literacy that demonstrates microcelebrities' competence related to product advertisement and social protocol.

Challenges and limitations of analyzing impression management

Lecture

Mrs. Éva Szabó¹

1. University of Szeged; MTA-SZTE-DE Research Group for Theoretical Linguistics and Informatics

Impression management is a complex, productive phenomenon which has been found to play a crucial role in social interactions. Social-psychological and pragmatic research analyzes its different levels and aspects, characteristics depending on the cultural, situational, and contextual factors (Goffman 1959; Leary 1995; Archer 2018, etc.).

There have been several attempts to describe impression management. According to Schlenker (1980), impression management is an un/conscious attempt to achieve a certain image and control of the projected self-image in real or imagined social interactions. Impression management manifests on different levels of awareness, and it affects verbal and nonverbal behavior, including the choice of linguistic items (Verschuereen 1999). Many studies define several patterns called impression management strategies and tactics which are adaptable for creating, maintaining or defending certain impressions. Nevertheless, the established taxonomies vary according to the analyzed corpora, methodological processes, and the scope of the acquired definition. Also, many scholars have explored external and internal factors which influence the usage of impression management tools by interlocutors such as motivation, short or long-term goals, current or potential image, and audience. The investigation of impression management has basically been founded on researchers' observations and spoken corpora.

This problem-based research aims to investigate impression management in Hungarian political discourses and everyday communication. Its object is to define the factors and methods which may be necessary and suitable for the pragmatic investigation of impression management in order to gain a wider scope of human interaction in this aspect. The research faces theoretical and methodological diversity and attempts to demonstrate what problems emerge during the application of various theories, methods, and analysis techniques in the study of impression management. This paper presents the investigation of Hungarian political debate shows, an open-ended discourse completion test (DCT) aiming to trigger impression management strategies filled out by Hungarian university students, and an attitude questionnaire which focuses on the relation between attitudes and linguistic items related to impression management. Combining these various types of data sources and analytical methods the paper introduces new methodological pathways for analyzing impression management. The study concludes that the applied methods separately offer limited insight into the understanding of impression management, but the combination of data collection and analytical methods may provide the possibility of verifying the components and factors of impression management and may lead to well-grounded results.

Changing sociocultural context, changing social meanings of gender references in the pragmatics of translation

Lecture

Prof. Zhuo Jing-Schmidt¹

1. University of Oregon

The social meaning of gendered referents has changed dramatically in the last 5 or so decades in response to changing sociocultural contexts. How does this change impact pragmatic decisions in translation across gender-diverse languages? This presentation examines the changing social meanings of gender and gendered references in translation from a gender-neutral language to a language with pronominal gender marking in the larger sociocultural context of Anglo-American developments in linguistic gender neutrality. This study draws attention to the social meaning of gender representation in the pragmatics of translational and its place in pragmatics in general.

Chinese is grammatically gender-neutral and number-unmarked. Its isolating typological profile poses difficulties for translation to a typologically different language such as English with number and pronominal gender marking. In this work-in-progress talk I trace how English translations of the ancient Chinese text Tao Te Ching (TTC) or Dao De Jing 'Book of the Way', ascribed to the sixth-century BCE philosopher, Lao Tzu (Laozi), have changed over time in handling gender as a translation problem arising from the typological differences between the source and the target languages. I specifically focus on the history of how gender-indefinite personal references in the Chinese original are rendered and recontextualized in English in relation to the larger socio-cultural shift toward gender parity in language use in the Anglo-American cultural context where gendered references have taken on new social meanings.

Quantitative analyses of frequency changes in generic masculine forms and qualitative semantic-pragmatic analyses of such forms were conducted based on a corpus of fifteen best known translations published between 1891 and 2003. The results showed a steady decrease of generic masculine forms in the TTC translations corpus. A strong correlation was found between this trend and the overall decrease of generic masculine uses in the corpus of Google Books n-grams within the same time interval. Scrutinizing these results for historical pragmatics, I argue that the pragmatic and semiotic interplay varies not only across cultural contexts in translation practice, but the recontextualization of the source semantics also changes across historical contexts shaped by macro sociocultural shifts in the target culture. The irony of this history is the gender-neutral Way in the original text finally came to the English-speaking audience thanks to the second wave feminist language reform in the U.S. after the masculine Way, semantically inaccurate as it is, had prevailed for over a century.

Children's and adults' sensitivity to over-informativeness and under-informativeness in referential communication

Lecture

Dr. Chiung-chih Huang¹, Dr. Kanyu Yeh¹

1. National Chengchi University

Effective communication requires interlocutors to be informative. According to the Maxim of Quantity (Grice, 1975), the speaker should be as informative as required but no more informative than needed. Previous studies, however, have shown inconsistent results as to whether adults and children are sensitive to informativeness as speakers and as hearers. Some studies reported that adult speakers and hearers are sensitive to under-informativeness but not to over-informativeness (e.g., Engelhardt et al., 2006); other studies revealed that adult speakers and hearers are sensitive to both under- and over-informativeness (Davies & Katsos, 2013). As for children, it has been suggested that children often fail to detect pragmatic violations of informativeness as hearers even though they have little difficulty producing optimally informative utterances as speakers (e.g., Sonnenschein, 1982). Other studies, however, demonstrated that children are pragmatically competent as speakers and hearers, but that they lack metalinguistic awareness about accepting or rejecting pragmatically infelicitous utterances (e.g., Davies & Katsos, 2010).

In order to gain a better picture of this issue, the present study investigated whether Mandarin-speaking adults and children were sensitive to informativeness in referential communication as speakers, hearers, and metalinguistic raters. Twenty-seven 5-year-old children and twenty-eight adults participated in three tasks: a production task, a comprehension task, and an appropriateness rating task. The tasks were presented on a laptop, and the materials were designed using the E-prime software. The trials involved an array of four objects manipulated with the presence or absence of a contrast set (i.e., two items of the same type contrasted in size). The responses and stimuli were classified into four informativeness types (over-informative, under-informative, optimal-1, and optimal-2). A 5-point Likert scale was adopted in the rating task. Each of the tasks consisted of 24 target trials for the child participants and 40 target trials for the adult participants; filler trials were also included. The informativeness types, the accuracy rates, the reaction times, and the rating scores were analyzed. The results of the production task showed that while all of the adults' responses were optimally informative, the children's responses were frequently under-informative. As suggested by Matthews et al. (2007), children may not realize that to refer means to describe differences. The results of the comprehension task showed that while the adults were sensitive to both under- and over-informativeness, the children were insensitive to over-informativeness. The results may be related to the fact that unlike under-informativeness, over-informativeness does not preclude establishing reference for the hearers. The results of the rating task showed that while the adults' rating scores for under-, over- and optimally-informative utterances were significantly different, the children's rating scores showed no significant difference. It appears that the children had difficulty judging the appropriateness about informativeness at this age. This study demonstrated that the adults followed the Maxim of Quantity in referential communication as speakers, hearers, and metalinguistic raters. The children, however, seemed to have asymmetrical sensitivity to under- and over-informativeness as speakers and hearers; in addition, they appeared to have limited metalinguistic awareness about informativeness.

Chinese politeness revisited: evidence from the *Yijing* ‘Book of Changes’

Lecture

Dr. Anita Huang¹

1. *Columbia University*

Previous works on Chinese politeness all emphasize modesty (humbleness, self-denigration, elevation of others) as the most important guiding principle of Chinese communicative behaviors as observed in the system of historical honorific forms of address and practiced in the Confucius rituals (Gu, 1990; Pan & Kádár, 2011). Many trace the origin of *li* ‘rites’ and *limao* ‘politeness’ to the *Liji* ‘Book of Rites’. However, *li* ‘rites’ was already under threat when the *Liji* was canonized. Most of the honorific forms have disappeared in everyday speech. Some even claim that Chinese lack negative face to counter Brown & Levinson’s (B&L’s) politeness theory (1987). Very little is said about Chinese impoliteness. In this study I reexamine Chinese (im)politeness through a careful reading of the most ancient and influential classic, the *Yijing* ‘Book of Changes’, which predates the *Liji*, and is a collective work of ancient sages’ wisdom including that of Confucius. Though the word *li* ‘rites’ did not stem from the *Yijing*, the unfolding of the line-statements in the *qiān* ‘humbleness’ hexagram reveals that Chinese possess both positive and negative face and that both politeness and impoliteness are motivated by the pursuit of auspiciousness.

Based on the teachings of the *Yijing* and B&L’s work, my study reexamines the notion of “self-face” in Cheng’s self-politeness model (2001) and challenges his approach, which discards B&L’s factors (power, distance, and rank of the imposition) that influence the assessment of a face-threatening act (FTA) when calculating the degree of self-face loss. Under his account the threat to a speaker’s face is evaluated depending on the confrontationality of a communicative event, the gravity of the threat which consists of two aspects: the severity and directness of the FTA such as a complaint, and the severity and consequence of doing a self-FTA (SFTA) such as an apology. The greater the self-face loss, the higher the number of a super strategy one would choose and vice versa (withholding an apology being the highest and boldly apologizing being the lowest). However, it is unclear how the confrontationality of an event, the severity of a FTA, and the consequence of a SFTA should be calculated. While Cheng would apologize to his wife in response to her complaint: “you left the shoes in the living room again,” a husband who is in a bad mood, with a tremendous ego, or sees his wife as an inferior would not. During the 2021 U.S.-China summit in Anchorage, Secretary Blinken went boldly on record to admit faults even without being asked to do so, while Chinese delegates avoided questions raised, risking being perceived as rude, despite a high level of confrontationality and the gravity of the threat. Without stipulating a separate model for self-politeness, I propose to add a dynamically calculated weight to evaluate self-face (*mianzi* ‘face’) which varies depending on one’s status, power, emotions, urgency, goals, etc., as revealed in the *Yijing*.

Code-switching and Code-mixing in Parsi Gujarati: A Structural Analysis

Lecture

*Ms. Scherezade Dastur*¹, *Dr. Anindita Sahoo*¹

1. Indian Institute of Technology Madras

The present study focuses on the constraint-based structural analysis of code-switching (CS) and code-mixing (CM) between Parsi Gujarati (a variety of Gujarati), and English, based on the observations of Parsi (Indian Zoroastrian) speech, using the Interactional Linguistics framework (Ford, 1993; Ochs, Schegloff & Thompson, 1996; Couper-Kuhlen & Selting, 2001). The objectives are three-fold. First, to identify the syntactic characterization of CS and CM in Parsi Gujarati (PG) discourse. Second, to explore which aspects of the English grammatical system are morphologically and syntactically integrated into the grammar of PG. Third, to examine whether the formal aspects sufficiently describe and explain the occurrences of CS and CM in PG.

The present study deals with four major constraints: the size-of-constituent constraint, the complementizer constraint, the conjunction constraint, and the determiner constraint (Kachru, 1978). The data for the current study was collected using audio-visual recordings of naturally-occurring conversations among Parsis. Our analysis reveals that the determiner and the size-of-constituent constraints (1-2) are adhered to but the complementizer and conjunction constraints (3-4) are violated. Regarding the second objective, it is observed that occurrences of morphological and syntactic integration of English elements into PG, are manifested (5).

‘I like (fritters) that’s why I make (him) bring them (for me), of potatoes and the like.’

To analyse the examples given above, we have used the Matrix Language Frame model (Myers-Scotton and Jake, 2009) which has been tested favourably against the data that are presented here. The model reflects the Uniform Structure Principle that motivates an explanation for which structures occur and do not occur in CS. Therefore, a thorough study, using this model, on the formal account of code-switching and code-mixing along with the structural constraints of PG would provide insights to understand the communicative process and language behaviour of bilinguals better.

Coherence and common ground in Facebook ‘group tagging’ interactions: Approaching platform-specific communicative practices

Lecture

*Mr. Vinicio Ntouvlis*¹

1. University of Vienna

This study presents a sociopragmatic approach to ‘group tagging’, a platform-specific communicative practice that is unique to Facebook (FB). When engaging in group tagging, FB users tag the titles of FB groups in posts and comments, so that these tagged titles may effectively constitute utterances. This results in stretches of interaction consisting of tagged FB group titles, which appear in hyperlink format and thereby differ from plain typed text. These titles functioning as utterances typically belong to pre-constructed FB groups, which are seen as existing primarily for the purpose of being tagged, and are thereby labeled ‘tag groups’. In (1), commenter A tags a group (marked in bold) intended for mocking unsupported claims, and B responds also tagging a group.

(1) A: **Source: Dude, trust me.**

B: **Hey I’m in that group**

[Screenshot: <https://ucloud.univie.ac.at/index.php/s/10fVFIUgWziAr14>]

The extensive reliance of this communicative practice on platform infrastructure (v. FB groups, tagging), which is mobilized in a unique way for interactional purposes, invites questions concerning how (or whether) group tagging interactions may function as conversations for users engaging in them.

In this vein, the present study asks how group tagging interactions are treated as coherent by FB users. For this examination, *coherence* is understood from a discursive pragmatic perspective as an interactional achievement (Bublitz 2011) with a particular emphasis on *common ground* as a key factor in coherence establishment. Given the study’s sociopragmatic orientation towards the ‘local’ characteristics of interactions, special attention is paid to the platform’s infrastructural elements since they are central to group tagging. The routine achievement of coherence in group tagging interaction is thereby also treated as connected to the platform’s *affordances*, inspired by recent developments in (Digital) Conversation Analysis (cf. Jucker 2021).

Methodologically, the analysis is based on data from a digital ethnographic study of two FB groups thematically focused on ‘tag groups’. The observational data is treated with an analytical apparatus inspired by Conversation Analysis, and the approach is additionally informed by interview data from semi-structured interviews with FB group administrators familiar with group tagging.

The findings suggest that group tagging engenders coherent multi-party interactions for users on the basis of common ground established through the users’ shared histories of socialization on FB. Specifically, to participate in group tagging conversations, users rely on: (a) shared learning concerning FB’s affordances; (b) dynamic communicative repertoires which include FB groups as stylized communicative resources; and (c) *media ideologies* (Gershon 2010) concerning FB’s infrastructure.

By examining a unique, platform-based communicative practice, the study illustrates how user-oriented, localized approaches can start from turn-by-turn micro-analysis to reveal how the dynamic (re)interpretations of social media infrastructure birth new forms of interaction that are uniquely meaningful for niche communities of social media users.

Common ground updates do not depend on how information is conveyed: a recognition memory study

Lecture

*Ms. Eleanor Miller*¹, *Prof. Mikhail Kissine*¹

1. *Université Libre de Bruxelles*

Assertions and implicatures typically convey new information, whereas presuppositions reference given content. But any content can be syntactically asserted, implicated or presupposed. Assertion, implicature, presupposition and conventional implicature are classically distinguished in the literature according to contributions to truth values, projection, and at-issueness (Beaver et al., 2017).

One seminal theoretical distinction is that of Stalnaker (2002): conversations take part against a backdrop of shared information, or common ground, made up of true presuppositions. Assertions are candidate common ground propositions. Speakers can presuppose those propositions which are in the common ground, but may also act as if they are presupposing content that is not in the common ground. Hearers are expected to accommodate these informative presuppositions, adding them to the common ground only to understand the utterance. Accordingly, presupposed content is not expected to update the common ground like asserted (or implicated) content. Results from the experimental literature vary: while some results indicate that accommodation is minimal (Tiemann et al, 2015), others show that informative presuppositions are not ignored (Bacovcin et al., 2019).

In three experiments conducted in English, we compared common ground updates across forms, using recognition memory as a proxy, because content that can be referenced in future conversation is necessarily remembered. We constructed a short story in which 12 targets were either asserted (“The driver was texting”), presupposed (“The driver stopped texting when their eyes met”), conventionally implicated (“the driver, who was texting, met her eyes”), or conversationally implicated (“Who still texts and drives? She wondered”). Participants read this story and, either immediately or after a delay of several days, completed a recognition test. Half of all participants were further distracted while reading the story. We found no significant differences in recognition memory across forms.

We then hypothesized that content may update the common ground quantitatively but be qualified differently. We replicated the first experiment with a within-participant design and collected certainty ratings per answer. Experiment 2 replicated our initial results and certainty ratings showed no significant differences. We then asked whether presupposition may trigger better verbatim memory, leading participants to derive the content only when cued by the recognition test. Experiment 3 found very low and similar verbatim recognition across forms. It thus appears that participants do indeed accommodate and remember presupposed contents similarly to assertions, implicatures and conventional implicatures.

Complex structures in real communications between pilots and air traffic controllers: making a case for a pragmatic analysis of Aviation English

Lecture

*Dr. Malila Prado*¹, *Dr. Adriana Porcellato*²

1. BNU-HKBU United International College, 2. Universidade de Sao Paulo

International radio communications between pilots and air traffic controllers are held in English and are highly prescribed, so as to guarantee flight safety. This prescriptive language consists of Standard Phraseology, a set of fixed phrases to be used in determined phases of flight, and what the UN agency International Civil Aviation Organization (ICAO) regards as *plain language* (ICAO, 2010), a more conversational language employed when the unexpected – such as engine failures, bird strikes and flight control issues – happens. In order to be licensed for international operations, pilots and controllers undergo aviation English tests that are presumably based on the Language Proficiency Requirements (LPRs – ICAO, 2010), put forth by ICAO to establish proficiency levels and parameters for language teaching and testing. To understand the language used in communications between pilots and controllers, corpus pragmatics studies were carried out through the Radio Telephony Plain English Corpus (RTPEC, Prado & Tosqui-Lucks, 2019), which contains transcriptions of 130 pilot-controller communications over abnormal situations, with a total of 110,737 words. We automatically tagged the corpus for parts of speech (POS) to investigate it quantitatively for items that are listed in the LPRs complex structures glossary (Prado & Porcellato, 2021). Now focusing on a qualitative examination of the complex grammar of the plain language, this paper investigates clause combination, more specifically those listed in the LPRs glossary as *relative clauses*, *participle clauses*, and *adverbial clauses*. The study reveals, on the one hand, the use of aeronautical lexicon combined with ellipsis, such as ‘until established’, ‘when able’, ‘as soon as possible’, among others, and, on the other hand, complex utterances with chunks of phrases grouped together with a view to serving pragmatic functions such as giving reasons, predicting a future action or event, or stating possible consequences of an action. The findings also resonate with studies on the regular patterning of professional discourse that go beyond specialized lexicon and focus on regular patterning/language patterns used to perform specific pragmatic functions (see McCarthy, 2020). We conclude with a discussion on how the study of complex structures employed in authentic communications can inform pedagogical materials in this field by promoting a pragmatic perspective on aviation English teaching and bridging the gap between the language taught in the classroom and the real language used by pilots and air traffic controllers.

Concealed Questions and Free Enrichment

Lecture

*Dr. Yuji Nishiyama*¹, *Dr. Koji Mineshima*¹

1. Keio University

It is well known that some NPs can be interpreted as concealed questions (CQs) (Baker 1968). Thus, *the capital of Italy* in (1a) can be paraphrased as an embedded question, as in (1b).

- (1) a. Ann knows the capital of Italy.
 b. Ann knows what the capital of Italy is.
 c. The capital of Italy is Rome.

Note that the answer to the embedded question takes the form of a specificational sentence like (1c). In (1c), *the capital of Italy* is not a referential NP but a Variable NP and *Rome* is its value (Higgins 1979).

Some authors argued that it is not possible to interpret sentences like (2) as CQs (Nathan 2006, Barker 2016).

- (2) ??Ann knows *the linguist*.

The reading easily available for (2) is not the CQ reading but the acquaintance reading.

One characteristic of sentences that allow CQ interpretation is that the head nominal is *relational*. Thus, *capital* in (1a) denotes some relation that holds of a pair such as (Italy, Rome). On the other hand, *linguist* in (2) denotes a sortal concept whose extension is a set of entities.

This observation suggests the following constraint (Barker 2016):

- (3) CQs require relational head nominals.

We argue against (3) by showing evidence that non-relational head NPs can allow CQ interpretation in a suitable context (cf. Kalpak 2020). Our claim is that the difficulty in interpreting *the linguist* in (2) as a CQ is due to pragmatic reasons, rather than semantic ones as suggested in (3).

It has been observed that the non-relational NP *the semanticist*, which could not be interpreted as a CQ in (4a), can be if it is combined with a restricted relative clause as in (4b) (Nathan 2006, Barker 2016).

- (4) a. *John told me the semanticist.
 b. John told me the semanticist who teaches there.

If it were possible to pragmatically enrich (4a) as in (4b) in a suitable context, then (4a) should also allow a CQ reading. The fact that (4a) does not allow a CQ reading is explained by an inaccessibility of *the semanticist* to pragmatic enrichment. In contrast, *the semanticist* in (5a) can be easily enriched as in (5b) in a suitable context. Such a pragmatic process is “free enrichment” (FE) (Carston 2002).

- (5) a. The semanticist is eccentric.
 b. The semanticist [who teaches there] is eccentric.

This raises the question why (4a) cannot be enriched as in (4b), whereas (5a) can be enriched as in (5b). To answer this question, we claim that FE cannot apply to Variable NPs such as *the semanticist* in (4a). Note that the predicate nominal *a painter* in (6a), which is a non-referential NP, cannot be enriched as in (6b).

- (6) a. John is a painter.
 b. John is a painter [Bob likes].

These examples suggest that FE cannot apply to non-referential NPs in general. We also argue that some apparent counter-examples can be avoided if we distinguish two types of CQ sentences.

Considering pragmalinguistic infelicities in persuasive writing: The case of Albanians writing in Greek

Lecture

*Ms. Alexandra Vasilopoulou*¹

1. Aristotle University of Thessaloniki

Alexandra E. Vasilopoulou

Philologist, MA Teaching Greek to Speakers of Other Languages

alexandravsl125@yahoo.com

George S. Ypsilandis

Professor of Applied Linguistics, Aristotle University of Thessaloniki

ypsi@itl.auth.gr

It has been abundantly documented that pragmalinguistic failure complicates intercultural communication in both productive (Thomas, 1983) and receptive (Riley, 1984) modes. In addition, it has been suggested that this phenomenon of failure creates in others an impression concerning the individual who commits it at a language and, erroneously, at a social level (Leech, 1977; Blum-Kulka and Olhstain, 1986). These consequences are reported to be mostly due to pragmatic differences between the L1 and the L2 and, as such, are based on a transfer hypothesis. This paper concentrates on the persuasive strategies used by Albanian learners of Greek in written discourse (scholarship application letters), and the overall suitability score these received when assessed by Greek professional primary and high school teachers (n=176). The evaluation body (who acted as judges) provided their scores through an internet-constructed evaluation tool and based their judgment on a purposefully created protocol sample which included three representative examples of each one of the three Aristotelian types of persuasive strategies used by the subjects. The suitability of persuasive strategies was examined by using a continuous scale (bar/rod) so as to increase the measurement sensitivity of the dependent variable considered. In addition, whether the educational level (Bachelor, Master, Doctorate) and the teaching experience of the judges (as independent variables) influenced their overall judging ability was explored. Scores registered concerning persuasive strategy suitability seem to have depended upon the type of strategy used. In more detail, scores for logical arguments concentrated around the mid-scale of the instrument, while scores for pathos and ethos tactics were lower and were thus found unsuitable to be employed for this purpose (scholarship application writing). It needs to be pointed out that, the exact same types of ethos and pathos arguments were recorded to be being employed also by Greek postgraduate learners of English (in a similar context, design, and procedure in an earlier study, by James, Scholfield, and Ypsilandis, 1992). This new research findings may indicate that: a) Greek and Albanian persuasive argumentative deployment are to some extent related (comparisons with other similar studies may also suggest suitability and acceptability of certain persuasive universals), and b) there seems to be an inconsistency between the recorded employment of ethos and pathos persuasive arguments by Greeks who used it in their L2 letters, in the study by James, Scholfield and Ypsilandis mentioned above (and thus thought it was suitable to be used in this context), and the evaluation of the same argumentative types (ethos and pathos) as unsuitable by individuals of the same culture and the same educational level. Is this an instance showing that individuals become stricter when they act as evaluators or is this a case displaying that individuals behave linguistically differently, depending on the side of the hill they are found on, in each occasion?

Keywords: Pragmalinguistic failure, persuasive strategies, pragmatic suitability, written discourse

Constraints on complaints: complementation in English and Dutch DCTs

Lecture

***Dr. Caroline Gentens*¹, *Dr. Bram Vertommen*²**

1. KU Leuven, 2. Utrecht University

For Present-day Germanic languages, the structure and function of different subordinated constructions is relatively well-studied. Less attention has been devoted to variation in complementation when it comes to use across individual speakers (but see e.g. Cuyckens et al. 2021), varieties (but see e.g. Van Driessche & Cuyckens 2019) and registers (but see e.g. Biber 1999). In this study, we will chart inter- and intralinguistic differences in the choice of complementation patterns, and examine whether these choices covary with situational variables and language- or variety-specific tendencies.

To keep the situational contexts constant, the primary data set consists of responses to discourse completion tasks (DCTs, see Blum-Kulka et al. 1989; Ogiermann 2018) from native speakers of British English, Flemish Dutch and Dutch Dutch. The respondents form a relatively homogeneous group of about 40 university students in the UK, Belgium and the Netherlands each. The DCTs present situations that are designed to vary in situational variables related to the relationship between the participants (power, acquaintance, closeness), as well as for written vs. spoken contexts of use. In terms of speech acts, the focus is on eliciting different expression patterns of complaints (cf. Nguyen 2013; House & Kasper 1981; Decock & Depraetere 2018), because these expressive speech acts lend themselves well to including the reason for an emotive reaction in the form of a complement clause.

In our talk, we first examine the degree of explicitness of the complaint components (Decock & Depraetere 2018) in relation to the specific language variety and the formality of the situational contexts. We then zoom in on attested differences for specific complementation patterns (e.g. *the fact that-/het feit dat*-clauses; object extraposition). Finally, we evaluate the validity of DCTs as a tool for eliciting complementation patterns in different languages.

Constructing a mob: A membership categorization analysis of accounts for gun use in local and national media

Lecture

Dr. Sarah Creider¹

1. Teachers College, Columbia University

As Wodak (2021) writes, a hallmark of far-right discourse is the construction of “some kind of... minority... as dangerous” (p. 5). In many cases, such groups are explicitly named. In others, however, cultural norms lead to the use of coded language in the creation of a “politics of fear” (Wodak, p. 5). For instance, as many generations of scholars have reminded us, there is a longstanding history of denial surrounding racism in the United States (Baldwin, 1962; Rawls & Duck, 2020; van Dijk, 1992). Because of this pattern, an analysis of even far-right discourse related to Race must include an exploration of what is implied just as much as what is explicitly stated. This study attempts such an investigation, using membership categorization analysis (MCA) to uncover similarities among three texts, all providing accounts for a situation where a White person carried, aimed, or fired a gun in response to an imagined threat from African Americans. The texts were broadcast or published within a one-week period during August, 2020 and include: 1) a transcript of a speech given by Mark and Patricia McClosky at the Republican national convention and describing an event where aimed guns towards a group of protestors; 2) press releases sent out via twitter by state police in response to an apparently racially motivated shooting in a rural mid-western county in the United States; and 3) a letter to the editor written by a member of a group who gathered, openly carrying firearms, in the town square shortly after the same shooting. While the events accounted for in text 1 may seem unrelated to those explained in texts 2 and 3, the three share striking similarities. In each case, actions associated with firearms are described in terms of protection of property. More specifically, category names and associated verbs are used to construct one group of people (*citizens* and *property owners*) who must *defend* their property against another group (*activists* and members of *mobs*). Just as important as what is said in each text is what is implied. For instance, the letter to the editor uses *looting* and *burning* to imply the existence of a group that would commit such actions, although there was no evidence of the presence of such a group. In addition, despite clear racial overtones in each situation, Race is not mentioned in any of the texts. Findings suggest that MCA allows a close look at precisely how imagined categories and actions are brought into being via the use of “inference-rich” (Sacks, 1992) terms. Findings also offer a case study of an instance where the same cultural pattern permeated discourse in the national and local texts, and in texts along a spectrum of institutionality and extremism. Perhaps more importantly, this study suggests that an analysis of what *is* said can lead to a better understanding of what is implied — and that comparing local and national texts can show us what is all too ordinary in both the discourse and the actions of extremist groups.

Construction and preliminary annotation of a telephone interpreting multilingual spoken corpus for the study of face-threatening acts

Lecture

*Mr. Marcelo Yuji Himoro*¹, *Prof. Raquel Lázaro Gutiérrez*², *Prof. Antonio Pareja-Lora*²

1. *Universidad de Alcalá / Universidad Nacional de Educación a Distancia*, 2. *Universidad de Alcalá*

In the last few decades, telephone interpreting services have seen solid growth and consolidation. This is thought to be due, in part, to the potential of lowering operating costs and ensuring the availability of services in remote areas or even in emergency situations, such as the recent COVID-19 pandemic. In fact, research on dialogue interpreting, however, has traditionally focused more on the public service interpreting domain. The primary goal of this piece of research is to present the first steps of a study on telephone interpreting across different domains, both within and outside public service interpreting. This contribution focuses on the domains of roadside assistance, and home and auto insurance, and describes the construction and preliminary annotation of a spoken corpus of interpreter-mediated telephone conversations, geared towards the study of face-threatening acts (FTAs – Brown/Levinson, 1987). For this purpose, we are using a methodology based on corpus pragmatics, and our initial assumption, following Lázaro-Gutiérrez (2021), is that a high number of FTAs of different natures occur in this kind of asynchronous and delocalized interaction.

Thus, we will briefly describe some tasks accomplished so far (Himoro/Pareja-Lora, 2022), namely the compilation, anonymization, initial processing, transcription and translation processes, conversion of the transcripts to the EXMARaLDA format (Schmidt, 2004) and its synchronisation with the corresponding recordings. The conversations compiled for the corpus involve Spanish and an additional language, such as German, Chinese, French, English or Russian, related to a bilateral interpretation between the agent and the client. Besides, we will discuss the tasks currently being carried out or to be dealt with in the near future within the new PRAGMACOR project (Spanish Ministry of Science & Innovation, PID2021-127196NA-I00), that is, (1) a deep analysis of metapragmatic elements and the discourse in the corpus, both quantitatively and qualitatively, to extract frequent discursive patterns (common questions, recurring topics and frequent formulas, among other aspects); (2) developing a tagset and tagging guidelines for the annotation of discourse and/or FTAs; (3) semi-automatically annotating the phenomena of interest and evaluating these annotations; and finally, as an ultimate goal, (4) creating of training and practical materials, such as glossaries and guides, for professionals in this field aiming at improving the quality of telephone interpreting services offered. The deliverables to be produced in the PRAGMACOR project will address the need for telephone interpreter training and the lack of materials, inevitable due to the newness of this modality.

Contingent (dis)agreement and emotional expressiveness in online sociopolitical talk

Lecture

*Prof. Mei-Ya Liang*¹

1. National Central University

This study explored online participants' expressions of (dis)agreement in response to controversial sociopolitical issues about the TikTok ban and the Mulan boycott. Online participants often express opinions and positions and judge the perspectives and actions of their interlocutors to construct identities and fulfil social-emotional functions in text-based computer-mediated communication (CMC). CMC cues, such as emoticons, multiple exclamation marks, and figures of speech, can be used with verbal emotive devices to mitigate, aggravate, or mock disagreement in online discussions (Langlotz & Locher, 2013; Vandergriff, 2013). A number of studies have investigated the use of online (dis)agreements (e.g., Angouri & Tseliga, 2010; Baym, 1996; Bolander, 2012; Fernández-Amaya, 2021; Graham, 2007; Harb, 2020; Shum & Lee, 2013) and in English as a lingua franca (ELF) (e.g., Harbib, 2008 ; Maíz-Arévalo, 2014). While sociability and emotional support can be achieved through agonism or ritualized forms of disagreements and disputes in playful or humorous socialization, disagreements may lead to conflicts and oppositions while negotiating knowledge, identity, views or relationships (Georgakopoulou, 2001; Harb, 2008; Kakava, 2002; Schiffrin, 1984; Tannen, 2002). In addition, CMC cues, such as emoticons, multiple exclamation marks, and figures of speech, can be used with verbal messages to mitigate, aggravate, or mock disagreement in online discussions (Langlotz & Locher, 2013; Vandergriff, 2013). However, fewer research studies have explored university students' employment of (dis)agreement and multimodal discursive strategies in an online intercultural group. This study focused on emotional expressiveness of (dis)agreement through emojis and verbal strategies by linguaculturally diverse students who socialized and communicated with one another on Facebook.

The data were selected from online comments made by 43 students (3 moderators, 20 Taiwanese undergraduate students, and 20 international graduate students) who participated in moderated discussions in a private Facebook group as extracurricular activities. International students were composed of different nationalities, including Haitian, Indian, Indonesian, Pakistan, Paraguayan, Russian, Swazi, Thai, and Vietnamese. The participants shared their perspectives mainly in ELF with emojis. This study analyzed their comments in an online intercultural context of debates about geoeconomic and sociopolitical conflicts. To identify the participants' disagreement strategies, the study adopted and adapted the analytic frameworks from previous studies (Fernández-Amaya, 2021; Harb, 2020; Shum & Lee, 2013). The results showed that all participants tended to mitigate (dis)agreements and provide supporting grounds and, in particular, personal and emotional reasons based on their knowledge about the ban and boycott. While both Taiwanese and international students always gave contingent (dis)agreements, indicating that they claimed no responsibilities for showing approval or dissent, the moderators frequently used reported speech, gave opposite opinions, and questioned the claims to encourage debates and discussions. It is interesting to note that the graduate students also made more suggestions compared to the Taiwanese undergraduate students. Further discourse-pragmatic analyses of a series of comments that contain cohesive and emotive moves with or without emojis demonstrate how the participants interactively managed (dis)agreements in the socioemotionally supportive ELF interactions while negotiating relational identities and political stances.

Conventional meaning and conventional implicature: non-truth-conditional meanings of conditionals

Lecture

*Dr. Alex Reunecker*¹, *Prof. Arie Verhagen*¹

1. Leiden University

In this paper, we address the terminological confusion that surrounds the notion of conventional implicature in the pragmatics literature. Grice's (1989: 25-26; 86, 88) remarks on the notion are very brief, and therefore, admittedly, involve a risk of obscurity. Indeed, different authors have understood and used the term *conventional implicature* in very different ways, ranging from non-truth-conditional aspects of the functions of words (e.g. Levinson 1979; Birner 2013; Potts 2005) and presuppositions of sentences (e.g. Karttunen & Peters 1979) to complete dismissal of the notion in Relevance Theory (e.g. Carston 2006).

First, we will argue that there is definitely a 'niche' in the theory of language use for a notion of conventional implicature, provided we recognize the necessity of fixing the meaning of terms in scientific theories more tightly than in everyday communication, especially in relation to the terms *meaning* and *convention* (Verhagen 2019, 2021). We begin with a fresh 'close reading' of the original remarks by Grice, concluding that these actually indicate a need for distinguishing, in rather specific ways, between a) conventional *meaning* and conventional *implicature*, and b) meaning at the level of items (words, but also grammatical constructions) and at the level of sentences and utterances. Most importantly: a combination of conventional meanings of items in an utterance may license an implicature (an interpretation of the utterance that does not affect its truth conditions) that is not co-dependent on knowledge beyond the conventional items involved. Second, we characterize common interpretations of the notion conventional implicature in the pragmatics literature and the more or less radical failures to recognize these distinctions.

Finally, we will demonstrate the usefulness of the distinctions we propose by means of a case study of conditional constructions in natural language, based on a corpus study of Dutch (Reunecker 2022). Our conceptualization of the difference between conventional meaning and conventional implicature allows us to assign the most common Dutch conditional construction ('*als p, (dan) q*', 'if p, (then) q') the function of indicating unassertiveness and connectedness as components of its conventional meaning, which contribute to various non-truth-conditional aspects of the interpretation of conditional sentences in discourse, such as specific types of unassertiveness (e.g. uncertainty or hypotheticality, Declerck & Reed 2001), and specific types of connections between *p* and *q* (e.g. causal, epistemic and speech act, Dancygier & Sweetser 2005). Although the corpus data show some grammatical features to be statistically correlated with certain implicatures, none of these relations is strong enough for an implicature to be called 'conventional' in the sense we are proposing (Reunecker 2022). This implies a relatively large role for pragmatics, and perhaps lexical semantics, in explaining the ways in which conditionals are interpreted.

So, while the notion of conventional implicature does not appear to be instantiated in the grammar of Dutch conditionals, we show it is precisely our act of distinguishing between conventional implicature and conventional meaning that allows for an analysis of natural language conditionals in terms of two general (non-truth-conditional) aspects of conventional meaning and more specific conversational implicatures.

Converging evidence for time-space conflation in Mandarin Chinese

Lecture

Prof. Zhengguang Liu¹, Ms. Ziyang Zhang¹

1. Hunan University

Contrary to the popular conception of unidirectional cross-domain mappings from space to time in thought and language, as demonstrated by an overwhelming list of studies on English (e.g., Lakoff and Johnson, 1980; Clark, 1973; Boroditsky, 2000, etc.), this paper proposes a new view of space-time conflation in Mandarin Chinese. Starting from the basic grammatical categories of nouns and verbs, which involve a conceptualization of spatial and temporal features respectively (Langacker 1987), we will focus on the distinctive grounding (Langacker, 1987, 2008; Brisard, 2002) of nouns and predicate verbs or clauses and their functional fusion in Chinese.

We argue that, unlike in English, time-space conflation can be demonstrated by the optionality of grounding nouns and predicate verbs or clauses, which leads to a typical features of Chinese, viz. the abundance of nominal predicate sentences and sentences without verbs. By extension, the multifunctionality of grounding elements, including conflation in the use of classifiers and aspect markers, also serves to support our hypothesis. Not only can nouns be used as predicates and are verbs optional for a sentence, nominal and verbal classifiers in Chinese can denote both spatial and temporal meanings and aspect markers, like “着” (Zhe), expressing continuation, can trigger both existential and ongoing process readings.

Furthermore, we discuss the functional fusion of nouns and verbs, serving as important evidence for our time-space hypothesis, on the basis of Shen Jiaxuan's (2016) Noun-Verb Inclusion Theory in Chinese, which regards verbs as a special subcategory of nouns: verbs can be used as subjects and objects without any grammatical marking and markers to modify or signify verbal expressions can be substituted by nominal ones. Despite these observations, we point out Shen Jiaxuan's overemphasis on the status of nouns and argue against regarding them as a basic category by discussing nominal and verbal constructions where both temporality and spatiality coexist, as with the combination of both NP and VP + locative words, such as “前” (Qian) (front), “后” (Hou) (back) and “中” (Zhong) (middle), etc., to express spatial and temporal meanings.

Based on this converging evidence, we argue that our time-space hypothesis can offer coherent accounts for various alleged “idiosyncrasies” in Chinese grammar, including subjectivity, topic-prominence, and the integrative cognitive style of Chinese thinking as well as its effects reflected in actual language use.

Corpus analysis of negative emotive words in Discourse Grammar Framework

Lecture

Prof. Károly Bibok¹, Dr. Martina Szabó²

1. University of Szeged, 2. University of Szeged and ELKH CSS-RECENS

Theoretical background. The term *negative emotive word* (henceforth: *NEW*) refers to words having a prior negative semantic content, but they can lose it partly or totally in certain cases, e.g. *terribly nice* or *The party was terrific!* (Szabó and Bibok 2019). The previous literature mainly discussed NEWs as intensifiers, not considering the pragmatic aspects in detail. However, they have several other pragmatic-related functions. In the function of intensifiers, they can be examined as *polarity losers* in a framework of lexical pragmatics. NEWs expressing positive evaluation (*polarity shifters*) can be considered a specific type of enantiosemy. What is more, being markers of positive politeness, evidentiality and attention, NEWs are able to fulfill a third – interjective – function (Szabó and Otani 2022).

Aims. Aims of the present paper are twofold. First, relying on corpus data, we analyze the above-mentioned functions within Discourse Grammar Framework, which distinguishes two domains of discourse organization, namely Sentence Grammar and Thetical Grammar (Heine 2013). For this investigation, the Hungarian *durva* (lit. ‘harsh’) and *durván* (lit. ‘harshly’) have been annotated in three corpora, representing (i) official texts published on a news web portal, (ii) informal texts of tweets, and (iii) spontaneous oral texts. Second, in the three examined corpora we compare domain-dependent peculiarities of NEWs, not discussed in the literature so far.

Conclusions. Based on our investigation, we can formulate the following conclusions. First, the polarity loser and polarity shifter functions of NEWs are related to Sentence Grammar since they are grammatically dependent, and, from a semantic point of view, contribute to the propositional meaning of utterances (Heine et al. 2013). At the same time, NEWs in their interjective function is related to Thetical Grammar since they are syntactically autonomous and positionally mobile, as well as their meaning is basically procedural rather than conceptual (Ahn and Yap 2022). Second, the frequency distribution of functions of NEWs is highly domain-dependent. What is more, the thetical usage is clearly underrepresented in the corpus of news. It can be probably argued that the thetical function is extremely subjective (Heine 2013). Therefore, it does not fit in the official text domain.

Correlations between pronominal elements referring to persons and things. A case study of third person and demonstrative pronouns in Hungarian

Lecture

Dr. Krisztina Laczkó¹, Dr. Szilárd Tátrai¹

1. Eötvös Loránd University

In this talk, we examine correlations between Hungarian third-person singular personal pronouns and demonstrative pronouns referring to things from the perspective of Cognitive Grammar and functional pragmatics. From the point of view of our study, it is a key theoretical insight that third-person personal pronouns and demonstrative pronouns that can be classified as deictic expressions do not typically function either as prototypical deictic or as prototypical grounding elements.

Hungarian, like other Uralic languages, does not differentiate between grammatical genders, and natural genders are not formed in the personal pronoun system either, so there is no differentiation between masculine, feminine and neuter genders. By default, the third-person deictic personal pronoun (*ő* 'he/she') refers to a person, that is a human being, regardless of gender. Inanimate things are denoted by demonstrative pronouns (*ez* 'this', *az* 'that') in the default case, with the spatial near-far mapping always at work.

In the framework of a corpus-based study, we ask to what extent this generic schema prevails in the non-gestural use of third person personal and demonstrative pronouns. Our research questions are as follows:

Q1: In which cases does the generic schema outlined above not apply, that is, in which cases do third-person pronouns refer to things and demonstrative pronouns to persons?

Q2: To what extent is the validity of the generic schema influenced by the focal prominence of the designated entity in the sentence, that is, whether it functions as trajector or landmark in the sentence?

Q3: To what extent does it affect the validity of the generic schema if the pronoun appears at the beginning of the sentence, functioning as an anchor for the conceptual processing of clausal information?

For this study, we used the Hungarian National Corpus, focusing exclusively on singular realizations of the pronouns, and we did not set up any statistical hypotheses. From the corpus, we retrieved a sample of 250 occurrences for each of the three pronouns in 50-word contexts. In the case of demonstrative pronouns, we marked constructional uses separately, that is to say, constructions in which the pronoun co-occurs with a determiner, e.g.: *ez a könyv* 'this book', lit. 'this the book', *abban a házban* 'in that house', lit. 'in that the house', so the results contain data on constructional and independent uses both collectively and separately.

Based on the corpus-based study, we can conclude that the singular forms of personal and demonstrative pronouns only partially follow the generic schema based on gestural use. Their use is fundamentally influenced by how they play a role in the grounding and anchoring process.

Covert Communication in Japanese Advertisements

Lecture

Prof. Shigeyuki Suzuki¹

1. Tokyo Kasei University

The presenter will demonstrate, with the help of actual advertisements in Japan, how and why covert communication is frequently used in Japanese advertisements. In his presentation, it will be shown that that covert communication is employed in Japanese advertisements with some sexual innuendo being used in them. In covert communication, advertisers try to accomplish their purpose without making their informative intention manifest to the audience. Tanaka says in her book that the use of sex and the exploitation of the notion of snobbery in advertisements appear to boost sales. As a result, advertisers want to continue to use them, but they simultaneously wish to avoid taking any responsibility for so doing (Tanaka 1994: 36). It is understood that advertisers are trying to boost sales, implicitly telling their intentions that they want to sell their products.

Hall (1976) talks about 'high-context cultures' and 'low-context cultures' in his book and also discusses the importance of context in communication. In his book, Japan is categorized as one of the countries with high-context culture. In such a country as Japan, rather than relying on explicit verbal skills, less-direct verbal and nonverbal communication prevails in the discourse of everyday conversation. This is considered to be the opposite of the countries with low-context cultures, where explicit verbal communication is needed to properly understand a message being communicated.

This idea is also true in the case of advertisements since they are regarded as part of communication. In this way Japanese people are used to looking at advertisements and thinking that the captions in them are not telling them everything and that there could be some kind of hidden agenda behind them.

This is one of the reasons why the use of covert communication is accepted in advertisements in Japan, which will be discussed concretely in the presentation.

With the help of actual examples from Japanese advertisements, the presenter will demonstrate how and why covert communication is frequently used in Japanese advertisements.

Covid 19 and Death Talk: A Conversation of Change

Lecture

***Dr. Gulab Chand*¹, *Dr. Urjani Chakravarty*²**

1. Manipal University Jaipur, 2. Indian Institute of Management Bodh Gaya

Indians have long practiced socialization through conversation. From birth to death the Indian community makes use of one social interaction or the other to celebrate or cope. The event as small or large required the participation of family and friends. In the last few years many such typical institutions were made (a) typical due to the difficult nature of the pandemic. It was heart wrenching to do- away with age-old practices and adapt to a situation never faced by all the living generations in the country. The current investigation looks at the changing practices of death and mourning in the context of Covid 19. Among the several social practices one major change was in the way that conversation related to death was handled among the directly involved and the extended list of people. The conversation of loss and rituals were changed forever as each family created their own way of coping. We see how the theme of death was part of the conversation and distinguish between a regular conversation and a conversation of death i.e. death talk. Conversation is considered as both pleasant and unpleasant depending on the context wherein the latter can cast a shadow on the relationship between the participants.

The approach adopted for data collection is comparative autoethnography with the first author as the collector of data from the local community in Kota, Rajasthan and the second author giving her own data from Patna Bihar. The cultural base of the discussion will try to answer the questions given below:

Is there any comfort in the conversation related to death? Does it help the participants to cope? Thus, the paper discusses the changing nature of a special kind of conversation i.e. death talk within the specific situation of Covid 19 in India.

Cross cultural issues within a dialect context in the Orkney Islands

Lecture

Dr. Tom Rendall¹

1. Orkney College UHI

Cross cultural issues within a dialect context in the Orkney Islands

Dr Tom Rendall November 2022

This paper will focus on the way in which the incomers to the North Isles of Orkney perceive the use of the local vernacular spoken by the indigenous people. Based on Scots English, the dialect also has influences from Nordic countries with lexical inferences and non-standard idioms.

Situated at the Northern tip of Scotland, Orkney has a population of 22,000 dispersed through the 15 inhabited islands, Research was carried out employing interviews with the local inhabitants and people who have moved to the islands.

The main research question asked whether or not the informants were dialect speakers and, if not, did they engage with the vernacular and understand the nuances and vocabulary.

From the perspective of cultural differences, it became clear that the use of dialect did not appear to adversely affect the integration between islanders and incomers. There was evidence of co-operation and collaboration within communities with unexpected high levels of assimilation and accommodation.

Some of the aspects of the culture of the islands may have been challenging for people moving to Orkney but those aspects appear to have been overcome through the willingness of incomers to accept and embrace the concepts of island life along with the meanings and idiosyncrasies of the vernacular.

There are some examples of conversational implicature where the “new” islanders will know what the local dialect speakers mean in their utterances even it is not explicitly enunciated in the speech acts.

The paper will give examples of comments from the interviews where the migrant population have exhibited high levels of understanding within an unfamiliar cultural context. As one of the informants commented:

“I’m not a speaker of dialect because I think that the dialect and the language is so part of life here, I think that if I attempted it, it would be so bad that I really wouldn’t want to offend anybody..... I do use Orcadian words all the time, but I don’t try and do it in an Orcadian accent because that would be awful and nobody needs to listen to that but I certainly text and email in Orcadian and as I say, we speak Orcadian words certainly in everyday language.” (Caroline, Shapinsay)

The main focus of the paper is on the way in which folk such as Caroline perceives the dialect and understands the lexicology without engaging in the vernacular in speech situations. This research in the Orkney Islands should provide a brief synopsis of the ways in which island communities with distinctive linguistic variations co-exist and also highlight features of conversational implicatures where incomers are able to identify meanings and conventions without adopting the words and phrases used by the local people.

Crossover Phenomena and Echo Questions

Lecture

Mr. Takeshi Tsurusaki¹

1. None

Since Postal (1971), varied explanations have been offered (and then discarded) to account for a class of unacceptable anaphora data, known as “crossover” examples:

(1) *Strong* Crossover:

- a. * Who did he shave t ?
- b. * Who does he say Mary likes t ?
- c. * [Whose mother] does he love t ?

(2) *Weak* Crossover:

- a. * Who does [his mother] love t ?
- b. * Who did [the girl he hated] describe t ?
- c. * [Whose mother] did you talk to [the girl who likes him] about t ?

(The distinction between *strong* and *weak* crossover is due to Wasow (1979).) In these examples, the wh-phrase is dislocated (or at least it “appears” to be dislocated) from its original position, crossing over an anaphoric pronoun, to the clause initial position.

To account for these data, Tsurusaki (1995) proposed a pragmatic constraint on anaphoric dependency:

(3) *Presupposedness Constraint on Interpretation (PCI)*:

Elements constituting the “presupposition” of a sentence must be interpreted independently of (i.e., without reference to) the elements constituting the “focus” of the sentence.

Given (3), we can offer a convincing explanation for a wide variety of crossover effects. Consider, for example, the Focus-Presupposition structure of (2a):

(4) F-P Structure of (2a):

- a. Focus: [Who]
- b. Presupposition: [[...] does his mother love t]

According to this F-P structure, “his” constitutes part of the Presupposition of the sentence, and the PCI prohibits “his” from being anaphorically dependent upon “Who,” the Focus element. The unacceptability of (2a), therefore, is readily explained.

Unfortunately, there are a number of systematic “counterexamples” to our PCI-based account:

- (5) a. ? Which picture did [the man who painted it] refuse to sell t ?
- b. ? How many dachshunds does [your friend who breeds them] own t ?
- c. ? What building was [the witness who claimed he had never seen it] walking towards t ?

These *weak* crossover examples (from Wasow (1979)) are fairly good, contrary to our prediction. In our view, (5a) has the following F-P structure, and the PCI predicts its unacceptability:

(6) F-P Structure of (5a):

- a. Focus: [Which picture]
- b. Presupposition: [[...] did [the man who painted it] refuse to sell t]

In this paper, I argue that (5a-c) need not be seen as genuine counterexamples to the PCI. The crucial point to notice is that these are not ordinary wh-questions. Consider the following hypothetical exchange:

- (7) A: John refused to sell a picture.
- B₁: Which picture did he refuse to sell?

B₂: He refused to sell WHICH picture?

In this exchange, B₁ is not a run-of-the-mill wh-question. It is a variant of a special type of echo-question (sometimes referred to as a *legalistic* question clause). Thus, we can use B₂ in place of B₁ without inducing any noticeable difference in meaning. If (5a-c) are echo-questions disguised as ordinary wh-questions, it is not surprising that they are outside the regulative domain of the PCI.

Culture as a tool for identity work: an exploration of L2 Japanese learners' autobiographic accounts

Lecture

Ms. Hiroko Ohashi¹

1. RMIT University

This study demonstrates a novel interpretation of the use of the term 'culture' used by L2 language learners. The study stems from the author's PhD research on L2 Japanese language learners' autobiographic accounts of their learning experiences. The impetus for the study came from the frequent use of 'culture' by the L2 Japanese learners in reflecting on their learning experiences. Culture is one of the most important concepts in L2 language teaching and learning, and Kramsch (2013) gives an overview of how culture has been discussed in language education since the 1970s. Monolithic understanding of "one language = one culture" prevailed and "cross-cultural pragmatics and sociolinguistic appropriateness of language use in its authentic cultural context" (p.66) had been the major research topics until the postmodernist perspectives were introduced in L2 teaching and learning around the turn of the century. In postmodern perspectives, L2 learners' subject positioning through interaction over time represents the discursive practice of 'culture', or 'third place' (Kramsch 2013). Therefore, culture is not only reflected in language but is created in conversation with others (Kramsh 2003). The present study investigates how former students of Japanese language in Australian universities (five+ years after their completing a university degree) construct narratives in their autobiographical accounts of their language learning, and the impact that these experiences have had on their sense of 'who they are'. It is found that 'culture' is one of the most frequently used lexical entities in their personal accounts. Various images are created and assigned to Japanese 'culture' from the outsider vantage points of individual former students. They are used for a cultural comparison which may be based on the already available common discourse of culture of mine (C1) and culture of others (C2) (Menard-Warwick, 2011), or their specific personal experiences. Their reflections on language learning experiences suggest that language learning process represents an intermedial/intercultural space that stimulates their identity work possibly because they react to and evaluate the given Japanese culture and position themselves in relation to it. By using the term 'culture', they position themselves inside/outside of what they imagine to be Japanese culture, and thus, it is a tool of identity work that sheds new light to the study of intercultural learning and pragmatics.

Deideophonization of Korean ideophones: Focusing on monosyllable words in spoken register

Lecture

*Dr. Jiyeon Park*¹

1. Jilin International Studies University

This paper investigates deideophonization in Korean monosyllabic ideophones (also known as sound symbolic words and expressive) by focusing on three factors in everyday language. Previous studies have claimed that monosyllable ideophones are limited to attaching verbal suffixes, such as *ha-ta* ‘do, be,’ *-keli-ta* ‘keep doing,’ *-tay-ta* ‘keep doing too much,’ *-i-ta* ‘keep doing, be’ (Park 1994, 1997). However, earlier works have been concerned with written language, and they overlooked how monosyllable ideophones are used in spoken language.

This paper proposes several monosyllable ideophones that can attach to the *-i-ta* suffix and function as predicates in the spoken register. Furthermore, the current paper argues that these predicative monosyllable ones are highly conventionalized. The current study attempts to show that three factors are related to the deideophonization of monosyllable ideophones: morphosyntactic integration, subjectification, and intersubjectification.

This paper found eight monosyllable ideophones that confirm progressed deideophonization. All eight ideophones share the same phonetic and semantic features. They have a tense sound in their initial consonant and describe metaphorical meanings. Their meanings are based on language-specific and universal form-meaning correspondences. In the first stage, ideophones that are morphosyntactically much more integrated into the sentences show higher deideophonization. For example, *ppang theci-ta* ‘cracks someone up’ shows lower lexicalization, the ideophone functions as an adverb and is combined with a prosaic verb. On the other hand, *ppeng-i-ta* ‘full of hot air’ shows higher lexicalization in which the ideophone functions as a predicative by combining *i-ta*. In the second stage, ideophones that imply subjectivity exhibit higher lexicalization. For example, *ttayng-i-ta* ‘it’s over’ describes a state that is everything finished and nothing more. On the other hand, *ttak-i-ta* ‘I am sure’ conveys the speaker’s strong attitude of certainty and the truth value of the proposition (Park 2022). In the third stage, an ideophone that implies interjectivity and accompanies by a specific intonation pattern shows most higher deideophonization. There are two predicative forms *ttak-i-ta* and *kkok-i-ta*, which express necessity, that show higher degree in morphosyntactic integration. *ttak-i-ta* and *kkok-i-ta* both begin with a high tone. However, *ttak-i-ta* falls to a low pitch at the end, whereas *kkok-i-ta* raises to a high pitch. In a speech, *ttak-i-ta* functions as a speaker-oriented marker, while *kkok-i-ta* functions as an agent-oriented marker (Park 2021). In Contemporary Korean, the intonation pattern is that the falling boundary tone rises to a peak before the last syllable and falls during the last syllable, most common in declarative and *wh*-questions (Jun 2000: 151). On the other hand, the intonation pattern is that a falling-rising boundary tone is used when a speaker is confident and expecting the listener’s agreement in a conversation. It can thus be suggested that *kkok-i-ta*, which has an extraordinary intonation pattern, conveys interjectivity and it is the most highly deideophonized.

The findings of this paper confirm that the association between semantic features could be one of the factors that measure the system integration of ideophones (Akita 2022). Furthermore, the findings highlight the importance of exploring the use of ideophones in the spoken register.

Delimiting senses: core issues in the polysemy of prepositions

Lecture

Ms. Michelle Weckermann¹

1. University of Augsburg

This paper is part of a corpus-based project investigating the polysemy of prepositions through a cognitive semantic lens, employing image schemas and semantic networks. There are numerous cognitive linguistic approaches to the polysemy of *over* (Lakoff, 1987; Tyler & Evans, 2003), which, however, differ in various respects. The aim of this paper is, therefore, to address some theoretical issues that relate not only to unresolved points of debate in the literature, but also to polysemy more generally.

The first point of debate concerns whether a polyseme should have a central sense, as most approaches to prepositions have posited. However, the opinions diverge regarding how the central sense should be determined and what the central sense is, for instance, whether the spatial central sense of *over* is dynamic (Lakoff, 1987) or static (Tyler & Evans, 2003).

Another point of debate is the definition of polysemy itself. While most researchers seem to agree that polysemy involves one lexical form associated with multiple distinct yet related senses, there is disagreement as to what constitutes a sense and where the line is to be drawn between a conventionalised sense and contextual influences. Thus, while some researchers argue that *over* has a motion sense (Lakoff, 1987), Tyler and Evans (2003) claim that it is the preposition together with a motion verb like *jump* that provides this dynamic meaning. Given this inconclusive literature, Tyler and Evans (2003) set methodological criteria for the identification of the central sense. This should be the first sense from an etymological perspective and the most frequent sense (among other criteria). While I agree with the necessity for methodological criteria, I argue that these criteria are partially contradictory. In contrast to *over*, the first attested sense of other prepositions like *by* and *for* is not the same as the most frequent sense nowadays. I would go even further and raise the question, does there have to be a single central sense or could we have multiple central senses of spatial, temporal and abstract nature in a semantic network?

Furthermore, Tyler and Evans (2003) also posited two criteria to define and distinguish senses, namely that any sense has to express a distinct nuance of meaning, and has to do so independent of context. I adopted both criteria, specifying them with ideas from Cruse (2000) on where the line is to be drawn between a conventionalised sense and pragmatic/contextual modifications. Should every minor change in a spatial scene constitute a distinct sense (e.g. whether a bee hovers over a flower or a pond) and how much influence can contextual information have on the meaning of a sense (e.g. the direct object or verb accompanying a polyseme)?

Deontology of assertion

Lecture

Prof. Marina Sbisà¹

1. University of Trieste

The nature and functioning of assertion are discussed in the philosophy of language (speech act theory in particular) and epistemology, but also constitute a topic of great social relevance. Utterances of any declarative sentence may be taken to be assertions, but not all such utterances are meant and understood as committing the speaker to the same extent (what about a guess? or a white lie?) or expressing the speaker's knowledge about how things are (what about expressions of belief? or bullshit?) and are suitable to be assessed as true/false without intermediate shades (what about exaggerations?). However, there is a pragmatic core of assertion which I shall try to identify. My purpose is not to delimit 'typical' cases of assertion as opposed to 'atypical' ones (on a statistical basis, 'atypical' cases are certainly the great majority), but to single out some aspects of the practice of assertion that endow it with epistemic value and social significance. I shall also consider how some communicative habits that are widespread in the Western and globalized world and show deep disregard of those core features exploit the forms of assertive language for purposes that do not match the 'deontology of assertion'. Of course, I am aware that the analysis and stigmatization of such communicative habits do not suffice to contrast them. However, theories of language and discourse, including pragmatic theories, may sometimes be accomplices of the damages those habits engender, by fostering views of assertion or truth that directly or indirectly legitimize them. Theories should, instead, provide a characterization of assertion accounting for its deontology and foster the awareness of the social function of the latter.

Developing Idiomatic Competence among Chinese EFL learners: An Empirical Study on the Effectiveness of a Self-designed Ediom Mobile App

Lecture

*Dr. Siying Li*¹, *Dr. John Liontas*²

1. Xi'an International Studies University, 2. University of South Florida

For many Chinese English as a Foreign Language (EFL) learners, their development of idiomatic abilities is critical and challenging, not least because native speakers' idiomatic knowledge is both natural and intuitive. However, for Chinese EFL learners, their idiomatic knowledge cannot be developed without explicit instruction. It is most unfortunate that idioms are infrequently addressed in the teaching-and-learning of English across the language curriculum in China, perhaps because most instructors have not yet acquired the requisite idiomatic knowledge properly. And because idioms are ubiquitous in daily conversations, not knowing their inherent figurative meaning may also lead to misunderstandings, frustration, and even breakdowns during conversations. The development of idiomatic competence among Chinese EFL learners is thus paramount. Moreover, the use of mobile technologies has long been considered a useful tool in enhancing the learning abilities and enthusiasm of English learners. Toward these two ends, the researchers of the study reported here developed a customized mobile app—*Ediom*—for Chinese EFL learners to spearhead the development of idiomatic competence. In so doing, the researchers employed a mixed-methods sequential explanatory design. One hundred and eight student volunteers from a Chinese university participated in the study. Three research questions guided this study:

1. To what extent does the use of *Ediom* app impact the acquisition of idioms by Chinese EFL learners?
2. To what extent does the *Ediom* app motivate Chinese EFL learners to learn English VP idioms more than those who do not use this app?
3. In what ways do Chinese EFL learners describe their ensuing idiom learning experiences?

Participants were randomly divided into two groups, an experimental group and a control group. The former learned 20 English Vivid Phrasal (VP) idioms via the *Ediom* mobile app, while the latter learned the same number and type of idioms, but in a more “traditional” classroom setting. The treatment session for both groups lasted four weeks. An English VP idioms pre-test was first administered, followed by a four-week period treatment session, and concluded with the English VP idioms post-tests and the completion of an Instructional Materials Motivation Survey (IMMS) to evaluate students' motivation. Qualitative data were collected via semi-structured interviews with six participants representing high-, medium-, and low-performing students.

Data analysis showed that not only did Chinese EFL learners achieve statistically significant higher scores when learning idioms via the *Ediom* mobile app, but their motivation towards idiom learning was also equally very high. Accordingly, the results provide strong empirical evidence that corroborates previous research findings: (1) Chinese EFL learners had positive attitudes towards mobile technologies; (2) use of mobile technologies can significantly improve the comprehension and retention of English VP idioms; and (3) achievement of English VP idioms is greater in classrooms that use digital technologies than in classrooms where traditional methods and materials remain supreme. Motivation is a confounding factor that impacts second language acquisition. Indeed, higher motivation can lead to better second language learning because they are positively correlated. Pedagogical implications for teaching and learning English VP idioms will be shared dialogically with all attendees.

Developing pragmatic fluency for study abroad: A targeted instructional intervention

Lecture

*Dr. Jiayi Wang*¹, *Dr. Nicola Halenko*²

1. University of DeMontfort, 2. University of Central Lancashire

We define L2 pragmatic fluency as the type of fluency which allows learners to ‘gain automatic control in processing linguistic information’ and to rapidly ‘process pragmatic knowledge and convey speech intentions’ (Taguchi 2007: 117). Pragmatic fluency has been measured in the form of planning time (amount of time taken for preparing the oral response) and speech rate (number of syllables/words produced per minute). Prior research has demonstrated that the acquisition of pragmatic fluency can be improved by consciousness-raising techniques such as giving learners explicit meta-pragmatic information (House 1996), and that the study abroad (SA) context alone does not always lead to pragmatic gains for all learners (Taguchi 2014).

This study focuses on the use of formulaic language in a SA context. Formulaic language is described as fixed or semi-fixed syntactic strings that are closely tied to recurrent situations and communicative events (Kecskes 2000), have well-known functional use to perform everyday tasks, and they are crucial for L2 speakers to succeed in a SA context. However, research continues to show that formulaic language is underused and remains a challenge even for those with advanced proficiency (Halenko and Economidou-Kogetsidis 2022; Taguchi, Li and Xiao 2013; Wang and Halenko 2022), calling for L2 pragmatics instruction before and/or during SA. This study answers this call. It investigates the immediate and sustained effects of a pre-departure SA training on the oral production of L2 Chinese formulaic language. Eighteen upper-intermediate learners of Chinese were assigned to either an instructed or non-instructed group to determine the efficacy of instruction designed to enhance their study abroad year in China and beyond. A pre-post-delayed longitudinal experimental design was adopted to examine instructional effects over an academic year, elicited by means of a computerised oral task.

The assessment was based on appropriateness, planning time and speech rate. Results show that the instructed group outperformed the control group immediately after the pre-SA instruction, as well as after the year abroad. The significant difference between the two groups, however, decreased after the period abroad as the control group also showed significant improvement without the pre-SA instruction. Nevertheless, the sustained effect of the instruction enabled the experimental group to retain their competitive edge, even after a year in the target language country. The findings show the longitudinal benefits of pre-SA instruction.

Developmental trajectories in the use of self-repair by a Japanese learner of English studying abroad

Lecture

*Dr. Seiko Harumi*¹

1. SOAS, University of London

This longitudinal case study explores how an intermediate Japanese EFL learner develops the use of self-repair over 16 weeks during study abroad in the UK while being active in social network development both inside and outside the L2 classroom. Adopting conversational analysis (CA) as a core analytical framework, this study aims to extend our understanding of developmental trajectories in self-repair practices seen as enrichment of L2 interactional repertoires.

This is a CA-informed applied pragmatic study which, as an analytical scope, draws on various types of elicited data. The data includes an initial questionnaire survey, five interviews investigating the learner's social network development focussing on oral participation in L2 interaction and five free dyadic L2 discussions involving the participant and the researcher with a combined length of 5.8 hours. Further, five stimulated recall interviews were conducted, involving the use of repair after each dyadic talk to explore the learner's perception of the use of self-repair. While identifying the learner's social network development, this study's main objective is to examine developmental changes in the learner's use of self-repair in L2 dyadic talk.

Through the detailed analysis of self-repair by a Japanese learner of English focusing on the use of self-initiated-self-repair (SISR) (Sacks et al., 1974), this study identified a clear developmental process and an emerging pattern of interactional trajectories over the 16 week evaluation period. At the initial stage, the participant frequently used self-repair within her turn to construct the talk. The use of SISR included a wide range of resources used to maintain interaction, including nonverbal cues such as: (1) gestures, (2) semiotic visual resources, (3) self-directed talk and (4) reformulation of own utterances, although lexical repair was usually involved.

Towards the end of study abroad, the use of SISR shifted to the phrasal and sentential level of reformulations. Although the participant's lexical level of SISR, especially at their turn-beginning, continued beyond the eighth week, the frequency of its use gradually diminished. In parallel, the participant's use of clarification requests to address interactional needs and the degree of 'granularity' in the L2 talk further improved.

This study demonstrates developmental trajectories in the use of self-repair, helping to deepen our understanding of enhancement in L2 interactional repertoire and also suggests that the use of self-repair can function as a useful signpost for the improvement of interactional competence. It also illustrates the use of interactional resources, ways in which the use of linguistic competence was finely interwoven with improvements in the learners' ability to self-monitor and coordinate various interactional elements during ongoing interaction in L2 collaborative interaction.

Diplomatic criticism/condemnation: A cross-cultural pragmatic perspective

Lecture

*Dr. Jun Ohashi*¹

1. *University of Melbourne*

Diplomatic criticism/condemnation is an effective way to explicitly position nation states in relation to aggressors' act of violation of the norms in the international system. It is also significant in foregrounding moral obligations of international community and establishing and upholding international laws and orders (Pattison, 2015). A series of nuclear tests and missile tests conducted by North Korea have attracted diplomatic criticism from South Korea, Japan, the US and the Western allies, and the current geopolitical tension will predictably increase the frequency and visibility of the expressions of diplomatic criticism through the media. However, few academic studies have examined diplomatic criticism/condemnation from a perspective of cross-cultural pragmatics, and the present study will seek to help fill this knowledge gap. Diplomatic criticism/condemnation is both publicly announced by the leaders of sovereign states and/or published through official statements. The study focuses on the announcements/statements of criticism/condemnation made by Japan and the US after North Korea's testing nuclear bombs (2006 - 2017) and missiles (2021 - 2022) and it analyses them through the lens of speech acts and cross-cultural pragmatics. While, speech act theory presents some weaknesses and limitations, which include its prescriptive and addresser-oriented construct, it has proven itself to be a useful tool to comparatively investigate political discourse and apology in war crimes from the perspectives of cross-cultural pragmatics (Kadar & House, 2021; Kampf, 2021). The study identifies formulaic and strategic nature of diplomatic criticism/condemnation announced/ issued by Japan and the US and discusses the role and significance of coordinated diplomatic measures to deal with aggressors.

Discourse Functions of Japanese Turn-final Use of *Kedo* ‘But’ in a Question-answer Sequence

Lecture

*Dr. Suhong Hu*¹

1. Institute of Linguistics, CASS

Question-answer is well-known as an adjacency pair (Schegloff and Sacks 1973). Thompson et al. (2015) explores the morphosyntactic and prosodic design of responsive actions in four sequential environments which include information-seeking sequences (initiated by question-word (QW-) interrogatives) in American English. Yokomori and Endo (2022) focuses on the use of Japanese contrastive conjunction *kedo* ‘but’ in responsive turns and argues that turn-final *kedo* ties the utterance retrospectively to the prior turn. This study aims to use 245 conversations (about 53 hours) from “Corpus of Spoken Japanese by BTSJ (Transcription and Audio Recordings) ver. 2011” to show the functions of turn-final *kedo* in question-answer sequences.

From our data, we totally collected 268 cases of turn-final *kedo* that were used in answers to the prior turn by the interlocutor. Through analyzing these cases, we find that, firstly, the number of turn-final *kedo* used to answer to a yes-no interrogative (175 cases) is about twice that of a question-word interrogative (93 cases). For this reason, we suggest that turn-final *kedo*, as one of the ways to talking politely in Japanese, tends to be used to answer a yes-no interrogative to avoid a direct denial and thus to save the listener’s face. Secondly, there are roughly four types of question-answer sequences where turn-final *kedo* can be used: (1) question → direct answer (115 cases); (2) question → indirect answer (57 cases); (3) question → pre-answer → convince of the pre-answer → direct answer (3 cases); (4) question → direct answer + additional information (93 cases). It is clear that turn-final *kedo* tends to be used in question → direct answer sequences. Finally, we find that besides the function of speaking politely, there are other four functions that were not mentioned in previous studies: (1) changing the topic; (2) resuming the main topic; (3) expanding the current topic; (4) let the listener have a psychological preparation for speaker’s answer.

On the whole, it is clear that turn-final *kedo* tends to be used to answer a yes-no interrogative to avoid a direct denial and to perform various functions in different answer-question sequences.

Discourse marker *jiushishuo* '(that) is to say' as a preface of formulating others' talk in Mandarin Chinese

Lecture

Dr. Li Chen¹

1. *kanda university of international studies*

Jiushishuo is a ubiquitous token in Mandarin conversation, which literally means '(that) is to say (that)'. It consists of the backward-linking adverb *jiu*, the copula *shi* 'is', and the verb *shuo*, 'say'. The canonical use of *jiushishuo* is to indicate an elaboration or clarification of something previously commented on. In previous literature, *jiushishuo* was described as a floor holder positioned before the (re)formulation of its speaker's own utterances (e.g., Biq, 2001; Fang, 2000). However, little attention has been paid to the interactional use of *jiushishuo* prefacing formulations of others' talk. While Guo & Yu (2022) referred to '*jiushishuo*+X' as a turn format to address problems of understanding the prior turn, the interactional payoffs of *jiushishuo*-prefaced formulations vary and depend on the local context of their deployment. This study aims to present a descriptive analysis of *jiushishuo*-prefaced formulations that occurred in different sequential contexts.

By adopting conversation analytic methods, the current study explores the interactional functions of *jiushishuo*-prefaced formulations of other people's talk and demonstrates how the placement and compositions of these formulations relate to their interactional import. The data were collected from 12-hour-long video-recorded face-to-face conversation and 18-hour-long audio-recorded telephone talk-in-interaction. Based on the examination of *jiushishuo*-prefaced formulations that repeatedly occurred in three different sequential environments, I outline the interactional roles of these formulations as follows.

(1) In the third position following question-answer sequences, *jiushishuo*-prefaced formulations indicate the speaker's problems with understanding the prior talk. By deploying these formulations, the speaker provides a candidate understanding of the prior talk to make a (dis)confirming response and a further explanation relevant. Most of these formulations are designed as interrogatives, ending with a question particle (*ma*) or a tag question (*duiba* 'right?'), with a rising final intonation.

(2) When placed after one of TCUs in a multi-unit turn, *jiushishuo*-prefaced formulations are used to provide the gist of the preceding utterances. These formulations function as declarative questions, ending with a falling intonation indicating an expectation of confirmation. Through these formulations, the speaker demonstrates their understanding of what the other has said before while minimizing the degree to which progressivity is hindered.

(3) At the possible completion point of a turn, especially where an affiliative/aligning response (Stivers, 2008) is relevant, *jiushishuo*-prefaced formulations can be used to implement disaffiliation and display the speaker's problems of expectation/acceptability (Svennevig, 2008) instead of problems of hearing/understanding.

Discourse, collective action and women's rights groups in Nigeria and Germany: A comparative analysis of online campaign discourses

Lecture

Prof. Innocent Chiluwa¹

1. Covenant University, Ota

This study investigates online activism by women's rights groups in Nigeria and Germany especially exploring their online advocacy and campaign approaches. Applying the new social movement theories with methodological insights from pragmatics and discourse analysis, this study will examine and compare how gender issues such as political participation, women trafficking, rape and violence against women are mediated discursively. The study will further assess the roles of social media in the campaign programmes of the women's rights groups under study. Two women's rights groups (WRG) each from Nigeria and Germany are selected for the study. Some of these WRG exist exclusively on the Internet and engage in some unique and interesting discursive practices that campaign for women's political empowerment.

Data will comprise messages on the websites and social media platforms of the WRG under study. Campaign messages that reflect collective action, radical opinion, populist demands or protests will be of particular interest to this study. Analysis at the micro level will then pay attention to language choices, pragmatic acts and discourse structures of the campaign messages. At the macro level, political and cultural factors that are reflective in the language data that have had some significant impact on women's participation in government in Nigeria and Germany will be analysed. **Keywords:** discourse, collective action, social media, women's rights groups, political participation, Nigeria, Germany.

Displaying uncertainty and avoiding disaffiliation with Estonian response particle *mhmh* ‘uh-huh’

Lecture

***Ms. Kirsi Laanesoo*¹, *Mr. Tiit Hennoste*¹, *Mrs. Andriela Rääbis*¹, *Ms. Andra Rumm*¹, *Ms. Andra Annuka-Loik*¹, *Ms. Piret Upser*¹**

1. University of Tartu

In the paper we will analyze the usage of the Estonian particle *mhmh* ‘uh-huh’ as response to the polar questions. In previous studies English *uh-huh* (equivalent of Estonian *mhmh*) has been analyzed primarily as a continuer (e.g. Jefferson, 1984). As a response particle it is categorized as ‘unmarked’ response and treated as equivalent to *yes* and *yeah*

(e.g. Stivers, 2018; Enfield et al, 2019).

Our analysis reveals that Estonian particle *mhmh* as a response particle is not equivalent to the other Estonian response particles *jah* and *jaa* ‘yes, yeah’ (see Hennoste et al, forthcoming). In our presentation we will show that *mhmh* as a response to polar questions has several functions.

Firstly, *mhmh* displays user’s uncertainty, without explicitly highlighting it.

Secondly, *mhmh* is used in contexts where the user has the knowledge to answer the question confidently. In those cases, *mhmh* downgrades the dispreferred information and it is used to deal with possible social issues that might come about when using strong confirmation with other response particles such as *jah* or *jaa* (Hennoste et al, forthcoming).

Thirdly, *mhmh* is used to distance the user from the topic initiated by the partner. With *mhmh* the speaker indicates that she is not interested in continuing this topic.

Our data come from the Corpus of Spoken Estonian of University of Tartu and is analyzed applying the methodology of conversation analysis. For this research 75 everyday face-to-face and telephone conversations (106 500 words) were randomly selected from the corpus and 39 *mhmh* ‘uh-huh’ responses were analyzed.

Distinctiveness of Procedural Expressions in Sequences

Lecture

Prof. Takahiro Otsu¹

1. Kyushu University

Discourse markers (DMs) comprise one of the most intriguing topics discussed in corpus-based pragmatic research. There is an ongoing debate regarding the combinations of DMs that may occur in a single utterance. This study attempts to provide a comprehensive account of how pragmatic markers, including primary discourse markers (PDMs), secondary discourse markers (SDMs) (Fraser's (2015) classification of DMs), fillers (FLs), and interjections (IJs), contribute to sequences. The framework of this paper is based on relevance theory, in which these pragmatic expressions fall into the category of "procedural expressions," which are expressions that activate the route of inference or procedures which leads toward the interpretation of the utterance that includes them. This study uses spoken data from the British National Corpus (BNC), the Wordbanks corpus, and the Corpus of Contemporary American English (COCA) to ensure the validity of the pragmatic research that explores and theorizes how procedural expressions are sequenced in a particular order.

Theoretically, four types of procedural expressions (PDMs, SDMs, FLs, and IJs) could construct 16 sequence patterns (PDM-PDM, PDM-SDM, PDM-FL, PDM-IJ, SDM-SDM, SDM-PDM, SDM-FL, SDM-IJ, FL-PDM, FL-SDM, FL-FL, FL-IJ, IJ-PDM, IJ-SDM, IJ-FL, and IJ-IJ). The corpus observations have created a rough sketch of the sequences of procedural expressions (Otsu 2021): (1) SDMs are combined in PDM-SDM sequences, but rarely combine with other procedural expressions (i.e., SDM-FL, FL-SDM, SDM-IJ, and IJ-SDM are infrequent sequences) and (2) PDMs, fillers, and interjections are combined with each other without difficulty. This is presumably because SDMs encode a distinctive procedure compared with other procedural expressions. From a procedural point of view, SDMs primarily impose constraints on constructing a higher-level explicature (i.e., a higher-level description such as a speech-act description, a propositional attitude, or some other comment on the embedded proposition). SDMs add comments to the proposition communicated by the subsequent utterance, whereas other procedural expressions do not involve such a conceptual construction. PDMs activate the direction of inferential comprehension, fillers contribute to precluding the utterance from being misinformed, and interjections activate "a range of attitudinal descriptions" associated with emotional activities (Wharton 2003, 2009), which suggests that these procedural expressions are likely to show some affinity with each other when they are sequenced.

This study proposes that the preferable sequences of these procedural expressions in a single utterance are reduced to the legitimate order and hierarchy of the activation of domain-specific modules: mindreading, emotion reading, social cognition, and epistemic vigilance, as well as inferential comprehension (Wilson 2011: 26). Epistemic vigilance comprises two aspects of cognitive mechanisms geared to evaluating the reliability of the speaker and the reliability of the communicated information (Wilson 2016:15). The former epistemic vigilance mechanism—conducted by fillers—and the latter—conducted by SDMs—have an order of activation. Combination is essentially an effort-consuming verbal act, especially for the addressee. This means that procedural expressions are sequenced to achieve a presumption of optimal relevance (i.e., to be relevant enough for the combination to be worth the addressee's effort to process it).

Ellipses in Advertising Communications and Brand Strategies of Luxury Experience Businesses

Lecture

Prof. Nami Arimitsu¹

1. Toyo University

This study reveals that different types of ellipses and multiple rhetorical devices are amalgamated in the advertisements of luxury experience businesses. Leech (1966) has mentioned that there are frequently used imperative forms of verbs that appear in the advertisements. Goatly (2000) mentions the relationship between advertising and consumerism and the psychology of consumers. Myers (1997) discusses the issues of pronouns in advertisements. However, the previous studies have not fully discussed the different types of ellipses employing multiple rhetorical devices in luxury experience businesses. Compared to advertisements of daily items, those of luxury experience businesses are more complex. Their brand strategies do not use persuasion via imperatives to buy something, but “Pre-Suasion,” which is an idea Cialdini (2017) proposed in his book.

This study first examines the advertisements for the Mandarin Oriental Hotel. The tagline “I am a fan” has two meanings. The first is a rhetoric of personification with the hotel symbolized with the logo of a folding fan. It simultaneously conveys that the lady in the advertisement is a fan of the hotel. The sentence “I am a fan” is grammatically correct, but pragmatically lacks information. The listener generally wants to know the following part: what is she a fan of? This pragmatic ellipsis makes the advertisement appealing.

The second is the advertisement of Chicago Booth, the University of Chicago School of Business. It states: “ARE YOU AFRAID TO MAKE A BOLD MOVE?” Then, in a smaller font written is “NEITHER ARE WE.” This advertisement addresses the reader, but does not write the reply of the reader. Instead, it anticipates the reader’s reply, which will be “No, I’m not,” and responds proactively. It employs the ellipses in the discourse where people expect that the communication between two parties generally follows the pattern — A questions, B responds, A reacts, etc. This advertisement leaves the response unsaid for not being intrusive.

The third is the advertisement of a Swiss watchmaker, Richard Mille. The tagline is “A Racing Machine On The Wrist.” The literal interpretation is difficult, and the reader might find this expression meaningless or unintelligible without the accompanying visual. The major rhetoric employed here is a metaphor. However, we can also analyze this from the perspective of ellipses. It refrains from explicitly stating “Buy this product, and you can have a luxury experience just like you are the owner of a racing machine.”

This study reveals that these ellipses are blank spaces for the readers, who are given the pleasure of filling-in, rebuilding, and interpreting them. In the advertisements of luxury experience businesses, leaving empty spaces via ellipses functions as a positive rhetorical device through which the companies convey their brand strategies.

English expressions of 'love' in Japanese subtitles and dubbing

Lecture

Dr. Christopher Long¹

1. *Tohoku Gakuin University*

Direct expressions of 'love' in English (e.g., 'I love you') are used more frequently and among a wider range of relationships compared to the semantically equivalent Japanese expression '*aishiteiru*' (e.g., Kimura, 1998; Yasutake, 2010). Given these differences, the current research seeks to (1) identify how such expressions are translated in Japanese subtitling and dubbing and (2) consider the significance of such translation practices. To this end, all examples of 'love' as a transitive verb with human subject and object were analyzed in a sample of 50 movies selected from the Cornell Movie-Dialogue Corpus (Chang, et al., 2020) (n=607).

Results revealed an overall greater use of '*aishiteiru*' compared to other expressions in both subtitles (435 vs. 172) ($X^2=113.95$, $df=1$, $p<.000$) and dubbings (460 vs. 147) ($X^2=161.39$, $df=1$, $p<.000$). Similar results were found for the following relationships: romantic/kinship, non-romantic/kinship, and romantic/non-kinship. No significant difference, however, was found for non-kinship/non-romantic relationships.

The fact that '*aishiteiru*' was used significantly more than other expressions overall, as well as for three of the four relationships investigated, provides evidence that subtitling and dubbing of English 'love' expressions overwhelmingly fails to undergo transformations via a cultural filter (House, 2006) and thus violate Japanese norms of usage. Because, this was not found to be the case for non-romantic/non-kinship relationships, however, the breaking of norms appears to be mediated by degree of potential for misunderstanding.

Most importantly, however, the fact that 'love' expressions tended to be translated as '*aishiteiru*' in subtitles and dubbing suggests that the representation of non-Japanese as speaking in an unnatural manner is not simply the result of constraints related to audiovisual translation (AVT). Rather, I argue that because AVT is a type of 'documentary translation' (Nord, 2005) (i.e., target culture (TC) members are aware it is a translation), the systematic use of unnatural expressions, a seemingly straightforward example of 'foreignization' (Venuti, 1995), because it aligns with TC expectations of source culture (SC) behavior, in fact represents a form of 'localization' (Jimenez-Crespo, 2013). Ultimately, any evaluation of translation strategies must consider media type and the nature of TC/SC relations. Because SC 'visibility' is inherent in AVT, emphasizing foreignness via the use of unnatural forms is unnecessary; It merely reinforces stereotypes and creates potential misunderstanding. This applies to Japanese subtitles and dubbing, if not AVT in general.

Entering the voluntary arts: methodological approaches to examining group membership in an amateur dance group

Lecture

*Ms. Naomi Smart*¹

1. King's College London

The Community of Practice (CoP) model (Lave and Wenger, 1991) has held significant impact on the ways in which we consider and examine groups. Whilst the model and processes of increasing membership discussed in the core literature have received much attention, however, it is not designed to gain a close look at interaction and negotiation to meaning within these sociological spaces. Beneficial, then, is a combined approach to investigation, operating through a multiplicity of methods within a shared theoretical stance to get closer to the day-to-day running of these groups as rich, *sociolinguistic* spaces.

Adopting such an approach, this project examines understandings of role and membership within a voluntary, dance-based CoP, combining ethnographic participant observation, carnal sociology (following Wacquant, 2004), and multi-modal conversation analysis as a means of fuller investigation.

Positing the existence of groups with a common craft or goal, the CoP model highlights the role of practice and communicative involvement in the achievement of both group aim(s) and increasing membership. Through a process of Legitimate Peripheral Participation, members move from a position of relative ignorance as a 'new-comer' towards one of 'full participation' as an 'old-timer' (Lave and Wenger, 1991, pp.36-7). Identities develop both within the group context and for the individual as this process continues, and competence in both the craft and the 'being' of a group member emerge in parallel. The strength of this model is its ability to examine broader, long-term processes of growing involvement and membership, however its ethnographic approach leaves several challenges around closer attention to interaction/s within these spaces.

Criticised for its harmonious, broad-brush approach to group membership, the CoP model is seen to overlook the messy actualities of conflict, clash, and power within groups, particularly those which aren't attached to careers. The current project seeks to overcome these critiques through the simultaneous application of multi-modal Conversation Analysis (CA), an analytic method known for its close, micro-attention to the moment-by-moment unfolding of interaction, and exploration of a voluntary dance group.

As a data-driven, micro-analytic approach, CA holds that participants' own orientations and negotiations to meaning within unfolding interaction shape communication. Looking closely at a minute level of detail, CA offers much to develop the CoP model.

Focussing on the value of a multiple-scale approach to analysis, this presentation discusses the framework employed for data collection and analysis within this project. Initially considering the shortcomings of a single framework perspective on CoP research, the discussion then turns to an example from the data to exemplify, empirically, the merits of this close, multi-modal approach in exploring participants' own understandings in these overlooked voluntary contexts.

This research will stimulate conversations around the application of crafted multi-method approaches for investigating voluntary groups, interactions, and individuals' orientations or perspectives within these. Through an investigation that operates across scales and levels, it becomes possible to approach analyses of meaning and involvement within these spaces from a range of analytically rich methods, united by a shared theoretical perspective.

Establishing Common Ground in Multilingual Video-Mediated Interactions

Lecture

Dr. Budimka Uskokovic¹

1. The Ohio State University

This paper concerns practices of establishing common ground (Clark, 1996; Enfield, 2006; Garfinkel, 1967; Tarasaki, 2004) – mutual knowledge, mutual beliefs, and mutual assumptions – in multilingual conversations in a digital environment. Using analytical frameworks of conversation analysis and multimodality, it investigates talk and embodied practices utilized by L1 speakers of German to establish common ground with L2 speakers of German prior to demonstrating their firsthand experience and expertise in videoconferencing conversations. One of the main rules in talk-in-interactions is: “Don’t tell others what they already know!” (Sacks, 1995). Following this rule, L1 speakers may not always position L2 speakers as non-experts (K-) in terms of their cultural expertise when asked to provide more information about their own culture. Rather, they first check on L2 speaker’s epistemic status and provide either status-based or source-based information about the cultural products, perspectives, or practices, based on how shallow or how deep L2 speaker’s epistemic status might be. Consider the following example between the language learner of German (Emma, EMM) and the L1 speaker of German (Amber, AMB):

- 1 EMM: ist ahm ist wichtig auch ist ahm für die kult(h)ur
 is important for German culture
- 2 hehe Fussba[ll,?
 hehe socc[er,?
- 3 AMB: [ähm also ich kann das mal erklären=habt
 [uhm well I can explain that=have
- 4 ihr über den film das wunder von bern gesprochen.=
 you ever watched the movie the miracle of bern
- 5 EMM: [=*nein*
 no
 shakes head

In lines 1-2, Emma poses a polar question. In doing so, Emma positions herself as a less knowing co-participant who attempts to elicit more culturally relevant information by posing a question to the more knowledgeable speaker and, thereby, she challenges her to elicit her cultural knowledge about this domain of expertise and provide some details about the importance of soccer for the German culture. By responding to the question, Amber displays her knowledge and thereby her ability to explain. She then poses a follow-up question (lines 3-4) to check whether Amber and Emma share common ground. Since Emma uses the minimal disconfirming token in line 5 (Imo, 2017), to signal to Amber that she is not familiar with the movie, Amber starts to unpack her epistemic status and to provide her account about the importance of soccer for German culture (not shown above). In doing so, she positions herself as a more knowledgeable speaker whose responsibility is to inform the L2 speaker about her domain of expertise by providing source-based information.

Analyzing practices to establish common ground based on three examples in semi-pedagogical conversations via video-conferencing, my paper demonstrates the ways in which L1 speakers establish common ground with L2 speakers, namely 1) by asking follow-up questions (as presented in the example above), 2) by co-constructing the meaning of the word without even having direct epistemic access to a particular cultural product, and 3) by ratifying assumptions about cultural products. In addition, I present how L1 speakers monitor and ratify L2 speakers’ cultural knowledge to help them improve their cultural knowledge.

Ethnopragmatics of Emotions in Pakistani culture: A Case of Urdu Affect Lexicon

Lecture

***Ms. Saima Mubashra*¹, *Dr. Ghazala Kausar*²**

1. Higher Education Department Pakistan, 2. National University of Modern Languages, Islamabad, Pakistan

Challenging the notion of universality, the Ethnopragmatic studies of emotions have highlighted the close proximity between how emotions are labelled and how emotions are processed in a given culture. Cultural expectations about regulating emotions during social interactions solidify in the form of emotion terms and their meaning. The study exploits this correlation between language and emotions to build the affect lexicon of the Urdu language and uses it to gain insight into how emotions are expressed and processed in Pakistani culture. The Urdu affect lexicon was built in two steps. In the first step, a list of lexical items denoting emotional experience was culled from three Urdu dictionaries, Farhang-e-Asfia, Naseem-ul Lughat and Ilmi Urdu Lughat. In the second step, key informants, who were cultural insiders and native speakers of the Urdu language, validated the amassed collection of affect categories. They based their judgement on the salience, entrenchment and relevance of the categories for the theme. This exercise generated the final list of almost 300 emotion terms/expressions, which were expected to reflect the speakers' day-to-day language use. The final list of emotion terms was then analyzed using the theory of cultural scripts. The findings were explicated in Natural Semantics of Metalanguage (NSM). The linguistic data revealed that Urdu emotion terms are mainly based on somatic images than solid or concrete words and ascribe little or no volition to the experiencer. These multi-word units situate emotions externally as a physiological activity located almost in every part of the body, including the prototypical heart, mind and face, as well as atypical body parts like armpits, corner of the lips and the bottom of the foot. Moreover, with a greater number of verbs than adjectives and nouns for emotions, the Urdu language exhibits a general tendency towards describing emotions as a process rather than a state. Furthermore, an exuberant collection of verbs that denote the severity of emotions may be symptomatic of a cultural allowance to be expressive about one's emotion states.

Evaluative adjectives and the problem of collocation

Lecture

*Prof. Marija Liudvika Drazdauskiene*¹

1. *Wszechnica Polska, Academy of Applied Sciences in Warsaw*

Evaluative adjectives, defined as the adjectives which express an opinion, value or quality of something differ from substantive adjectives in their meaning, spheres of use and collocation. Adjectives of this kind (*wonderful, marvellous, fantastic, splendid; awful, terrible, appalling, ghastly*, etc) are most common in trivial conversation. The richest material of the function of evaluative adjectives has been drawn from the phatic use of English in which overstatement and evaluative qualification are current (*It's ages since we met! How on earth did you hear all this? You look gorgeous. Christ, what an armful! I feel wonderful. ..., how enchanting to see you, how very kind of you to come! ...she looked marvellous in it. God, he's adorable! It's lovely. You look knockout, SallyO! etc*)

The syntactical structure of existential and exclamatory utterances in the phatic use form the context for the use of single evaluative words. The question of combinability does not arise at this point. But this condition also creates a psychological effect which forms a false impression that evaluative adjectives have no restrictions on their collocation, which may turn into a problem for foreign speakers of English. Foreigners happen to use curious units, if judged by comments of native speakers. E.g.: (1) *My stockings were a nightmare.* (2) *I was terribly happy to see her.* (3) *Great thanks go to amazing team...* (4) *Thank you, amazing people of the North...* (5) *What a crazy week has just ended...*

It is not always that evaluative adjectives express an overstatement. Praiseworthy statements in studies of literature use evaluative adjectives in their direct sense. But even in the phatic use of English, the choice and use of evaluative adjectives is not wholly random. Cf.: (6) *This was, of course, the most fascinating remark...* (7) *I'm lucky because I can find marvellous people who are brilliant makers of the things that I appreciate...* (8) *... it's full of fascinating stories and terrific insights, ...* (9) *„Amazing display of street art, theatre, music, sport and more... What a joyous occasion!“* (10) *This must have been a splendid house, sir.*

The semic analysis of the highlighted collocations discloses their semantic motivation. For instance, *amazing story, amazing display, amazing experience*. The first and/or the second seme in ‚story‘, i.e. the meaning of a description of events or an account of them, combines with the second seme, meaning very impressive, excellent, speaking informally, in ‚amazing‘. This explanation also holds true for ‚amazing display‘ and ‚amazing experience‘. But ‚thanks to amazing team‘ is not a customary collocation in English even if it may be acceptable in global English.

Similarly, ‚a fascinating story‘ and ‚a fascinating remark‘ are semantically motivated in the semic analysis. Additionally, Emily Post's warning to women not to exaggerate their compliments to men adds a reason: you can say ‚Thank you for a fascinating evening‘ only if there was something really fascinating about it. Even though the currency of collocations is frequency-dependant in native speech, the semic analysis displays semantic links which motivate their combinability.

Everyday is like war: The tensions and anxieties of Japanese youth negotiating typical and atypical masculine pronouns and identities

Lecture

*Dr. Ayumi Miyazaki*¹

1. Japan Women's University

This presentation, based on metapragmatic accounts (e.g., Silverstein 1976) collected from an ethnography at a junior high school and surveys at universities, explores how Japanese male-identified youth choose their first-person pronouns from the diverse repertoire of masculine pronouns in the Japanese language and how they negotiate their identities, masculinities and power through these pronouns in their social context. Connell's framework of hegemonic masculinity (1995), the most influential theory in research on men and masculinities, illuminates how multiple masculinities - hegemonic and marginal, or typical and atypical, masculinities - are practiced every day in constructing complex power relationships. In the Japanese language, different pronouns represent different kinds of masculinities (e.g., SturtzSreetharan 2009). This facet of Japanese pronouns provides an effective tool to analyze the linguistic construction of social identities and the ethical life (Keane 2016) of Japanese youth, who are constantly seeking who they are and who they ought to be in their social relationships.

In a Japanese junior high school where I conducted fieldwork, boys negotiated their metapragmatic meanings about masculine pronouns, such as *ore*, *boku*, *jibun*, and *wai*, while gauging their power and their masculinities in their social world. Boys in "strong" groups explained that maintaining their power was like an everyday war: They needed to maintain powerful and typical masculinities in their moment-to-moment discourses. Boys in "weak" groups, on the other hand, generally used the pronouns that are indexed as atypical and undesirable pronouns in the social world of junior high schools. They tried to achieve a higher status, or defend their position, however, through occasionally employing powerful speech, but exhibited anxieties about what pronouns they were allowed to use in different contexts. At universities, young people also exhibit anxieties and tensions regarding their choice of masculine pronouns, in particular, between *boku*, which indexes politeness, gentleness and childishness, and *ore*, which indexes vulgarity, masculinity, and aggressiveness. They search for different pronouns between those two extremes, such as *jibun*, but often hesitate to use them because they feel that these pronouns are rather atypical and not yet banalized.

Thus, everyday politics of masculine pronouns illuminates ethical consciousness about oneself and others as to what kind of masculine identities Japanese youth want to construct and what kind of men they want to be perceived as in their social relationships. Their negotiations with their masculine speech and identities in their social context, however, are not an easy process. The anxieties and tensions exhibited in their negotiations show multiple voices and struggles (Bakhtin 1981) that reside not only within juxtaposed ideological positions, but also within an individual who is constantly trying to resist gendered moral evaluations and typifications (Keane 2011) that are imposed on them.

Examining pitch range, gender, and politeness in Spanish polar questions

Lecture

Mr. Bruno Staszkiwicz Garcia¹

1. *Purdue University*

Seminal works on the fields of phonetics (Ohala, 1984; Ladd, 2008) and politeness (Brown & Levinson, 1987) have broadly suggested that suprasegmental features can be employed as indicators for formal or informal speech. Recent research on diverse languages have found that pitch is one of the prosodic mitigators used to show politeness or formality. While much of this work has focused exclusively on the social variable of the power difference between interlocutors, there has been little systematic analysis of the differential impacts of power, distance, and imposition on suprasegmental phonetic features, and more specifically of gender differences. Given the general lack of systematic analysis of power, distance, and imposition, and suprasegmental features, the current study investigates how female and male speakers use the pitch range of the final intonational contours of polar questions in Peninsular Spanish – the most conventionalized way of performing a request in Spanish – as an indicator of politeness. The hypothesis for this experiment accounts for an increase in pitch range in those situations that are more face-threatening following Ladd's (2008) perspective on the paralinguistic use of pitch range across genders.

To answer these research questions, 35 Spanish native speakers ($M = 26.5$, $SD = 2.39$) from Madrid, Spain completed a contextualized sentence reading task where they read aloud 16 paragraph-length contextualizing situations, followed by polar questions (see Example 1 and 2). The 16 situations were balanced for two levels of power (high/low), distance (high/low), and imposition (high/low). Each polar question followed the same structure (i.e., ¿Me puedes...? 'Can you...?') and contained the same number of syllables. The final lexical item was always CVCV. Each utterance was repeated three times, in randomized order. Analysis, using Praat, focuses on and the pitch range of the final contour. A linear fixed-effects model was conducted for both female and male speakers.

The linear model for the pitch range analysis showed that variable of distance was the only significant variable ($p < 0.05$) for all participants. The linear model for male speakers showed that distance was the only significant variable ($p < 0.05$), whereas the analysis for female speakers showed that there were no significant variables. Male subjects increased their pitch when performing a request with higher pitch range when addressing someone that they do not interact frequently, whereas female speakers did not use pitch to index any type of contextual relationship. The findings of this project shed light on (a) the effect of pitch range that can trigger different pragmatic meanings related to politeness, and (b) the variable of distance was only found to be significant for the use of pitch range on male speakers, not female speakers.

Experts and novices: Examining academic email requests to faculty during study abroad

Lecture

*Dr. Nicola Halenko*¹, *Dr. Jiayi Wang*²

1. University of Central Lancashire, 2. De Montfort University

This study directly addresses the conference theme of atypical language by analysing the difficulties learners face with (mis)mapping L1 communication styles on to L2 email composition during study abroad (SA).

Communicative interaction at university level is increasingly undertaken using some form of online communication and email is typically the go-to option for expediting academic matters. For students, contacting and accessing information from academic staff is most efficiently achieved via this medium, but a particular set of skills is required to successfully achieve communicative goals in this unique, hybrid form of oral and written interaction. This longitudinal investigation aims to contribute to a shortage of email studies examining expert (L1) and novice (L2) email practices and examines to what extent SA plays a facilitative role in shaping learners' understanding and production of L2 emails to faculty. Drawing on language socialisation theory (Schieffelin & Ochs, 1986), which contends that by interacting with expert members of a community, novices can develop into more competent members themselves, the study specifically examines two research questions: i) the distinctive features of expert and novice English users' email requests, and ii) evidence of change in novice L2 English request emails over one academic year. What sets this study apart from existing email research is its longitudinal focus of one academic year, observing development change in the SA environment, the UK-based research context, and the comparison of expert and novice email practices.

The email corpus consisted of 315 archived request emails sent to the two authors who were members of faculty interacting with either the L1 (expert) users of English ($n= 153$) or L2 (novice) Chinese students of upper intermediate English proficiency ($n= 162$). The emails were categorised as requests for meetings, requests for information or requests for assistance. To maintain internal validity, ensuring the corpus was authentic and organically grown, a passive consent approach was adopted. This provided a means for subjects to document permission to use their emails in the study, after the emails had reached the faculty members, at the end of the research cycle. A mixed-methods approach, analysing the data from quantitative and qualitative perspectives, focused on a unique combination of three features not found in existing email studies: request strategies, internal lexical modification, and request perspective.

Findings firstly indicated that the choices of request strategies, internal modification and request perspective showed much variation between the two groups due to different approaches to projecting politeness. Secondly, exposure to the L2 and engagement in email writing seemed to have minimal impact on pragmatic performance over the academic year. Non L2-like features identified in the first half of SA, mostly remained at the end of the academic year. The findings conclude with a consideration of the pedagogical implications, in addition to practical solutions for classroom application.

Explicit and Implicit (Im)politeness: A Corpus-based Study of the Chinese Formulaic Expression “Nikezhen+X”

Lecture

Prof. Shaojie Zhang¹, Ms. Keyuan Wang¹

1. Northeast Normal University

This paper aims to investigate the specific realisation and recognition of explicit and implicit (im)politeness in interpersonal communication by drawing on the corpus-based data analysis of a metapragmatic expression “*Nikezhen+X*” (lit. ‘You really +X’ in English), commonly used for evaluations in Chinese. The data was collected from the BCC (BLCU Corpus Center) corpus (<http://bcc.blcu.edu.cn>), an online corpus made available by the Corpus Center of the Beijing Language and Culture University.

For example, in a situation in which someone did a good favour for a friend, then his/her friend may say, “*Nikezhen bang*” (‘You are really great.’). By saying “You are really great” in this situation, the speaker is praising his/her friend for the good favour, and in this sense, literally, the speaker makes a polite judgment of his/her friend’s behaviour. This formulaic expression is generally employed to explicitly refer to the acts of making evaluations, and thereby, it constitutes an assembly of evaluative resources that guide people’s making evaluations.

The results of the study reveal that this formulaic expression can be used to make both explicit and implicit (im)politeness evaluations, residing in the literal meaning (what is said) and implied meaning (what is implicated) respectively. From an addressee-oriented perspective, the explicit (im)politeness is recognized based on the conventional meaning accepted by default. The implicit (im)politeness is recognized by dint of inferences drawn from the speaker’s intention in situational contexts. The recognition of (im)politeness is dependent on how the speaker uses the expression to represent his/her intention with consideration of the politeness elements, namely, friendliness, attitudinal warmth, respectfulness, etc., which are highly valued in the Chinese Politeness Principle.

Through an empirical analysis of the realisation and recognition of explicit (im)politeness and implicit (im)politeness, the present study can shed new light on the interaction of politeness and implicatures and pose a challenge to indirectness as politeness.

Keywords: *Nikezhen + X*; formulaic expression; explicit (im)politeness; implicit (im)politeness; intention; politeness elements

Exploring Illocutionary Force of Tense-Aspect-Modality (TAM) Specified Canonical Constructions: A Collostructional Approach

Lecture

*Dr. Yoshiyuki Notohara*¹

1. Doshisha University

This paper explores and confirms *illocutionary force* of tense-aspect-modality (TAM) specified canonical constructions (CCs) in native English spoken corpus through collostructional analysis. In cognitive grammar, constructions (form-meaning pairings) are assumed to be pragmatically grounded and developed through social interactions (Langacker, 2008; 2009). In pragmatics, constructions can be considered *salient* linguistic features in daily conversations to be pragmatically noticed, processed and conceptualized (i.e., a heuristic pragmatic analysis) (e.g., Verschueren & Frank, 2009). In usage-based construction grammar, there have so far been much discussion on the syntax-semantics interface in constructions, but relatively a few on the syntax-pragmatics interface although there are some theoretical (esp. image-schematic) discussions on the relationships between syntactical constructions and indirect speech acts (ISAs) (e.g., Panther & Thornburg, 2003; Ruiz de Mendoza Ibañez, 2003; Stefanowitsch, 2000). Traditionally, the syntax-pragmatics interfaces have been discussed referring to modal expressions-based *illocutionary indicating devices* (IFIDs) and *illocutionary force potential* (e.g., Searle, 1969, 1975, 1983, 1995; Searle & Vanderveken, 1985; Stefanowitsch, 2003 Vanderveken, 1990). Recently, some researchers in both cognitive linguistics and pragmatics have been investigating a wider range of IFIDs and the degree of illocutionary force salience in combined illocutionary force effects (e.g., Ruytenbeek, Ostashchenko, & Kissine, 2017; Ruytenbeek, 2021; Sbisà, 2001, 2009; Zufferey, Moeschler, & Reboul, 2019). Then, the current study tries to explore the actual realisation of TAM markers in three material world event schema and multi-functional illocutionary force constructions (States/SVC, Location/SV, Possession/SVO) (e.g., Radden & Dirven, 2007) and compare the degree of illocutionary force salience in terms of its collostructional strength (e.g., Gries, 2015, 2019; Gries & Stefanowitsch, 2004; Gries, Hampe, & Schönefeld, 2005, 2010; Hampe, 2013; Schmidt & Küchenhoff, 2013; Stefanowitsch, 2013; Stefanowitsch & Gries, 2003). The procedure was as follows: (1) randomly selected 1000 examples of three representative verbs of three constructions (States/SVC/BE, Location/SV/BE, Possession/SVO/HAVE) were respectively extracted from the Spoken BNC2014 corpus (Love et al., 2017); (2) all the examples were coded in terms of three perspectives considering sequences of spoken interaction: canonical constructions, TAM markers, and ISAs; (3) the collostructional strengths between TAM specified canonical constructions and frequent ISAs were confirmed through collostructional analysis. As a result, the following seven tendencies were confirmed: (1) the States/SVC/Present tense construction (identifying (defining), expressing pleasure, expressing dissatisfaction, correcting, asking, and expressing certainty); (2) the States/SVC/Past tense construction (reporting, asking, and correcting); (3) the States/SVC/Modality construction (expressing probability and expressing certainty); (4) the Location/SV/Present tense construction (reporting, correcting, asking); (5) the Location/SV/Past tense construction (asking); (6) the Possession/SVO/Past tense construction (reporting, expressing probability, and asking); (7) the Possession/SVO/Perfect aspect construction (correcting, reporting, and asking). Based on the empirical results, the relationships between TAM specified event schemata of three canonical constructions and illocutionary force realization in English spoken interaction are theoretically discussed.

Exploring the relationship between information structure and intersubjectivity in spoken Mandarin: A corpus-based approach

Lecture

*Dr. Carmen Lepadat*¹

1. RomaTre University

The way in which information is tailored within a discourse unit to fit the addressee's presumed state of mind is inherently connected with the relationship existing between the speaker/writer and the addressee (Van Valin & LaPolla, 1998): intersubjectivity – intended as “the locutionary agent's expression of his or her awareness of the addressee's attitudes and beliefs” (Traugott, 2010: 33) – is clearly at stake in the very same definition of some information-structure (IS) related constructions, including right-dislocated topics. The latter have been defined in functional linguistics as involving “an implicit request from the speaker to the hearer to put the propositional information on hold until the antitopic is uttered” (Lambrecht, 1994: 203) or even as “a grammaticalized device for creating an affective bond with the hearer” (Aijmer, 1989:150). A massive amount of research has been produced in the area of IS over the past century, but seldom in the light of (socio)pragmatic factors such as (inter)subjectivity, speaker/hearer gender or social contexts, with the exception of very few theoretical-based accounts (e.g., Van der Wal, 2015).

This study proposes a new way of operationalising the relationship between IS and intersubjectivity in spoken Mandarin from a corpus-based perspective. 250 utterances containing right dislocations (RDs) were identified and compared with 250 instances of topic-focus utterances from the CallFriend Corpus in terms of intersubjectivity, referent activation, illocutionary force and speaker/hearer gender. Multiple correspondence analyses show that utterances containing RDs are significantly marked by the presence of right peripheral expressions of intersubjectivity such as sentence-final particles, indicating that encoding of the “speaker's attention to addressee self-image” (Traugott, 2010: 60) might be a prerequisite for the use of RDs. Furthermore, intersubjectivity was found to be at play more often in male than in female productions of RDs, contrary to previous findings on gendered use of sentence-final particles (Chan, 1997). Finally, referential RDs had fully active referents significantly more often than referential utterance-initial topics, confirming that a phatic, intersubjective value may be ascribed to the former construction rather than a mere referential integration function (Lepadat, 2021). Exploring unfamiliar ingredients in instructional cooking activities of foreign cuisines

Lecture

*Ms. Shu-Yu Huang*¹

1. *University of Hawaii at Manoa*

Bodily sensing is one of the most fundamental methods human beings use to explore unknowns. Through mobilizing different senses with various ways of object manipulation, the materiality of an object can be obtained and revealed to others in socially recognizable manners in interactions. As ethnomethodological and conversation analytic studies have shown, inspecting sequences shape and are shaped by the wider activities they are embedded in. For example, in tasting sessions, participants achieve objective descriptions of tasting samples through negotiating judgements in more or less standard procedures (e.g., Fele, 2019). In contrast, in shop encounters, customers' physical engagements with food are occasioned for making buying decisions, and their assessments are general and subjective (e.g., Mondada, 2021).

Building on the above-mentioned studies of multisensorial practices with food, this study investigates how student participants in a recreational cooking class explore unfamiliar ingredients. Cooking class is a perspicuous setting for investigating the relations between multimodality and multisensoriality because the materiality of ingredients is consequential to how participants sense and transform them. The data come from 12.5-hour video recordings collected at an adult learning center in Taiwan where four Southeast Asian immigrant teachers took turns teaching local students food from their hometowns. The interactions are conducted in Mandarin and Taiwanese.

This study investigates how participants initiate and conduct sensing actions that are recognizable as doing exploration of unfamiliar ingredients and how they make their sensorial experiences intelligible in interactions. First, sensing actions predominantly follow questions about what the focal ingredient is or specifically about its sensorial features. Their sequential positions indicate that sensing is deployed as a key method to make sense of unknown ingredients. Second, in terms of sensing conduct, participants maximize their sensorial access with distant (sight, smell) senses by leaning toward the ingredient or bringing it close to themselves. However, with contact senses (touch, taste), they minimally expose themselves to ingredients by taking only small bites or touching it with the tip of one or two fingers. The differentiated sensing practices display participants' dual orientation of apprehending unfamiliar food with senses and minimizing potential undesirable outcomes resulting from sensing unknown ingredients. Finally, participants produce intelligible sensorial outcomes by describing the material features of the sensed ingredients and making analogies with multimodal resources. Through delineating the interactional organization of sensing activities, the findings contribute to the understanding of how multisensorial exploration of materiality is interactionally achieved and made locally relevant.

Expressing anger in Spanish speaking online service interactions: The case of Cabify customer complaints

Lecture

Dr. H Powell¹, Prof. Maria Elena Placencia¹

1. Birkbeck college, London

In a previous work Powell and Placencia (2021) analysed complaints made on Twitter against taxicab companies from the point of view of Spencer-Oatey's (2008) Rapport Management framework. As discussed by Locher and Langlotz (2008) the appropriateness of rapport management strategies in a given situation involves subjective judgements in which emotional response is key – inappropriate strategies or impoliteness are likely to produce negative emotions. The links between emotion and (im)politeness are still, however, an underdeveloped area in research relating to the Spanish-speaking world (but see, e.g., Arancibia y Montecino 2017; Kaul de Marlangeon 2018; Maíz-Arévalo 2018; Fernández Vallejo, 2020). We hope to contribute to this growing body of work with a study within a service context, focussing on the ways in which users of Cabify, an online taxicab service operating in Latin America and Spain, express their anger due to unsatisfactory service experiences.

The study adopts a qualitative perspective and uses examples from a corpus of 93 complaints on Twitter concerning Cabify. As observed in McColl-Kennedy et al.'s (2009) study of customer rage episodes, complainers in this corpus display a range of anger intensity and expressed this employing a variety of lexical choices such as negative adjectives or profanities, and shouting - indicated in our online context using the prosodic stand-in (Androutsopoulos 2000) of capitalisation. Complainers also reference retaliatory behaviour they may engage in or attempt to displace their own anger by ridiculing the object of their complaint. Interestingly, complainers in our corpus rely very little on the particular affordances of the medium (emojis or hashtags). Also, complainers rarely describe how events make them feel but rather perform their anger through emotive language.

Expressions of responsibility in the last statements by inmates on death row

Lecture

Prof. Jan-Ola Östman¹, Prof. Helena Halmari²

1. University of Helsinki, 2. Sam Houston State University

In this study we investigate the linguistic manifestations of responsibility in a highly atypical genre: the last statements by Texas inmates who are about to be executed by their state. The data consist of transcribed last statements (ca. 48,000 words) from the period 1982–2021, during which 573 executions took place in Texas. Our general question is the following: How—and how often—do the inmates express responsibility for their crimes in this last moment of their lives?

Concepts of responsibility (Östman and Solin 2016) and complicity (Verschuere 2022) are rapidly gaining a status comparable to that of ideology in discourse analysis and narrative analysis. We exploit the means of traditional approaches to responsibility, distinguishing between moral (personal), legal (formal), interactive (interpersonal), and collective (socio-cultural) responsibility. While this categorization may seem clear, some types of discourse present challenges right from the start.

In our analysis of the last statements by the inmates, we tease out expressions of either taking or avoiding responsibility. The following patterns appear: (1) Those inmates who take moral/personal responsibility for their crimes tend to do so on-record: *I know I was wrong; I accept full responsibility like a man; There is so much hurt that I have caused you all*. They often use the head phrases of an apology (*I apologize; I am sorry*), and they may directly address the victim's family to apologize. The word *sorry* often clusters: it may be repeated multiple times within one short statement. Religious content is heavily present, and it tends to be indexical of taking responsibility for the crime committed. (2) Those inmates who do not express the act of taking responsibility may insist on their innocence or transfer the responsibility of what is happening at the moment (execution) to a broken system—the death penalty as a wrongful institution: *What is happening to me now is unjust and the system is broken; I have no ill will towards anyone carrying out this so-called justice*. Expressions of interactional responsibility may also surface, as in *people seeking revenge towards me*. (3) Inmates in both categories (those who convey responsibility and those who do not) may express compliance (*This is destiny, this is life*) or self-pity (*I wanted to kill myself*).

We couple the analysis of the expressions of responsibility, or avoidance of it, with narrative analyses, especially Level-3 analysis (cf. De Fina 2013). This approach opens up the possibility for discourse analysts to use inmates' last statements as forceful criticisms of the system of executions. We also argue that a detailed analysis of this atypical, peripheral genre of last statements may lead to a better understanding of more mundane kinds of discourse—especially in relation to notions of responsibility and its linguistic manifestations.

Fallacies of war metaphors in the COVID-19 pandemic: a diachronic approach

Lecture

***Dr. Maria Stroinska*¹, *Dr. Grażyna Drzazga*²**

1. McMaster University, 2. University Medical Centre, Groningen

The COVID-19 pandemic changed the way we communicate and produced its own set of public discourses. We review the use of - arguably the most frequently used - war metaphors in government medical discourse and compare it to public discourse on social media, including the fake news.

We look at three countries: Poland, with a very high rate of COVID related deaths, Canada – an example of model vaccine mandate compliance, and the Netherlands, a country with high vaccination rates which went into lockdown as a response the Omicron wave.

The most common metaphor in the discourse about illness has been that of war (Sonntag 1978), with focus on individual patients fighting the disease (Casarett et al. 2017). The pandemic shifted the emphasis to addressing entire societies and influencing their behaviour towards a new health hazard. Doctors no longer talked about individuals fighting a disease: it was the healthcare system's struggle with the virus and patients were reduced to battleground and casualties. However, at different times, a competing narrative emerged, one about the *people* struggling to regain their personal freedoms lost as governments imposed lockdowns and vaccine mandates. Both narratives employ the same war metaphor but assign the roles differently.

War metaphors simplify complex issues and communicate the seriousness of the confrontation, encouraging others to fulfill their duty in the fight against the enemy. And yet, war metaphors may have both positive and negative connotation depending on how one is being cast and how much agency one has (Rohela et al 2020). War metaphors for COVID-19 used by the healthcare authorities tend to cast people as a passive battleground in the fight against the disease waged by the medical profession. In the COVID-19 social media conspiracy theories, people are cast as the fighters for freedom against corrupt governments and profit greedy pharmaceutical companies. The 2nd Freedom Convoy planned for 2023 may change or confirm this script.

Recasting ordinary people as freedom-fighters and returning their agency helps conspiracy theories gain support in situations where the official discourse gives them no active role. Despite it being the same war, it is the casting that determines which side people may feel more likely to align with.

Within the war metaphor frame, the recent idea that we need to learn to live with the virus is akin to treason, adding fuel to the growing conspiracy theories proclaiming the virus as a hoax. The final blow to the war metaphor for COVID was the Russian invasion of Ukraine in February 2022. In the face of a real war, metaphorical wars require immediate reframing.

Fighting for democracy: Ideological implications embedded in the scenarios of WAR

Lecture

Dr. Hsiao-Ling Hsu¹, Prof. Huei-ling Lai¹, Prof. Jyi-Shane Liu¹

1. National Chengchi University

This study investigates the ideological implications embedded in the scenarios of WAR metaphor on DEMOCRACY in Taiwanese presidential addresses between 1948 and 2021. Four main steps are involved in the analysis: determining and extracting metaphorical cases of *mínzhǔ* 'democracy' according to MIP (Pragglejaz Group, 2007) and MIPVU (Steen et al, 2010), verifying source domains according to source domain verification procedures (Ahrens & Jiang, 2020), analyzing the scenarios profiled in the source domains, and discussing the ideological implications based on DHA (Wodak2001, Reisigl, 2017).

Among the four main source domains verified (i.e., WAR, BUILDING, JOURNEY, and ORGANISM), WAR is the most dominant, accounting for 31.8 percent of the total metaphorical expressions on DEMOCRACY. In WAR, four scenarios are profiled: *offensive and defensive processes in war*, *avoiding military/armed attacks and seeking peaceful reconciliation*, *alliances forged in war*, and *a desirable outcome in war*. *Offensive and defensive processes in war* is manifested significantly and constantly throughout all presidents' addresses. Its prevalent status concurs with a constant theme of fighting for democracy within the political background of internal transition from authoritarian regime to democracy and of external long-standing geopolitical tensions. The other three scenarios mainly occur occasionally after 1990. This year marks a turning point in Taiwan's political history: the Wild Lily student movement for democracy is successful and the indirect presidential election is abolished after this year. *Avoiding military/armed attacks and seeking peaceful reconciliation* is profiled to indicate that democracy could serve as a means to sustainable peace. *Alliances forged in war* points out that democracy can forge strong alliances with worldwide partners and fight against threats from authoritarianists. Mainly profiled after the success of the first party alternation, *a desirable outcome in war* relays that in the fight for democracy, a victory is earned. Further exploration of the manifestation of *offensive and defensive processes in war* reveals that it carries different messages in different stages. Before 1990, the primary concern of the ruling party is to fight against the communists and reclaim their lost territory. To distinguish themselves from the communists, the government regards democracy as an offensive and defensive strategy which can be carried out to protect the country. This also implies that democracy is not the government's priority but a means to their legitimacy in Taiwan. The absence of freedom of speech in that period further bears out this implication. After 1990, the success of seven direct presidential elections and three party alternations signifies the advancement of democracy. However, with ongoing geopolitical threats, the governments emphasize the importance of democracy: democracy is the essence of Taiwan, and offensive and defensive processes should be employed to defend democracy. More specifically, it is highlighted that defending democracy is essential to safeguard Taiwan. The role of democracy has thus shifted from a means to a primary goal. This study demonstrates the function of metaphor and scenarios and exemplifies how ideological implications can be scrutinized based on linguistic manifestation and contextual information, particularly the historical and socio-political circumstances.

Food as a Source of Intercultural Communication in Virtual Exchange: Japan and China

Panel contribution

***Mr. Martin Parsons*¹, *Dr. Mikel Garant*²**

1. Hannan University, 2. Beijing Institute of Technology, Zhuhai

This presentation will introduce an ongoing, multimodal, virtual exchange project between university student in Japan and China that seeks to enhance learners intercultural, digital literacy and English as a Foreign Language proficiencies.

We will also describe the results from a particular project which is being undertaken in the latter half of 2022. In this project, as part of their English courses, students from each country formed small groups to collaborate in the production of a short video on an aspect of the food culture of their respective nations. Students wrote a script, recorded video, took photographs or acquired copyright free images, to enhance the script with visual representations. They narrated their script, adding copyright free background music to create an original multimodal, digital artefact. The completed videos were then made available to all students in both countries via a password-protected, bespoke website. A rubric designed for the project allowed students to provide one another with written feedback, which was used to re-edit the videos to complete the project. All interaction between students was conducted in English.

As is well known, relations between the two countries have been fractious for several decades, presenting problems in communication between both the nations and their citizens. Recent global political trends and events may also prove to be a source of further tension. Discussing food culture, however, offers a possible nexus point for communication. In fact, both Japan and China can lay claim to unique and popular culinary traditions of which they are justly proud. Presenting these traditions to one another may lead to opportunities for reflection and deeper understanding. In short, we theorise that if students have the opportunity to meet, even in a virtual exchange, their attitudes towards the other country may improve.

In the presentation, we will outline the project, show examples of the videos produced by students and discuss their impressions of the other country based upon pre- and post-project questionnaires and written reflective comments. Using the students' own words, we will examine how students used the cuisine of their nations to communicate in this intercultural environment in order to make meaning of the task before them.

From the universal impairment hypothesis to the double empathy problem: Theory of Mind and pragmatic skills in autism as a case of epistemic injustice

Lecture

Dr. Eleonora Marocchini¹

1. Institute for Globally Distributed Open Research and Education (IGDORE)

Experimental pragmatics has extensively focused on pragmatics in atypical development. However, only a few works addressed the epistemic limits that specific theoretical approaches to these populations put forward, sometimes affecting decades of research. In fact, while research on neurotypical populations has shifted towards a view of pragmatic and cognitive abilities in terms of individual differences, tackling concepts such as co-constructed discourse and meaning negotiation, research on autism has mainly framed specific pragmatic phenomena into a wider view of autistic pragmatic abilities as impaired.

The hypothesis of a universal Theory of Mind (ToM) deficit in autism has been one of the most impactful in pragmatics. While this idea prompted a wealth of studies, some autistic people passed the false-belief task that was created to test it, leading to the development of more advanced tasks and, even, removal from some tests of items on which autistic performances were neurotypical-like (Chevallier, 2012). Subsequent studies were so strongly based on the assumption of an impairment, that tests not revealing it were considered unsuitable rather than revealing of a bias towards autistic people (Rajendran & Mitchell, 2007).

Similarly, literature in pragmatics has risen from the biased root of a unitary pragmatic deficit in autism, only to find several pragmatic abilities, such as lexical ambiguity resolution, scalar implicatures, metaphor, and indirect speech acts comprehension to be “preserved”. However, the interpretations of these findings often suggest we should not interpret surface level performance as actual competence. Autistic comprehension strategies are framed as “compensatory”, suggesting a supposed superiority of the “normal” strategies, and framing neurotypical strategies as a single standard route to comprehension, losing insights on individual differences and cognitive diversity.

Recent contributions from autistic academics enriched the field focusing on differences rather than impairments, and drawing hypotheses on communication difficulties between neurotypes rather than within a specific neurotype, such as the double empathy problem (Milton, 2012) and its potential application to mutual (mis)understanding in pragmatics (Williams, 2021). However, such contributions are hardly ever cited.

The present work reports on a critical analysis of classic and contemporary approaches to the topic, highlighting potential biases and epistemic injustice, and suggests insights from 2 virtual focus groups with (n=22) autistic adults on cross-neurotype communication. Preliminary results seem to be in favor of the double empathy theory and suggest that the subfield would benefit from a thorough review of the tools we use, higher levels of attention to autistic-led and participatory research and an epistemological perspective shift within the mostly neurotypical academic community.

Gender neutralizing processes in Brazilian Portuguese: style and indexicalization in a feminist corpus

Lecture

*Mrs. Rafaely Carolina da Cruz*¹, *Dr. Anna Bentes*¹

1. University of Campinas

Gender marking in Brazilian Portuguese is performed in a binary way, that is, feminine and masculine. For Mattoso Câmara ([1969] 2002) the masculine -o is an unmarked form and the feminine -a is a specialization, for example, *jarra* (jar) is a specialization of *jarro* (jug). Morphologically, gender marking happens similarly to other Romance languages: in adjectives, nominals, determiners (quantifiers, demonstratives, possessives and numerals) and third person pronouns. Despite that, gender marking is still considered a sensitive aspect for linguistic studies, especially in recent years when sexism in language is discussed and when the creation of neutralization gender processes and/or of inclusive language can reveal solidarity in relation to a social minority. Within this perspective, this work intends to present the phenomenon of gender marking in Brazilian Portuguese in the texts of a feminist *corpus*. The corpus consists of 149 texts collected from self-identified feminist and/or nonbinary social media pages, covering a time span of 3 years (2019-2021). We consider feminism social movement as a discursive field of action (Alvarez, 2014) that is sensitive to social demands, we agree with Blommaert (2005) when he says that any “order of indexicality” is organized by regimes related to feelings of belonging and controlling processes of certain groups. In this sense, the results of our research reveal that we have four metalinguistic actions to neutralize gender marking and/or to produce an inclusive language: a) coordination of binary gender inflections (*amigo*, *amiga*); b) coordination of masculine, feminine and non binary gender inflections (*amigo*, *amiga*, *amig^{ue}*); c) replacing binary gender markers (*amig^{ue}*); d) gender specification/vizibilization (*amiga*). We propose that these metalinguistic actions are part of a process of stylization (Eckert, 2000) through which writers index meanings, values, and contexts that are cultivated by the various feminists collectives observed. The gender-neutral stylistic work we have analyzed are conditioned by textual and discursive features such as genre, intended audience, and speech acts. For instance, in the feminist corpus, gender-neutral forms tend to appear more frequently in informative texts and are concentrated in the opening and closing sections, serving thus an emblematic function.

Gender Prejudices and Identity Contestations in Nigerian Police-Civilian Encounters

Lecture

Dr. Felix Ogoanah¹

1. University of Benin

This study examines the effects of verbal aggression as employed by Nigerian police officers in their interactions with civilians in non-criminal contexts such as stop-and-search at authorized and unauthorized checkpoints and how their performance of these impoliteness events is marked by gender prejudices, identity contestations and power abuses. In this context, impoliteness is unidirectional and because victims are usually presumed guilty until they are proven innocent, much of the encounter is a demonstration of power and legitimation. The study investigates these impoliteness events in order to identify those marked gender prejudices, and reactions and inaction the strategies provoke from the other interlocutor(s). The multimodal datasets utilised in this research were sourced from ten naturally-occurring interactions recorded spontaneously by third parties and published on various social media platforms, (particularly YouTube and Twitter) between the years 2010-2020. These videos were subjected to content and critical analysis. The study discovers that of the five impoliteness strategies proposed by Jonathan Culpeper, Nigerian police officers use four namely, bald on record impoliteness, off record/mock impoliteness, positive impoliteness, and negative impoliteness. The findings also reveal that in deploying these impoliteness strategies, the police officers attack the face of their male and female victims with gender stereotypes of fraud and promiscuity, respectively. They deploy these strategies to perform two of Culpeper's impoliteness functions – the affective and the coercive impoliteness functions and they do it to intimidate, harass and force their targets into compliance for personal gains. More importantly, the study underscores the horrific impacts of these impoliteness events, and their unanticipated risks, which culminated in the 2020 tragic #EndSARS protest among Nigerian youths.

General extenders in university classroom talk: discourse-pragmatic and register variation

Lecture

Dr. Federica Barbieri¹

1. Swansea University

Over the past three decades, sociolinguistics and pragmatics have witnessed growing interest in markers of vagueness, specifically clause-final pragmatic markers (e.g., *or whatever, and stuff like that*; Traugott, 2016), best known as ‘general extenders’ (GEs). Previous research on GEs has focused on their metapragmatic functions, sociolinguistic distribution, and grammaticalization processes. Most studies have focused on conversational data from sociolinguistic interviews (Cheshire, 2007; Tagliamonte & Denis, 2010), while a handful studies have looked at GEs in radio phone-in programs (O’Keefe, 2004), formal interviews (Stubbe & Holmes, 1995), and TV political debates (Overstreet & Yules, 1997). To date, however, research on GEs use in non-conversational, institutional contexts is very limited.

This study addresses this gap by comparing GEs in casual conversation and classroom discourse, an institutional register “at the interface of an oral-literate continuum” (Csomay, 2006, p. 119). Specifically, it examines GEs use in a large corpus (1.3 million words) of American university classroom discourse representing three major disciplinary domains (Humanities, Social Sciences, Natural Sciences), in order to examine the role of disciplinary and intra-register variation on the type, frequency, and discourse-pragmatic functions of GEs in university classroom talk. Patterns are compared with use in a corpus of American conversation (ca. 500,000 words) from the same period.

Findings reveal that GEs are nearly twice as common in conversation than in classroom discourse. GEs were found to vary across disciplinary domains: GEs are most common in the Social Sciences, followed by the Humanities. Taken together, these findings reveal that GEs vary both across registers and within registers. This suggests that, in institutional registers, situational factors (e.g., academic discipline) may be stronger predictors of variation than social factors. Analyses also reveal differences in the particular types of GEs favored in conversation and in different disciplinary domains within university classroom discourse (e.g., Conversation favors *or something, and stuff, or whatever*; university talk favors *and so on, and something like that*).

Gestural discourse markers in multimodal topic-shifting

Lecture

Dr. Schuyler Laparle¹

1. *University of California, Berkeley*

Topic-shifting as a discourse structural phenomenon remains a subject of debate, especially in regards to shift-types (Garcia & Joannette 1997) and the relationship between topic-shifts and digressions (Bordería & Arguedas 2009). Similar complications arise in analyses of lexical discourse markers (LDMs) used to signal topic-shifts, such as “anyway” in English and its cross-linguistic equivalents (e.g. Takahara 1998). In this work, I consider topic-shifting from a multimodal perspective, looking in particular at hand gestures co-occurring with the LDM “anyway”. I demonstrate the ways in which variation in the gestural mode can be accounted for by reconsidering variation in discourse structure, especially in regards to shift-type. Through this analysis, I argue that *gestural* discourse markers (GDMs) can meaningfully contribute to our understanding of contentious concepts in discourse analysis, including the meaning of LDMs and the nature of between-utterance relations.

All data comes from the American talk show *The Late Show with Stephen Colbert*, gathered through UCLA's Communication Studies Archive in collaboration with the Red Hen Lab. I consider 150 examples of “anyway”, which include 111 instances of LDM “anyway” and 39 instances of distinct attitude and semantic senses. In describing accompanying gestures, I take an action-schematic approach, in which the meaning of a gesture is derived from primary motor routines compatible with its formal features (e.g. Müller 2017). I identify and discuss three classes of GDMs with this methodology: (i) *removal gestures* in which a virtual object is removed from the interlocutors' interaction space (25 instances); (ii) *presentation gestures* in which a virtual object is introduced into the interaction space (32 instances); and (iii) *locating gestures* in which a virtual object is referred to in the interaction space (10 instances).

Each class of gestures serves to express different properties of the topic-shift that are left underspecified by the LDM. Removal gestures emphasize topic dismissal, and are strongly associated in the data with ‘full shifts’ (shifts that begin a new discourse topic). Presentation gestures emphasize topic initiation, and are associated with ‘partial shifts’ (shifts that continue a discourse topic but change how it is being discussed) and ‘return shifts’ (shifts that continue a discourse topic after a digressive segment). Locating gestures also emphasize topic initiation, but are most closely associated with return shifts only.

The systematicity of GDMs with “anyway” is exposed by carefully considering other discourse structural factors. These GDMs thus express discourse structural meaning independently from the lexical item they are most closely affiliated with. This independence of contribution suggests that GDMs can serve as another tool for testing our theories of discourse structure.

Greek political discourses in the years 2019-2022: instrumentalizing impoliteness and aggression

Lecture

Prof. Marianthi Georgalidou¹

1. University of the Aegean

The aim of this presentation is to discuss impoliteness, aggression and derogatory forms of speech attested in Greek political discourse since 2008 (Georgalidou, 2011), focusing on the years 2019-2022. Within the framework of im/politeness research (Garcés-Conejos Blitvich 2010; Culpeper 2011; Lorenzo-Dus, et al. 2011; Erjavec and Kovačič 2012; Mitchell and Haugh 2015), I investigate the correlation between impoliteness, or else strategic rudeness (Keinpointer 1997), and abusive verbal discourse in institutional communities of political practice (Harris, 2001). I explore the potential of the said strategies to address not only immediate recipients, i.e., MPs, but also the electorate, and to establish a common ground in viewing political issues and determining ideological polarizations (Tracy, 2017; Georgalidou, Frantzi and Giakoumakis, 2020; Georgalidou, 2020). Within ongoing research (2008-2022), the language material examined consists of the Minutes of Plenary Sessions of the Hellenic Parliament between the years 2019-2022.

The questions posed in the analysis are twofold. Firstly, incidents containing sequences of personal attacks-defense/counterattacks against adversaries in the Greek Parliament are structurally examined as discursive practices in the context of parliamentary combat and political divisions. Secondly, in a macro-level approach, the incidents are examined within the political context that has evolved in Greece, after a long post-junta era (1974 onwards) and the years of the economic crisis (2008 onwards). The study adopts an emic ethnographic/interactional approach. Discourse units are analyzed as there and then social actions. Moreover, a combination of interactional and critical frameworks is applied so that complicated distinctions between expected political rivalry and verbal abuse can be approached.

Analysis focuses on establishing coherence among excerpts that form sequences embedded in long stretches of parliamentary speeches. In such episodes, forms of debasing discourse are examined as part of the aggravated confrontational style dominating Greek politics (Archakis and Tsakona, 2011; Boukala, 2014, 2019; Georgalidou 2011, 2017; Hatzidaki 2017; Georgalidou, Frantzi and Giakoumakis, 2020). This tendency forms part of a long history of divisions between the (far-)right and left-wing political polars of the past century which thematically fuel confrontations reintroducing recurring patterns of opposition (Boukala, 2014; Kostopoulos, 2021). Another question the study attempts to tackle concerns the negotiation of preferences in political combat and the potential normalization of debasing choices attacking the personality of adversaries which could render such choices expected, if not preferred. Strong reactions and rebuttals on the other hand, are examined as indications of a dispreferred act having been committed, at least as far as the perspective of the attackee is concerned. All in all, the study puts forth questions of the sequential organization of parliamentary interactions embedded in the context of contemporary Greek politics.

How do scholars understand (im)politeness? An analysis using computational methods

Lecture

*Dr. Xi Chen*¹, *Dr. Mian Jia*²

1. University of Central Lancashire, 2. The University of Texas at Austin

In the recent development of politeness research, pragmatics scholars have made increasing efforts to conceptualize (im)politeness (second-order politeness) through analyzing the emic and individual understanding that are provided by laypersons (first-order politeness). This process, namely, identifying regularities from discursive understanding, has generated a dynamic range of scholarly explanations for (im)politeness, affected by the cultures, the situations, the languages, and the research targets that are investigated in the studies. This study explores both the variations and common features in scholarly understanding of (im)politeness, using computational methods. The findings aim to open an avenue for politeness researchers to learn from the other's perspectives and potentially help them to gain generalizable definitions of (im)politeness for future studies. Specifically, this study used data scraping techniques to glean full sentences, where the keywords 'politeness', 'impoliteness', 'im/politeness' and '(im)politeness' were used, from three hundred journal publications in the field of pragmatics between 2018 and 2022. In total, 11701 sentences were extracted. The data were then processed using KeyBERT and BERTopic. The former helps to obtain representational expressions that describe each sentence the best, while the latter identifies patterns across different sentences.

Based on self-attention neural networks, the computational models split the data into eight different topics (clustering of expressions). Each topic provided 30 representative expressions, which were listed by their strength of association with the topic. All the topics contain both keywords 'politeness' and 'impoliteness', except the one described by 'prosody'. It seems that prosody has primarily been related to politeness only, indicating a potential research gap. More interestingly, there is not a single term that has been used to define (im)politeness across the eight topics. The most common descriptions related to (im)politeness are 'social' and 'use', which appear in six and five topics, respectively. Other common, but less topic-widely used, terms include 'context', 'linguistic', 'face', 'strategies' and 'evaluation'. The topic-unique descriptions demonstrate interesting pairs of co-occurrence, such as 'norms' and 'markers', 'discursive' and 'moral' 'order', 'genuine' and 'intended', 'identity' and 'rapport' and many others. In addition, 'Greek' and 'Chinese' top two separate topics with Egyptian included under Greek and Japanese under Chinese. Their topic descriptions, however, differ saliently, reflecting culture-specific interpretations of (im)politeness.

The found clusters of expressions might not be a surprise to politeness researchers. Their studies might have used some of them to describe their own understandings of (im)politeness. Indeed, what each topic in this study presents is the distinguishable 'segments' that different (im)politeness scholarships collectively share between them. These findings of the different 'segments' are expected to contribute to mapping the complex conceptualization of (im)politeness towards its wholeness and scientificity.

How to dismantle Responsibility in the Public Apology of the Diet of Japan — From the Perspective of Local Grammar

Lecture

*Dr. Huiling Chen*¹, *Mr. Hengcong Li*², *Dr. Jianying Du*¹

1. Huazhong University of Science and Technology, 2. Osaka University

In a public apology compared to a private apology, the question of who should be held responsible is at the center of academic and public concern (Alice MacLachlan, 2015; Qi et al., 2019). And in what is considered a serious public event, an apology that contains a clear statement of responsibility seems to be a taboo for apologizers. Therefore, apologies in public arena will always be done in creative ways. This paper takes public apology in the Diet of Japan as the research object and attempts to explore which language structures Japanese politicians use when making public apologies and their relevance to dealing with the responsibility speech. The research method mainly uses local grammar analysis (Barnbrook, 2002), combining quantitative research with qualitative investigation.

This survey used the online full-text database of the Minutes of the Diet, jointly produced by the National Diet Library of Japan and the upper and lower houses of the Diet. Firstly, the stereotyped expression of apology is used to automatically retrieve the apology examples and manually delete the examples without apology intention. After that, on the basis of local grammar analysis of all examples, 27 different apology functional labels are extracted, and 291 different apology local grammar patterns are determined. According to the combination pattern of functional labels in each local grammar pattern, it can be divided into three types: “weak informative apology”, “strong informative apology” and “non-informative apology”, among which “weak informative apology” is the most frequently used type.

By analyzing the correlation of events and responsibilities in specific instances, this paper summarizes three progressive stages and eight corresponding pragmatic strategies for Japanese politicians to cover up their responsibilities. The three stages are “whether to apologize, whether to choose to be responsible for the event itself, and whether to accept punishment”. The eight strategies were “avoid apology while taking responsibility”, “take responsibility for compensation”, “use objective reasons as an excuse”, “attribute responsibility to broad concepts”, “emphasize indirect responsibility”, “refer to past achievements”, “arouse sympathy”, “weaken the crime of the events while taking responsibility”.

This paper adopts a new method, local grammar, to analyze the unique apology speech acts of Japanese politicians from a microscopic perspective and finds out the main language means to dismantle their responsibilities, thus filling the gap in the research of public apology in Japanese political discourse. At the same time, this paper also opens up a new path of local grammar analysis for the study of speech acts in Japanese.

I AM criticizing you when I say “I am not criticizing you”: A multimodal analysis of the Chinese metapragmatic structure *bushi wo shuo ni* 不是我说你

Lecture

Mr. Zepeng Wang¹

1. Nanjing University

Although the Chinese metapragmatic structure *bushi wo + V + (NP)* contains a negation marker, *bushi* “not”, literally meaning “I am not performing the speech act of V (to NP)”, the sequences following it are often doing its opposite (Ran, 2015). This controversy serves as the departure point for the present study that takes the Chinese metapragmatic expression *bushi wo shuo ni* “I am not criticizing you” as a case, which has been widely used in the interaction and received continuous attention from scholars due to its conflicting property. One influential argument in this line of research is that *bushi wo shuo ni* mainly functions as a rapport-oriented mitigating device used to reduce or soften the possible unwelcome effects of the speech act of criticizing (Ran, 2015; Yang, 2021). Nonetheless, such studies remain narrow in focus dealing only with written data retrieved from novels, TV dramas, etc. Questions like how verbal language and nonverbal resources such as prosody, gesture, and facial expression jointly construct the speaker meaning are yet unanswered.

It is well acknowledged that human communication, as a multimodal system, is composed of both verbal and nonverbal components, of which the latter plays a more critical role in the interaction. As such, the present study adopted a multimodal approach to advance our understanding of the metapragmatic awareness of the speaker when saying *bushi wo shuo ni* and how such awareness is manifested through the coordination of multimodalities by answering the following two research questions:

(1) what are the prosodic features of the Chinese metapragmatic structure *bushi wo shuo ni*?

(2) what are the speaker’s facial expressions when saying the Chinese metapragmatic structure *bushi wo shuo ni*?

The data were collected from 30 native Chinese speakers who participated in two recording sessions designed by the author. The preliminary results of the prosodic analysis of *bushi wo shuo ni* show that *shuo* “to criticize” is the focus of the prosodic unit *bushi wo shuo ni* in the sense that the character *shuo* has the largest duration ratio. In addition, the initial analysis of the facial expression indicates that speakers’ facial expressions are mostly sad and angry when uttering *bushi wo shuo ni*. Thus, it might be concluded that the speaker, indeed, is criticizing the listener when saying *bushi wo shuo ni*. In this case, the metapragmatic negation marker *bushi* could be seen as a mitigator fulfilling its unique interpersonal function.

IAW phrases with attributive question words in German

Lecture

Dr. Steven Schoonjans¹

1. Alpen-Adria-Universität Klagenfurt & KU Leuven

IAW phrases, also called aggressively non-D-linked phrases in more formal frameworks, are a group of expressions that can be used especially in wh-questions to express “incomprehension from the side of the speaker with regard to the sentence proposition” (Stefanowitsch 2011:190, my translation). Typical German examples include *in aller Welt* ‘in all world’, *zur Hölle* ‘the hell’ and *um Himmels willen* ‘for heaven’s sake’, as illustrated in (1–2):

(1) Warum *in aller Welt* sollte man ein Rockkonzert besuchen? (Stefanowitsch 2011:190)

‘Why IAW should you visit a rock concert?’

(2) Wieso *zum Teufel* habt ihr überhaupt gewettet? (Catasso 2021:141)

‘Why IAW did you bet in the first place?’

In English, these phrases have to immediately follow the question word (e.g. Akiyama 2014, Polinsky 2007), which excludes them more or less from being used with attributive question words such as *which*, that are necessarily followed by a (pro)noun, combinations such as *which the hell* being highly marked. In German, IAW phrases can also occur later in the sentence, which allows them to be used with attributive question words such as *welch* ‘which’, as in (3–4), taken from my dataset:

(3) Und mit welchem Geld *zum Teufel* wollen Sie das alles in Zukunft sanieren?

‘And which money IAW do you plan to use to renovate all that in the future?’

(4) In welches Paderborner Provinztheater sind wir da *zum Teufel* geraten?

‘Which Paderborn province theatre did we IAW get into here?’

The aim of this presentation is to get a better view of how IAW phrases behave in wh-questions with attributive question words such as *welch* and *was für* ‘what kind of’, compared to questions with non-attributive question words such as *warum* ‘why’ and *wie* ‘how’. To this end, I present an analysis of the IAW phrases in the German reference corpus *DeReKo* (in COSMAS-II). I will show that the range of IAW phrases that can be used in both conditions is largely the same and that they also show largely the same topological tendencies: although IAW phrases occur slightly more often in the middle field (i.e. after the finite verb, as in (4)) with attributive question words, they still show a clear preference for the prefield (i.e. preceding the finite verb, as in (3)), despite still not being adjacent to the question word as they are with non-attributive question words as in (1–2).

Impoliteness of polite disagreement: The perception of (im)politeness between honorifics and speech acts in Korean

Lecture

*Dr. Narah Lee*¹

1. *The University of Queensland*

There has been much research on politeness in Korean, which is often considered as the study of ‘honorific grammar’ (Kim, 2011:178), and the focus has been on the use of honorifics and speech levels in the expression of respect and deference towards an elder or superior speaker. However, as Cho (1986) discussed the conditions of politeness in Korean, an appropriate choice of honorifics and speech levels may not guarantee politeness of an utterance when the speech act involves an unfavourable or unconcerned attitude towards the interlocutor. Speech acts that are Face Threatening Acts (Brown & Levinson, 1987) on the surface, such as request, refusal and apology, have been partly discussed in relation to politeness strategies in Korean (Koo, 2004; Moon, 2017), but in the cultural context of Korea where consideration of interpersonal relationships in discourse, such as relative age and social hierarchy, makes a substantial contribution to the perception of (im)politeness, a wider range of speech acts can be re-examined in the influence of (im)politeness. For example, a younger speaker who does not show compassion and agreement to an older interlocutor’s opinion or disagrees with the elder may be seen as impolite even if their utterance is formed with appropriate speech levels and honorifics. Also, as complimenting attributes credit to the interlocutor as a politeness strategy and is positively valued by the speakers (Homes, 1988), the acknowledgement of epistemic status between speakers would need to be addressed in the discussion of (im)politeness in Korean. Through the epistemic and discursive perspective, the current research investigates the mechanism of (dis)agreement and compliment/criticism as (im)politeness strategies in Korean. An online survey asking the degrees of (im)politeness of a set of utterances combining different speech levels, honorifics, (dis)agreement and compliment/criticism was conducted on 272 native Korean speakers. The results reveal that speech acts of agreement/disagreement and compliment/criticism affect the speakers’ perception of (im)politeness of the utterances more critically than honorifics and speech levels. By analysing empirical data with the new lens of agreement and compliment as politeness strategies, this study sheds light on the further understanding of (im)politeness in Korean beyond the ‘honorific grammar’.

In/directness in requests and refusals in multilinguals: A linguistic and textual perspective

Lecture

Dr. Ronit Webman Shafran¹, Prof. Anat Stavans¹

1. Beit Berl Academic College

Pragmatic competence in monolinguals develops fairly late in early childhood. The mastery of pragmatic competence among non-native speakers is also a protracted process even for those with high proficiency (Bardovi-Harlig 2001) in the language. One of the key forms of interpersonal communication that enters into the mastery of pragmatic competence is speech acts. Studies on speech act production in first (e.g., Ruiz de Zarobe & Ruiz de Zarobe, 2012) and second languages (Gass & Neu, 1996) have revealed variability in speech act patterns across languages, especially among non-native speakers of the language. While numerous studies have dealt with speech acts in bilinguals and second language learners (Cenoz, 2007), fewer studies have examined speech act productions of L2 and L3 speakers of a given language (e.g., Safont Jordà, 2011; Stavans & Webman Shafran 2018).

The present study examined the linguistic and textual features characterizing direct and indirect speech act productions of requests and refusals in English by two multilingual groups: Arabic speakers for whom English is their L3 (trilinguals) and Hebrew speakers for whom English is their L2 (bilinguals). Data were collected using a Discourse Completion Task and a background questionnaire. Results showed that there were no differences between the groups (bi-/tri-linguals) in the production of either in/direct mode of request and refusal: both groups preferred the indirect mode for requests and the direct mode for refusals. However, there were differences in the use of linguistic/textual features between in/direct requests/refusals within each language group and differences in the use of features across the language groups within the directness mode. The discussion centers on the role of cultural influences as well as differences in English proficiency, pragmalinguistic competence and age across groups.

Information status and verbal/non-verbal referential acts in Mandarin mother-child conversation

Lecture

Dr. Kanyu Yeh¹, Dr. Chiung-chih Huang¹

1. National Chengchi University

During the past decades, increasing studies have demonstrated the influence of information status on adult speakers' verbal and non-verbal referential acts (Azar et al., 2019; Debreslioska, & Gullberg, 2019, 2020, 2022). Earlier research on child language has also suggested that information status (i.e., new and old) is one of the pragmatic factors that influence children's referential choices from an early stage (Allen, 2000; Hughes & Allen, 2013, 2015). Children were found to differentiate new and old referents through verbal expressions at around age two (Allen, 2000; AUTHOR, 2011; Guerriero et al., 2006). While children produce non-verbal devices along with verbal ones to co-express meaning from early on (Ateş & Küntay, 2018; Goldin-Meadow & Butcher, 2003; So et al., 2010), few studies have examined the influence of information status on children's referential acts in the two modalities. More studies are also needed to gain a clearer picture of children's multimodal referential ability throughout their development.

The present study investigated Mandarin-speaking children's referential communication at ages one, three, and five in relation to information status to understand their increasing sensitivity to that discourse-pragmatic factor and their developing communicative ability in the two modalities. Their mothers' verbal and non-verbal referential acts were also examined to further understand the children's acquisition of such usage. The data included 12 hours of natural conversations between Mandarin-speaking mother-child dyads (one hour per dyad, four hours per age group). Each of the third-person referents in the conversations was coded for (1) information status (new and old) and (2) types of referential acts (verbal, cross-modal, and non-verbal). Referential expressions in the two modalities were also categorized (nominal forms, pronominal forms, and null forms for verbal acts; gestures and communicative functional acts for non-verbal acts).

The results showed that the children differentiated new and old referents in both the modalities and the referential expressions they used as early as age one and throughout their development. They used cross-modal acts more frequently to refer to new referents and verbal acts more often to indicate old referents. As for referential expressions, the children used more informative forms, including nominal forms and pronominal forms with non-verbal devices, when they indicated new referents, while they frequently chose reduced forms such as null forms when they referred to old referents. Similar patterns were found in their mothers' usage. Nevertheless, the children relied on cross-modal acts more often than their mothers did, especially when they referred to new referents. The results demonstrated that the children at different ages used both verbal and non-verbal expressions available in their current repertoire to provide more information to specify new referents. As their verbal ability developed, cross-modal acts continually played an important role in co-expressing referents in their interaction with their mothers. It is suggested that the children's referential choices in both modalities reflected not only their communicative and pragmatic abilities but also some characteristics of early mother-child interaction.

Initiating repair in transition space with the Norwegian particle “eller”

Lecture

Dr. Marja Etelämäki¹

1. University of Oslo

The paper will focus on the TCU initial use of *eller* as a repair initiator in transition space (see Schegloff, Jefferson & Sacks 1977). The Norwegian word *eller* is classified as a disjunctive conjunction in *Norsk referansegrammatikk* (Norwegian descriptive grammar). It can roughly be translated as ‘or’ in English. In addition to its use as a conjunction, *eller* is frequently used as a TCU initial and TCU final particle. In these positions it has the potential to transform the on-going turn into an alternative question or a list of alternatives. It shares, thus, some of the uses with, for example, Finland Swedish *eller* (Lindström 2008), English *or* (Drake 2015), Finnish *tai* (Laakso & Sorjonen 2010), and Finnish *vai* (Koivisto 2017).

The data consist of approximately 15 hours of audio and video recorded everyday informal face-to-face conversations. Three main uses for *eller*-initiated TCUs in transition space are found: (1) Modifying but not deleting a description given in the previous TCU, (2) Offering an alternative that excludes the one given in the previous TCU, and (3) Emergent listing of one or more alternatives.

Of these uses, (1) the modifying but not deleting and (2) offering an alternative that excludes the one given in the previous turn are more repair-like because they stop the progressivity of the conversation in order to revise something in the previous talk (see, e.g. Schegloff 2013). In these cases, *eller* is produced in a faster tempo than the surrounding talk, and it is often latched to the following word (>*eller vi*< *kan gå* ‘or we can walk’). The listing-use (3), however, points forward rather than backwards: alternatives are added without deleting the previous ones. In these cases, *eller* is produced in the same tempos as surrounding talk.

The paper will discuss these three main uses with examples. In the end, it will discuss the continuum between repair and emergent listing, and reflect the findings from Norwegian against findings of similar types of particles in e.g. Finnish, Finland Swedish, English, and Swedish.

Innuendo and its Pragmatics on the Path to American Political Hate

Lecture

*Prof. Norma Mendoza-Denton*¹

1. UCLA

Recent work in philosophy of language and the discourse/pragmatics of political hate speech has focused on “dog-whistles,” “fig-leaves,” and “stupefying,” all terms that point to the real world effects of indirectness in the carrying out of political aims (Dénigot and Burnett 2020; Henderson and McCready 2019 a,b; Saul 2021; Deigan 2022). Various accounts for these processes of implicature, deniability, in-group identitarian appeals, indexical field effects, and the at-issue/not-at-issue distinction, these are all types of conversational manipulation that fall into a broader category that I will here call innuendo. Not only do multiple linguistic strategies involving speaker, target, audience and interpretant support innuendo; it also happens through other semiotic channels: for example, the Trump administration’s frequent photo-ops eating KFC, while ostensibly innocuous, were a veiled sexist dig at Hillary Clinton.

An example of interpretive bifurcation found in a religious dogwhistle is documented in Albertson (2015). Consider the following utterance by George Bush in his 2003 SoTU address: (1). In an experimental setup probing the phrase’s interpretation, Albertson found that 89% of Pentecostals recognized the reference as coming from a well-known church hymn, vs. 9% of a more general subject population. This effect suggests differing interpretations for two different categories of people: those who can recover the in-group reference and those who cannot. Albertson additionally found that for those who did recover the reference, a preference was exhibited for covert rather than explicit religious appeals, leading to the conclusion that coded religious communication is particularly persuasive in politics.

Innuendo effects are crucially dependent on background social context: coded religious innuendo obtains in the United States because it is a normatively (though variably) secular society, with an established-but-barely-holding norm of the separation of church and state, coexisting with a pervasive religiosity until recently relatively excluded from official government actions. Along with other normatively frowned-upon but pervasive behaviors (sexism, racism, classism, etc), this creates the conditions for religious, sexist, racist, and classist innuendo.

Here I present examples of racist innuendo (dog-whistles and fig-leaves) alluding to a broader construct of eugenics/genetic purity (the so-called “racehorse theory”) from the Trump dynasty-cum-administration and its followers. While most of the semantic and pragmatic literature cited above aims to examine dog whistles and fig leaves at the level of a single utterance, I argue that studying them as a system uncovers greater regularities, historical continuities (like intergenerational transmission) and coordinated acts in general messaging, as well as elucidating dog-whistles/fig-leaves’ takeup within indexical chains among followers. I see the study of innuendo as an investigation into the pragmatics of what remains unsaid, and its recoverability beyond the sentence level as of utmost importance for the understanding of political hate speech. Working hand-in-hand with other semiotic indices, understanding innuendo gives us a chance to describe a broader linguistic aesthetics (Meyerhoff and Mendoza-Denton 2022) of our current political moment.

Institutional Crisis Communication: inspiring hope through verbal and non-verbal strategies

Lecture

Dr. Dorothy Agyepong¹, Prof. Nana Aba Appiah Amfo¹

1. University of Ghana

Discourses (and narratives) “simplify” economic and political relations. The complex nature of the latter requires “discursive simplification”—a careful selection in terms of what to include and exclude in discourses of such nature, (Fairclough 2005: 55). On this premise, our study investigates crisis communication management in Ghana. Between 2020 and 2022, Ghana has experienced two major crises; COVID-19 pandemic and quite recently an economic crisis—going to the International Monetary Fund for financial support. The COVID-19 crisis was a global one. There was therefore the urgent need to create awareness about the virus as well as communicate measures to mitigate the effect of the pandemic on the nation’s socio-economic life. To achieve this, the President of the Republic of Ghana led the communication, delivering an estimated number of twenty-six televised COVID-19 updates between 2020 and 2021. These periodic updates appeared more deliberate and multimodal (verbal and non-verbal). For instance, the speeches included synchronous sign language interpretations. To recognize the linguistic diversity of his audience, the President often concluded his speeches with highlights in at least two local languages. Further, there seemed to be the progression of a few of his speeches in line with the progression (or otherwise) of the crisis. These updates were subsequently distilled through press conferences organized by the Ministries of Information and Health.

Ghana is experiencing another crisis— an economic one. After several assurances from key people in government that Ghana would not go to the IMF, the country eventually succumbed. Adopting a comparative approach, we investigate the link between how communication was managed during the pandemic vis-à-vis its management during the current economic crisis. We further explore the strategies used in communicating the economic crisis to citizens by focusing on issues such as who the key communicators are, whether the President has been involved in the communication process and if he has, at what point in time, the language(s) and stylistic devices employed in the information delivery process, etc. We also examine the extent of deliberateness (in terms of multimodality) adopted in the communication processes. Critically, we explore the possibility of a bottom-up approach in contradistinction to the COVID-19 situation. Finally, we investigate how these communication strategies inspire hope or otherwise in Ghanaians.

Our presentation is based on discourses sourced from various news outlets (media briefings, online articles, and TV interviews). Of particular interest are the addresses delivered by the President and key members of government. The data is analyzed using a critical discourse analytic approach (Fairclough 2005), and Van Dijk’s (2017) socio-economic approach to discourse analysis, with the hope of examining the aspects of CDA or other modern communication strategies that best appeals to this study. In terms of the analysis, we seek to provide a deeper understanding through detailed descriptions and interpretations of the texts gathered.

Interactional Functions of "Jiu shi" in Mandarin Chinese Conversation

Lecture

Dr. Yue Guan¹

1. Peking University

The discourse marker "jiu shi" [就是], roughly means "(it) is (just)" in Mandarin Chinese, has a very high frequency as a linking device of two-part utterances. After a long process of grammaticalization from verb to adverbial conjunction, it developed functions of infer meta-language to describe the language itself in naturally occurring spoken language, such as transitions and connections within a given discourse, and to reinforce affirmations. In particular, "jiu shi" can be used in interactional situations to show the state of understanding, to help produce obstructed speech, and to express one's own point of view. In different cases, "jiu shi" can syntactically concessional, explanatory, selective and transitive in meaning, but after all these are not brought about by "jiu shi" itself, but by the context and the sequential position.

My research focuses on "jiu shi" in syntactic collaborative construction in naturally occurring Chinese conversations, which means a syntactically complete sentence can be co-constructed by different speakers in adjacent turns. According to their positions, tokens of "jiu shi" can be divided into two types: "jiu shi" belongs to the former part, and to the latter part.

I) Belongs to the former

Ex.1 (C-25)

1 C Jiuxiang wo didi j iushi tizuqiu a,

For example, my brother does like playing football,

2 → jiushi,p<

It is,

3 B fengkuangde,

Insane,

4 [Tebie xihuan a.

like it very much

5 C [Te fengkaungde.

Very insane

In example 1, speaker C mentions her brother is enthusiastic about football games. In line 2 she wants to find an expression to describe her brother. She is the main teller but another participant B collaboratively completes the utterance. This is signalled by the hearable click from the main teller A which indicates that she is trying to find a proper word to complete her utterance but encounters obstacles.

II) Belongs to the latter

Ex.2 (S-07)

1 R Qishi ta shi ta die

Actually he is his father

2 L Na, dui.

That, right.

3 Jiushi houlai danshi nage ni dei xiang nizhidaome,

But you need to think about it later you know,

4 R → [jiushi feidian naozi.

It is mentally tiring

5 L [jiushi ni dei naozi shaowei xiangyixia.

it is that you have to use your brain to think about it

6 Jiu shui gen shui jiaohuan le.

It is someone change to another

In example 2, the two speaker's utterances overlap in lines 4-5. The two speakers achieve the alignment in the following turns.

When "*jiu shi*" belongs to the former part, it often uses to project later part, or to hold the turn, thus devoid of losing the speakership although such an attempt may not work; when "*jiu shi*" appears in the latter part, it acts as the connector between the prior talk and the subsequent one. This connection can be projected in full accord with the speaking agenda, or it is only the hearer's intention to grab the talk at a transition-relevance place of the speaker's prior turn.

Intergenerational discourses on climate change

Lecture

Dr. Hermine Penz¹

1. University of Graz

Climate change is a global issue which is already having negative effects on biological diversity, people's living conditions and has thus become a growing concern worldwide. It has potential for intergenerational conflict as the younger generation will have to deal with the consequences of the activities of the previous generations. However, people of all ages are already experiencing the effects of the changing climate.

This paper analyses intergenerational discourses on how people are experiencing climate change in their immediate environment and investigates conflicts between generations as well as solidarity in their attempts to deal with this threat and the fears and hopes they express for the future. Age-based perceptions will be the focus of the analysis.

The data is based on (semi-structured) interviews with two different age groups, i.e. 15-30 years and 60+, some of which also include an age gap between interviewer and interviewee. The data are analysed by means of qualitative discourse analysis.

Interkinesthetics in Enskillment: Calibrating Force at the Potter's Wheel

Lecture

Dr. Eton Churchill¹

1. Kanagawa University

This study explores the interactive realization and calibration of force in enskillment. In enskillment, the novice's attention is not only educated to reproductive points of articulation between their body and the material world, but also to how to effectively mobilize and calibrate the body's forcefulness. Although cognitive linguists have explored the relationship between language and force schemas (Talmy, 1988; Gibbs, 2005), multimodal analysis may be better suited to illuminating the interactive realization of force during enskillment. Whereas several studies on social interaction have examined related phenomenon (e.g., touch, movement, gesture), the examination of force has remained peripheral in studies on social interaction. Accordingly, this is one of the first studies to investigate explicitly how participants interactively realize and calibrate force in enskillment.

The analytical framework for this study is inspired by Goodwin's (2018) co-operative action. Specifically, based on videotaped interaction collected over 6 months, this study explores how a master and novice potter working at an electric wheel in Japan use multimodal resources across trajectories of action to orient to force. Through their talk and embodied action, participants animate force by indexing its various dimensions—e.g., its source, direction, and intensity. Interkinesthetic understandings are attained through the embodied sharing of force dynamics within turns, and across trajectories of action. Multimodal resources employed to this end include *inter alia* mimetic gestures, onomatopoeia, prosody, and the modification of verb forms and turn designs across trajectories of instruction. The participants are shown to carefully synchronize embodied action to facilitate the analogous perception of force dynamics and their proprioceptive realizations. This paper will present a categorical analysis of the different multimodal resources used to animate and calibrate force, and probe the dynamics through which forces animated by the master potter become analogously realized in the novice's subsequent actions. It is argued that participants' orientation to and sharing of force dynamics in enskillment contributes to the cultural (re)production of techniques of the body, and thus promises further insight into the anthropology of the body, social interaction, and human sociality.

Interpreting demonstratives using emanation paths: The role of voice source in early language development

Lecture

*Dr. Jack Wilson*¹, *Dr. Amy Bidgood*²

1. University of Salford, 2. Liverpool John Moores University

The English demonstratives, *this* and *that*, are often analysed as referring to an object that is proximal or distal to the speaker, respectively. This analysis suggests that a proper understanding of demonstratives involves the interpretation of a speaker's language use and their perspective. Therefore, theory of mind / mindreading is often used to explain the processing of demonstratives. Since infants have been shown to use and comprehend demonstratives very early on in development, it has been suggested that children's early mindreading capacities (implicit theory of mind) involves some form of perspective taking (Rubio Fernandez, 2021). What's more, some have argued that demonstratives and mindreading might mutually boost each other in development. In this talk, we agree with the second of these ideas, but question the first.

There are two possible ways to interpret the English demonstratives. The first, or standard way, is to treat understanding the distinction between *this* and *that* as involving perspective taking. *This* means 'near the speaker' and *that* means 'not near the speaker'. An alternative is that demonstratives are interpreted using *emanation paths*. Emanation paths, such as the ripples a pebble leaves on the surface of water, emanate from a central source. Acoustic linguistic productions form emanation paths from the speaker's location. As such, infants may interpret demonstratives as proximal or distal from path source. This interpretation would not involve mindreading but could facilitate an infant's developing ability to mentalise as they develop an association between the source of the emanation path and the speaker.

The path interpretation of demonstratives is impossible to distinguish from the perspective taking approach in English because it has a binary proximal/distal distinction. However, while demonstratives appear to be universal, a binary proximal/distal distinction is not. Japanese, for example, has a three-way distinction, *proximal to speaker*, *proximal to hearer*, and *distal from both hearer and speaker*. The perspective taking analysis would expect no difference between proximal to speaker and proximal to hearer demonstratives, whereas the path analysis would expect that proximal to hearer is learnt later in development since it must rely on perspective taking. In a recent study, it was found that while proximal to speaker demonstratives are acquired along a similar time frame in English and Japanese, proximal to hearer demonstratives were not produced in the window under investigation (Diessel and Monakhov, 2022). We argue that this favours the path interpretation and presents a challenge to the perspective taking explanation. We believe that this finding presents an avenue for new research and can shed light on the nativist and developmental (nominalist) approaches to theory of mind.

Interpreting Pragmatics of the Matrimonial Adverts: A socio-cultural perspective

Lecture

Dr. Tazanfal Tehseem¹

1. University of Sargodha

This paper aims at interpreting how matrimonial adverts portray pragmatics of culture through language with a focus on how marriage discourse is conducted in the two cultures, as a way of reinforcing the SFL claim that language reflects and constructs the context of culture (Halliday and Matthiessen, 1999). Pragmatically, meaning potential remains dynamic as construed by the language use therefore, its interpretation is deeply rooted in its social context (Verschueren, 1999). Historically, marriage was considered not only a romantic tale but a right to exploit women as commodities so was advertised screening the consumership (Anand, 2017). The traits advertised include age group, skin colour and appearance, social stature, caste and ethnicity, education and occupation etc. to complement the demands in the two cultures; western and Pakistan. We hypothesize that there would be socio-cultural differences in the adverts from the two cultures in focus.

Since the marriage discourses offer rewarding data on how the people choose to display their intended attributes regarding socio-cultural traits, therefore, is of great interest to the discourse analysts to unfold linguistic patterns employed. The paper draws on the systemic functional framework (Halliday and Matthiessen, 2014) for discourse analysis mainly the transitivity choices and the attitude types; affect, judgement and appreciation (Thompson 2014) and the differences in the linguistic choices will reflect the cultural constructions. The data is collected from different sources including print as well as digital media from the two cultures embedding match-making practices. In total 54 adverts have been scrutinized which look deemed representative of the given cultures to make a comparison. The findings are consistent with the predictions hypothesized and illuminate the ways in which the two cultures portray marriage clients.

Interpretive Constructs: what do flattery, incitement and hypocrisy have in common?

Lecture

Dr. Roni Danziger¹

1. Lancaster University

The ability to identify what others are doing with language is the basis of human interaction (Tomasello, 1999). However, the interpretation of semiotic and linguistic resources is not at all clear-cut. Sometimes, impolite language is used to build rapport, like in jocular mockery (Haugh, 2010), and very polite language is used maliciously (Danziger, 2023). Scholars of Pragmatics have therefore concluded that no utterance is inherently polite or impolite (Locher & Watts, 2005). Participants in interactions evaluate language in context, according to personal as well as social and cultural expectations. But social interaction is even more complex, dynamic and fuzzy. Previous research has further shown that some utterances can never be unequivocally identified (Danziger, 2020; 2021). For example, positive evaluations can be interpreted at face-value, as compliments or praise, or they can be identified as strategic, i.e., as flattery.

Flattery is an evaluative label. It reveals that a participant in an interaction has judged a positive social act (Danziger, 2023) as strategic language that negatively exceeded expectations in context. Flattery is a strategic non-conventionalized social behaviour that abuses verbal actions that are coded as conventionalized and recognizable positive communication and not a conventionalized speech act in itself. Flattery thus lies in the interpretation of an action and not the action itself. Labeling a suspicious action as flattery is performative because it frames an action as instrumental, by so bringing forward the underlying strategic use of language implied by the meta-pragmatic label. Until the label of flattery is given to that action, its status as flattery remains completely potential. In uttering it, the label transforms a positive act of communication into flattery. An important characteristic of flattery is that it is always a matter of perspective. The same positive social act can be perceived as a compliment or as flattery by different observers who judge the recipient of the positive evaluation as praiseworthy or not (Danziger, 2020; Danziger, 2021). Thus, the positive evaluation is and is not flattery, simultaneously. The different observers have gone through an interpretive process and reached a different conclusion, neither more correct than the other.

Two other similar socio-pragmatic phenomena, hypocrisy (Sorlin & Virtanen, 2021) and incitement (Kurzon, 1998) have received limited attention in the field of pragmatics. Hypocrisy is too an indeterminate interpretive construct; it is positive discourse (moral discourse) that receives a negative label due to a perceived mismatch between previous and current moral behavior of the speaker. Incitement, like flattery, does not have a conventionalized form, and it is defined by the perlocution sequel (Austin, 1976), i.e., the action that follows a successful incitement. In this presentation, I will compare hypocrisy and incitement with flattery in order to advance our understanding of interpretive construct. Understanding what interpretive constructs are and what labels fall under this category will contribute to the field of and pragmatics in that it will demonstrate how not only are utterances never inherently polite or impolite, but also that some utterances can never be unequivocally classified.

Into the “grey zone” of formality

Lecture

*Ms. Yuning Cao*¹

1. Stanford University

The current presentation examines real-life data from a corpus I build for my dissertation that investigates the pedagogy for teaching honorifics. I intend to select a few representative excerpts to demonstrate that speakers constantly vary the usages of honorifics in the same setting to achieve different purposes.

I would first like to question what “formal context” means. Not all contexts can be identified as (in)formal in a black-and-white way like NHK news and casual chats in a drinking bar. For instance, a YouTuber may shoot a monologue video with the purpose of interacting with asynchronous viewers, where he/she tries to convey some serious messages but meanwhile entertain others. In this case, I argue that instead of labelling the video as formal or informal, it belongs to the grey zone on the formality scale, which in fact, exists far more commonly in real life. Workshop presentations are usually on the formal end of the scale. However, during the presentation, the presenter may want to make jokes to attract the attention of the audience.

Many data in my corpus illustrate how speakers make use of honorifics to be interactive, engaging, and funny in “formal” contexts. I will first demonstrate how the YouTuber uses plain forms to the asynchronous viewers, which seems to be impolite under a normative view but exactly suggests that he is joking in the context. By switching between polite forms and plain forms in one discourse the speaker skillfully distinguishes serious talk and unserious talk. In this way, he is able to build intimacy and simultaneously convey a message with heart in one discourse.

In the workshop example, I show how the presenter gradually shifts from a hyper-polite style to a slightly more intimate style as she moved forward in the presentation. Instead of interpreting the phenomenon as the presenter is too tired to sustain a refined speech level, I argue that the presenter makes an effort to engage the audience by manipulating her usage of honorifics. That is, the presenter actively chose more-than-necessary honorific forms at the beginning of the workshop to establish her authority in the setting. However, as the presentation went on, the presenter shifted her focus to building a closer relationship with the audience so that they can interact with the material better. She purposefully used this strategy to keep the audience engaged through the 90-minute workshop on Japanese linguistics. Both examples demonstrate how the speaker use style-shift as a linguistic device to achieve conversational purposes with the traditionally defined “hierarchy between speakers” and “the formality of the situation” staying the same.

Unlike a more static, ideological view that speech styles should be predetermined by the relationship between interlocutors, the current presentation demonstrates that it is possible, actually common, to use plain forms in formal contexts to temporarily adjust the social distance between the speaker and the hearer. Therefore, the so-called “formal” contexts indeed have many grey zones for linguistics to further explore.

Intralingual translation in “Suske en Wiske”: the case of the pragmatic particle “hè”

Lecture

***Dr. Bram Vertommen*¹, *Mrs. Melina Pasanikolakis*²**

1. Utrecht University, 2. University of Antwerp

In Jakobson’s (2013) view, translation may either involve the “interpretation of verbal signs by means of some other language” (*interlingual translation*), “by means of signs of nonverbal sign systems” (*intersemiotic translation*) or “by means of other signs of the same language” (*intralingual translation*). This trichotomy emphasizes a close affinity between the three subtypes of translation: regardless of whether a source and target text are in a different language/sign system or not, translators are still considered “cultural mediators” who carefully negotiate linguistic and cultural differences (Schmid 2008). Even if the readers of a source and target text officially speak the same language, they can still be seen as members of different “cultures” (Holliday 1999) because of their different sociodemographic status: e.g. working versus middle class, or American versus British English. Nevertheless, intralingual translation has been understudied (Korning Zethsen & Hill-Madsen 2016). This paper intends to fill this gap by analyzing intralingual translation strategies in the Flemish (Belgian) comic book series *Suske en Wiske*, written by Willy Vandersteen. The oldest comics of this series, written in the late 1940s, first appeared in the Flemish broadsheet *De Standaard* and subsequently as albums. Soon Vandersteen also released his series in the Netherlands, albeit in versions adapted to Dutch readers. Only from 1964 onwards, uniform album versions for both Flemish and Dutch readers have been issued (Meesters 2000). The resulting different versions of one and the same comic (e.g. newspaper versus album version, Flemish versus Dutch version) served to accommodate different classes or nationalities of readers (Van Hooydonck 1995), or (in the case of the uniform versus the Flemish version) to respond to changing attitudes regarding Standard Dutch in Flanders during the 1960s (Jaspers & Van Hoof 2013).

In order to examine the intralingual translation strategies between the different versions above, this paper will focus on the Dutch pragmatic particle *hè* [‘right?']. The translators’ choices with respect to *hè* (to reformulate, to omit or to preserve the particle) strongly suggest different interpretations of it depending on the class, nationality or language attitude of the reader. These observations also further support Wierzbicka’s (1992, p. 160) claim that the use of interjections is culture-dependent.

Ironic speech and its prosodic correlates in the Spanish of Chilean women

Lecture

***Dr. Abril Jimenez**¹, **Dr. Mariška Bolyanatz Brown**², **Ms. Isabella Silva DePue**¹*

1. Davidson College, 2. Occidental College

Verbal irony can manifest in a variety of forms and it displays prosodic particularities that distinguish them from non-ironic speech, especially when examining rhythm, duration, pitch (F0), amplitude, and voice quality (Anolli, Ciceri, & Infantino, 2000; Bryant, 2010; Gibbs, 2000; Niebuhr, 2014). While some of the studies examining this prosody-irony connection have relied on naturally-occurring speech, only a few have explored irony in Spanish and none have examined Chilean Spanish despite the unique intonation patterns of this dialect.

This paper examines how prosody in female talk contributes to the creation of pragmatic meaning of verbal irony. We examined spontaneously-occurring ironic utterances in speech of 15 Chilean women residents of La Pintana, a low-income Santiago neighborhood. The conversations, extracted from sociolinguistic interviews, revolved around sensitive topics such as relationships with friends and family members, neighborhood-based discrimination in Santiago, and drug addiction and violence in the community. We analyzed five subtypes of verbal irony (jocularity, rhetorical questions, understatements, hyperbole, and sarcasm) to (i) determine what subtype was more prevalent in the data and (ii) provide a detailed prosodic analysis of each subtype. For the acoustic analysis, we segmented, in Praat (Boersma and Weenink, 2022), 3,987 syllable nuclei and compared ironic to pre-ironic utterances along seven dependent variables: pitch range, duration, F0, F1, F2, H1*-H2*, and HNR. Data were submitted to six linear mixed-effects regression analyses for each of the dependent variables. The participants produced a total of 200 ironic utterances with an average of 13.47 ironic utterances per speaker (ranging from 4 to 31 per speaker; SD=7.54). Our findings revealed that jocularity, described by Gibbs (2000) as playful ironic teasing, represented 62.5% of all the ironic utterances and thus, was the most prevalent. Approximately 16% of the data were rhetorical questions (questions for which explicit responses are not expected.), 19% hyperbolic utterances (exaggerating the reality of a situation.), and only 4% were understatements (stating far less than what the situation obviously merits). There were zero occurrences of sarcasm (talking positively to convey a negative meaning, often involving criticism). Furthermore, the prosodic analysis showed that the three most frequent types of irony were prosodically distinct from preceding non-ironic utterances. That is, each of these subtypes of irony showed an increased pitch range across the utterance, as well as more non-modal phonation. While we do not claim that these prosodic features are a marker of irony alone, we suggest that increased pitch range and non-modal voice quality contribute to indicating that the utterances are counter to expectations (i.e. should not be interpreted as literal), and also allow the speaker to establish rapport with the hearer while discussing difficult real-life events with a touch of humor.

Japanese English L2 learners, email writing and pragmatic competence: A corpus approach to identifying learner challenges

Lecture

Dr. Allan Nicholas¹, Dr. John Blake¹, Dr. Maxim Mozgovoy¹, Dr. Jeremy Perkins¹

1. University of Aizu

While the use of instant messaging services has increased in recent years, English L2 email remains a widely-used mode of communication within Japanese higher education institutions when communicating with non-Japanese faculty. The pragmatic aspect of English L2 email communication can be challenging for many learners; however, there are relatively few supporting tools available to English L2 learners that focus on the pragmatic aspect of communication. Addressing this need among Japanese English L2 learners entails taking the initial step of identifying the specific elements of email writing in English they find challenging.

A corpus approach can be useful in this regard, allowing for the systematic identification of perceived divergence from pragmatic norms in the email dataset. Few corpora, however, have focused on pragmatic or register variation in L2 learner English, in part due to the need to manually annotate corpora for pragmatic features.

We report on the development, annotation and analysis of a specialised learner corpus of request-focused Japanese learner English L2 email writing, annotated for specific instances of perceived divergence from pragmatic or register-specific norms. Approximately 1,300 texts were elicited from 426 participants, and collated into a corpus. Participants completed four email tasks, each with varying levels of Power (P), Distance (D), and Rank of imposition (R) (Brown & Levinson, 1987). Task scenarios primarily focused on the academic context, with non-academic scenarios also included in order to prompt variation in language choices. The data set was then manually annotated by trained expert English users– who were also relevant members of the target community– for perceived instances of divergence from pragmatic norms. The coding scheme used for annotation was based on the CCSARP (Blum-Kulka & Olshtain, 1984), adapted for use with email text data, and for identification of perceived pragmatic failure. Findings show high frequencies of perceived pragmatic divergence across all areas of English L2 email writing, with participants frequently finding appropriate variation of language choices in response to differing levels of P, D and R to be challenging. In particular, variation of the R value in task scenarios led to high frequencies of identified perceived instances of divergence from expected norms within the head act. The absence of expected modifying strategies external to the head act was highly frequent across tasks, as were identified issues with email openings and closings. Results are discussed in detail, along with implications for the English language classroom.

L2 proficiency and preference organization in online text-based interaction

Lecture

Mr. Xingcheng Wang¹, Prof. Carsten Roever¹

1. University of Melbourne

Despite the rapid development of research on second language (L2) interactional competence in the past decade (see Pekarek Doehler, 2019, for an overview), only a few studies have investigated online text-based exchanges in real-time second language communication (e.g., Abe & Roever, 2019, 2020; Kampen Robinson & Liebscher, 2019). As part of a larger project investigating L2 learners' development of interactional competence in a wide range of social actions, the present study focuses on preference and dispreference organization in learners' target language (English) during online text chat. More specifically, we were interested in how L2 learners managed social actions such as refusals, invitations, apologies, and complaints in a socially preferred or dispreferred manner.

A total of 72 Chinese learners of English at three proficiency levels (B1, B2, and C1) and 20 native English speakers participated to interact in four dyadic role plays involving refusing, invitational, apologetic, and complaining scenarios on an instant messaging platform WeChat. Through conversation analysis (CA), our data showed that L2 learners adapted spoken interactional practices in the online written interaction, despite the lack of prosodic and embodied cues. However, learners at different L2 proficiency levels demonstrably differed in their organization and formatting of preferred and dispreferred actions.

Regarding dispreference organization for refusals and complaints, lower-intermediate (B1) learners either directly negated their ability to accept the interlocutor's invitation when refusing or deployed a single dispreference marker (e.g., apologies, expressions of positive feeling, prefatory particles) in their production of refusals. However, upper-intermediate (B2) learners unanimously marked refusals as dispreferred through a broader range of interactional tools, including *pro forma* agreements, counteroffers, and mitigation (e.g., downgraders, hedges). Advanced (C1) learners displayed a stronger orientation to social harmony through ongoing monitoring, active reciprocity, and a combination of sequential and linguistic tools. Similarly, when complaining, higher-level learners were more sensitive to the delicacy of complaining and could legitimize their complaints based on gradually established grounds. Advanced learners also tended to refrain from explicitly labeling their talk as 'complaining' and make efforts to restore social harmony towards the end of the interaction.

Regarding organizing apologies and invitations as preferred actions, lower-intermediate learners delayed their apologies or apologized through limited tools (e.g., IFID + account + status quo). In contrast, upper-intermediate and advanced learners often fronted their apologies which usually consisted of a broader spectrum of devices (e.g., acknowledgment of responsibility, offer of repair, reassurance, etc). For invitations, higher-level learners more fittingly contextualized their invitations with positive feelings (e.g., gratitude, acknowledgment). In all scenarios, native speakers deployed a similar repertoire of interactional tools to L2 learners, but they demonstrated more fine-tuned social actions and a more overt orientation to social norms. Implications for research on L2 interactional competence and the impact of the affordances of the medium of text chat will be discussed.

Lexical blending: from typical concepts to atypical ad hoc concept creation. A corpus-based analysis

Lecture

Dr. Anabella-Gloria Niculescu-Gorpin¹

1. *The Iorgu Iordan Alexandru Rosetti Institute of Linguistics, Romanian Academy*

New words are coined every day by derivation, back formation, conversion, compounding, clipping, abbreviation, acronyms or borrowing. But there is one word creation/formation process that still puzzles: lexical blending. Contradiction is the key-word when trying to define blending more exactly: source words need to be clipped (Ralli, Xydopoulos 2012) or clipping should be done only on the inner edges (Bat-El 2006; Bauer, Lieber, Plag 2013), etc.

Here, lexical blends are words coined by fusing together parts of (at least) two other source words, where the output is shorter than the concatenation of the source words, a process ultimately presupposing clipping of at least one of the source words and the compounding of the resulting forms. The literature has been focused more on the formal characteristics (where and how clipping is done, the overlapping segment, etc.), and less on the conceptual dimension.

The presentation here offers a possible explanation of how lexical blending occurs in people's mind. Since the new words are atypical forms presupposing the amalgamation of the source words, the proposal is that, conceptually, lexical blending starts from at least two typical concepts already existing in people's mind and yields an atypical concept. Initially, nonce words are born, but due to linguistics and extralinguistic factors that are going to be exemplified here by recourse to Romanian and English corpora, nonce words may get accepted. But why and how these atypical concepts occur? Following relevance theory, and their lexical pragmatics approach, I claim that lexical blending presupposes *ad hoc concept formation* (Barsalou 1983; Carston 2002; Sperber & Wilson 2006). The aim is both theoretical and applied as it provides a possible step-by-step conceptual explanation of the process of lexical blending formation and comprehension supported by real examples taken from corpora (more than 300 examples, eg. En./Ro. *brunch* or Ro. *țuicomycină* (alcoholic drink with alleged medicinal properties). The proposal is also salient because it explains why many lexical blends result in the narrowing or broadening of one of the source words. Moreover, being a pragmatic approach, the proposal also accommodates the extralinguistic factors that play an extremely important role in lexical blending – most often, blends are used as ostensive stimuli – they are there in the discourse to attract people's attention, to make the audience process the message. They create some effects (to be analysed for each example) that would not be otherwise possible if the two words would have been used separately.

Linear placement of subjects of active and passive clauses in Mansi: Pragmatic reasons for non-clause-initial placement

Lecture

*Dr. Susanna Virtanen*¹

1. University of Helsinki

This paper discusses the linear placement of the syntactic function of subject in Northern Mansi, concentrating on the less frequent non-clause-initial placement, and differences between the nature of subject in active (SA) and passive (SP) clauses. Mansi is a seriously endangered indigenous language spoken in Western Siberia, belonging to the Ob-Ugrian branch of the Finno-Ugrian language family. There are still approximately 1,000 living speakers of Mansi.

I have previously discussed Northern Mansi constituent order and its pragmatic variation in Virtanen (2021). My template analysis (see Good 2016) proved that the arrangement of constituent order is twofold. First, the basic constituent order is connected to the order of syntactic functions. Secondly, particular syntactic functions alternate between two or more slots, depending on which pragmatic status they represent. The same template model can be applied to both active and passive clauses. The clause-initial default placement of subject is due to correlation between syntactic functions and pragmatic status (the pragmatic primary topic occupies the syntactic function of subject), and the tendency for primary topic to occupy clause-initial position. 74% of SAs and 63% of SPs are placed in clause-initial position due to their topicality. Furthermore, those subjects accompanied by a scene-setting adverbial are placed just after the scene-setting adverbial. (Virtanen 2021.)

In this paper, I will expand on my previous analysis and concentrate on those SAs and SPs that are placed in non-clause-initial position. My data consist of a corpus of 676 entries from the newspaper *Lūimā Sēripo* (LS). I will discuss the pragmatic reasons for the non-clause-initial placement of SAs and SPs. My main arguments are:

1. The most frequent reason for placing an SP in non-clause-initial position is the focality of the syntactic subject, in connection with impersonality of the passive clause (no agent).

Туйт-ныл нётнэ хури-т ва̄р-вѐ-с-ыт

snow-abl beautiful figure-pl make-pass-pst-pl

‘Beautiful figures were made out of the snow.’

2. In active clauses, only in approx. 50% of the non-clause-initial cases, the syntactic subject holds topical pragmatic status, and the scene-setting adverbial in clause-initial position causes the non-clause-initial position of the subject.

Тувыл ма̄н ханищтахт-ӯнкве мина-с-ӯв.

later 1pl study-inf go-pst-1pl

‘Later on, we left to study.’

3. In approx. 50% of cases, the SA is pragmatically focal and for that reason occupies the non-clause-initial position.

То̄нт к̄ӯщай-г Ольга Александрова ол-ыс.

then leader-transl Olga Alexandrovna be-pst.3sg

‘Back then, their leader was Olga Alexandrovna.’

Unlike the earlier results, majority of the SPs and half of the SAs placed in non-clause-initial position are pragmatically focal. Focal subjects are not frequent in Mansi, but they are possible, especially in passive clauses. The fact that the mentioned SAs and SPs practically appear immediately before the clause-final predicate – the default “focus slot” in my template analysis – supports this result.

Management of disagreement in small group discussions for reading comprehension

Lecture

Dr. Masanobu Masuda¹

1. Kyoto Sangyo University

This study analyzes disagreement sequences during peer discussion in a university English reading comprehension course in Japan using conversation analysis. The analysis is aimed at examining how the students manage disagreement on answers to comprehension questions which suppose one correct answer and how classroom activity design influences their interaction.

The course involves TOEIC test preparation, and the students discuss their justification for answers to multiple choice comprehension questions to reach a group consensus. Group discussions (lasting about three minutes for each question) were recorded, resulting in a dataset consisting of 31 discussions by 11 groups of three to four students. The discussions were held primarily in students' first language (Japanese) without the teacher present.

While disagreement is generally considered a dispreferred action (Pomerantz, 1984), some studies argue that this is not the case in discussion, argumentation, or disputes, where pursuit of different perspectives is expected (Fujimoto, 2010; Georgakopoulou, 2001; Kotthoff, 1993). Observation reveals that disagreement turns in my dataset were also not oriented to as dispreferred, with no markers such as delay or mitigation. It is notable that the disagreement turns in my dataset did not involve "pursuit of different perspectives" so much as "pursuit of a correct answer." In the discussions examined, the students' goal was to work together to determine which of the four choices was correct, implicitly rejecting the other choices as incorrect. The inevitability of disagreement in this classroom activity resulted in preference or unmarkedness of disagreement.

Another feature of disagreement sequences in the discussions examined is that students referred to text in the materials after each disagreement. It is a relevant action in this reading comprehension activity, when students inspect the validity of the answers they disagree about and determine which choice is correct to resolve their disagreement, because the answers should be grounded in the content of the materials. The students' orientation to text as the grounds for the answer proved so strong that they failed to reach the correct answer to questions which required inference or comprehension of pragmatic meaning. Because the correct answer to such questions does not relate directly to words explicitly written in the text of the reading passage, strong orientation to text led students to choose distractors.

Some cases in which a delayed response to a proposed answer was oriented to as a marker of dispreference were found. In these cases, students withdrew an answer they had proposed immediately after they were met with a delayed response, without discussing the validity of the answer with other students. The students were working on questions which required inference or comprehension of pragmatic meaning in these cases. A feature of these questions, difficulty to find a direct support for the answer from the text, contributed to early withdrawal of the answer to avoid upcoming disagreement, even in the activity where disagreement was preferred. These cases illustrate that the students' orientation to text in reading comprehension influences not only their choice of answers but also preference structure.

Managing Delicacy in Persian Conversations: the Case of Placeholders

Lecture

*Dr. Elham Monfaredi*¹

1. University of Washington

Using vulgar language is viewed as violating typical behavior in interaction. In order to restore a routine conduct, interlocutors may deploy a variety of interactional resources to manage delicacy in talk. This study identifies the Persian nominal placeholders (*chiz, felān*) as interactional means through which taboo words can be avoided in Persian conversations. While the interactional function of placeholder fillers has been identified as holding a place for a delayed referent and searching for words (C. Goodwin 1987; Goodwin, 1983; Hayashi & Yoon, 2010; Hayashi, Raymond & Sidnell 2013; Keevallik 2010), their use in atypical contexts is yet under researched. This study uses multimodal conversation analysis (Mondada, 2014) to explore how Persian interlocutors replace a delicate word (e.g., words that are considered obscene, vulgar, blasphemous etc.) with a placeholder to manage delicacy in conversation. The data for this study was collected from eleven hours of TV shows and videos of YouTube influencers. The findings of the study shows that Persian speakers use placeholders for a vulgar referent to withhold its actual production while displaying its inappropriateness. The particular interactional affordances of placeholders enable a vague language (Channell 1994) that makes the referent contextually retrievable for the recipients. This study contributes to a growing body of research exploring the cross-linguistic applicability of conversation-analytic findings to languages other than English.

Mandarin Chinese peer advice online: A study of gender disparity

Lecture

Prof. Chihsia Tang¹

1. National Kaohsiung University of Science and Technology

Peer evaluation is a common learning activity and is beneficial to students' development. Nevertheless, peer evaluations often include unsolicited advice, which potentially damages the face of advice-receivers and their interpersonal relationship with advice-givers. In the literature, little is known about how peer advice messages in the academic discourse are pragmatically constructed by Chinese speakers who generally define advice-giving as a rapport-building behavior. The present study, therefore, investigated how Chinese-speaking students rhetorically manage unsolicited advice in an online learning activity. Whether and how gender exerts impacts on the students' advising styles in the formal institutional setting was inspected.

The corpus involved 1,118 units of advice messages elicited from peer evaluations given by 43 Taiwanese students in an online English class in 2020. Each advice communication was coded as a speech event, which includes a head act and optionally one or more internal and external modifiers. The qualitative analyses drew on the scheme of Li (2010) and Blum-Kulka et al. (1989). Regarding the quantitative examination, one-way analyses of variance were run to compare the distributions of the advising strategies and modifiers in the advice comments addressed in different gender dyads.

Regarding advice strategies, results showed that *Option Offering* is most frequently used to encode advice illocutions addressed in mixed-gender and same-gender situations. Despite its rapport-building function, the students' strong preference for the indirect advice strategy might be due to the unsolicitation of their given remarks and the structural power equality between the advice-givers and receivers in the academic discourse. Even so, the gender of both the advice-givers and receivers have significant impacts on the distribution of redressive devices. Due to its effectiveness in persuasion, women are more likely than men to use *conditional* constructions with a *reasoning* discursive move to encode their advice. This structural configuration increases the likelihood for the advised proposition to be taken into action and eventually lends support to the peers' performances. On the other hand, men prefer using *subjectivizers*, such as *I think*, to redress their advice comments, especially those addressed to men. Moderated with *Subjectivizer*, the advice comments are pragmatically restricted to the advisors' subjective opinions, thus diminishing the destructive effects on the masculine attributes, including assertion of autonomy, and minimizing the deprivation of the advice-recipients' sense of accomplishment.

Briefly, in the formal institutional setting, the discourse is more critical than gender to the students' linguistic explicitness while addressing peer advice. However, the students' preferred redressive strategies still reflect the stereotypical politeness behaviors characterized as masculinity and femininity. While women show a propensity for utilizing positive politeness languages, men rely more on negative politeness devices in their advice responses, which may be pertinent to gender disparity in value priority and social-emotional orientations that they inherently have towards their addressees.

Maximizing the unique combination of critical and ethnomethodological approaches in critical discursive psychology

Lecture

Ms. Mai Shirahata¹

1. University of Jyväskylä

Critical discursive psychology (CDP) allows addressing large-scale societal discourses in locally situated discourses. In my doctoral research project, I have been utilizing CDP to examine language ideologies in macro-, meso-, and micro-level discourses about students and language in internationalizing higher education. In so doing, I realized the importance of revisiting the debate between Schegloff (1997) and Wetherell (1998) on how to study sociopolitical issues. While Schegloff suggests doing technical analysis first, and then critical or sociopolitical analysis, Wetherell suggests a synthetic approach. Nevertheless, both agree on the usefulness of technical analysis for avoiding presuppositions, which likely mislead analysis. In this respect, CDP proposes a point of compromise by combining critical and ethnomethodological approaches (Wiggins, 2017). In practice, however, I find this combination challenging, especially when using CDP to analyze visual images. Unlike in talk and text, which are common data types for CDP studies, the process of discourse construction in visual images tends to be less explicit when topics are abstract and complex. This would let researchers' own as well as common-sense worldviews act as presuppositions in the analysis of possible meaning of visual images, violating the very principle of discursive psychology: discourse as social action, not representation of mind (Potter & Wetherell, 1987). In this paper, I aim to explore ways in which the unique combination of critical and ethnomethodological approaches in CDP can be best utilized while reducing the risk of being constrained by presuppositions. I reflect on three CDP studies in my doctoral research project, all of which deal with different types of data (university documents, student organization social media, and student focus group discussions). My question is: How do I (and my co-authors) anchor the analysis within the data rather than theories or common-sense beliefs? The preliminary findings indicate that I (and my co-authors) pay attention to the process of language being locally defined and students being locally constructed or categorized as specific language speakers in text or talk. The findings will contribute to the development of CDP as a theoretical and methodological framework to address important societal issues with a nuanced bottom-up approach.

Meaning control and algorithmic power in political discussions on social media

Lecture

*Dr. Inês Signorini*¹, *Dr. Maria Lucena*²

1. Unicamp, 2. Universidade Federal de Santa Catarina

Meaning control in the context of social media is a complex and multifaceted issue, as it encompasses both conscious human activity and the “technological unconscious” of the performative socio-technical infrastructures that make up contemporary eco-social systems (Latour, 1996; Lemke, 2015; Beer, 2009; Maly, 2018; Cesarino, 2022). Indeed, social media users are receivers and consumers, producers and participants of communicative flows, increasingly perceived as a co-production of humans and machines, although user-generated content and sociability dynamics are centered on commercial motives and data driven profit strategies, most often without the knowledge of those they are affecting to. As computer codes and business models into an approach built around statistical and correlational analysis reconfigure the norms and values inherited from the scientific approach to social phenomena and from the linguistic and discursive approach to social communication, coherent models or unified theories built around causation or modelling and explanation are put aside. And since in the algorithmic model individuals have become variables rather than actors, algorithmic power is a key element to better understand the issues at stake in online verbal communication practices aimed at reflective and civic engagement against misinformation, verbal violence and political polarization in specific contexts (Signorini, 2022). The data supporting the discussion are drawn from the results of empirical research on how Brazilian experts trained in the humanities examine these issues in conversational podcasts produced by a prestigious newspaper in São Paulo, Brazil. These experts seek to explain how opponents in debates on social networks define the limits of freedom of expression, (a)typical arguments and electoral decisions, particularly on the eve of the 2022 presidential election. The qualitative content analysis (Tunison, 2023; Selvi, 2019) identifies the projection, in the studied corpus, of a representative taxonomy of the (a)typical reasoning and behaviour the reader/listener/voter engaged in social media. However, as we intend to show, it is a taxonomy inspired by the humanist tradition on the study of identities and roles in social interaction which is completely alien to the role of performative sociotechnical infrastructures in the reasoning and behavior of this reader/listener/voter.

Mediated justice or immoral act? Discourse of ambivalence about doxxing

Lecture

Dr. Carmen Lee¹

1. Chinese University of Hong Kong

Doxxing is commonly understood as actively seeking and publishing targets' personal information because of their perceived wrongdoing. As an act of digital vigilantism, doxxing exposes the target's 'true' identity and invites public shaming, seeking retributive justice and deterring others from engaging in similar actions (Lee, 2020; Garcés-Conejos Blitvich, 2021; Trottier, 2020). Scholarly attention to doxxing is evident in various disciplines, but rarely has it been the focus of applied linguistics research. Aligning itself with the conference theme, this paper understands doxxing as a form of (a)typical social practice. It aims to uncover how doxxing practices are discursively constructed as abusive and/or normal by various social actors. In Hong Kong, doxxing has become a criminal offense since 2021, a decision met with much criticism from lawmakers, tech firms, and the general public. Part of a government-funded project that offers a discourse-analytic perspective to doxxing in Hong Kong, this paper asks the overarching question: *How is doxxing discursively constructed by active forum users, bystanders, and the government respectively*, probing specifically into ambivalent discourses surrounding 'doing justice'. Based on a critical discourse analysis of a database of online interaction (43 forum posts and 28943 comments), 3 focus group interviews with 13 participants and 5 individual interviews, the study found that doxxing was positively and negatively evaluated simultaneously by participants: justification and framing strategies enabled a positive evaluation of doxxing as a justice-seeking tool. Atypical and potentially harmful discourses of doxxing were regularly normalized; at the same time, participants repositioned doxxed targets as victims experiencing harm, thus considering doxxing as a transgressive practice. Such ambivalence results in uncertainty and confusion about the moral and legal implications of doxxing. This paper critically engages the notions of *ambivalence* and *reflexivity* in understanding the complexity of public perceptions of controversial online behaviour (Fisher, 2019). It also underscores the methodological significance of analyzing ambivalent discourse in policy decisions targeting online utterances. With the rise of digital vigilantism and cancel culture, reflexive awareness of the intent, moral values, and sociocultural contexts surrounding online behaviour should be taken into account in internet governance.

Mediating Group Agency in the Digital Classroom

Lecture

Dr. Melanie Moll¹

1. Europäische Fernhochschule Hamburg

Mediating Group Agency in the Digital Classroom

The notion of social presence in the e-learning context (Kehrwald 2008; Lowenthal 2010; Nowak & Biocca 2001) has been developed as a means of better understanding human interaction. Following the continuum of social presence (Cui et al. 2013; de Susa 2002; Kehrwald 2008, 2010) this study answers the call to explore the connections between social presence and the interactional co-construction of group agency. Specifically, I investigate how groups in a university business program are creating agency related to their group memberships when assigned certain tasks, and how they portray their group vis-à-vis other groups in the class. I also explore the detailed work done through discourse as they arrange and manage a group task in the online, asynchronic environment.

With data collected over 2 years in multiple online classrooms of a European business university, I use a discourse analysis method to show how the function of intersubjective social presence is visible through language usage, and how participants shape their bids for leadership in task management. My aim is two-fold: first, to explore how participants negotiate their social identities in a virtual community, and second, to further our understanding of effective learning contexts in business education. Specifically, my goal is to understand what instructors and facilitators can do to encourage dialogical acts of learning and further humanize digital context.

Mediating Interpersonal Interaction in the Interpreted Chinese Premier's Press Conferences

Lecture

*Dr. Rui Zhang*¹

1. Dalian University of Technology

The study aims to explore how institutional interpreters mediate the salience of the participants' personal and institutional identity in the interpersonal interaction among the Chinese premier, international journalists, and their audience at the Chinese Premier's Press Conferences (the CPPCs). It investigates the underlying forces that drive the participants' identity shift between as an individual and as a collective member of groups or an institutional mouthpiece in the interpreted discourse.

Speakers manage the interpersonal relationship in political interaction mainly for the purpose of constructing alignment with their audience or other participants so as to get their attitudes and stances more readily accepted and build up a favorable image. The interpreted CPPCs are an important site of public diplomacy, the limited existing studies on interpreted Chinese political interaction dominantly focus on interpreters' mediation in alignment or conflict management (Gu, 2019; Fu and Chen, 2019; Li and Zhang, 2021) for conveying China's official voices and stances whereas participants' individual elements such as personal responsibility, commitment as well as involvement are overlooked.

As the spokesperson of the country facing the international audience with great temporal constraints, the use of first and second-person pronouns reflects how the premier interacts with journalists and the audience, how questions and answers are more personally or institutionally tuned. How is it mediated by the interpreter will affect China's interaction and communication with the international community. This study, therefore, addresses the following questions: (1) What changes at interpersonal levels can be identified in utterances where first-person-singular pronouns and second-person pronouns are mediated by the interpreter? (2) How do those changes affect the salience of the premier's and journalists' institutional and personal identity? (3) What can be accountable for the circumstances when personal identity is either weakened or strengthened?

Our study uses a self-built transcribed Chinese-English parallel corpus of the nine-year CPPCs from 2014 to 2022. Our study uses a self-built transcribed Chinese-English parallel corpus of CPPCs from 2014 to 2022 with 120,107 tokens. Utterances are extracted in which interpreters' mediation of first-person-singular pronouns (I, me, my, mine, myself and their corresponding Chinese version *wo*, *wode*) and second-person pronouns (you, your, yours, yourself and their corresponding Chinese version *ni*, *nin*, *ni-de*, *ni-men*) occur. Then deviation of interpersonal markers and speech acts in the extracted utterances from the speakers' discourse and the interpreter's discourse is further analyzed by resorting to Hyland's Interpersonal Model of Metadiscourse (2005) and Searle's classification (1979) of speech acts. The shift of the participants' identities between as an individual (more salience on their individual emotions and attitudes) and as institutional spokesperson (more salience on the institution's position) are analyzed. How the premier, the journalists and the interpreter position themselves and their interlocutors in the complex system of *interactional roles* and *social roles* (Davies and Harré, 1990; Weizman, 2008) would be used to account for the interpreter's possible motivations. This study contributes to the conference interpreter's complex role performance in institutional interpreting and echoes the increasing interest in relational work in pragmatics.

Metaphor of CAT and DOG in Taiwan Hakka proverbial expressions

Lecture

Prof. Huei-ling Lai¹, Dr. Hsiao-Ling Hsu¹

1. National Chengchi University

This study investigates the interactive relationship between metaphor and culture, examining how specific salient cultural elements can constrain the formation of metaphor. Analyzing proverbial expressions containing CAT (13 tokens) and DOG (74 tokens) in Taiwan Hakka, this study addresses two questions: how CAT and DOG are conceptualized in metaphor, and what interactive patterns between metaphor and culture these expressions manifest. Four steps are followed: searching for source domain vocabulary strategy to obtain expressions containing *cat* and *dog* (Stefanowitsch & Gries 2007), identifying specific target domains and analyzing the intended meanings, teasing out salient cultural elements, and then making a comparison of the difference between metaphors of CAT and DOG. The results demonstrate that CAT and DOG, the two domesticated animals, are conceptualized differently in proverbial expressions, manifesting cultural influence on forming metaphor from CAT and DOG. Target domains of CAT metaphor such as KINDNESS, INTEGRITY, RESPONSIBILITY, HUMBLENESS, COMPETENCE, CONTENTMENT, MISBEHAVIOR, SLOPPINESS, and GREEDINESS are identified, ambivalently revealing either positive (56%) or negative (44%) values associated with cats. On the other hand, target domains of DOG metaphor such as MISBEHAVIOR, GREEDINESS, INGRATITUDE, INCOMPETENCE, IMPETUOUSNESS, IRRESPONSIBILITY, and STINGINESS are mostly identified, overwhelmingly showing negative values (91%) associated with dogs.

As proverbs give speakers a way of understanding complicated propensities of human beings through other forms of being, the result unravels how domesticated animals strongly reflect the Hakka people's local folk cultural knowledge schemas. Some inherent characters and behaviors associated with cats and dogs are particularly profiled as a result of their experience of life and their impressions on them. Cats are considered beneficial to them because of their talent for rat hunting and killing—rats stealing their crops and rats often carrying lethal bacteria and viruses. And this function of cats is illustrated by the abstract characteristics, such as COMPETENCE (歪貓好嚇鼠 *vai24 meu55 ho42 hag2 su42* 'Even an ugly cat is able to scare off rats.'), employed to educate people not judge others simply by their appearance. On the contrary, dogs often leave unfavorable impressions due to their craving for food, engaging in a gang fight and annoying loud bark, as illustrated by the example exhibiting the feature of GREEDINESS (狗爭屎食 *gieu42 zang24 sii42 siid4* 'Dogs fight even for feces.'), employed to criticize how close friends can contend with each other even over trivial matters.

The findings not only exemplify how proverbial expressions of the most common domestic animals can bring out value judgments embedded in cultural conceptions through the manifestation of metaphor but also reveal how cultural constraints can influence the development of metaphor (Kövecses 2005, 2015). The analysis carries a further implication. Using lower forms of being such as cats and dogs to convey certain attitudes, comment on or evaluate situations can be pragmatically and socially inappropriate if not humiliating. Nevertheless, their connotative opaqueness through cultural metaphors can lighten up such didactic force of proverbs if any, easing out possible interactional unpleasantness and hence maintaining relational and social harmony.

Metaphor Processing: Referring and Predicating

Lecture

*Prof. Robyn Carston*¹, *Ms. Xinxin Yan*¹

1. University College London

The general consensus emerging from decades of empirical investigation of metaphor processing is that, when appropriately contextualised, metaphorically used language is no more effort demanding than literally used language (Shinjo & Myers 1987; Gerrig 1989; Gibbs 1994). However, a small number of studies contradict this view, notably Noveck et al. (2001), who maintain that relevance-based pragmatic theory predicts increased cognitive costs incurred in deriving the extra effects that metaphors typically yield, and they provide experimental results that support this prediction. In our study, we first surveyed tasks and stimulus materials of a large number of experiments on metaphor processing from the 1970's to the present day. Our most significant findings were (a) that the few studies finding extra effort for metaphor relative to literal equivalents had tended to test participants on metaphors used as referring expressions rather than as predicates (e.g. 'The wilting violet mumbled nervously' vs. 'That woman is a wilting violet'), and (b) that there was considerable variation and inconsistency in the nature of the (so-called) literal equivalents used.

Based on this meta-analysis, we ran two self-paced reading experiments to test our hypothesis that when used as a predicate metaphorical language is no more costly than literal language, but when used referentially it does incur extra processing costs relative to a literal referring expression. We were careful to employ literal counterparts that were consistent cross the two conditions (referring and predicating). Here is a sample of the materials used in the first experiment (each preceded by the same context describing a neighbour's noisiness when vacuum cleaning his apartment):

Metaphorical referring: "That *clanking tank* is back in action."

Literal referring: "That noisy machine is back in action."

Metaphorical predicating: "That vacuum cleaner is a *clanking tank*."

Literal predicating: "That vacuum cleaner is a noisy machine."

Statistical analysis (using a linear mixed effects model) showed no effect of either figurativeness or communicative function, but a significant crossover interaction between the two ($p = .0073$). In short, referential metaphors were significantly more costly to process than literal equivalents, while predication metaphors took no longer to process than literal equivalents.

The second experiment was motivated by the need to control for sentence position, as an early study by Gerrig & Healey (1983) indicates that this may make a difference to speed of metaphor comprehension. So we included referentially used metaphors placed in object position, thus making their location in the sentence similar to that of the predicate metaphors. Again, however, the results showed a significant difference in time taken to process metaphorical referring expressions relative to both literal referring expressions (of comparable descriptive length) and metaphorical predicates. Thus sentence position has no effect on the metaphorical referring/predicating difference when the target sentences are presented with appropriate preceding context. We end with an analysis of what it is about the referential use of metaphors that is special and effort-demanding, calling here on insights from philosophical and linguistic analyses of metaphor and reference.

Mitigated opinions in oral spontaneous conversations from Tegucigalpa, Honduras

Lecture

Mr. Danny Murillo Lanza¹

1. Universitat de València

Assertive acts, where speakers convey their belief or opinion about a fact or reality (Searle, 1976), have been considered one of the acts most likely to be mitigated (Bravo, 2002). According to Albelda *et al.* (2014), assertive acts can be of two types: those of information and those of opinion. In the first ones, a mitigating strategy is used to reduce “the speaker’s epistemic commitment to the truth that he or she is expressing”, while in the latter the aim is to “soften or relativize the expression of judgments or speaker’s own opinions”. Giving an opinion can “provoke different reactions such as reaching an agreement, or expressing an open disagreement, because [...] an opinion [...] can go against or in favor of what the interlocutor believes” (Flores and Ramírez, 2015). Ultimately, when a speaker expresses an opinion, his social face “is more compromised, therefore the greater mitigating activity can be expected” Albelda *et al.* (2014).

Taking all these conceptual considerations in mind, the aim of this research is to show how the mitigating work on opinions is linguistically conveyed by Spanish speakers from Tegucigalpa, specifically in spontaneous oral conversations. This research is considered relevant because studies on this local Spanish variety are scarce, whereas it is also assumed that speakers from Honduras mitigate opinions in a very high rate (Murillo, in process).

Methodologically, this research is corpus-based, coming from the analysis of the Ameresco-Tegucigalpa corpus, included in the broader American corpus of Spanish conversations (Ameresco, Albelda and Estellés, online, available at www.corpusameresco.com). For data analysis, methodological guidelines proposed by Albelda *et al.* (2014) have been followed and the recognition tests proposed by Villalba (2020) have been applied.

The preliminary qualitative results show that the speakers mitigate their opinions, not only because the content is negative, but also because it is too categorical. They mitigate them in three ways: a) they give the possibility to the interlocutor to show his agreement –or disagreement– through the contact control particle: ¿*va?*, b) they limit or restrict them to a certain space through various opinion-delimiting constructions. And c) they show partial agreement through concessive structures. Ultimately, when they give a mitigated opinion, they want to protect their social face and to prevent possible disagreements with the interlocutor.

Mitigation in social media posts of autistic users

Lecture

***Prof. Nelya Koteyko*¹, *Dr. Martine Van Driel*²**

1. *Queen Mary University of London*, 2. *University of Birmingham*

As a minority group affected by a stigmatised social status autistic people modify their behaviour to try to fit in with social situations. This presentation considers how digital pragmatics can contribute to the understanding of autistic adults' 'adaptive morphing' (Lawson, 2020) or camouflaging online. We used the corpus linguistics tools of keywords and concordances to establish the topics and relative frequencies of discourse and mitigation markers in the posts of Twitter and Facebook users who regularly disclose autism versus those who do not (35 users in total). The analysis shows that mitigation at the level of proposition, illocution, and utterance source is more frequently used by those who avoid disclosing autism (15 users). Semi-structured interviews with these users reveal that negative stereotyping and anxiety about misinterpretation of one's posts occupy a key place in justifications for using or avoiding linguistic and visual forms. We discuss the implications of our findings for addressing the relationship between body, mind and technology related to digitally mediated interaction. First, social stress and past negative experiences of social interactions continue to shape autistic users' linguistic choices on social media, in contrast to optimistic statements in earlier research that 'the different symbolic capacity [of autistic people] was less relevant in the interactional world of the Internet' (Ryan and Räisänen, 2008: 140). Second, while most studies of both face-to-face and digitally mediated interactions address the cause of mitigation as the need to follow politeness norms our findings point to alternative causes focused on the reduction of vulnerability (Bates, 2021).

Mock Affect, and the socio-pragmatics of unlicensed epenthesis

Lecture

***Prof. Rakesh Bhatt*¹, *Ms. Taraneh Sanei*¹**

1. University of Illinois at Urbana-Champaign

In this paper we present evidence of Mock Affect—a ludic interpellation that is indexically tied to the phonological process of unlicensed epenthesis in non-native language use—and show the various community responses, the meta-pragmatic commentaries, that sustain its ideological dimension: the denigrated Other. The unlicensed epenthesis, phonological relic of native tongues, mobilizes a variety of closely-related socio-pragmatic meanings—rustic, amateur, rural—that easily coalesces into a ‘vernacular voice’ that is picked up in mimetic performances, produced steadily on a jocular key, as shown in (1) below where second generation Kashmiri migrants (R1-R3) in New Delhi, India, mimic how their uncle from Kashmir speaks Hindi with a “Kashmiri Accent”

Excerpt 1. Discussion on Kashmiri *Accent*

1. I: koi example hai aapke paas (Do you have any example)
2. R1: haan, aur kyaa (yes, of course)
3. jaise, voh kaheNge, *fizika*s exam kaisa hua (like, they will say, “how was your physics exam”)
4. R2: zaraa aaj *daresad* chicken khaane ka man hai (“please today I feel like having dressed chicken”)
5. R1, R2, R3: (Loud laughter follows)
6. (3.0)
7. R3: His wife is worse
8. I: How
9. R2: She does that a [lot
10. R3: [I think she is originally (2.0) {switch to Kashmiri} gaam-ic (of/from village)
11. R1: I don’t know that, but not well educated

Even in this short (T: 32 secs) excerpt, taken out of 13 hours of recorded conversations among second-generation Kashmiri migrants in New Delhi, India, ages 20-54, we observe the negative evaluation of the use of epenthetic vowel: unlicensed in form and mocking in function. The switch to Kashmiri, gaam-ic (belonging to village), by R3 in line 10 above foregrounds this Affect—jocular mockery—by relating frequent epenthesis (line 9) to images of personhood: rural/rustic (line 10), and uneducated (line 11). What undergirds Mock Affect is, on the one hand, the low symbolic, cultural and economic capital of Kashmiri, vis-à-vis Hindi and English, and on the other hand, a set of (historical-political and colonial) ideologies that denigrates Kashmiri to the status of a ‘vernacular,’ cumulatively enabling vernacular exhibitions such as (1) above.

The cross-cultural reflex of Mock Affect appears among young Farsi-English bilingual speakers in Iran. The Farsi data also show how the unlicensed epenthesis in English words gets picked up and deployed, through jocular mockery, as a resource to ‘Other’ certain speakers, as lower-class and uncouth. The data further show that the ‘degree’ of epenthesis, the number of epenthetic insertions, in single words impacts how the resolution of the ‘vernacular voice’ is interactionally constructed; that is, the more instances of epenthesis within a word, the higher the resolution of the constructed images of personhood.

In conclusion, we argue that linguistic diacritics of Othering, effecting Mock Affect, serves as a proxy to denigrate groups, stereotyping them as caricatures of their selves.

Modal values and NEG-raising in ‘I think’, ‘I’m sure’ and ‘there is a/some chance’

Lecture

*Mr. Jiqiang Lu*¹, *Prof. Kristin Davidse*¹

1. KU Leuven

Clausal epistemic modal markers (henceforth CLEMs) like *I think* have been studied intensively from the perspective of grammaticalization (e.g. Shank et al. 2016). However, conceptual questions about the full grammatical system formed by CLEMs have remained largely unaddressed, such as:

- i. Do CLEMs express the whole epistemic scale of degrees of likelihood?
- ii. How does NEG-raising, i.e. transfer of the negation of the proposition into the CLEM, as in (1b), play out within the full grammatical system?

(1a) If it was going to be conclusive evidence I think I’d have sympathy with what you’re saying but **I think** it’s not going to be that conclusive. (WB)

(1b) things could get hard, but **I do not think** it is going to be a war on the field. (WB)

In this presentation, we propose an analytical model in which CLEMs, just like modal auxiliaries and adverbials, express values ranging from high over median to low, as visualized in Figure 1.

Modal value Modal markers

high *must / surely / I am sure*

intermediate *will / probably / I think*

low *may / perhaps / there is a/some chance*

Figure 1: Epistemic modal scale

We stress that, semantically, epistemic modality is inherently positive (Halliday 1970, Nuyts 2001). This entails that the negative polarity is always a constituent of the proposition. We further predict rough semantic equivalence for alternate CLEMs with median value, e.g. (1a-b). By contrast, high and low value CLEMs containing a negation are predicted to be equivalent with CLEMs of the opposite value, as in (2a-b).

(2a) Origin’s Mortlake plant won’t be operating until 2008. But at least **there’s a chance** the lights won’t go out in the following year. (WB)

(2b) The crops are so late that **I’m not sure** the tonnage or volume will be there. (WB)

With qualitative and quantitative corpus study, we will verify these predictions and examine the distribution of the CLEMs *I think*, *I’m sure* and *there is a/some chance* with negative propositions and the same CLEMs with NEG-raising. We will do this by calculating the normalized frequencies of all their attestations in the subcorpus UKspoken WordbanksOnline (WB). There are 86,938 potentially relevant hits, but lexical and non-modal uses as well as examples with positive propositions will have to be filtered out. We will also develop a typology of the different pragmatic effects of these two variants, in terms of such rhetorical goals as countering the interlocutor’s expectation (1a), putting a positive spin on the low likelihood of a negative state-of-affairs (2a), or soft-peddalling the likelihood of a negative state-of-affairs, as in (1b) and (2b).

Modification of Linguistic Landscape as a Social Practice: Revealing the Gaze

Lecture

Prof. Michal Tannenbaum¹, Prof. Elana Shohamy¹

1. Tel Aviv University

Research in Linguistic Landscape (LL) in recent years has broadened in various directions, including the investigation of its potential to raise school students' awareness regarding their surroundings, as part of broader education and language pragmatics. It asks questions such as how people read and interpret public spaces and how LL affects them in terms of their identity, emotions, and sense of belonging to their own communities and to wider society. In collecting and analyzing LL data (such as signs, graffiti, ads, and street names), students become aware of issues like language hierarchies, unequal power relations between groups, representation, discrimination and exclusion.

A number of studies that have examined the pragmatics of LL in education have pointed to the centrality of *gaze*, i.e., how students perceive and interpret their LL environment differentially, reflecting their group affiliations and experiences. Thus, a study by Goldstein-Havetzky (2011) pointed to the difference between Jewish and Arab students in a mixed (Arab/Jewish) city in Israel: The Arab students reacted with anger to their realization of the lack of written Arabic in their surroundings. The Jewish students in contrast were rather indifferent; the issue of language did not strike them as relevant to social justice. Hayik (2017), using the tool of PhotoVoice, exposed the intense negative emotional reactions of Arab students in Israel after interpreting the LL in their environment, realizing the relative absence of Arabic and a range of misuses of the language. Another study related to gaze employed an innovative methodology in which high school students, following an introductory course about LL, were asked to document signs in their environment that they perceived as discriminatory in terms of linguistic representation. They then (virtually) modified them towards greater inclusivity and fairness in terms of language, identity, and other symbolic features, providing explanations for their modifications (Shohamy & Pennycook, 2022; Tannenbaum & Shohamy, 2019).

To learn more about the interrelationships between group affiliation and LL interpretation, the present study expands the above-mentioned research, employing similar methodology with more ethnolinguistic groups in Israeli schools: a. Arabic-speakers (including Muslims, Christians, and Druze), b. Immigrants from various countries (first and 1.5 generations), and c. Refugees and asylum seekers. This study also included a new component: After the modification phase, participants were given photos that had been modified by members of other groups, and were asked to analyze them from their own gaze, thus generating a discussion about impact of representation and subjectivity. In our presentation, we will describe the different pragmatic styles of different groups, the contribution of trying to view things from other perspectives and points of view, and the implications of the study for activist pedagogy in terms of its potential to promote equality, empathy, mutual understanding and tolerance.

Moments of WeChat, moments of identity struggle

Lecture

Prof. Chaoqun Xie¹

1. Zhejiang International Studies University

Technological innovations and advances have transformed and facilitated social members' ways of interaction with their life-worlds. WeChat has, thanks to its one-stop affordances of a wide range of features of convenience, become the most widely used social networking application in (mainland) China, and doing social life on WeChat has become an everyday normal, which is evidenced, among others, by more and more netizens posting updates in Moments of WeChat. Posting updates is not necessarily a mere act of sharing in pursuit of lots of 'likes'; it can be one of social presence struggling for group/community membership and recognition. Updates posted in Moments of WeChat are not something fixed, passive or static but dynamic, active and complex in the sense that posting updates may represent an action of identity struggle, the interpretation of which needs to go beyond updates proper and take into account various social, cognitive and/or historical factors. This paper, focusing on the chronological investigation of Moments of a single WeChat account coupled with relevant interviews, argues that identity constructed in and through updates in WeChat Moments may turn out to be a struggle for identity.

Multimodal Argumentation in digital media: brazilian political tweets as case studies

Lecture

*Prof. Rosalice Pinto*¹, *Prof. Fabrizio Macagno*¹

1. Universidade Nova de Lisboa

Digital media is now being used as an important means of political propaganda. Tweets, especially, have taken a leading role in political campaigns due to the technological advantages they provide. Considering their growing relevance in political communication, this paper aims to present an analytical and multidisciplinary methodology for the study of multimodal argumentation in political tweets. Analytical categories from Pragmatics, Argumentation Theory, Text Linguistics, Social Semiotics, and Digital Discourse Analysis will be used to study verbal and visual argumentation in these digital genres. In a previous study (Macagno and Pinto 2021), the analysis of visual-verbal argumentation in advertisements was analyzed through five steps dynamically related: (1) the analysis of its context, the text genre and the images; (2) the polyphonic articulations and presuppositions; (3) the explicatures; (4) the dialogical functions and illocutionary forces; (5) the construction of argumentation schemes. In the present analysis of tweets, this method will be enriched by further categories drawn from Digital Discourse Analysis. In empirical terms, we will present tweets that circulated in Brazil's 2022 election campaign, namely from the two most-voted presidential candidates: Jair Bolsonaro and Luiz Ignácio Lula da Silva. Preliminary results show that the multimodal strategies used by the first candidate appear to be more diversified, which may have contributed to the negligible voting difference between the two candidates.

Multimodal narratives in children: the interplay between gesture and referring expressions

Lecture

Mr. Corrado Bellifemine¹, Ms. Camille Dupret¹

1. Université Sorbonne Nouvelle

Our study aims to explore the concomitant use of gestures and referring expressions in narratives by children between 7 and 9. Since children tend to produce more ambiguous referring expressions in narratives than adults, we formulate the hypothesis that gestures could have the function of clarifying the verbal modality when the chosen referring expression is potentially ambiguous for the interlocutor or when the referent is weakly accessible.

We videorecorded 20 French speaking children's oral narratives in two different situations. In the first situation, 10 children told a story to an experimenter from a set of static textless pictures visually shared by both parties. In the other situation, 10 children recounted a story to their mother after watching a cartoon without her. We analyzed the referring expressions according to their form (i.e. pronominal or lexical), the animacy of the referent mentioned and the position on the referential chain. We analyzed gestures in terms of their density to the absolute number of referring expressions and for each one of the abovementioned features. We also determined the types of gestures used (deictic, iconic, beat gestures) and their density in the two situations according to the different features of the referring expressions.

Results show that children's gesture ratio is similar in the two situations, suggesting that the degree of shared knowledge with the interlocutor has no effect on the density of gestures produced during the two types of narratives. However, despite a large interindividual variability, several differences are found as for the types of gestures used in the two contexts, that qualitative data analysis is able to put forth.

Overall, children are sensitive to the interactional settings and they adapt their use of gestures based on their interlocutor's knowledge of the referents mentioned. Moreover, our study consolidates the multimodal character of language and shows that gestures are strongly intertwined with the verbal content of speech. Thus, both verbal and nonverbal modalities work together, contributing to the construction of meaning during discourse elaboration and highlighting a specific multimodal dimension of reference.

Narrating Success Stories - How Migrants from the Balkans Forge Their Identity as Entrepreneurs

Lecture

*Prof. Nadine Thielemann*¹, *Ms. Lejla Atagan*¹

1. WU Wien

People from the former Yugoslavia represent Vienna's largest group of migrants (Statistik Austria 2021). Due to difficulties in accessing the labour market, many start a business of their own – mostly a deli, restaurant, or café where they commodify the Balkan culinary culture and hospitality – and thus turn into migrant entrepreneurs (Dheer 2018). In our research, we analyse how they construct their identity as migrant entrepreneurs.

For this purpose, we have conducted in-depth interviews to learn more about their ideas and experiences as migrants to and entrepreneurs in Austria. These data further enabled us to investigate the discursive practices which they use for identity construction. A practice widely adopted in our data is the narrative (de Fina & Georgakopoulou 2008). The personal story of becoming an entrepreneur here plays a key role.

The recurrent plot pattern we observe highlights the transformation of the protagonist (cf. Tobias 1993: 153-159). Consequently, the three essential elements of the reconstructed plot characterise stages of life and mark milestones in the process of change. These include

- an initial self-presentation as an 'underdog' comprising experiences of social marginalisation and economic precarisation both in their community and in the host society, which is characterised by a lack of agency on behalf of the protagonist.

- a moment of transformation as a key element, marking a juncture in the protagonist's life; this is presented as the moment in which they decided to start a business of their own and in which they thus took the fate into their own hands and gained agency.

- the coda / evaluation frames this transformation from an underdog to an entrepreneur as a success (e.g., external validation and recognition within the community and the host society), which they attribute to a set of character traits ('yugoslavian discipline', etc.), hard work, having gone through the school of life, etc.

Our analysis thus reveals how migrant entrepreneurs forge their identity as successful business founders, which enables them to gain status and recognition in the host society by couching their personal stories in the narrative pattern of a transformation that stresses the idea of self-empowerment. In doing so, our analysis complements research from a business perspective (e.g., O'Connor 2002, Hjorth & Steyaert (eds.) 2004) and adds to the understanding of the role and power of the narrative in this process.

National identity as a socially differentiated way of performing professional identity in the Qatari context of the reformed national university

Lecture

*Mrs. Afra Al-Khulaifi*¹, *Prof. Dorien Van De Mieroop*²

1. Qatar University, 2. KU Leuven

In Qatar, top-down structural changes have intrinsically linked the role of the national university with a transformative agenda that targets both society and economy. From a discursive perspective such macro-level processes especially affect the identity work of employees (Van De Mieroop and Schnurr 2017) as change in the system and role of the university essentially 'brings about redefinitions of the professional identity of educators in relation to the job market and the consumers of education' (Sarangi and Roberts 1999: 18). Although the topic of reforms is extensively discussed, the impact of these changes on the various groups of employees involved is largely lacking.

In this study, we tap into the complexities of these reforms and capture their implications on the group of Qatari junior academics who are the target of these reforms. We demonstrate how the university's 'Qatarization' employment scheme – which is, roughly speaking, an apprenticeship scheme for Qatari nationals – intricately links the process of becoming a 'Qatari academic' with a process of socialising into an increasingly complex workplace structure through a career path that combines competing values of internationalisation and nationalisation. While this scheme emphasises 'nationality' and thus entails an advantageous position for the Qatari native minority group, it also emphasises 'foreign', rather than 'local', knowledge and qualifications and thereby entails an especially ambivalent position for native employees who need to confront these conflicting values.

In particular, we adopt the social constructionist perspective to explore how this macro-social context is reflected in the micro-discursive identity work of junior academics, particularly in terms of how they construct their professional identities when telling stories about their careers. We draw on a corpus of 12 semi-structured interviews in Arabic language with female Qatari junior academics. As an analytical procedure, we adopt the narrative as social practice approach (De Fina and Georgakopoulou 2008), which combines a focus on the fine-grained and local occasioning of stories with a consideration of the more general backdrop of the macro-levels of social organisation. The analysis presents a selection of stories from two interviews and an emergent pattern of similar identity work that explicitly invokes 'national identity' as a crucial aspect in the development of the interviewees' career. This thus points at the construction of a very specific version of 'professional' identity that can be considered as emblematic of the characteristics of the academic profession as it takes shape in current-day Qatar.

Negotiating the boundaries of resistance in parent-child interaction

Lecture

Prof. Richard Fitzgerald¹, Dr. Younhee Kim¹

1. University of Macau

While certain behaviour is a preferred response to parental directives, directive-response sequences in parent-child interaction are routinely infused with resistance. Children might resist by challenging the grounds on which parents request the modification of their behaviour or they might simply ignore the request. However rather than these actions being organised around a binary of compliance or noncompliance, examination of expanded conflict sequences between children and parents reveals that there is constant negotiation around the relevant boundaries in the here and now around some action and possible resistance through ‘fudging’ between the request and judging the action required has or has not been completed satisfactorily, which may include the child not doing what was asked. Drawing on 36 hours of video-recording of parent-child interaction, the analysis uses conversation analysis and embodied analysis to examine extended sequences where a parent and a child are engaged in pursuing conflictual action trajectory concerning a required behaviour of the child. The analysis begins from preliminary findings concerning a ‘standard’ rule of behaviour within the family (e.g., you have to sit at the table until other people finish), and examines how far and how strictly the rule is pursued or flouted/resisted in particular instances. Through this, the analysis highlights how, even in conflictual sequences, there is an orientation to the boundaries (i.e., how far they can resist) both by the parent and the child but also how a particular sequence of actions of resistance is subject to negotiation by both parent and child *in situ*. In examining the *in situ* interpretation and articulation of a behaviour ‘rule’, the analysis demonstrates how boundaries evolve, are worked out, oriented to and fudged through forms of interaction and embodied action.

Notions of disinformation as a resource in interaction: Empirical and theoretical observations on commenters' metapragmatic awareness

Lecture

*Dr. Cedric Deschrijver*¹

1. Ming Chuan University

Contemporary geopolitics is increasingly marked by transnational flows of disinformation that occur in complex and multi-layered contexts of online communication. Despite a growing focus on this type of disinformation, existing research has mainly investigated its spread and reach of disinformation, or its specific discursive or linguistic features. Far less attention has been devoted to analyzing audience orientations towards, receptiveness to, or suspicion of, disinformation.

The current paper seeks to contribute to this gap from both an empirical and a theoretical angle. The paper analyses *The Financial Times* anonymous online user comments on the 2019 Hong Kong protests. The city's internationalized fabric ensured global coverage of the events, yet also incited an internationalized clash of discourses, with disinformation campaigns spreading far beyond the city. This was seemingly also the case in *The Financial Times* comments sections, where comments regularly referred to the *prima facie* presence of organised disinformation campaigns.

The paper's empirical focus lies on the results of a linguistic-pragmatic discourse analysis focusing on participants' metapragmatic awareness in the context under investigation. Firstly, the paper provides a brief overview of the variety linguistic/discursive features that participants explicitly designated as 'atypical': taken as potentially indicative of commenters linked to disinformation campaigns. Secondly, the analysis tracks one of these specific features throughout the dataset, i.e., the discursive representation of the protests themselves. By focusing on discussions on this discursive representation, the paper argues that the notion of 'state-led disinformation' became part of a dynamically engendered context of the interaction, in turn amenable to further recontextualization and enregisterment. Simultaneously, this dynamically engendered context narrowed the range of possible interpretations: commenters explicitly rejected any comment that was seen to echo comments previously identified by participants as part of a disinformation campaign.

The paper concludes with preliminary reflections on the results' theoretical relevance. Specifically, it argues that in data where key contextual features are unknown both to participants and analysts, a focus metapragmatics provides a necessary way to assess interactional processes. This, however, prompts a revisiting of certain traditional discourse-analytical claims, which do not consistently take into account audience reception. Indeed, the empirical results suggest that, rather than discourse being instrumental in shaping worldviews, it may be metapragmatic descriptions of discourse (academic or otherwise) that may be more consequential in influencing worldviews.

Nullius In Verba: Conceptual Engineering and the Royal Society Corpus

Lecture

*Ms. Nina Haket*¹

1. University of Cambridge

Conceptual Engineering (CE) is the practice of improving certain concepts we use in discourse, for example, those to do with scientific theories, social reality, or politics. Despite involving words and their meanings, this practice has not been looked at from the perspective of linguistic pragmatics, instead remaining within the bounds of philosophical methodologies. I aim to show that linguistic pragmatics has a significant role to play in the study of CE.

To bring CE into linguistics, linguists can use empirical linguistic tools to help evaluate the extent to which engineered terms are successfully implemented and diffused in scientific and everyday discourse. To exemplify this, I use the case study of *mass* and *weight* in the Early Modern scientific register, which I argue is an instance of CE, and track their implementation through scientific journal articles associated with The Royal Society between 1700 and 1920. The aim was to investigate whether these lexical items were differentiated based on their sense or by other extra-linguistic factors such as the author, object, and subfield. Success, for this project, is differentiation based on sense and not on any other extra-linguistic factors since the project aimed to get scientific writing to use these terms consistently and accurately. 1500 tokens of *mass* and *weight* from the Royal Society Corpus were manually annotated for their sense and extra-linguistic factors and analysed by looking at the frequencies of the respective senses over time, along with Ctrees and Random Forests to identify annotations that were the most important in predicting the lemma, and Principal Component Analysis to visually inspect clustering and patterns over time. These analyses concluded that this instance of CE was not successfully implemented, despite targeting a small, ideologically niche community with shared goals, because sense had little predictive power over the chosen lemma, whereas extra-linguistic factors had much greater predictive power.

These results speak to the ongoing debate on the semantics/pragmatics boundary. Introducing an innovative word meaning does not guarantee usage with that meaning in contextually-situated forms of language, even in a niche community with shared goals that might be thought of as cooperating with the language authority within their society. I will explore the notion that despite standing meaning not changing according to the criteria set out in this work, the discourse in scientific articles is constructed so that understanding is maintained despite an unclear concept-meaning-word mapping across the *mass-weight* domain. What is understood is different from what is written, and speculate the role of interlocutor common ground, communicative assumptions, and inference in pinning down speaker-meaning. From the perspective of CE more generally, this work shows that philosophers and linguists need to work together on such projects to avoid the simplification of semantic prescriptivism without consideration of pragmatic or ideological factors. Rather than targeting literal word meaning, it must be explored whether other levels of linguistic meaning may be more appropriate targets for CE.

On Discourse Markers of Interruption: *Iltan* and *Wusen* in Korean

Lecture

Prof. Sunhee Yae¹

1. Chung-Ang University

Interrupting the speaker is generally regarded as impolite. For various reasons, however, discourse markers of interruption (DMIs) are often employed by the discourse participant to cut in the discourse and discourage the speaker. The DMI is displayed tactfully and effectively in discourse to accomplish the purpose of the interlocuter by minimizing the face-threatening speech act for the speaker. Therefore, the DMI tends to be a fragment in form to get the instant attention, for example, *guard* 'look' in Italian (Balteiro, 2018), *wait* (Tagaliamonte, 2021; Waltereit, 2002), *camkkan*, *kaman*, and *kuman* 'just a moment' in Korean (Rhee, forthc.) and to be characterized by momentariness, sensory perception, and priority in its lexical origin.

This paper aims to investigate the two similar yet different DMIs *iltan* and *wusen* in Korean from the perspectives of grammaticalization and pragmatics. The DMIs *iltan* (—旦) and *wusen* (于先) are Chinese-origin words. *Iltan* consists of *il* (—) 'one' and *tan* (旦) 'morning,' designating 'one morning' or 'overnight.' The word *iltan* was first attested in 1496. *Phyocwunkwuketaysacen* presents three meanings of *iltan*: (i) 'first of all,' (ii) 'wait,' 'hold on,' (iii) 'once, in case of emergency.' The example in (1) shows that *iltan* has developed into a DMI, with which S interrupts C's talk.

(1) (in the telephone conversation between C (Cwunho) and S (Swumi))

C: I am going to work in some other city from the next week.

S: Really?

C: I will drop by at home at the weekend to meet our children.

S: *al-ass-e iltan kkunhe cikum com pappe* (hang up the phone)

see-Pst-SE DMI hang.up.the.phone now a.little busy

'I see. First of all, hang up the phone. I am a little busy now'.

(2007 Drama *Kangnamemma Ttalacapki* #16)

Wusen is composed of a particle *wu* (于) and *sen* (先) 'first of all,' 'ahead.' Based on *Phyocwunkwuketaysacen*, *wusen* has two sense designations: (i) 'first of all,' 'ahead,' (ii) 'just as it is, somehow or other.' *Wusen* was first attested in the 18th century. The example in (2) represents the DMI function of *wusen* in contemporary Korean, with which C interrupts K's serious line of talk.

(2) (in the dialogue between K (Kayin) and C (Cinho) in which C tries to talk seriously)

K: ...Look

C: Look what?

K: *wusen pap-pwuthe mek-ko cincihan tayhwa-nun nacwungey* ...

DMI rice-from eat-and serious conversation-Top afterward

'First of all, let's have dinner and then have a serious conversation...'

(2010 Drama *Kayinuy Chwihyang* #06)

This study will illuminate the differences and commonalities of the DMIs *iltan* and *wusen* (i) by tracing back the diachronic paths from the Chinese origins to the discourse markers and (ii) by categorizing their discourse functions drawing upon textual organization, subjectification and intersubjectification (Heine 2013: 1215) in Present Day Korean. Theoretical implications such as pragmatic inferences in the DMI fragments, feigned interactivity (Rhee, forthc.), etc. will also be looked at closely.

On the acquisition of formal pronouns in Bangla

Lecture

Ms. Yangchen Roy¹

1. Jawaharlal Nehru University

Languages may encode the social relationship between the speaker, the addressee or the third person via honorifics, pronouns, allocutive marking on the verb, and/or other speech act markers in the clause. Bangla does this via three levels of second person pronouns (L1, L2 & L3) and two levels of third person pronouns (L2 & L3). Using novel language data from picture description tasks done with Bangla speaking adults (n=10) and children (n=19), I show that children not only do not produce formal pronouns, they replace them using non-formal counterparts, something that adults do not do. Based on a Generative understanding of the grammar, I propose and discuss two hypotheses on why children do this.

The choice of the feature bundles that result in the manifestation of the morphemes that represent formal pronouns, is dependent on discourse/speech-context. Therefore, the speaker and addressee, and the relation(s) they share need to be represented in the narrow syntax (Ross, 1970; Sadock, 1974; Miyagawa, 1987). Speech act layers have been proposed above CPs (Speas & Tenny, 2003; Haegeman & Hill, 2013), and as projections above pronouns (Portner, Pak, & Zanuttini, 2019), or as elaborate nominal speech act structure (Ritter and Wiltschko, 2019; Wiltschko, 2021). Using a battery of tests from Ritter & Wiltschko (2018), I first establish that Bangla has a nominal periphery, and then argue that the results of the experiments can be explained by the following two competing hypotheses: children lack a fully developed nominal periphery (PAH1), or they lack the features in their feature inventory that constitute politeness (PAH2).

PAH1 has the following consequences. If the Speech Act Structure is responsible for licensing the 1st, 2nd persons (Speaker and Addressee), and the 3rd person personal pronouns as per the Duality of Person Hypothesis of Ritter & Wiltschko (2018), then a missing Speech Act layer should mean a deficiency in the acquisition of 1st and/or 2nd person, along with problems with politeness acquisition. Children are infamous for referring to themselves in the third person. Those with autism too are known to refer to themselves in the wrong person i.e., the second and/or third. If the third person is argued to be first built in the DP layer, and then raised to the Speech act layer to acquire the personal pronoun form, these are not unusual.

The idea behind PAH2 is that unless the child encounters speech that includes linguistic items that represent a bundle of politeness features with the appropriate feature values, they will not begin learning the feature values. In this case it involves the child stepping out of the informal setting of the home, and into the formal setting of the school. Further, children not only did not produce third person L3 pronouns, they referred to the researcher using L1 pronouns. This suggests that children may only have a single level of politeness in their system i.e., they lack a demarcation between the three levels. This means they have not acquired all the feature values that constitute the politeness levels.

On the persuasive power of personification in online car reviews: an empirical pilot study

Lecture

*Dr. Gábor Simon*¹

1. Eötvös Loránd University

According to the rhetorical approach, personification as a “literary device” contributes to the emergence of an image of the speaker as an eloquent and competent member of the community (Halmari 2005: 123). The persuasive effect of personifying language use is not limited to modern political discourse but has a significant record in the history of arts (see Melion–Ramakers 2016), raising, however, the question of whether the persuasive power of personification is confined to initiating an attitude shift towards the speaker. An alternative approach can consider personification as a strategy of symbolization that initiates also the reconceptualization of the subject of the discourse (see Dorst 2011), not only our impression of the speaker.

The main question of the paper is the following: how can we model the persuasive effect of personifications in online media discourses? As reported by a previous corpus-driven study (Simon 2022), personifications are not infrequent in current Hungarian online car reviews. In the present research, I do not focus on the overall distribution of personifications in the corpus but on their pragmatic effect evoked in the readers. I assume that this effect is complex, with one attitudinal dimension towards the journalist (as a car-lover) and another one towards the car (as a living, human-like entity). While the former may have an interpersonal orientation (from a neutral domain to a positive evaluation, e.g., to respect), the latter may have a role in the conceptual elaboration of the subject of the discourse in a more sophisticated manner.

To test this assumption, I measure the persuasive power of personifying language use with a questionnaire using personifying excerpts from the reviews and their modified versions with no personification and a more objective usage of language. The informants answer questions about how they evaluate the writer of the review, the car under review, what are their basic impressions about them, and whether they would buy the car and because of what reasons. The paper not only provides new data about the different dimensions of persuasion using personification (based on corpus examples) but also investigates their potential relationship, moving well beyond the mere labelling of personification as a persuasive device of language.

On the pragmatics of English necessity verbs: the role of ‘source’

Lecture

*Dr. Benoît Leclercq*¹, *Dr. Bert Cappelle*², *Prof. Ilse Depraetere*², *Mr. Cyril Grandin*²

1. Université Paris 8, 2. University of Lille

On the pragmatics of English necessity verbs: the role of ‘source’

One of the striking features in taxonomic discussions of modal meanings is that, compared to possibility modals, far less clearly delineated meaning distinctions stand out in the realm of root necessity (Depraetere 2015). Since no clear semantic distinctions can be established, this raises the question of what factor(s) predict the choice of a necessity verb. We assume it must be a pragmatic factor. It is typically advanced that necessity modals exhibit differences in *strength*; however this concept is difficult to operationalize (Schützler and Herzky 2021). Another crucial factor that is often put forward is the ‘source’ of the modality, i.e. the (extra-linguistic) driving force that makes a state of affairs necessary, and this concept has been captured in specific classifications that can be tested empirically (Depraetere and Verhulst 2008). This factor is, in part, pragmatic in nature, as it escapes simple truth-conditional verification. It is the predictive power of this factor that we aim to assess.

We extracted from COCA (Corpus of Contemporary American English, Davies 2008-) 500 tokens of each of the modals *must*, *have to*, *need to*, *ought to* and *should*. These sentences were annotated in terms of five types of sources: ‘discourse-internal’ (i.e. the speaker acting as the source in statements, or the hearer in interrogatives), ‘circumstantial’, ‘rules and regulations’, ‘conditional’ (e.g. *if you want to succeed, you...*) and ‘subject-internal’ (e.g. *Tom has to have everything his own way*). Using the vcd package in R (R Core Team 2018), we found that the distribution between the choice of modal and source type is not random. We calculated Pearson Residuals to pin down patterns of attraction/repulsion (confirmed by *configural frequency analysis*). The results show that clear distinctions can be established between the five modal verbs, each of which is strongly associated with one source (*must* with ‘rules and regulations’, *have to* with ‘circumstantial’, *need to* with ‘conditional’, *ought to* with ‘discourse internal’), with the exception of *should*. A qualitative analysis enables us to relate these results to previous claims about necessity verbs, for instance the well-known claim that *have to* is more ‘objective’ than *must*. In addition, it will be shown that comparing the five verbs together provides a crucial advantage over standard accounts (which usually focus on pairs such as *must* vs *have to* or *should* vs. *ought to*). More importantly, our study confirms that the choice of necessity verb is closely linked to a pragmatic factor.

On the stative progressive in English: A temporal structure analysis based on a cognitive perspective

Lecture

*Mr. Naoaki Wada*¹, *Ms. Haruka Shimura*¹

1. University of Tsukuba

The progressive is often said to indicate a dynamic/non-stative situation in progress (Langacker 2008), but there actually exist “stative progressives” (Higuchi 2019; Kranich 2010; Leech et al. 2009; Levin 2013; Smith 1997). However, not all stative verbs appear in the progressive, e.g., **I am owning this carpet* (Leech 2004), and some stative verbs describe dynamic/developing situations when in the progressive, e.g., *He is resembling his father more and more as the years go by/He’s being fool* (Leech 2004). The distribution of “real” stative progressives is more restricted (cf. Leech et al. 2009) and some studies (e.g., Dowty 1975, Kranich 2010) have presented constraints and licensing conditions.

Stative progressives can be divided mainly into three types: (i) the “temporary” type, e.g., *I am living in Wimbledon* (Leech 2004); (ii) the “resultative imperfective” type (Smith 1997), e.g., *The socks are lying under the sofa* (Dowty 1975); and (iii) the “intensifying” type (Levin 2013), e.g., *I’m loving it* (Higuchi 2019). (We are excluding the “politeness” type, e.g., *I’m thinking/wondering...*). What motivates us to use these stative progressives and explains why very many stative situations resist progressivization is Williams’s (2002) notion of “susceptibility-to-change”. Meanwhile, the three stative progressives differ from each other in certain respects. The above observations enable us to take a prototype analysis of the English progressive and in fact some cognitive approaches do so. However, to our knowledge, no study has clarified, within a comprehensive model of tense interpretation, how the three stative progressives are related to each other or derived from more prototypical ones.

We therefore present a temporal structure analysis within the tense-interpretation model proposed by Wada (2001, 2019), which has systematically explained various temporal/aspectual/modal phenomena in English. A temporal structure is a structuralized cognitive time information of a tense form consisting of information about the relation between speech time, orientation time, and event time(s), and cognitive schema information reflecting the relevant time-related notions. The susceptibility-to-change comes from the time of the internal part of the situation described by *-ing* being situated at the time of *be* as orientation time, which implies tentativeness, incompleteness, and changeability. The stative progressives are derived from more prototypical ones with some changes in their temporal structures, based on pragmatic factors such as frame-semantics information of the elements involved, profile shift or segmental profiling.

Person deixis in Persian interactions: A dialogic account

Lecture

*Prof. Mohammad Amouzadeh*¹, *Ms. Masoumeh Diyanati*²

1. Sun Yat-sen University and University of Isfahan, 2. University of Isfahan

The use of person deixis, more specifically the use of paradigmatic personal pronouns has long been of primary interest (e.g. Bühler 1990 [1934]; Silverstein 1976; Lyons 1977). A number of studies focused on the relationship between personal deictics and social factors to find how the participants' identities (age, sex, social status, and so on) and the speaker-addressee relationship determine the choice of personal deictic terms (e.g., Brown and Gilman 1960; Ervin-Tripp 1972). Other studies (e.g., Silverstein 1976, 2003; Agha 1993) adopted an anthropological orientation by using the notion of social indexicality to explain the multiple functions of situational context by a single deictic form. In this paper, however, we take a cognitive-interactional approach to examine the dynamic and emerging uses of personal pronouns to shed some light on how to interpret the construction of interpersonal relations by Persian speakers. More importantly, we aim to account for the alternation mechanisms between paradigmatic pronouns of lowering and elevating one's status within a single interaction. The analysis of a few conversations reveals that interlocutors' use of personal deictic terms is, to a great extent, a fluid, emergent, and contingent practice, governed by a number of interactional factors, such as the speaker's emotions, the speaker's situational intentions, the prior speaker's turn, the shift of discourse topic, bystander(s), and the message. Interlocutors' shift from lowering into elevating terms and vice versa brings about a fluctuation of the interlocutors' interpersonal relationships. The following interaction is a case in point:

1 A: Bijan âqâ Bijan

Bijan Mr. Bijan ('*Bijan ... Mr. Bijan!*')

2 B: bale âqâ ĵun?

yes sir dear ('*Yes, my dear father! (what is it?)*')

3 A: ye lahze lotfan tašrif bi-yâr-**id** birun pesar-am?

a moment please presence ipm-bring-2pl out son-1POSS

'*My dear! Please come out for a moment!*

4 B: bale âqâ ĵun?

yes sir dear ('*Yes, my dear father! (what is it?)*')

5 A: **to** xeĵâlat ne-mi-keš-**i** be-gir in pul-o

you.2sg shame neg-ipfv-bear.prs-2sg imp-take.2sg this money-om

bo-ro ye meqdâr mive be-gir bardâr bi-yâr

imp-go.2sg a amount fruit imp-take.2sg imp.take.2sg imp-bring.2sg

'*Don't you feel ashamed? Take this money, and fetch some fruit!*

This interaction is between A (father) and his son (B). When A initiates the conversation and asks B to come out for a moment (lines 1 and 3), both participants are in the living room, where the A's new employer is also present. Then, the interaction proceeds in the kitchen, where the A's employer is out of earshot as a bystander (lines 4-6). Although, in contemporary Iranian society, a new trend toward reciprocal use of the informal address pronoun between parents and children is socially accepted (Nanbakhsh 2011), A addresses B (line 3) by using the other-elevating forms (i.e., the formal verbal inflection *-id* and the honorific verbal form *tašrif âvardan* 'to bring one's presence') because his employer is within the earshot as a bystander. Interestingly, in his next turn (lines 5-6), A switches into the informal address pronoun and verbal agreement because of his employer absence.

Persuasion and power: An analysis of metadiscourse in EFL students' oral practices

Lecture

*Dr. Yi Zhao*¹, *Dr. Mian Jia*², *Dr. Yi An*³

1. Tsinghua University, 2. The University of Texas at Austin, 3. Beijing University of Posts and Telecommunications

Abstract: English metadiscourse has been a research focus in both written and oral communication, displaying variation across registers (Hyland & Jiang, 2022; Zhang, 2022). In the light of previous studies, metadiscourse as a pragmatic construct of social engagement can be used to influence understanding (illocutionary uptake) and attitude (perlocutionary effect) of the audience. Despite a host of studies on persuasion and power, especially among interlocutors of asymmetric resources such as business communication and teacher-student communication, there is insufficient knowledge about how peer students use metadiscourse to persuade. This study, based on Hyland's metadiscourse framework (2005), aims to explore how persuasion is (not) achieved and how power is imposed in terms of metadiscourse markers such as engagement markers and attitude markers. The data analyzed for this study were collected from a 16-week course - *English Listening and Speaking for Academic Purposes*, aiming at first-year college students. 1 Mongolia student, 2 South Korean students, and 66 Chinese students were randomly grouped for an English discussion for about 10-20 minutes twice, one around the mid-term and the other at the end of the semester. Each group was assigned a debatable topic and students should discuss to make a conclusion or consensus. The unscripted speeches, approximately 600 minutes, were recorded and transcribed. According to our pilot study, power of a peer talk could be perceived in two ways: demanding the right to speak and imposing reception on others (Bourdieu, 1977:648). The use of metadiscourse to persuade is therefore revealed mainly by a sequence of stance indexing. Following Zhang (2022), the metadiscourse markers analyzed in this study are categorized as referring to speech event components, describing discourse actions, and describing discourse circumstances. Nuances across groups about the sequence and salience of metadiscourse types in persuasion will be further explored in terms of closeness among speakers and readiness levels of speakers including English proficiency and topic familiarity. Our study presents the use of metadiscourse in peer talks among EFL learners, which in turn provides pedagogical implications especially raising metapragmatic awareness for language teachers.

Phonetic Encoding of Sincerity in Expressive Speech Acts: An Analysis of Japanese Apologies in Experimental Settings

Lecture

Prof. Sachiko Shudo¹, Dr. Takayuki Konishi¹

1. Waseda University

Searle's (1969) notion of sincerity condition presents an interesting paradox in the case of expressive speech acts (ESAs hereafter), such as apologizing and thanking, which express the speaker's psychological state. While it is deemed the essence of ESAs since the sincerity condition itself is what is expressed in ESAs, it is a contradiction in terms since the condition does not have to be satisfied for ESAs to be accomplished. Some ESAs may be insincere. However, if insincerity is overtly expressed, the act may not qualify as an ESA.

We often hear complaints that an apology does not *sound* sincere. This seems to indicate that the sincerity of an apology is influenced by its phonetic manifestation. While we intuitively know such influences of phonetic features, knowledge about those features is tacit and has not been systematically investigated.

In our study, we conducted extensive phonetic research on apologies as an example of ESAs. The subjects were provided with 80 scenarios, for which they gave scores on how remorseful they would feel on a 100-point slider scale. The subjects then produced utterances of apology according to how they felt in each scenario. The results showed a correlation between the scores of remorsefulness and estimated phonetic features to manifest sincerity such as vowel duration and average pitch of words.

We then conducted a perceptual experiment using the collected data as stimuli. The subjects listened to the recorded apologies and rated how apologetic each stimulus sounded on a 100-point scale. The results showed a correlation between the scores of the encoded remorsefulness and those of how apologetic the recordings were perceived. There also existed individual differences among speakers in how well they phonetically encoded sincerity.

Based on the results, it seems the phonetic encoding of sincerity in ESAs is relatively stable, at least in the current experimental setting, in which speakers assumed the situations of varying remorsefulness. Our results indicate that some utterances of apology with low encoded sincerity were not actually perceived as apology. While the speaker does not have to be actually sincere to satisfy the sincerity condition, the utterance has to *sound* sincere to some extent for the hearer to perceive it as apology.

The 'relatively,' but not absolutely, stable phonetic encoding of sincerity is what we expected. The relative stability may be explained by the uncertain relationship between the speaker's intention and their performance. Some apologies are performed with speaker's fully intentional effort to sound sincere while others are naturally performed without such an intentional effort. Many apologies fall probably somewhere in between. The intentional encoding of sincerity may be an effort to resemble naturally produced sincere sounds. While Grice's (1957) notions of natural meaning and non-natural meaning clearly account for the crucial role of speakers' intention in linguistic meaning, the phonetic encoding of sincerity is unique in that it is a mixture of both types of meaning.

Plain Language Initiatives for Cross-Cultural Communication: Comparison between European Institutions and Japanese Public Offices

Lecture

Dr. Naoko Hosokawa¹

1. *The University of Tokyo*

This paper examines the implications of the ‘easy Japanese’ initiative in Japan from a comparative point of view. As the number of immigrants and foreign residents in Japan increases, there is a growing need for the national and local governments to provide information in multiple languages. The importance of equal access to information is crucial for health and safety especially during natural disasters or pandemics, as seen from the 1995 Great Hanshin earthquake, the 2011 Great East Japan earthquake, and the 2020 Covid-19 crisis. In response to this need, the government has launched an initiative to make essential information available in simple Japanese, in addition to translations in major foreign languages. According to a survey carried out by the National Institute of Japanese Language and Linguistics (2009), Japanese is the most common second language among permanent residents in Japan, spoken by 62.6%, followed by English (44%) and Chinese (38.3%). Furthermore, according to a survey carried out by the Tokyo International Communication Committee (2018), the largest number of foreign residents in Japan want to receive information in easy Japanese (76%), followed by English (68%). Based on these survey results, the Agency for Cultural Affairs and the Immigration Service Agency published the ‘*yasashii*’ (with multiple meanings including easy, kind, gentle, and soft) Japanese guideline in August 2020. The use of plain language supports clear and democratic communication in multicultural societies while preserving multilingualism. However, the concept of plain language is still relatively new in Japan, and the initiative has not yet gained full public recognition. To enable future development of the initiative, it is worthwhile to examine comparable case studies, as the use of plain language initiatives has been promoted in many multilingual communities. The European Union, for example, promotes multilingualism and cultural diversity with its twenty-four official languages. In such an environment, English and French are often used as base languages from which documents are translated into various other languages. In order to ensure the clarity of these working languages, the European Parliament encourages the use of ‘clear language’ to manage communication in highly multilingual settings. This paper compares the plain language initiatives, the ‘easy Japanese’ initiative in Japanese public offices and the ‘clear language’ initiative in European institutions in terms of their disciplines, approaches, guidelines, and implementation. By highlighting some key differences between the two cases, this paper sheds light on the potential contributions of plain language initiatives to cross-cultural communication in contemporary societies.

Plain Speech: Ideology, Identity, and Religious Practice in 19th-Century Quakers' Use of "Thee" and "Thou"

Lecture

*Ms. Jessica Marsh*¹

1. University of Surrey

The Religious Society of Friends, a Protestant Christian denomination commonly known as Quakers, was formed in England in the mid-17th century under the leadership of George Fox. Among their beliefs was the position that many common acknowledgements of rank or social position were inappropriate because such deference should be reserved for God alone. Quakers thus used the T-forms "thee" and "thou" for all individuals. At the time of their founding, when the V-form "you" was expected when addressing a social superior, this practice was quite a radical statement of Quakers' belief in equality. By the 19th century, however, when "thee" and "thou" were no longer used by the majority of English speakers, much of the egalitarian meaning indexed by this choice had been obscured. The continued use of this "quaint" form thus became a distinctive marker of Quaker identity as well as an aspect of religious practice.

There is a considerable body of metalinguistic discourse both justifying this "plain language" as a religious requirement and discussing what it meant to speakers (or what they believed and/or sought to convince others that it *should* mean). This feature is thus a particularly rich topic for inquiry into language ideology and identity work as well as changes in pragmatic meaning over time. This paper uses a sociolinguistic approach to analyze data compiled from records of meeting disciplines (i.e., rules for members published at a local level), theological writing, advice literature, (auto)biographies, and personal letters and diaries. In particular, it explores a) the often complex combination of linguistic prescriptivism and religious theology used to justify the position that the singular "you" was both grammatically incorrect and inconsistent with Quaker beliefs; b) the belief that this unique linguistic feature should serve as a reminder to speakers of their Quaker identities and a defense against temptation; and c) the self-consciousness or embarrassment frequently expressed, especially by younger members, about using this form with non-Quakers.

Please laugh: illocutionary acts as a theory of meaning for jokes

Lecture

*Mr. Alexander Sparrow*¹

1. *Victoria University of Wellington*

Having been a touring comedian for a decade – and read *very* different interpretations of Chris Rock’s Oscars joke about Jada Pinkett Smith, Ricky Gervais and Dave Chapelle’s stand-up routines about transgender people, and Jimmy Carr’s jokes about Romani victims of the Holocaust – it’s become clear that jokes need a framework for correct interpretation. Jokes require their own theory of meaning, because general theories of meaning struggle with non-literal language use. Firstly, I define jokes as illocutionary acts spoken with the intent of provoking laughter. Secondly, I differentiate between jokes and utterances that may also provoke laughter, but are not jokes: these are anecdotes and opinions. Thirdly, I develop a more nuanced definition of jokes by clarifying their status as humorous lies. Finally, I build on my theory of the meaning of lies, to produce my theory of the meaning of jokes – arguing that jokes carry no meaning beyond *Please laugh*.

This builds on Austin’s work by taking his theory of illocutionary acts, applying it to jokes, and taking it to its logical conclusion. This theory of meaning for jokes i) breaks down the different types of utterance used by comedians, and ii) clarifies what audiences are meant to take away from these types of utterances. It also helps explain why the positive illocutionary aim of the comedian (provoking laughter) is sometimes met with a negative perlocutionary response of the audience (taking offense).

Police officer serving as a moral judge in Chinese mediation discourse

Lecture

*Dr. Wenjing Feng*¹

1. Nanjing University of Posts and Telecommunications

Although there is a lot of discussion on the topic of identity in social sciences and on the interactional mechanism of police interview/interrogation discourse, identity in police mediation discourse has been quite underexplored. In one ethnographic study on Chinese police mediation discourse, the author found that Chinese police officers are often designated by disputants to be a moral judge. With the discourse of 19 police officer-mediated interactions transcribed as data, employing a qualitative research method, this article examines how and why police officers serve as a moral judge in Chinese mediation discourse, as well as the moral order underlying their moral judging practice. It is found that Chinese police officers are often expected by the disputants to be a moral judge in civil conflict mediation discourse based on typical Chinese moral order or traditional values advocated by the life philosophy of Mencius and Confucius. Those moral order and cultural values emerged in our data mainly include “孝悌”(filial piety and respect for brothers), “尊老爱幼”, (respecting the old and cherishing the young), “和为贵”(harmony is the most important), five cardinal virtues (“五常”), (namely, “仁义礼智信”, benevolence, righteousness, courtesy, wisdom and honesty). This study can help improve our understanding of Chinese police mediation discourse, Chinese people’s social life and the Chinese society in general.

Politeness and Ritual in Ancient Chinese: A Case Study of *Shijing*

Lecture

***Mr. Yafeng Liu*¹, *Prof. Fengguang Liu*², *Prof. Dániel Z. Kádár*³, *Prof. Juliane House*⁴**

1. Dalian University of Foreign Languages & Research Institute for Linguistics, 2. Dalian University of Foreign Languages, 3. Hungarian Research Centre for Linguistics, 4. University of Hamburg

In this talk, we aim to contribute to research on politeness in ancient texts, by exploring language use in the *Shijing* (The Book of Odes), an ancient Chinese classic dating roughly at the 11th century BC. Considering that many ancient texts reflect highly ritualised language use, we approach and categorise pragmatic conventions of politeness in *Shijing* by using interaction ritual theory. Our study shows that politeness in ancient texts can be less captured by using frameworks of interpersonal politeness: for example, manifestations of language use that one would associate with interpersonal features in the *Shijing* are embedded in ritual interaction between the speaker and his ancestors and gods. Because of this, it is important to merge understandings of politeness with a ritual view on language use, allowing us to observe language use beyond the realm of interpersonal pragmatics.

Politeness in Sundanese: Verbs affixation system and its meaning alternation

Lecture

Ms. Intan Wulandari¹

1. Gadjah Mada University

Sundanese is a language spoken in the speech community centered in West Java, Indonesia. It is also well known as the second most spoken local language in Indonesia after Javanese. As one of the Austronesian families, Sundanese has many uniqueness in the affixation system. Austronesian language is known as a family language that has a voice system and is marked by affixation. The affix in Sundanese are; (i) prefix: *di-*, *ti-*, *pang-*, *ng-*, *la-*; (ii) infix: *-ar-*; and (iii) suffix: *-keun*, *-an*. The affixation system in Sundanese could transform the meaning and politeness system in utterance based on the context. The affixes in Sundanese could change the meaning by the alternation rule and construct the verbs. This research aims to observe the verbs in Sundanese that possibly could transform the meaning incorporated with Sundanese affixes, which is part of the Sundanese voice system in morphological aspect related to the politeness system. A qualitative method is used in this research with a descriptive approach. The source of the data is taken from the daily utterances of Sundanese people in *Manglé* Magazine which indicates the emergence of affixation. The verb phrase *nakol maneh* 'hit you' has different meaning when it is followed by affixes. *Nakol-keun maneh* 'hit my self', the suffix *-keun* changes the function of the verb phrase. The suffix *-keun* transforms the function of *maneh* 'you' into 'my self'. The data illustrate only the change of verb meaning which is caused by affixation. The verbal phrase *nakolkeun manéh* is only uttered to show the intimacy between the speaker and interlocutor. This utterance is culturally forbidden to be spoken to the older interlocutor. This shows the dimension of politeness regarding speech level in Sundanese. Sundanese is a wilderness in language which is a treasure. It also can be a research repository that should be explored more in any aspect.

Post-positioned tag questions in pursuit of response: A multimodal approach

Lecture

*Ms. Juman Al-qaoud*¹

1. *University of Cologne*

“Given the first, the second is expectable”: this is how Schegloff (1968, p. 1083) expresses the principle of conditional relevance in conversational base sequences. Thus, in some types of actions, a related response is usually sought and regularly provided; however, when improper or absent, the speaker may view it as a failure on the part of the recipient. To explore this phenomenon, a total of 20 hours of audio- and video-recordings of casual face-to-face Jordanian Arabic conversation of 69 university students and graduates in Irbid City were collected. This study explores how a combination of linguistic structures, prosodic and visual features contribute to the way post-positioned tag questions function to elicit a response from the recipient after lack of uptake and investigates the diverse nature of these responses, by adopting the methodologies of Conversation Analysis and interactional linguistics. The focus is on how different modes enhance the response-pursuit potential of the post-positioned tags to different degrees, and whether the recipients are held more accountable for responding when using specific modes. By shedding light on an area that has largely remained unexplored in the existing literature on Jordanian Arabic interaction, this study shows that a) post-positioned tags are a multimodal construction used in the organization of turns and actions, and b) that they can be utilized as powerful tools to trigger a missing response. Drawing on previous work on response pursuits by Jefferson (1981), Pomerantz (1984) and Stivers & Rossano (2010), in addition to the current data, post-positioned tags such as *s’aħ* “right” and *wella la?* “or not” are analysed as multimodally produced with a final rising intonation and accompanied by a fixed gaze toward the recipient, in addition to a possible head nod and raised eyebrows.

Practices of resisting categorization: Membership categorization analysis of tele-cinematic discourse in Japanese

Lecture

*Dr. Miyuki Takenoya*¹

1. Toyo University

Tele-cinematic discourse refers to the discourse in media such as film, animation, and TV dramas. It is considered to be a valid source for membership categorization analysis (MCA) since it enables several types of linguistic acts to be observable for researchers. Some communicative acts such as resisting categorization can be face-threatening in some cultures, and they are difficult for researchers to encounter in face-to-face ordinary conversations.

The data for the study were collected from TV drama series (twelve 30-minute long drama episodes) called “*kinoo nani tabeta* (What did you eat yesterday?)” in Japanese. This drama series shows the humoristic daily life of a gay couple in their forties living in downtown Tokyo. The research questions which guided the study are twofold: (1) what expressions do the speakers use when they have been wrongly assigned a categorization? ; and (2) how do the speakers handle repetitive wrong categorizations?

Tele-cinematic discourse is considered to be valid for analysis because of its two-layered nature of communication levels: (1) the communication level among fictional characters in the drama; and (2) that between the collective senders (script writers, directors, and producers) of the message and the audience members in front of the TV. The communication level (2) is the arena which uncovers the ethical incongruity hidden among the members of different cultures and societies.

In the following excerpt, Kenji categorizes Shiro as bisexual by giving the category-bound predicate of Shiro having dated a woman in the past (01). Shiro resists this categorization by giving the category-bound predicate of it “having occurred only one time” and “being a long time ago” (02). Without being convinced, Kenji again categorizes Shiro as bisexual by giving the category-bound predicate of “bisexual people who get married to a woman due to social pressure”(03). Shiro again resists Kenji’s categorization of bisexual by giving the category-bound predicate of “just being gay.” Here, “having dated a woman when he was young, but not anymore” is considered to be a category-bound predicate of “just being gay.”

01 Kenji: *dattte shiro-san mukashi onnanohito to tsukiatteta Desho?*

[you were dating a woman before]

02 Shiro: *Hitori dakedayo shikamo 20nenmo maeno hanashi janaika*

[only one person, it was even 20 years ago. . .]

03 Kenji: . . . *iruyone: sooyatte sekentei toritsukurotte*

[I know some cases after acting as if they were not gay]

04 *sonomama onnanohitoto kekkonshichau Hitotte*

[but getting married to a woman eventually]

05 Shiro: *...oremo wakakattashi shinpai suruna.*

[I was young back then. Do not worry.]

06 *Orewa moo bai ja nai yo.*

[I am not bisexual anymore.]

As Okazawa (2021) pointed out, the collective sender of the drama arranges the fictional categories as well as resisting categorization in interaction. In these sequential arrangements, category bound predicates are used in interaction to create incongruity for the audience (p.33).

Pragmatic intervention in academic writing

Lecture

Dr. Aurélia Lyrio¹, Dr. Antonio Abreu²

1. Universidade Federal do Espírito Santo (UFES), 2. Universidade Estadual Paulista Júlio de Mesquita Filho - UNESP;
Faculdade São Leopoldo Mandic, Campinas

In the increasingly global knowledge-sharing, academic writing poses a challenge for Brazilian university students, since they lack customized materials, familiarization with rhetorical practices and lexico-grammatical realizations which define academic writing (SWALES, 1990), and exposure to coherent syllabi. Additionally, academic writing courses seem to neglect the teaching of the pragmatic resources underlying the social practices which characterize academic literacy (LEA and STREET, 1998). Among the several rhetorical-interactional devices which typify the academic text, we find hedges. Such issues led us to look for the presence of these expressions in the writings of 14 undergraduate students in the academic writing discipline of the English Language and Literature course at UFES. The objective was to verify the use and distribution of such rhetorical mechanisms in their academic production. We analyzed 42 students' essays. The first 28 refer to their first and second assignments required before the intervention. The last one, to the third assignment required after the intervention. Our results demonstrated that most students did not make use of such discursive devices, in their initial writings, which made their claims seem too *authoritative*. This pointed to the need for a systematic approach to teaching the proper use of such mitigating devices, along with the preparation of suitable materials, and the promotion of an awareness of their role in the socio-academic and disciplinary practices at the university. Therefore, *we began a period of intervention, in which we taught students how to mitigate their claims with the use of hedges. Two weeks after the intervention, we assigned a final essay with the same topics as the previous ones. The new results suggest that the intervention was effective, since they made a good use of hedges.*

Pragmatic values of Spanish ‘future’ forms in colloquial speech: Grammar in interaction

Lecture

Ms. Claudia Gómez-Valadés¹, Prof. María Sol Sansiñena¹

1. KU Leuven

Spanish has both an inflexional future form -i.e. the **synthetic future** (SF)-, as in *Hablarán con él mañana* ‘They will speak to him tomorrow’, and a **periphrastic future** construction (PF) <*ir a* ‘go to’ + infinitive>, as in *Van a hablar con él mañana* ‘They are going to speak to him tomorrow’, which have a wide range of possible interpretations and have developed different functional and frequency profiles. The Spanish future forms have evolved new uses expressing different types of (inter)subjective qualifications (see a.o. Rodríguez Rosique, 2019). Some of these developments have been addressed in the literature, while others have not been discussed at all, particularly some new uses whose semantics-pragmatics are at first sight incongruent with the meanings typically associated with the ‘future’ constructions.

This paper analyzes the pragmatic values of the SF and the PF in Peninsular and Rioplatense Spanish in computer-mediated communication and social networking services, such as Twitter, as well as in colloquial speech. For the latter, we use four different corpora, namely, COLA, C-ORAL-ROM, Val.Es.Co. and Ameresco. All documented tokens of the SF and the PF are annotated and analyzed in terms of morphosyntactic, lexicogrammatical, semantic-pragmatic and discourse-interactional parameters, as well as contextual elements expressing speaker-related meanings (modal adverbs, discourse particles, hedges, etc.).

We expect sentence type to play an important role in the expression of modal meanings, since e.g., polar and partial futurizing interrogatives are more likely to display rhetorical effects, as in (1), than futurizing declaratives (Rosemeyer & Sansiñena, 2022).

(1) A: *O le mentís claro*

‘Or you lie to her, of course’

B: *¿cómo le voy a mentir a mi psicóloga?*

‘How could I (lit. go to) lie to my psychologist?’ (Ameresco, 2021)

The refutational use of the PF in (1), constructed as a rhetorical question with *cómo* (‘how’) counts as a repetition of the interlocutor’s previous proposition presented as non-factual. It would be ungrammatical to use the SF in such a context. However, we documented challenging uses of both the SF and the PF in dispreferred response-initiations that are *wh*-interrogatives with *qué* (‘what’), as in (2), where the speaker conveys that the interlocutor surely does not know (or is expected not to know) anything about the topic under discussion.

(2) A: *Anda a estudiar eso que es re fácil*

‘Go and study that, it is very easy’

B: *Qué **sabrás** vos de estudiar*

‘What would (lit. will) you know about studying?’ (Twitter, 2022)

We explain the pragmatic differences between the use of the PF and the SF in such dispreferred response-initiations and we also discuss the documented substantial dialectal variation in the use of futurizing morphology.

Pragmaticists' views on what laypeople should know about language

Lecture

***Dr. Tomas Lehecka*¹, *Prof. Jan-Ola Östman*²**

1. Åbo Akademi University, 2. University of Helsinki

Many fields of science have recently seen an increased interest in laypeople's perceptions and understanding of scientific facts. In particular, studies have focused on common misconceptions about social inequality, public health, and climate change etc. (e.g. Rosling et al. 2018, de Figueiredo et al. 2020). Anecdotal evidence also suggest that lay people hold many false beliefs about language (e.g. Bauer & Trudgill 1998, Davies 2012), but these suggestions have not been subjected to detailed empirical investigation. Our research project seeks to address this challenging point through a large-scale survey into the nature and prevalence of language-related misperceptions among the general public.

In order to survey what laypeople know about language, one needs first to decide what questions their knowledge should be tested with: What should the general public know about language for their own benefit or for the benefit of society? What do linguists of all credos agree on? Previous studies in this field have had a national focus; e.g. Hudson (1981) on what British linguists all agree on. To investigate this question empirically, we carried out a global survey among linguists (n=552) where we asked linguistic experts to write down questions about language that they think everyone should know the answer to. We received 3,349 open text responses which we have annotated and categorized thematically.

The results of the survey show that views about what is important for the general public to be aware of vary between linguists from different parts of the world, and between linguists who are active in different subfields of linguistics. In this contribution, we focus on comparing the views of "pragmaticists" (i.e., linguists who indicated in our survey that they work in the subfield of pragmatics) against linguists from other subfields. Not surprisingly, we find that pragmaticists consider, on average, the relationship between language, social status and power a more important issue than what linguists from other subfields do. We also find that the top three "macro-questions" that linguists of any field of interest most frequently offer as questions that the general public should know the answer to are "How and why do languages change?", "How do children acquire language?", and "How many languages are there in the world?" – in other words, questions that are central to pragmatics. Theoretically, the presentation utilizes insights from the field of science communication and raises discussion about the "universals" of important language-related issues, and what role knowledge of various functions of language play among them.

Pragmatics and loyalty issues in the translation of university diplomas and CVs

Lecture

Prof. Verena Jung¹

1. AKAD University

While translation studies researchers from the 1980s onwards (Hönig&Kusssmaul 1982, Kusssmaul 1980) have espoused pragmatics as a valuable analysis tool for shifts in stance, politeness, relevance, etc. between originals and translations (House 1997, Blum-Kulka et al. 1989, House&Kadar 2021), different schools of translation studies have focussed on very different aspects of pragmatics.

The skopos translation principle (Reiss &Vermeer 1984/2010), which would normally see a pragmatic shift in the translation as desirable if it makes the utterance more acceptable in the other culture, has been problematized by the translation scholar Nord (2001) who created the concept of loyalty in translation to overcome the pragmatic shifts expressly allowed and commended by skopos theorists.

Where Jung & Schrott in 2003 have looked at pragmatic shifts in translations of historical texts, this paper looks at the difficult meaning calibrations that translators have to negotiate when they translate different propositional content, especially when this content is linked to claims of professional skills that must be translated accurately, without either understatement or overstatement, especially for employability claims.

By means of the translation studies concept of loyalty as well as pragmatic concepts of identity, relevance and scope (Bucholtz&Hall 2010, Li 2021), translations of international CVs from English into German and university graduate qualification level claims from university diplomas from German into English are analysed according to the widening or narrowing of scopes and of propositional content they allow for.

The stakeholder loyalty concept framework developed by Kilic (2022) will be used to visualize and assess pragmatic shifts as well as widening or narrowing of scope or relevance shifts in the translations.

Pragmatics of atypical capitalization: ‘alternating caps’ in digital discourse

Lecture

Prof. Jannis Androutsopoulos¹

1. University of Hamburg

The shift of computer-mediated communication (CMC) research during the 2010s towards digitally-mediated interaction (DMI, Meredith et al. 2021) has shed new light on the role of graphic devices – punctuation, diacritics, other non-referential writing features – in the coordination and contextualization of mediated interaction. Punctuation signs, in particular, have been shown to afford DMI participants various interactional practices (Androutsopoulos/Busch 2021, Busch 2021). Following this line of research, this paper focuses on a particular graphic feature, i.e. ‘alternating caps’, and its use in public digital discourse. The term ‘alternating caps’ refers to a seemingly random pattern of (multiple) alternation of upper and lowercase characters within a word or utterance, e.g. ‘cLIMAtE chANge Is a hOAX’. The term itself is familiar to online culture, as evidenced by respective entries in Wikipedia and urbandictionary.com, but the practice and process of doing alternating caps in DMI is still undocumented.

Drawing on a large set of computationally collected German and Greek data from Reddit (a social media platform organized into anonymous discussion forums), this paper examines alternating caps in a ‘total linguistic fact’ approach, i.e. an integrated analysis of the structure, use, and awareness of this feature (Silverstein 1985, Androutsopoulos/Busch 2021). Alternating caps came into usage in American English in 2016 and quickly spread to other languages and scripts, including German and Greek. Formal analysis shows that alternating caps differ from conventional word-internal capitalization in acronyms (e.g. ‘PhD’) and compounds (e.g. ‘LaserJet’), in that they neither support the perception of morphemic boundaries nor lead to the formation of lexicalized types. Pragmatically, alternating caps work as a double-voicing cue (Agha 2005). They index a dissociation of the writer from the word or utterance that is set in alternating caps, and position this utterance, and by extension its principal, in an indexical field (Eckert 2008) which includes evaluative qualities such as ‘irrational’, ‘unreliable’, or ‘ridiculous’. This way, alternating caps provide a non-referential resource for indexing evaluation, a key practice in social media discourse (Zappavigna 2017).

Overall, this study provides new evidence for the role of graphic resources for pragmatic work in digital discourse and the interplay of global semiotic circulation and local adaptation in the development of graphic cues in DMI.

Pragmatics of queer ‘palabreo’ in Chile

Lecture

*Dr. Jaime Crisosto-Alarcón*¹

1. *Universidad del Bío-Bío*

Various groups of people develop linguistic mechanisms to generate identity ties within a community of practice (Eckert & McConnell-Ginet, 2013). Queer argots involve different degrees of lexical replacement in which queer neologisms replace some words (Barrett, 2018) or manipulates gender morphology and syntactic forms (Gaudio, 2014). The queer community in Chile use a speech style broadly called ‘palabreo’, which works under certain rules and dynamics that are shared within the collective. The pragmatic-interactive features of this conversational style are addressed in this study with an emic-speaker focus.

The research is embedded into an interpretive - qualitative framework with a transverse temporality and uses the content analysis as methodology. A semi-structured interview is conducted with 30 auto-reported LGBTIQ+ chilean people.

The results indicate that the ‘palabreo’ is a conversational format that the Chilean LGBTIQ+ community considers as part of their own identity. In it, prosocial and antisocial discursive tendencies are noted, which are manifested simultaneously in the discourse with a vindictory, political, and fraternal-friendly role. Also, the participants recognize the importance of contextual clues for an adequate interpretation of the messages between the interlocutors. The topics addressed in the palabreo are the sex-affective relationships of the participants, the appearance of the interlocutor, the socio-economic status of the interactants, and daily life issues. Finally, the palabreo blurs the line between private and public topics, using resources of mock impoliteness and a permanent humorous setting in the conversation.

Pragmemic Dialogicality of Hate-Speech Comments on Facebook in Arabic, English, and Romanian

Lecture

Dr. Hussain Al Sharoufi¹

1. Gulf University for Science&Technology

The current study investigates hate speech in comments written by English, Arab, and Romanian participants on Facebook. Hate speech represents a common characteristic of numerous comments written by some Facebook participants. To understand this critical aspect of Facebook comments, this paper poses three main questions:

1. Do hate-speech writers use specific pragmemes in their comments?
2. Do Arab, English, and Romanian speakers use similar cultural schemata when exchanging hate speech with other Facebook participants?
3. Do hate speech disseminators impose certain culturemes, depending on hate-speech schemata, in their discourse?

To answer the above questions, 90 hate-speech comments made on specific political and social articles published on Facebook were investigated. Drawing on Mey's pragmemes (2010), Al Sharoufi's culturemes (2020), and Sharifian's schemas, pragmemes, and practs(2016), the data was analysed. The results showed that specific pragmemes were used to impose hate speech on Facebook participants. Other important results showed that specific Facebook users, using hate speech in particular, share similar cultural schemata in Arabic, English, and Romanian respectively. The paper concludes with the idea that hate-speech disseminators use specific culturemes that are based on specific hate-speech schema that exist in all the three languages and cultures. Such findings will help Facebook users become more aware of their communicative behaviour and pay more attention to the kind of language they use on Facebook to avoid any possible conflicts.

Primary School Children's Narratives

Lecture

*Dr. Kyoko Sugisaki*¹

1. Carl von Ossietzky Universität Oldenburg

This presentation is based on an on-going research project on primary school children's storytelling in Germany. In this presentation, I examine children's narratives in terms of their (a)typicality.

Investigating the primary school children's narratives provides insights into which (a)typical narrative forms and structures they are acquiring in spoken communication in the period of literacy socialisation. In this presentation, I am going to analyse children's narrative practices in multimodal conversation analysis (CA) (Goodwin 2000; Mondada 2016). I investigate how children co-construct their narratives in interaction and how they deploy language and other resources such as body and materials in their "interactional space" (Mondada 2013; Hausendorf 2013) to construct the "narrative/imaginary space" (Heller 2019, 2022). In other words, I investigate how children bring their narratives from the "here and now" into the "then and there" (Filipi 2014) and construct the "narrative/imaginary space" by establishing the places, times, and persons of the story in spoken discourse with the deployment of verbal and non-verbal resources (cf. Heller 2019; Quasthoff et. al (2019)).

Methodologically, I open up data-derived corpus-linguistic methodologies to CA in terms of the (a)typicality in the narratives. In this work, (a)typicality is understood as recurrent patterns of children's solutions (verbal and non-verbal "forms" in sequential "devices") to "jobs" in storytelling (Hausendorf & Quasthoff 1996; Quasthoff et. al (2019)). The corpus-linguistic methodology provides an overall pattern of children's narrative forms to accomplish the storytelling jobs in interaction. In addition, I will discuss the methodological issues and challenges in my approach.

Public Discourse Changes with the Times and Media: Writer and Reader Responsibility in Corporate Mission Statements

Lecture

*Ms. Mana Kitazawa*¹

1. Keio University

This study analyzed corporate discourse to explore how changing times and the associated change in the form of media from print to digital influence people's use of language in public. Corporate discourse, such as corporate websites and annual reports, is a type of public discourse accessible to virtually everyone. By focusing on corporate discourse, the study investigated how companies take account of their potential audience when using language and how that use of language changes over time.

This research focused on mission statements, which appear in the annual reports that most companies distribute or publish on their websites. The texts of these statements are relatively stable, as a company's products, services, and direction do not fluctuate significantly, but writers must sometimes revise the statements to make them acceptable to as many of a society's readers as possible at a given time.

The data were collected from the annual reports of ten companies and cover the years 1986–2021. This research looked at what the companies included in their statements and how those elements evolved over time. First, it classified the statements' content by adopting—or, occasionally, revising—classifications from earlier studies (Bart, 1997; Bartkus et al., 2004; Williams, 2008). Second, each element in the statements was qualitatively examined from the viewpoint of writer and reader responsibility (Hinds, 1987), including the degree of detail and whether a company explained itself directly or indirectly. The remarks can be considered to reflect greater writerly responsibility if they are explicit and clear enough for readers to understand without ambiguity.

The findings reveal that, while the elements in these statements are similar, companies describe them in different ways over time. Three stages may be identified. When the reports are initially published in print, companies promote themselves in a self-contained manner by presenting their products as precisely as possible. For example, the 1986 report of Best Buy says, "Best Buy Co., Inc., sells nationally recognized, brand name consumer electronics and major appliances through 12 retail stores located in Minnesota." In the subsequent stage, the references to the companies' products become more generalized as demonstrated in Best Buy's 1998 report: "Our Company is devoted to providing our customers the best value on the products they want." During this stage, companies express themselves more indirectly by integrating their products into their actions toward specific stakeholders. In the final stage, companies make broadly general references to stakeholders as well as to products and services as in Best Buy's 2021 statement: "At Best Buy, our goal is to enrich lives via technology." The terms *lives* and *technology* make it difficult to define exactly whose lives are meant and what the company's products are.

This study suggests that mission statements may become more ambiguous over time due to changes in the form of media, increased opportunities to be seen by a wider variety of audiences, or the public's greater knowledge of the companies. As a result, reader responsibility is now greater than before, as readers must decide how to interpret ambiguous meanings.

Rationales for Covert Hate Speech: A game-theoretic approach

Lecture

*Ms. Xinya Liu*¹

1. University of International Business and Economics

This paper is a proposal of using game-theoretic model in analyzing the mechanism of covert hate speech. The gist of the model is that the production and perception of covert hate speech can be viewed as social recursive reasoning between rational interlocutors. Experiment will be used to collect participants' production and interpretation strategies under different communicative goals for model testing.

Hate speech has generated much interest in sociopragmatic research for its pervasive use on social media and intertwined with impoliteness and identity (Terkourafi et al., 2018), usually disguised in a covert way. Previous research on covert hate speech has primarily relied on discourse analysis and corpus method, examining various discursive strategies (Bhat & Klein 2020). While the descriptive approach provides us with insights on various forms the covert hate speech can take, it hasn't explained the motivation for using such techniques and how they can be reliably understood. More importantly, the interplay between speaker's discursive strategy and listener's evaluation is underexplored. Therefore, this study takes covert hate speech as co-constructed and negotiated between group members. Though such coded messages seem ambiguous, it is a critical strategy adopted by speaker who strikes a balance between being informative and lessening resentment, and it can be reliably communicated if listeners can recover speaker's communicative goals. This process is formalized through Bayesian game-theoretic approach with the support of experimental data, which has been proposed in understanding politeness (Yoon et al., 2020). In a game-theoretic model, the strategic speaker is uncertain about the types of potential audience; therefore, he/she has to alter the implicitness according to the prior belief of probability distribution of audience types to maximize the expected utility. The utterance functions as a signal to reveal the speaker's group affiliation, promoting hatred against outgroup members while still maintaining plausible deniability. In supporting experiment, this study adopts an interactive experimental paradigm involving action-based tasks both on production and comprehension sides, with material and scenarios collected from Chinese online social media "Weibo". Native speakers and listeners are paired in the same game where the speakers' messages generated in a given scenario are immediately transmitted to listeners' computer screen for interpretation. The results are to find whether the covert strategy can be reliably understood meanwhile generate less resentment to the speaker.

Reaching the “Black Box” of Politicians: Mediating Political Intentions Through the Eyes of Journalists

Lecture

Ms. Mia Schreiber¹

1. The Hebrew University of Jerusalem

This study aims to illuminate meaning-making processes by analyzing journalists' perception of their role as mediators of intentions in reports of political utterances. Political utterances serve as the foundations of news-stories regarding the political sphere (Gans, 1979; Van Dijk, 1988), and their mediation is a significant part of journalists' everyday practice of news reporting (Sigal, 1986; Wierzbicka, 1987). Research on reported speech in news-stories has demonstrated that the act of mediating utterances involves different levels of interpretation (Clayman, 1995; Fairclough, 1988; Kampf, 2009; Schreiber and Kampf, 2022; Stubbs, 1983). Studies that dealt with speech presentation in news reports engaged mainly in the analysis of news stories, focusing on journalists' practices of citation (Fairclough, 1988; Roeh and Nir, 1990; Zelizer, 1993), the different ways of assimilating source's texts in news stories (Baden and Tenenboim-Weinblatt, 2018; Livio and Cohen-Yechezkely, 2018; Tenenboim-Weinblatt and Baden, 2016), and the reporting of speech acts (Kampf, 2009, 2013; Schreiber and Kampf, 2022; Stubbs, 1983). Yet, the subtle, nearly unnoticed practice of interpreting political intentions within news stories did not receive research attention so far.

The current study aims to shed light on the act of mediating intentions and its importance to the meaning-making process in news reports, by analyzing journalists' perspective regarding their role as mediators of political intentions. The research questions guiding this study are: How do journalists describe the process of inferring intentions when reporting on politicians' words? and what are their main motivations for mediating political intentions? In order to examine journalists' perspective on the mediation process of political intentions, I conducted semi-structured interviews with eighteen Israeli journalists (reporters and editors) from a variety of news platforms that represents a mix of ownerships and political ideologies.

While most interviewees began the interview by arguing that the reporting of intentions is meaningless, the use of the reconstruction technique in the interviews (Reich, 2006) enabled a shift in journalists' perspective regarding the act of mediating intentions and their importance in shaping news stories. What was perceived as a trivial, meaningless matter that does not require any journalistic thought or skills, turned during the interviews to an act that involves different considerations and requires personal knowledge and professional abilities. Alongside the acknowledgment in the importance of mediated intentions to news reports, the analysis points to the evaluative categories journalists apply in the attempt to interpret political intentions. Furthermore, the findings suggests that the reporting of intentions meets two main journalistic needs: storytelling, or the need to give meaning and to make sense of events in the political sphere; and verification, or the need to uncover politicians' "true faces". I conclude by discussing the importance of meta-discourse for deciphering the mechanisms of journalistic work and the process of inferring intentions, and suggest that this type of analysis can shed light on other social interactions in which the mediators are of crucial importance in the process of meaning-making.

Reconsidering the interactional functions of *Bushi* /*Meiyou* ('No-') prefaced responsive turns in Mandarin conversation.

Lecture

*Dr. Jia Li*¹

1. *Gifu Shotoku Gakuen University / Graduate School, The University of Tokyo*

Bu- and *mei-* are two high frequency negation markers in Mandarin Chinese. Li and Thompson (1981) have reported the difference between *bu* and *mei(you)* is whether completion is involved; *bu* provides a neutral negation, whereas *mei(you)* negates the completion of an event. According to previous research on discourse markers and conversational actions, *bushi* and *meiyou*, two negators developed from *bu-* and *mei-*, function differently. *Bushi* serves to directly refute assertions, and *meiyou* hedges the negative response it initiates and thus functions to seek alignment with the interlocutor (Wang 2008). *Meiyou* mitigates the disagreement by avoiding a pointed syntactic negation in polar-question-response sequences (Wang 2020).

Although these findings are informative, the following problems still persist; (i) In what sequential contexts do Mandarin Chinese native speakers utilize *bushi* and *meiyou* prefaced responsive turns in everyday conversation other than the question-response sequences? (ii) How does the prosodic feature effect the functions of *bushi* and *meiyou*?

To address these questions, this study examines *bushi* /*meiyou* prefaced responsive turns in 9 hours of everyday Mandarin face-to-face conversation audio recordings, adopting an interactional linguistic approach and using the methods of conversation analysis. Detailed analysis revealed that:

1. Although certain syntactic constraints are imposed by preceding turns: *bushi* prefaced responses frequently follow the utterances contain *shi* (be-verb), and *meiyou* prefaced responses commonly seen behind *you* (have) or *you...guo* (have experienced) related claims or confirmations, the counterexample is demonstrated in the following excerpt:

1 L: Ài wo juéde ni bèi dōngxi shízài shì tài liháì le. [assessment]

'I think you are so good at remember things.'

2 W: Wo méi:you:=wo xiànzài lao la. Wo zhēnde.hhh. [denial+account]

'I méi:you, I am old now, really. (laughter)'

After a *shi* contained assessment (line1), *meiyou* prefaced response is produced, which is involved in the action combination of denial plus account operating in the sequential context of expressing humility (line2).

2. In Beijing Mandarin conversation, these two negators have diversified prosodic representations (five kinds of each according to our observation). *Bú:shì:* and *méi:you:* with vowels lengthening may represent strong denial whereas their truncated form *búr* and *méi* as simple turn-taking markers.

While conversational actions conducted by *bushi* / *meiyou* prefaced turns has been examined (Chiu 2012), this research offers new insight into the sequential context where *bushi* /*meiyou* prefaced responsive turns constrained by interactional rules as well as the pragmatic function-prosody interface in everyday conversation. The results can help learners better understand the usages of Mandarin negators.

Reference Ascriptions, Ambiguity, and Coordination

Lecture

Prof. Mihai Hîncu¹

1. Valahia University of Târgoviște

In this paper, I focus on the linguistic constructions in which occurs the most emblematic verb of our pragmatic lexicon, the verb „refer (to)” by means of which the speaker’s meaning is reported, and I look at its complex semantic profile through the prism of the logical aspects considered definitory for the extensional verbs. In this regard, I scrutinize the semantic differences between the verb used to ascribe reference and the extensional transitive verbs with respect to the existential entailment, to the substitution ‘salva veritate’ of the coextensional terms and to the semantic specificity, and I show that there are strong theoretical reasons for considering that it belongs to the class of the intensional transitive verbs (ITVs).

Insofar as the sentences containing ITVs are structurally ambiguous between an intensional, *de dicto* interpretation, and an extensional, *de re* interpretation, they threaten the coordination between agents. For this reason, if the speaker uses a reference ascription in one way and the hearer’s reading of it diverges from the speaker’s intended meaning, both agents have a coordination problem. In this regard, using the mathematical framework of games of partial information, I will show what conditions have to be satisfied in order for a rational speaker and a rational hearer to efficiently communicate with a reference ascription, and to converge on its right interpretation when the sentence’s surface syntax is probabilistically silent about which of the *de re* or *de dicto* meaning the hearer has to choose in order to coordinate with the speaker.

In order to accomplish this task, I present a scenario of strategic communication involving reference ascriptions and I model it as a two-agent coordination game. The cognitive dynamics peculiar to the agents’ interaction will be presented on the background of some reasonable assumptions introduced to guarantee the finding of a solution concept corresponding to the game. In this regard, after I let the utility functions be sensitive to the agents’ preferences for more economical expressions, I compute the expected utilities of the strategic profiles, I determine a set of Nash equilibria and I show that the game’s unique solution can be equated with that set’s member which passes the test of Paretian efficiency. The present model highlights the mutually recursive way in which each agent reasons about the other agent’s probabilistic reasoning, and it manages to integrate the uncertainty involved in the successful communication with the reasoning about reasoning process involved in the language production and interpretation.

In the end, I present the picture of the interplay between the speaker’s reference and the semantic reference which emerges from the game-theoretical framework adopted here and I will show some of its methodological consequences related to the way in which the key concept of reference has to be theoretically framed.

Refusals in English as a lingua franca: An investigation of Chinese and Indonesian speakers

Lecture

*Mr. Xianming Fang*¹

1. Monash University

This study examines refusals in the English as a lingua franca (ELF) context where the interactants are usually English L2 speakers. It particularly focuses on two major ELF user groups in the Asia-Pacific region, namely Chinese and Indonesian ELF speakers. Thirty Chinese and 30 Indonesian L1 speakers took part in this study. They were made in pairs to play role-plays. The role-play data is divided into two data set. The first data set includes 15 Chinese participants who acted as refusers and 15 Indonesians who played the role of requesters. The second data set includes 15 Chinese (as requesters) and 15 Indonesians (as refusers). In addition to role-plays, each participant had an immediate interview with the researcher after the completion of role-plays. The role-play data were examined in terms of the refusal strategies and refusal sequences.

Results show that Chinese English speakers share many similarities with Indonesian English speakers when making refusals in intercultural communication. Strategically, both Chinese and Indonesian participants usually prefer indirect strategies, especially explanations. Sequentially, both Chinese and Indonesian participants usually tend to delay their refusals with a variety of interactional tools, such as pauses, turn-initial delay, and anticipatory accounts, etc., and prefer to end their interactions with an acceptance. The interview data suggest that many participants linked their indirect refusal performance with their L1-derived sociopragmatic norms and believed that the preference for “indirectness” is a commonality shared by Asian English users who are different from Westerners. Despite the similarities, Chinese and Indonesian ELF speakers still have some differences, particularly in some pragmalinguistics (e.g., the discourse markers, the downgraders).

The findings of this study show that ELF refusals used by speakers from different Asian linguacultures appear to be similar in strategies and sequential organization. The similarities are likely due to the participants’ transfer of their L1 pragmatic norms which are similar regardless of the different national boundaries. Participants seem to favour their L1 pragmatic transfer when interacting with Asian speakers because they thought that it is shared by the Asian interlocutor with whom they are interacting. Hence, when using English as a regional lingua franca in Asia, the local pragmatic norms seem to be a more ideal choice rather than English L1 speakers’ pragmatic norms. Moreover, we should realize that the so-called Asian ELF speakers are not a homogeneous group but have some differences when using ELF. An implication of these findings in pedagogy is that pragmatic instruction should pay more attention to local pragmatic norms rather than sole English L1 speakers’ norms.

Repair lexemes as tweet-initial responses in Finnish Twitter interaction

Lecture

*Ms. Helena Nurmikari*¹

1. University of Helsinki

On Twitter, where interaction is asynchronous, the need for repairs is different than in spoken interaction and repair practices can develop new pragmatic and metapragmatic purposes (Nurmikari, 2021). Using the conversation analytic approach and by applying Digital CA (Giles, Stommel, Paulus & Reed, 2015), this paper answers the following research question: What interactional tasks do Finnish open class repair lexemes *mitä*, *tä(h)*, *hä(h)* and *anteeks(i) mitä* have when used at the beginning of a tweet, followed by more text in the same tweet?

As a response after the turn-transitional space in spoken interaction, an open class repair initiator points out a problem in receiving, understanding or accepting the previous turn or a longer stretch of talk, and calls for a repair, which often is a full or partial repetition of the trouble source by the producer of the trouble source (Schegloff, Jefferson & Sacks, 1977). In Finnish spoken interactions, open class repair initiators are used similarly to how Drew (1997) has described their use in English, often pointing out to problems in hearing or understanding (Haakana, 2011; see also Schegloff, 2004). The most common open class repair initiators in Finnish are *mitä* ('what') and its abbreviation *tä(h)*.

The data consist of 368 manually collected tweets that include Finnish repair lexemes that in spoken interaction are used as open class repair initiators. I will show that the tweet-initial use of these lexemes does not call for a repeat or other repair as a response from the co-participant. In a tweet-initial position, these lexemes make both use of the function of repair, in pointing out something problematic or difficult in accepting the previous turn, and the pragmatics of surprised response tokens (see Wilkinson & Kitzinger, 2006 on response tokens) in displaying an affective and distancing stance. The tweet as a whole can be either affiliative and aligning or disaffiliative and challenging to the previous tweet, in which the previous writer has presented their stance to some topic for example by commenting a news topic or a another Twitter user's tweet.

Repair of misunderstandings on Twitter: report on a pilot study

Lecture

Ms. Chloé Duquesnoy¹, Prof. Ilse Depraetere²

1. Université de Lille, 2. University of Lille, UMR 8163 STL

Misunderstandings constitute an important member of the mis-family, next to *mis-hearing* or *misleading* (Dascal, 1999). They are “a form of understanding which is partially or totally deviant from what the speaker intended to communicate” and in which “the interlocutor who misunderstands is not aware of it” (Weigand, 1999: 769). Research on the topic has mainly focused on misunderstandings in face-to-face (FTF) communication with particular attention for the sources of misunderstandings (Weigand, 1999), their structure (i.e., the *origin*, the *manifestation*, the *devices* and the *state of realisation*; Humphreys-Jones, 1986), the conflict resolution strategies (i.e., *integrative*, *distributive* and *avoidance* strategies; Sillars, 1980) and the types of repair (*self* or *other* repair; McRoy and Hirst, 1995).

In this presentation, the focus is on misunderstandings in computer-mediated communication (CMC). Edwards (2017) argues that misunderstandings in text messaging tend to get resolved as often as in FTF communication. Here, we aim to find out how the participants reach the *state of realisation* (i.e., the moment when the participants realise that a misunderstanding occurred) in another CMC context, that is, Twitter. We also examine how misunderstandings are *resolved*, if, at all, and by whom.

Starting from Humphreys-Jones’ analysis of the *state of realisation* (1986), we searched for misunderstandings making use of 22 sequences that signal misunderstanding. In this way, we collected a sample of 100 tweet threads from Twitter and analysed the tweet which caused the misunderstanding and the tweets that follow until all the participants reach a state of understanding. We applied Humphreys-Jones’s (1986) framework and coded the turns in terms of three features: (a) the *devices* (i.e., optional textual components elaborating the misunderstanding), (b) the conflict resolution strategies and (c) the participant resolving the misunderstanding (i.e., *self-repair* or *other repair*).

Our analysis shows that misunderstandings on Twitter are generally resolved in the same way as in FTF contexts. It is usually the participant who produces the misunderstood utterance who also resolves the misunderstanding. They typically use integrative strategies (i.e., by maintaining a positive evaluation of the partners; Sillars, 1980) and devices that help the other participant understand the communicative problem.

Reporting Non-literal: An Empirical Study of Belief Reports on Metaphors

Lecture

Ms. Xiaoxuan Chen¹

1. *University of Cambridge*

In this study, I examine the intersection of belief reports and metaphor—two widely studied topics in separation but significantly underresearched in tandem. It aims to investigate people’s preferences for how they report metaphor in belief reports compared with non-metaphorical language, and to what degree conventionality affects the preferences.

Under a post-Gricean contextualist framework which includes metaphorical meaning in the truth-conditional content of an utterance (see e.g., Carston, 2002, 2010; Recanati, 2004, 2010; Sperber & Wilson, 2008), the prediction is that there will not be a significant difference between people’s preferences on how they report literal and metaphorical utterances. I analyze whether, and how, speakers paraphrase metaphors in their reports, in order to shed more light on the literal/non-literal distinction and metaphor interpretation using evidence from propositional attitude reports.

In this talk, I present and briefly discuss the results of a questionnaire-based survey that addresses this question with respect to three categories of sentences: (i) sentences with conventional metaphor, (ii) sentences with novel metaphor and (iii) literal sentences, checking whether participants adopt different strategies when constructing the reports on them. Participants are asked to respond to an open-ended task, i.e., completing a report in the frame “B believes that _____” after reading each target sentence placed at the end of a short story context. The main strategies they are expected to adopt are reusing the target expression, paraphrasing the target expression and substituting the sentence with implicature. This approach allows us to compare their responses through both quantitative and qualitative analysis.

Resistance by defendants in Chinese criminal trials

Lecture

***Ms. Yan Chen*¹, *Dr. Alison May*¹**

1. University of Leeds

China is conducting a ‘trial-centred’ judicial reform, which highlights the critical role of questioning in trials to find out the facts, verify evidence and deliver justice. However, in comparison with legal professionals’ language, defendants’ language draws much less attention because the questioners’ language (mostly questions) has formal markers while the responses do not (Liao, 2004, p.29), and responses are mainly ‘shaped by the constraints of prior questions and turn-allocation systems’(Carter, 2019, p.225). This research fills the gap in the academic field and contributes a linguistic perspective to the legal discussion. This research examines resistance practices by defendants in 49 transcribed trials. This research adopts a combined approach of corpus linguistics and conversation analysis for both quantitative and qualitative analysis. The corpus results show that defendants are frequently interrupted by legal professionals, which usually signals a response to defendant resistance. The resistance by defendants who plead not guilty is more obviously seen when their responses are compared with those by defendants pleading guilty. Specifically, this research finds that defendants’ most frequent resistance practices are ‘我就 (I *jiu*)’ sentences and the nonanswer responses structured with ‘不知道 (not know)’. The analysis of ‘我就 (I *jiu*)’ sentences demonstrates how the defendants try to create an opportunity for narratives, where they use ‘我就 (I *jiu*)’ sentences to justify and normalise their behaviours. The close examination of the sequences triggered by nonanswer shows that defendants tend to resort to nonanswer as a convenient resistance strategy though they usually provide an account for not knowing. Nevertheless, it is found that legal professionals have different strategies to deal with a nonanswer response to either get a real answer or to undermine the credibility of the defendant. Though resistance in courtroom settings has been researched before (e.g., Drew, 1992; Matoesian, 2008), this study which examines an underexplored non-Anglo-American jurisdiction, enriches our understanding of questioning and response in institutional talk.

Resisting gaslighting: Conversational strategies, linguistic resources, and oral deaf people

Lecture

*Dr. Tsung-Lun Alan Wan*¹

1. National Cheng Kung University

This paper explores how orally educated deaf people in Taiwan adopt conversational strategies and linguistic resources to claim legitimacy as the subject of lived experiences of disability, negotiating with others who attempt to question their disability experiences (i.e., “gaslighting”).

From a disability studies perspective (Kerschbaum, 2021), it is argued that much work needs to be done in exploring how disabled persons navigate experiences of disability among themselves or with their important others, rather than with abled researchers or clinicians. This study is in alignment with this intellectual agenda. This study looks at two pairs of participants: one consists of two deaf persons (one is a hearing aid user, and the other is a cochlear implant user), and the other consists of one deaf person and her hearing mother.

In the first pair, a cochlear implant user, Xiao-Kun, talks about how cochlear implants are a powerful technology for heavily deafened people like her. Her interlocutor, a hearing aid user with mild deafness, does not buy Xiao-Kun’s argument and tries to question the materiality of cochlear implants and her experiences. It is observed that Xiao-Kun adopts conversational strategies such as interruption, trouble-identification, and membership categorization as well as linguistic resources like code-switching to legitimize her experiences with cochlear implants and deafness.

In the second pair, a deaf person, Grace, shares with me (a hearing researcher) her frustration with learning English as a foreign language. However, her (hearing) mother questions her experiences and argues that hearing people in Taiwan are also frustrated with English learning. To claim her legitimacy in experiencing disability, Grace adopts phonetic resources in turn allocation, such as raising her pitch in interrupting her mother and claiming the floor, as well as hypo-articulating vowels in expressing negative affect towards her mother’s stance.

Different from work that focuses on “medical gaslighting” from clinicians (Sebring, 2021), this study aims to look at how disabled people respond to gaslighting from people who do not perform medical authority. By the examples mentioned in this talk, I argue that we should recognize the potential agency of disabled people in negotiating disability experiences. This study also shows how pragmatics as a field concerning language-in-action can inspire further intellectual projects in exploring microsocial practices among disabled people.

Ritual Small Talk in Chinese: A Speech Act Analysis

Lecture

***Ms. Zongfeng Xia*¹, *Prof. Fengguang Liu*¹, *Prof. Dániel Z. Kádár*², *Prof. Juliane House*³**

1. Dalian University of Foreign Languages, 2. Hungarian Research Centre for Linguistics, 3. University of Hamburg

In this study, we examine ritual small talk in Chinese, which is a regrettably understudied phenomenon. We analyse small talk by capturing its recurrent pragmatic features in the units of interactional structures and speech acts, and also by interpreting such pragmatic features through the lens of an interaction ritual (House et al. 2020; House & Kádár, 2021). As a case study, we examine instances of small talk taking place in front of Chinese primary schools where parents engage in casual phatic conversations to kill the time while waiting for their children. The study of our corpus of small talk conversations allows us to unearth linguaculturally embedded patterns of language use in the complex participatory setting of various parents interacting on busy Chinese streets in front of schools.

Russian *čto li* as modal particle: Testing pragmatic hypotheses with robots

Lecture

*Ms. Beatrice Bernasconi*¹, *Prof. Kerstin Fischer*²

1. Roma Tre University - Sapienza University of Rome, 2. University of Southern Denmark

In this study, we aim to verify the hypothesis that the Russian complex particle *čto li* behaves as a modal particle. The particle *čto li* is attested in a corpus of spoken Russian in various contexts, such as requests for confirmation (1), rhetorical questions (2), declaratives (3), and imperatives (4):

1. *Mamen'ka. Tak čto pravda my čto li v Peterburg ne edem?*

'Mom. So it's true, we are not going to St. Petersburg *čto li*?'

2. *Èto čë takoe? Èto čto, čaj čto li? Uberi!*

'What is this? Is this tea *čto li*? Take it away!'

3. *Znaeš', ja znala, čto ty soglasiš'sja. Potomy čto utebja glaza takie... Dobrye čto li. Nežnye.*

'You know, I knew you would agree. Because your eyes are so...kind *čto li*. Gentle.'

4. *Nu, obnimites' čto li.*

'Well, hug yourselves *čto li*.'

Depending on the context, the particle performs different pragmatic functions, i.e., interlocutor's involvement in the meaning construction process, commitment reduction, and meaning approximation (Bernasconi under review; Bezjaeva 2002; Bogdanova-Beglarian 2016). Our claim is that the polyfunctionality of *čto li* is due to its function to anchor the utterance in common ground, therefore behaving as a modal particle (Diewald 2006; Fischer 2007; Fischer & Heide 2018). To verify this hypothesis, we carried out an empirical study on L1 Russian speakers.

In an online questionnaire, we showed participants videos with robots interacting either with a human or another robot and asked them a few questions. In the videos, the robots utter sentences that are adapted from authentic examples from the multimodal subcorpus of the Russian National Corpus. Each participant rated one of the two versions of each example, either with or without the particle. Audio files both with and without the particle were synthesised and then manipulated in Praat to recreate a natural intonation pattern. Videos with robots were then recorded and matched with the audio files. Using a robot allows us to create identical situations of use and is furthermore neutral concerning human characteristics. The online questionnaire included 26 questions to be answered on 7-point Likert scales. The following research questions guided the design of the questionnaire:

- Does *čto li* entail a close relationship between interlocutors that motivates the sharing of common ground?
- Anchoring the proposition to common ground, does *čto li* influence the answer to a polar question?
- Does *čto li* mitigate orders and evaluative comments (as in rhetorical questions) by referring to notions that are shared by the speakers?
- Does *čto li* approximate the meaning by implicitly referring to notions stored in common ground?

Participants were recruited through the online platform Prolific. 61 of the 73 collected responses were valid. The statistical analysis confirms our hypotheses a, c, and d, suggesting that *čto li* influences how close the relationship between speaker and hearer is perceived, how polite the interaction is understood to be, and the extent to which common ground is evoked. The results were however mitigated by the different grammatical contexts in which *čto li* was used.

Selectional Restrictions as Natural Language Ontology_Presupposition Projection and Copredication

Lecture

*Mr. Zhengjie Situ*¹

1. University of Edinburgh

Selectional restrictions are limitations on the applicability of predicates to arguments. Those sensitive to ‘the type of entity selected for’ I dub Typed Selectional Restrictions. To illustrate, consider:

(1) *The blood of that person is blue.*

(2) ? *The ambition of that person is blue.*

One interprets (1) as implausible and false but (2) ‘not even false’ since ambition cannot be coloured.

A presuppositional treatment is widely preferred (Horn 1990, Beaver 2001) over a syntactic account (Chomsky 1965). More controversial is their nature (semantic vs. pragmatic) and source (lexical specification, linguistic composition vs. world knowledge).

Independently, the Presupposition Projection Problem has been extensively studied (Karttunen & Peters 1979; Soames 1982). Presupposition projection in conjoined complex sentences shows a distinct pattern. Certain connectives are ‘filters’, allowing projection exclusively on certain occasions. Experiments exploring presupposition projection from conjunction and disjunction confirm principled symmetric behaviour for ‘and’ but asymmetric behaviour for ‘or’ (Kalomoiros & Schwarz 2022). To illustrate, Contrast (3) and (4), where ‘quit VPing’ presupposes ‘used to VP’ and ‘#’ indicates infelicity in the out-of-blue context.

(3) a. *John used to smoke and quit smoking.*

b. # *John quitted smoking and used to smoke.*

(4) a. *Either John has never smoked, or he quit smoking.*

b. *Either John quitted smoking, or he has never smoked.*

The two-way interaction is further complicated by polysemy of the subject nominal in ‘co-predication’ constructions, when one polysemous nominal has simultaneous predications selecting for two different senses (Ortega-Andrés and Vicente 2019).

(5) a. *The city has 500,000 inhabitants and outlawed smoking in bars last year.*

b. # *The city outlawed smoking in bars last year and has 500,000 inhabitants.*

An account that treats such selectional restrictions as lexically specified, semantically typed presuppositions (Asher 2011) which place stringent formal requirements has difficulty accounting for the contrast in (5). Pragmatic factors, factoring in worldly knowledge about the ontological dependency relations between territories and political representations as concepts, seem to be at play.

Moreover, the choice of connective manipulates sentence acceptability in identical ways. To illustrate, observe how the contrast between (5) and (6) parallels that between (3) and (4).

(6) a. *Either the city has 500,000 inhabitants or outlawed smoking in bars last year.*

b. *Either the city outlawed smoking in bars last year or it has 500,000 inhabitants.*

A presupposition projection algorithm, independently motivated to explain (3) and (4), can thus be naturally extended to account for felicity data like (5) and (6). The observed similar patterns strongly argue for a pragmatic treatment of selectional restrictions especially since a refined pragmatic account of presupposition projection, empirically supported recently, has been developed (Schlenker 2009).

We argue that selectional restrictions are pragmatic presuppositions of a special type that arise during composition. Furthermore, they are constrained by ‘natural language metaphysics’ (Bach 1986), a level of cognitive representation intermediate between linguistic and world knowledge.

Our approach better accounts for selectional restrictions' weakly typed, coarse-grained, constraint-like behaviour and sensitivity to linear order. This work has implications for semantics-pragmatics distinction, linguistic-conceptual interface and compositionality.

Self-denigration in academic settings: Ritualized relational equilibrium in doctoral defense sessions

Lecture

Dr. Alireza Jalilifar¹, Dr. Nadia Mayahi¹

1. Shahid Chamran University of Ahvaz

Drawing on the constructivist grounded theory methodology, this mixed-methods study aimed to explore self-denigration in dissertation defense sessions as a tri-cultural politeness phenomenon influenced by the context of situation. Self-denigration in academic contexts, particularly English as a foreign language doctoral defense sessions, is more than a sign of modesty. It constitutes the native language culture of the interactants, the target language culture, and the disciplinary culture that lead to the emergence of novel functions of self-denigration. This study is based on the data obtained from rigorous coding of the transcripts of 53 Iranian applied linguistics doctoral defense sessions, the qualitative analysis of two focus group discussions, and a questionnaire built on the findings of the focus groups which was validated using confirmatory factor analysis. The findings indicated that self-denigration is the threshold relating the ideational and interpersonal aspects of the interaction in defense sessions. The meticulous analysis of the data led to the construction of a pragmatic theory of self-denigration grounded in the data in which self-denigration is theorized as the source of a ritualized relational equilibrium triggered by the triadic interactional practices of the defense session participants, namely, doctoral candidates, supervisor(s), and examiners. The theory consists of two constraints and three theorems which can be evaluated as ritual acts where different intentions tend to intermix to fulfil a variety of functions (i.e., Social Decorum, Diffidence, Coercive Self-deprecation, Contrived modesty, and Flamboyance). These functions emanate from the criticism-generating nature of the defense session where self-denigration seems to have been conventionalized as an inseparable part of the rituals of the Iranian applied linguistics dissertation defense sessions. Contrived modesty was found to be the most common intention behind self-denigration in defense sessions. The findings highlight the significance of self-denigration in managing talk-in-interaction by focusing on the emerging patterns of self-denigration and the perceptions and experiences of the participants in this context. This study has pedagogical implications for both doctoral students and academics as it enhances their theoretical and empirical knowledge about the interactional norms of applied linguistics defense sessions. The theory suggested in this study seems to be able to justify and predict the behavior of the participants. The ability to predict what will happen gives the theory relevance for those seeking an element of control over their environment.

Self-promotion in Academia: Constructing value positions and identity narratives in job application statements

Lecture

*Dr. Mohammed Albakry*¹

1. Middle Tennessee State University

Job application statements such as teaching philosophy statements (TPS) and research statements (RS) are rhetorical and self-promotional documents that focus on pedagogy and the scholarship of job applicants. Such texts are representative of academic support genres that are not readily available to the public and, thus, can pose difficulties for applicants who have minimal experience composing in these genres (Swales, 1996; Merkel, 2020). The presentation, based on a corpus of hundreds of statements extracted from job applications for different academic positions in the humanities, combines the corpus-based approach and in-depth textual approach to investigate how job applicants construct value positions, build interpersonal relations, engage in face-boasts, and express commitments by using metadiscursive features (Hyland, 2005; Hyland & Jiang, 2020). The presentation also investigates narrative episodes and small stories informed by positioning theory as a broad framework (Harré et al., 2009; Georgakopoulou, 2015). The analysis reveals that the writers frequently use three stance-based areas (Boosters, Emphasizers, and Attitude Markers) to craft a persona commensurate with the academic job advertisements as they interpreted them. It also shows that applicants predominantly employ the central motifs of growth and transformation through personal learning and experience to weave together the thematic complexities of their diverse personal stories. The presentation seeks to contribute an important perspective to the existing literature on academic support genres by highlighting the role of stance and storytelling in how job applicants in academia share professional values and construct scholarly and teacherly identities.

Sensitivity to Inter-speaker Gaps in the Broad Autism Phenotype

Lecture

*Prof. Felicia Roberts*¹, *Mr. Wei Siong Neo*¹, *Dr. Mai Yamamoto*¹, *Dr. Brigitte Kelleher*¹, *Dr. Daniel Foti*

¹

1. *Purdue University*

Autism spectrum disorder (ASD) is a neurodevelopmental disorder characterized by persistent challenges in social communication. Pragmatic difficulties have been consistently reported and are considered a hallmark feature of ASD (Friedman & Sterling, 2019). Challenges manifest broadly, including issues with appropriate conversational turn-taking (Andrés-Roqueta & Katsos, 2017). Furthermore, caregivers cite conversational skills as a key outcome priority (Knott et al., 2006). Thus, a better understanding of neural processes that underlie social communication, especially an examination of turn-taking, may inform clinical assessments and facilitate targeted support for developing pragmatic and interactional skill. Our approach is to leverage psychophysiological methodologies to examine well-researched pragmatic aspects of interaction that have been attested and analyzed in naturally occurring conversation. The current paper provides such a starting point by assessing neural response in persons with ASD to inter-turn silences in conversation.

Given that inter-speaker gaps are typically on the order of milliseconds, event-related potentials (ERPs) offer optimal temporal precision to map out neural subprocesses as conversation processing occurs in real time. The current paper builds on work in typically developing adults that employed a series of simulated phone conversations between two friends that ended with the recipient agreeing to a request by the caller, either after an appropriate pause of 200 ms or after an extended pause of 700 ms.

Participants

Sixty-three adult participants ranged along a continuum as measured by the Broad Autism Phenotype Questionnaire (BAPQ). During the laboratory visit, participants completed three self-report measures that operationalize BAP features in similar but non-identical ways, as well as a cognitive assessment (using the NIH Toolbox), and experimental tasks involving judgment about gaps in conversation while electroencephalography (EEG) signals were recorded.

Electrophysiological Recording and Processing

EEG data were continuously recorded and EEG signals were sampled at 500 Hz through BrainVision PyCorder without any online filters. Electrooculography data were also continuously recorded and processed offline.

Preliminary Results

Between-subjects analyses provide evidence that reduced attention to unexpected responses to requests (e.g., affirmative responses after unexpectedly long inter-speaker gaps) may be a specific aspect of conversation processing implicated in the Broad Autism Phenotype, as evidenced by the significant association between BAPQ total score and the P3 ERP. Notably, the strength of this association remained unchanged, even after controlling for age, sex, cognitive ability and language skills. Individuals with greater autism-associated traits seem to be less neurally sensitive to differences between normal and atypically long pauses.

Sharing Syntax for Complex Interactions

Lecture

*Prof. Eleni Gregoromichelaki*¹, *Dr. Gregory Mills*², *Dr. Christine Howes*¹

1. University of Gothenburg, 2. University of Kingston

Grammars that take a dialogical view on the formal and semantic properties of natural languages (NLs) (Ginzburg, 2012; Gregoromichelaki et al., 2009; 2011; Eshghi et al., 2015; Ginzburg & Cooper, 2014) suggest that integration of multiple voices in a single speaker's utterance ("quotation mechanisms") belong within the remit of standard grammatical frameworks since the same mechanisms are involved in metacommunicative conversational interaction, eg., clarifications. Gregoromichelaki (2018) goes further arguing against a separate representational level of syntax (cf. Auer, 2009; 2014).

Instead, it is argued that our notion of "grammar" should include the fact that NL use relies on incremental/predictive processing in a landscape of multimodal affordances picked up and integrated at each word-by-word processing stage (see also, Gregoromichelaki et al., 2022). This is on the basis of data showing the grammatical continuum underpinning various supposedly distinct quotational constructions and interactions between quotation mechanisms and interactional phenomena (*split-utterances* (Gregoromichelaki et al., 2011), "mixed syntax" (Slama-Cazacu, 1976), code-switching, puns, non-verbal demonstrations (Clark & Gerrig, 1990; Clark, 2019; Keevallik, 2013):

Stanley: Louis, I_[ref: Stanley] just didn't_[NPI-licensor] think

Louis: you_[ref: Stanley] 'd ever_[NPI] hear from me_[ref: Louis]?

[[continuation & clarification & confirmation request & quotation]]

Jem: Mary, whatever it is you think you know you mustn't speak of it. Not if you want to stay safe.

Mary: **says the horse-thief**

[BBC Transcripts, Jamaica Inn, Episode 1]

Miriam: That is the nastiest, dirtiest thing anyone has ever done

Patience: **says Black Peter's strumpet!** What are you crying for?

[Jamaica Inn, Episode 1]

Here participants share and adapt grammatical resources that cut across traditional boundaries of syntax/semantics/pragmatics, subordinate/coordinate clause structure, but also notions of footing, epistemics, and accountability.

The need for such an approach to grammar is also indicated by research on text- and VR-mediated communication (Mills, 2014; Mills and Gregoromichelaki, 2010; Mills, 2014; Mills et al., 2021). In such cases, action coordination is established and maintained through resources that are not the linguistic units or constructions standard theories assume while the effects of mediating technology show the need for expanding our views of what language use might involve. As human-to-human interactions become increasingly machine-mediated, the "written language bias" (Linell, 2005) is no longer justified even for written language: text-mediated communication has become conversational, fragmentary, informal but also multimodal through the use of visual elements like emojis and images as well as sounds and video. The means of communication now available also support a view of diffused cognition and agency distributed across groups living within human-machine ecosystems.

These developments in language use and associated mediating technology require reconsideration of traditional linguistic models to accommodate the integrated use of new styles and resources and the technological and societal challenges posed by the role of AI-mediated communications we now face in everyday life. We propose a

dynamic, incremental perspective that takes joint action in a sociomaterial context as the basis for the definition of the grammar (DS-TTR, Purver et al., 2010; Eshghi et al., 2015; Howes and Eshghi, 2021).

Social action formats across languages: The case of initial proposals in German and Finnish messaging

Lecture

Dr. Katharina König¹, Dr. Aino Koivisto²

1. WWU Münster, 2. University of Helsinki

Proposals for a shared future activity are a social action in which issues of entitlement, necessity or commitment are negotiated (Asmuß/Oshima 2012, Couper-Kuhlen 2014, Stevanovic/Peräkylä 2012). In recent years, Interactional Linguistics has begun to study the different formats with which proposals are routinely implemented. In English, for instance, speakers take the likelihood of acceptance into account when they choose between lexically specified proposals, modal declaratives or modal interrogatives (Thompson et al. 2021). Moreover, sequentiality plays a role: In initial position, speakers rather ask for or solicit proposals. Only later do they use declarative formats (Robinson/Kevoe-Feldman 2016).

To date, proposals have mainly been studied in spoken interaction, often in institutional contexts. Despite their importance in everyday conduct, they are sometimes hard to detect in larger corpora (Stivers/Sidnell 2016). In contrast, text-based interaction in messenger chats yields an abundance of proposing actions. Based on recent advances in digital conversation analysis (Giles et al. 2015), our paper will be concerned with initial proposals in German and Finnish WhatsApp group chats. Our comparative analysis aims at identifying the varying routinised action formats texters apply to communicate “benefactive symmetry” characteristic of the action (Clayman/Heritage 2014, Couper-Kuhlen 2014). It also highlights aspects of routinisation as it is afforded by the organisation of digital interaction in pre-set groups.

We will show that interrogative formats are prominent in both, Finnish and German. However, the languages differ substantially in terms of how proposals are modalised (conditional mood, modal verbs, modal particles) and how agents are left unspecified (impersonal verb constructions, indefinite pronouns, ellipsis).

We will discuss the interplay between social action, sequentiality, language-specific resources and technological affordances. With this we hope to show how an action-based approach to digital interaction can engender questions for future conversation-analytic research of action formation.

Social Inclusion through Language within a Multilingual Academic Setting

Lecture

Ms. Anthonia Bamidele¹

1. University of Limerick

The spread of English across the world seems to inform the need for social interactions and inclusion amongst people who come from diverse multicultural and multilingual backdrops. This makes social inclusion through language, within the workplace contexts to be accentuated especially in Arabic speaking countries like Bahrain where English is recognised as a major international language used mainly in Business and Education (Vermandere, Vangehuchten, & Van Herck, 2019; Amara, 2018; Angouri, 2013). This research focused on the international workers in Bahrain who use English and other languages that are available to them in their conversations. This pilot study investigated through research the following questions: What languages are prevalent and notably present amongst various multinationals as members of a community of practice within a multilingual academic setting? And how do these multinationals manage their different language ideologies and experiences using English in comparisons to other languages in relation to language choice and language use in a multilingual academic setting? The objective was to identify language features that were found in the data such as workplace discourse and workplace language policy using the analytical framework of Spolsky's (2009) Language Management Theory. The pilot study adopted a mixed method approach, using quantitative and qualitative methods in collecting and analysing the data. The survey questions collected demographic profiles such as gender, staff category, age range, nationality, work tenure. Other sections included language proficiency, language competency, and language use in the workplace. The audio interviews with self-selecting participants, determined the participants' perceptions and attitudes towards language use in the workplace. Consequently, the reliance on survey questions and audio interviews for the preliminary findings, served as the basis for identifying experiences with language in general and potential language policies and ideologies. Hence, the study on social inclusion reflects the language choices that are applicable in a multilingual academic setting, highlights the multi-diversity language structures, and indicates which languages are generally permissible for official or social interactions. It also proffers the apparent need for acceptance of a language policy when most international workers come from different countries and speak diverse languages.

Some Remarks on the Pragmatics of the GPT-3

Lecture

Dr. Sung Do Kim¹

1. Korea University

Some super-powerful AIs like GPT-3 are proficient in syntax and semantics but they still lack pragmatics that lives in social context, common and tacit knowledge, subjective experience, shared reality, emotion, and body. In fact, pragmatic information and understanding cannot be controlled by data and statistics. Large language models need to be embodied and live in a social and pragmatic reality. GPT-3 can't access contextual and pragmatic information that make possible human conversation. From the point of ethical pragmatics, GPT-3 other LLMs can be fooled into producing racist, sexist, and biased content that's deviant from common sense and devoid of proper sensibilities. These AIs can generate algorithmic written and spoken text and even produce coherent narratives that have the potential to pass the Turing test. Language is hard, because it is constructed by layers of situational and social context, intent, emotion. The GPT-3 cannot extract all these pragmatic elements from words that don't contain pragmatics. The same sequence of words, 'Do you love me?' pronounced between a man and a woman could have fundamentally different pragmatic implicatures in different social situations. Large-scale language technologies become pervasively used in various forms of communication. One particular modality is conversational agents that raise a number of social pragmatic issues. In this paper, we will examine conversational capacity of LLM training paradigm through the lens of pragmatics. We will provide pragmatic evidences to explain why GPT-3 will not replace the cognitive dynamics of human conversation. In the same time, we will make some suggestions to make align conversational capacity of the LLM with pragmatic norms. We will start by developing a pragmatic analysis of the architecture of linguistic communication between human interlocutors and conversational agents of AI. We will then apply this pragmatic model to formulate adequate norms and rules that might govern linguistic communication between two kinds of agents. Three main domains of this pragmatic modelling are causal inference, grounding knowledge, and emotion. As a dataset to test a pragmatic relevance and capacity of the most recent ChatGPT's dialogue, there are two categories. I will cast 10 prompts in this pragmatic research to verify the question: can this program understand causal inference, grounding, contextual information? The second category of data will be constructed by the meta-pragmatic dialogue with the ChatGPT. Namely I will check its pragmatic knowledge through a real time dialogue about its depth and width of pragmatic knowledge concerning some key concepts such as illocutionary and perlocutionary effect, inference, context.

Speech act and ideological analysis of media report on selected Boko Haram operation in Nigeria

Lecture

*Mrs. Abiodun Ayeni*¹

1. Veritas University Abuja

Jamā'at Ahl as-Sunnah lid-Da'wah wa'l-Jihād popularly known as Boko Haram (BK) is a hallmark name that identifies a terrorist sect which believes that Western education is forbidden and, unleashes terror on educational institutions, as well as on all who believe in, or propagate the education. To them, anyone who believes in Western education and spreads it is a *kafir*, which means an infidel in Islam. This Islamic sect which is largely found in Nigeria believes also that politics in Northern Nigeria has been hijacked by a group of corrupt false Muslims -*kafir*. So, the sect wants to wage a war against them and a *Jihad* -holy war- against the republic of Nigeria in totality to create an unadulterated Islamic state ruled by sharia law. As a consequence, this terrorist sect has persistently unleashed physical, mental and verbal terror on Nigerians who do not share their belief. The Boko Haram sect make use of the widest range of social media platforms to ensure they are widely heard. These platforms include; Facebook, Twitter, YouTube and WhatsApp and a host of others.

Previous linguistic studies on the sect have focused on stance, ideology and speech function (mainly speech and pragmatic acts) with little attention paid to the combined occurrences of speech acts and ideological positions in BH discourses. This paper, therefore, investigated the kinds of speech acts the Boko Haram terrorists employed in their broadcast between 2012 to 2017 in buttressing their ideology about Western education and enforcing the sharia law in Nigeria. Data was taken from posts relating to BH activities on Facebook, Twitter, YouTube and WhatsApp, and was analysed using John Searle's speech acts theory and van Dijk's model of critical discourse analysis. The findings reveal the following speech acts in the sampled BH discourses: intimidation, blackmail, incitement and coercion, which are constructed in social and cognitive contexts. In the social contexts, the speech acts instantiate religious extremism, sect-based emotionalism and political defensiveness. In the cognitive contexts, the acts express fear and anxiety. The ideological manifestations of the speech acts connected to the two contexts are separatism and Islamic fundamentalism.

Speech Act Theory of Quotation: Quotation, Indirect Quotation and Japanese Quasi-quotation

Lecture

Prof. Etsuko Oishi¹

1. *Tokyo University of Science*

Issues of quotation have attracted philosophers' and linguists' interest from the mid-20th century. Philosophers took notice of uniqueness of pure quotation, and the use-mention distinction was introduced to account for it. Theories such as (Proper) Name Theory (Quine 1940; Tarski 1956), Demonstrative Theory (Davidson 1979) and Identity Theory (Frege 1892; Searle 1969; Washington 1992) were advocated to describe pure quotation, while other types of quotation, namely, mixed quotation (Davidson 1979, Cappelen Lepore 1997), scare/emphatic quotes (Predelli 2003, Abbott 2003) and open quotation (Recanati 2001, 2010) pose challenges.

To adequately analyze these types of quotation, the present lecture introduces a discourse-oriented speech act theory of quotation: (i) a phone, a pheme and a rheme as a locutionary act (Austin [1962]1975: 91-92) are enclosed within quotation marks and (ii) how each contributes to the meaning of the utterance depends on the type of the illocutionary act the whole utterance performs (i.e., illocutionary-act-type sensitive). The theory is extended to explain differences between direct/mixed/open quotation and indirect quotation: a direct/mixed/open quotation is used when (i) the rhetic act in the original discourse was significant for performing the illocutionary act and (ii) indicating the rhetic act in the original discourse is important for producing illocutionary and perlocutionary act in the current discourse. To scrutinize illocutionary and perlocutionary effects of quoting further, the lecture describes a type of *quasi-quotation* in Japanese: by putting sentence-final particles which indicate (i) the speaker's affirmation and request for the hearer's confirmation or (ii) the speaker's doubt and question for the hearer (as a tag question in English) at the clause-final position, the speaker brings to the current discourse the affirmation or doubt as if it is a quotation of the illocutionary effect produced in another discourse.

Speech and thought presentation: the norms and contemporary present-tense fiction

Lecture

Prof. Reiko Ikeo¹

1. Senshu University

This paper discusses how the concept of the norms of speech and thought presentation is related to how speech and thought is presented in actual texts with reference to contemporary present-tense fiction, and thereby, reviews the meaning of the norms. Leech and Short (1981) argue in *Style in Fiction* that the norm or baseline for the presentation of speech is DS (direct speech) and the norm for thought presentation is IT (indirect speech). The “norm” is explained in terms of the “semantics of reporting”; how speech and thoughts are formed and (re)presented in social practice including literary fiction. Leech and Short explain that speech can be observed and perceived by others and thus it can be represented in the form in which it is directly manifest to the listener, using the original speaker’s words and expressions. On the other hand, thoughts, they argue, are not accessible to direct perception and this results in a presentational mode which conveys only the content of what was thought being acceptable as the norm.

Two decades later, Semino and Short (2004) tested Leech and Short’s claim with their corpus data, consisting of both fictional and non-fictional texts. Semino and Short state that their data lends quantitative support to Leech and Short’s claim. As for speech presentation, Semino and Short have shown that the direct forms are the most frequent of all the forms in both the fictional and non-fictional sections. With thought presentation, Semino and Short report that FIT (free indirect thought) is the most frequent of the thought presentation categories.

Contemporary present-tense fiction also seems to have a different configuration of speech and thought presentation categories. In my corpus data of 21st-century present-tense fiction, direct forms of speech are the most frequent, which additionally confirms Leech and Short’s claim about the norm for speech presentation. For thought presentation, the data show that FDT (free direct thought) is the most frequent category. This does not agree with the norm of thought presentation. The analyses of present-tense narrative additionally indicate that both direct and indirect forms of thought presentation are used.

In the two corpora discussed above, the norm of speech presentation has been confirmed as direct speech, but the categories which are most frequently used in thought presentation do not agree with the norm. However, this does not necessarily justify abandoning the idea of the norm of thought presentation. These disagreements of the most frequent thought presentation categories can be explained by the term of deviation from the norm. The discrepancy between the norm and the corpus data of the thought presentation categories also suggests that the concept of the norm should be defined within the scope of a bigger, more general corpus.

Speech reporting in a historical socio-pragmatic perspective: an investigation of 18th- and 19th-century Flemish witness depositions

Lecture

*Ms. Magda Serwaczak*¹

1. Vrije Universiteit Brussel, Universiteit Antwerpen

Represented speech is generally considered to play a pivotal role in courtroom discourse, especially in trial proceedings (cf. Collins 2001, Grund & Walker 2021). Case decision-making often entails a continuous negotiation of words and meaning, and requires witnesses and suspects to frequently engage in ((in)direct) speech reporting. This, however, involves a series of complex choices made by speech reporters, who attempt to elicit past speech events and allow the audience to interpret them. Specific representation strategies might be used to construct the credibility of the reporter or to influence the audience's perception of past speech events and those involved in them. Although speech reporting (in institutional contexts) has received quite a great deal of attention in synchronic linguistic inquiries, diachronic studies, especially in Dutch, remain limited.

In an attempt to fill this gap, this study investigates a corpus of 18th- and 19th-century witness depositions used in trial cases held at Flemish courts. The corpus currently entails 3,191 documents (1,122,785 words) from the Belgian National Archives in Bruges (Rijksarchief Brugge), which had been transcribed and digitized as part of the *Witnesses* project (www.getuigenissen.org). They are examples of speech-based texts, which means that they are based on actual, real-life speech events. For the purpose of trial proceedings, oral testimonies delivered by the witnesses and suspects were committed to paper by legal scribes. Therefore, studying represented speech not only entails investigating the choices made by speakers (the original speech reporters), but also potentially those made by the courtroom scribes.

The current study sets out to explore different forms of reported speech preserved in the corpus. In doing so, a variety of speech representation devices is investigated, with an empirical focus put on speech tags (particularly speech introducing verbs) and reporting expressions. The goal of the study is twofold: on the one hand to determine if speech representation devices are context-sensitive and subject to sociolinguistic variation and on the other to see if the (relative) stability of their use changes with time. As it has previously been observed that modern-day system of marking speech does not in fact mirror the historical strategies of speech representation (Grund & Walker 2021), inductive analysis of the corpus is carried out: witness depositions and suspect interrogations are individually scanned in search for speech representation devices. Once the features had been found and tagged, a quantitative statistical analysis is carried out in order to count their frequency and distribution across texts. Overall, this study seeks to shed more light on represented speech in historical contexts in Dutch and answer questions about the relations between form and function of specific speech reporting devices.

Spoken and Written L1 and L2 Narratives: A Cross-Modal Approach

Lecture

Dr. Keiko Nakamura¹

1. Meikai University

There has been a significant amount of research on the similarities and differences between spoken and written discourse, with spoken discourse being described as structurally simple and informal, and written discourse being considered as structurally more elaborated, complex and formal (e.g., Chafe, 1982). Research comparing spoken and written narratives has also reported both similarities and differences (e.g., Tannen, 1982; Strömquist, Nordqvist & Wengelin, 2004). Differences in processing constraints in written narratives allow for more careful planning, revising, and monitoring in the production process. Written narratives have been found to show a greater variety of vocabulary, as well as more lexical and syntactic complexity (e.g., dependent clauses, nominalizations, adjectival and adverbial clauses). Furthermore, in written narratives, writers need to lexicalize and grammaticalize information that may be conveyed in spoken narratives through non-linguistic and paralinguistic channels, such as gestures and prosody.

This study uses a large database of narratives by L1 English and L1 Japanese narrators, as well as Japanese learners of English (L2), to explore the similarities and differences between spoken narratives and written narratives. Although the database itself contains a wide variety of narratives (e.g., personal narratives, fictional narratives, collaborative narratives), comparisons will be made by focusing specifically on elicited narratives, to facilitate systematic comparisons between the spoken and written narratives. The elicited narratives were collected using the wordless picture book, *Frog, where are you?* (Mayer, 1969), adapting the Frog Story paradigm (Slobin & Berman, 1994). There were two narrative modes: (1) spoken narratives and (2) written narratives (handwritten and online), and three groups of narrators: (1) L1 English narrators (100); (2) L1 Japanese narrators (100); and (3) Japanese learners of English (100). Spoken and handwritten narratives were transcribed and all narratives were coded. The three narratives modes were analyzed for length, lexical and syntactic complexity, and various discourse strategies (e.g., referential strategies).

Results showed differences in length, lexical and syntactic complexity, and various discourse strategies (e.g., referential strategies). In general, the written narratives, regardless of whether they were handwritten or online, were longer and more complex, in terms of propositional content and lexical and syntactic complexity. However, similarities were also observed. For example, strategies creating involvement in spoken narratives (e.g., direct speech) which were found in the written narratives. Differences between handwritten and online written narratives were also observed.

Stance alignment in television sportscasting of a high school baseball tournament game – another case of open communication in Japanese

Lecture

*Ms. Tomoko Nagayama*¹

1. Kanagawa University

This paper discusses Japanese sportscasting talk-in-interaction of a high school baseball game from an interactional sociolinguistic perspective, focusing on stance alignment (Du Bois, 2007) in the talk. With the announcing and the commentary, which Ferguson (1983) points out, sportscasting counts as a case of open communication: actual participants expect distant audience as side participants who stay away from the physical space of the talk and at least one of the actual participants acts as facilitator to provide “empathy channel” (Okamoto, 2018), which intends to have those expected side participants share and empathise with the ongoing situations. I analyzed a videorecording of a televised sportscasting of a high school baseball tournament game at the prefectural stage of Kanagawa, Japan, in 2022, which was broadcast live by the local television network in the region with a TV professional announcer and an expert commentator. Typically, the announcer presented the stance lead and invited the commentator to provide the stance follow rhythmically, sequentially and historically within as well as across successive events in the ongoing game. This case of open communication necessitates the verbal articulation of the actual participants to be heard by the expected side participants. Seemingly acting as the empathy channel, the announcer frequently presented the stance lead and tried to involve his interlocutor in the local stance alignment. Interactional stance alignments of the participants, however, varied depending on which phases of the sportscasting they put themselves in. In the announcing the announcer usually did not ask for the commentator’s confirmation, which in a sharp contrast he frequently carried out in the commentary. It is certainly true that the commentary phase presumes some prior event(s) to metapragmatically comment on and accordingly the commenting utterance is likely to become the stance follow. It should be noted, however, that it is not so unusual for the two phases of sportscasting to inseparably get fused in the talk-in-interaction. The institutional distinction between the participants did not exactly match the discursive classification between the announcing and the commentary: the announcer, who appeared to have represented the expected side participants in this case of open communication, presented his interpretation and verbally attempted to solicit some kinds of expert words of endorsement. Consequently, the stance lead by the announcer was frequent, while the commentator remained quite amenable offering few substantial remarks. These phenomena I suspect might prove certain traces of the discourse of high school baseball sportscasting in Japan.

Sustainability communication as an identity-negotiation strategy: A case study of Instagram business accounts from the food industry

Lecture

Dr. Marie-Louise Brunner¹

1. Trier University of Applied Sciences, Environment Campus Birkenfeld

Sustainable business models provide a competitive advantage, particularly in the medium and long term (Bonini & Swartz 2014). However, if companies are unable to successfully communicate their sustainable achievements and impact, they are unable to profit from this effect. Sustainability communication is a complex topic since it has to strike a balance between making concepts easily understandable for the public and the incredibly complicated realities of sustainability research (Prexl 2010). One site where this balance needs to be constantly met are social media.

The study uses a multimodal discourse analysis (O'Halloran 2011) approach to analyze data from 10 German and 10 English Instagram accounts of companies and NGOs from the food industry selling sustainable products. The analyzed business accounts were selected based on their active use of Instagram as well as the sustainable concepts and presentations of their products and companies.

My analysis investigates how sustainability communication is used to contribute to creating a brand identity and focuses on three basic identity negotiation strategies that can be subsumed from previous research (see Brunner 2021): 1) I explore how companies' own identities are foregrounded by using sustainability communication. 2) I analyze how a differentiation from a perceived 'Other' (non-sustainable) product can contribute to creating a company's own identity. 3) I analyze how companies carefully position themselves in the context of a larger societal discourse on sustainability.

This study provides first insights into how sustainability communication works as an identity-negotiation strategy in a business context on Instagram. Findings show that companies develop their own specific identity and style on Instagram which creates a consistent image in terms of sustainability. The Instagram account often becomes an extension of the website and is used for more personal interactions and engagement, to demonstrate impact on a more personal level, and, of course, to showcase the product and the sustainable concept in the best light. All in all, the analyzed food companies are very good examples of how sustainable concepts can contribute to building a successful brand image on Instagram.

Task openings during EFL oral proficiency exams

Lecture

*Mr. David Ryska*¹

1. Masaryk University

In this presentation, I focus on how university English as a foreign language (EFL) students use English in a paired or grouped speaking task during an oral proficiency exam. Although students are supposed to cooperate during the task, discuss a given set of ideas, share their views, and arrive at a mutual decision, and although the rating criteria for exams such as those within the *Cambridge English Qualifications* include a category seemingly related to the concept of interactional competence (Hall & Pekarek Doehler, 2011), the assessment is usually based primarily on the quality of a candidate's monologue while dialogic and interactional abilities are overlooked (Huth, 2021; Roever & Ikeda, 2021). Recent years have therefore seen attempts to describe various manifestations of learners' interactional competence in the oral assessment setting with the aim to distinguish interactional features across various levels of proficiency and thus contribute towards the creation of rating scales which would better reflect natural interaction. While many of these studies focus on collaborative turn construction in general (e.g. Lam, 2018; Rydell, 2019; Hırçın-Çoban & Sert, 2020; Hırçın-Çoban & Çimenli, 2022), little attention has been given to a systematic description of how the designedly collaborative exam tasks are initiated by learners after having received instructions from the interlocutor.

My analysis builds on the dataset of video-recordings featuring 44 paired or grouped interactions between Czech university EFL students who are taking an oral proficiency exam that follows the *B2 First* format (assessment criteria included). By employing the method of multimodal Conversation Analysis, I investigate the variety and complexity of both verbal and multimodal resources employed by students with various final test score to initiate the collaborative task and develop it into a fully-fledged discussion.

The findings have revealed that a successful task initiation is largely dependent on two factors: 1) the complexity of resources used by a student to formulate the first discussion topic or a question and to relinquish the floor afterwards, and 2) the other student(s)' ability to produce a contingent first response. Regarding 1), the first turns of higher-scoring students are generally shorter, more frequently accompanied by gazing at the co-participants to monitor their reciprocity and to signal a potential transition-relevance place (Goodwin, 1981), and concluded by an opinion-seeking question (e.g. "what do you think?", see e.g. Balen et al., 2022). As for 2), while higher-scoring students are able to follow up on the first turn by paraphrasing, summarising, or in other ways extending the previous contribution (cf. Lam, 2018), their lower-scoring peers orient extensively to the task prompts instead, opening a new topic without addressing the previous one.

The discussed findings expand our understanding of the construct of interactional competence and its development, particularly in relation to topic management and recipient design, and have the potential to inform future oral assessment practices.

That's everything we need: Everything-cleft constructions in spoken British English

Lecture

*Ms. Eleni Seitanidi*¹, *Dr. Nele Pöldvere*², *Prof. Carita Paradis*¹

1. Centre for Languages and Literature, Lund University, 2. Lund University/University of Oslo

This study examines the use of *everything* in cleft constructions in spoken British English (*everything that we do is evidence-based*). It investigates if *everything* in such constructions, in addition to having a quantificational function, can also create the smallness and the exhaustive meanings which have been considered characteristic of *all*- rather than *everything*-cleft constructions (Tellings, 2020, p. 6). The 'smallness' contribution of *all* expresses the idea that what is being discussed is 'not much', whereas its exhaustive reading expresses the meaning of something being 'no more than', e.g., *all (that) John ate for lunch was a banana* (Homer, 2019, p. 1; AUTHORS, forthcoming).

We use the Spoken British National Corpus (BNC) 1994 (BNC Consortium, 2007), the Spoken BNC2014 (Love et al., 2017), London—Lund Corpus 1 (Greenbaum & Svartvik, 1990) and London—Lund Corpus 2 (AUTHORS, 2021) totalling 22.9 million words to address two questions:

1. How frequent are *everything*-cleft constructions in spoken British English?
2. What are the formal and semantic properties of *everything*-cleft constructions?

We approach these questions from a Cognitive Linguistics perspective (e.g., Langacker, 2016) focusing on the construction's contexts of use. We combine quantitative and qualitative analysis by analysing the frequency of occurrence of *everything*-clefts, their constructional variants and pragmatic functions.

Fifty-five *everything*-cleft constructions occurred in our data. Regular *everything*-clefts (*everything I do is right*) were the most frequent (71%—39 instances), followed by demonstrative/ deictic *everything*-clefts (*that's everything we need*) (24%—13 instances), and reversed *everything*-clefts (*the bibliography is everything you've used to influence you*) (5%—3 instances). In the regular *everything*-cleft constructions, which often contain evaluations, *everything* has a quantificational function meaning 'all the things discussed in the *everything* clause'. However, when it occurs after the copula, *everything* can create the exhaustivity reading which is associated with clefts and *all*-clefts, but not the smallness reading. Instead, *everything* can at times create a sufficiency reading whereby what is discussed is 'enough'.

The Babel Fish Out of Water: Discourse-Pragmatic Variation and the Role of Contact Languages in World Englishes

Lecture

Dr. Sven Leuckert¹

1. *Technische Universität Dresden*

World Englishes research is inexorably tied to the investigation of languages in contact with English: Regional substrate languages (i) are in direct competition with English in various contexts, (ii) are used in conjunction with English in code-switching and translanguaging (e.g. Dovchin 2021), and (iii) heavily influence the linguistic features that eventually become nativised parts of World Englishes on all linguistic levels (Sharma 2009), including pragmatic features (see Chapter 5 in Mesthrie & Bhatt 2008). While a lot of important research on World Englishes is carried out by linguists in former colonies of England and the USA who are speakers of relevant contact languages, a significant bulk of World Englishes research is produced by linguists in Western contexts for whom this is likely not the case.

In this contribution, I intend to illustrate the importance of in-depth typological knowledge of relevant contact languages by means of two case studies on discourse-pragmatic phenomena in Indian English (IndE), specifically topicalization (Lange 2012; Leuckert 2019) and the ‘intrusive *as*’ construction (Lange 2016). While both features are linguistically complex and can only be understood properly by including a range of intra- and extra-linguistic factors, the typological structure of their contact languages emerges as crucial in their analysis. Both features are used more frequently when a language user is proficient in a contact language that has a similar structure. However, as Sharma (2009) notes for various features of IndE, the situation is not one of 1:1 transfer but, instead, transfer depends on specific morphosyntactic constraints that are often difficult to disentangle for researchers with little or no proficiency in the respective language(s).

From a methodological point of view, I argue that, in line with decolonization efforts, World Englishes scholars should not discard contact languages as secondary in importance but instead put emphasis on them. In addition to addressing the impact of contact languages in World Englishes contexts, this can be done by thorough analysis of their typological make-up and devoting space in research products to them. More importantly, however, directly involving researchers and speakers of contact languages – if possible – can shine a light on their work and provides a kind of access to contact languages that is not possible otherwise.

The commodification of pluricentricity in language teaching: Taiwanese Mandarin teachers in the neoliberal gig economy

Lecture

*Ms. Sandra Kaltenecker*¹

1. City University of Hong Kong

Neoliberalism and the rise of the gig economy have caused a major shift in the labor market for language-related service providers. In traditional forms of employment, the employer took up the role of intermediary who matches clients with service providers, yet a growing number of service providers now rely on digital platforms to find their clients directly (Vallas & Schor, 2020). These online trading sites allow them to access a ‘planetary labor market’ (Graham & Anwar, 2019) that transcends the spatial limitations of traditional labor markets, yet it also makes them linguistic entrepreneurs in that they need to “strategically exploit language-related resources for enhancing [their] worth in the world” (De Costa et al., 2016, p. 696). This environment of self-branding or self-marketing (Gershon, 2014) encourages the commodification of language in two ways, “language-as-skill and language-as-identity” (Heller, 2010, p. 103)—the first relies on a taylorist regulation of language by means of standardization and efficiency, whereas the latter highlights authenticity. The commodification of language and its impact on language-related service providers has been studied with a particular focus on English in relation to native speakers vs. non-native speakers (e.g. Curran & Jenks, 2022). Other language contexts and the tensions within the group of native speakers remain less explored.

To fill this gap, this study looks into the gig economy of Chinese language teaching and Mandarin teachers from Taiwan who offer their language teaching services on a popular online tutoring platform. This group of participants is chosen intentionally because Taiwanese Standard Mandarin (Guóyǔ) is a pluricentric variety of Mandarin, meaning that it differs from the dominant variety of Mainland China (Pǔtōnghuà) in terms of not only lexis and pronunciation but also script system (traditional vs. simplified) (Kaltenecker, 2020). This circumstance makes intralinguistic standard variation a salient issue that influences the self-marketing of Taiwanese Mandarin teachers on the online tutoring platform. To explore these teachers’ experiences and the varied ways they conceptualize their selves and their linguistic repertoires within the context of neoliberalism, this study analyzes semi-structured interviews with these teachers and their platform profiles. The analysis takes a chronotopic-scalar approach which conceives of time and space as inherently linked to each other and to matters of social appropriateness and linguistic normalcy within hierarchically layered power relations (Blommaert, 2015). Thus, this approach can simultaneously account for Taiwanese Mandarin teachers’ identity work (Blommaert & de Fina, 2017) and imaginations of authenticity and linguistic standardness (Sanei, 2021) within the variously scaled space-times of the neoliberal market (Park, 2017). By bringing together multiple lines of research (chronotopy, pluricentricity, globalization), this study gains new insights into the ways in which the pluricentric nature of a language is commodified while, at the same time, the self is constructed within a neoliberal gig economy.

The Copula Polarity Marker in Wagdi and its Reformulation in Contrastive Contexts

Lecture

*Mr. Vyom Sharma*¹

1. Indian Institute of Technology Delhi

The Copula Polarity Marker in Wagdi and its Reformulation in Contrastive Contexts

This paper introduces the Copular Polarity Marker (CPM), a polarity marker for Copular Constructions (CC). I propose that the CPM in Wagdi is a discourse-sensitive element and gets reformulated to the default propositional negator (PNEG) in a contrastive context.

The primary data in this paper is from Wagdi, an Indo-Aryan language spoken by the Bhil tribes and other communities in Southern Rajasthan. In the example below, sentence 1b is the negative counterpart of sentence 1a, which is a CC. *nathi* in 1b is the CPM in Wagdi. It differs from the PNEG *ne*, which occurs with verbal predicates, as shown in sentence 1c.

- 1.a. Lala rupaaro he (Wagdi)
 Lala beautiful be.PRS
 ‘Lala is beautiful’
- b. Lala rupaaro **nathi**
 Lala beautiful CPM
 ‘Lala is not beautiful’
- c. Lala kerī ne khaa-e
 Lala mango PNEG eat-IMPV
 ‘Lala does not eat mangoes’

I propose the following:

- CCs are not event-based propositions. The Davidsonian notion of semantic event requires that it is temporally bound (Maienborn, 2011). I demonstrate that CCs are not time-bound and thus cannot be negated by PNEG. Instead, a CC has negative polarity at the discourse level.
- The CPM in Wagdi is a polarity focus marker. Let us set up a context, which creates alternatives for the predicate in a CC to induce contrast:

Context: Lala was sick, so he went to the hospital. He met Ram, who gave him some medicines. Lala is speaking to Sita the next day, praising Ram as an amazing doctor. However, Sita already knows that Ram is not a doctor, but a nurse at the hospital. The following conversation ensues:

- 2.a. Lala: kevu padega, ram khub asal daaktar he!
 Say.INF MOD.FUT Ram very good doctor be.PRS
 ‘Have to say, Ram is a very good doctor!’
- b. Sita: #ram DAAKTAR **NATHI**, nars he
- c. Sita: ram DAAKTAR **ne** he, nars he
 Ram doctor NEG be.PRS nurse be.PRS
 ‘Ram is not only a doctor, he is a nurse!’ (Wagdi)

I follow Poletto’s (2008) and Servidio’s (2015) account of focus polarity markers in Northern Italian Dialects (NID) to propose that CPM *nathi* in Wagdi is a polarity focus marker. In example 1b, *nathi* generates a set of two propositions: a world where the speaker believes Lala is beautiful, and a world where he does NOT believe Lala is beautiful.

As shown in example 2c, PNEG *ne* is allowed in a discourse that triggers a set of multiple propositions contrastive to one another: a world where Ram is a nurse, or Ram a manager, or Ram is a doctor. But since CPM can only generate two propositions, the CC with *nathi* is reformulated with PNEG *ne* in contrastive contexts.

The Cyclic negative nature of exceptive markers: From implicit to explicit The case of Hebrew *bilti* ('not')

Lecture

Dr. Ruti Bardenstein¹

1. Ben Gurion University and Shenkar College

The Hebrew negation adverbial *bilti* 'not' seems to function very differently in Biblical Hebrew than it does in Contemporary Hebrew. This talk addresses this difference and discusses its evolution. The main question addressed in this paper is: How has Hebrew *bilti*, originally an exceptive marker (with sentential scoping), ended up functioning solely as a privative in contemporary Hebrew? First, this paper argues that the biblical usage of *bilti* was expanded and turned into a polyfunctional (or 'polysemous') item. This happened via a constructionalization process which led to grammatical changes ('grammaticalization'): The initially implicated negation (via a generalized implicature) turned explicit (semantic). In addition, in Hebrew's later periods, the usage of *bilti* was narrowed and it became a privative. Thus, firstly, a pragmatically motivated path of constructionalization of *bilti* in Biblical Hebrew is suggested. That is, the "pragmatic negation" that arose via a generalized implicature shifted to the semantic level (performing semantic negation, explicit negation). Secondly, *bilti*'s functions in post-biblical Hebrew periods are outlined, tracing its narrowing functions persistently until its fixation in Contemporary Hebrew as a privative. Lastly, this general path of *bilti* will be claimed to be 'universal' or 'cross linguistic' as follows:

Stage I: Exception= 'not' generalized implicature

Stage II: Negation + Exception= 'only' generalized implicature

Stage II: Negation + NPI exception = exclusive 'only'

Stage III: Negation/Jespersen's Cycle

Stage IV: The **implicit** (either 'not' or 'only') becomes grammaticalized (explicit).

Key words: Grammaticalization, Polyfunctionality, Jespersen's Cycle, Negation, Privative, Construction.

The discursive construction of maternal martyrdom in family talk

Lecture

*Dr. Domenica DelPrete*¹, *Dr. Catherine Box*²

1. Columbia University, 2. University of Pennsylvania

The framing of the maternal figure as a self-sacrificing woman, who devotes herself intensely and unselfishly to the needs of her children (Hays, 1996), has a long history in the ideological discourse of what constitutes a “good” mother (Dillaway, 2021). This idealized version of motherhood approximates cultural representations of the mother as a martyr. In this role, a woman forgoes her own needs and subjectivity to attend entirely to her partner and children. Both scholarly work and writings for broader audience have addressed the negative emotional consequences of maternal martyrdom for both a mother and her child. Despite admonitions from mental health professionals (e.g., Lakshmin, 2020; Northrup, 2006; Secunda, 1990) to unshackle themselves from a martyr mentality, mothers continue to index the role and explicitly equate it to good mothering. According to Dillaway (2021), the 21st century mother often strives to embody the archetypal “supermom,” balancing work and family, to inhabit the role of “good mother” and avoid any perception of “lesser” parenting. Despite the robust body of work exploring the constructs of *mother* and *martyrdom*, exactly *how* a mother discursively constructs herself as a martyr in interactions with her family has not been sufficiently explored.

To address this lacuna, we conducted a case study on mother-adolescent daughter interaction, which consisted of seven and half hours of videotaped naturally occurring interaction between a mother and her cisgender adolescent daughter in their family home. Data were analyzed primarily from an interactional sociolinguistic perspective, proven fruitful when investigating roles and identity in family talk (e.g., Gordon, 2009; Johnson, 2018; Tannen, 2006), and transcribed utilizing the conventions of conversation analysis (Jefferson, 1988). The following questions guided this research: First, how does the mother discursively construct herself as a martyr in conversations with her daughter? Second, what interactional consequences emerge from the mother’s displays of martyrdom in conversations with her daughter?

Findings reveal that the mother’s discursively constructs as a martyr by: (1) victimizing herself, (2) engaging in self-praise, and (3) denying her emotional distress. This discourse analytic study provides a microscopic view of the discursive construction of maternal martyrdom in everyday family conversations, as well as its interactional outcomes. It also calls for what we term *discursive consciousness raising*, or the prompting of individuals to become more aware of their discursive behavior, including how other interlocutors receive this behavior. From a broader perspective, we also aim to encourage mothers to repudiate notions of good mothering as synonymous with martyr-like maternal practices. This increased self-awareness may result in more harmonious interactions between mothers and their daughters.

The dynamics of coding human arguments in Datooga: Integrating functional-typological and socio-interactional approaches

Lecture

Dr. Alice Mitchell¹, Ms. Mandy Lorenzen¹

1. University of Cologne

This paper investigates the coding of arguments with human referents in Datooga, a Southern Nilotic language spoken in Tanzania. In dealing with the vast literature on argument realization, we draw on and attempt to integrate two different traditions to the study of (person) reference: on the one hand, discourse-oriented, functional-typological approaches (e.g., Givón 2017, Haig & Schnell 2016) and on the other, conversation analytic, socio-pragmatic, and anthropological linguistic approaches, for which we use the cover term ‘socio-interactional’ (e.g., Enfield & Stivers 2007; Garde 2013). By combining these approaches, we aim to investigate the extent to which the morphosyntactic realization of human arguments in Datooga is sensitive to cognitive and discourse-related factors as well as to interactional dynamics and in particular to the social relations that hold between discourse referents and speech participants.

Following a functional-typological line of enquiry, the paper first examines the coding properties of human arguments in a corpus of narrative and conversational texts in Datooga, annotated using the GRAID scheme (Haig & Schnell 2014). Certain cross-linguistic tendencies are borne out in the Datooga data, such as the finding that A arguments are overwhelmingly human and typically nonlexical, in contrast to S. We assess the claim in the literature that human participants are typically introduced into the discourse via S arguments, identifying a range of other possibilities for Datooga. We also provide quantitative details on the high levels of zero argument coding in our corpus and consider how referent tracking might function under these circumstances. Recognizing the highly context-specific nature of reference, we then look at human argument coding from a more fine-grained, qualitative perspective, showing how “apparent referential obscurity” (Garde 2013:133) is partly motivated by social-relational concerns. Local sociocultural knowledge about roles and responsibilities can also help account for what outsider researchers may perceive as referential indeterminacy. Finally, we underline the point that speakers’ referential choices do not only reflect cognitive, discursive, and/or social ‘principles’ but that they also serve to create contingent indexical effects (such as displaying epistemic and affective stances towards human referents). As such, analysts’ attempts to characterize the coding of human arguments can only ever be partial.

The effect of explicit pragmatic instruction on production of pragmatic routines

Lecture

Dr. Naoko Osuka¹

1. Meiji University

This study investigates the effect of explicit pragmatic instruction on acquisition of pragmatic routines used in requests, refusals, and thanking. Pragmatic routines are multi-word strings recurrently used in the same form by a speech community in specific situations (Bardovi-Harlig, 2012), such as “Thank you for having me” and “No thank you”. Although there are many benefits in using pragmatic routines for communication, previous studies have reported that it is difficult for second language (L2) learners to acquire them. The researcher has found in her previous study that exposure to the target language during studying abroad has a very limited effect on acquisition of pragmatic routines. A necessity for explicit pragmatic instruction was suggested, and this study was designed. Thirty-three Japanese college students participated in this study. They received three one-hour periods of instruction once a week for three weeks. One lesson focused on one speech act. Each lesson consisted of a noticing-the-gap activity, metapragmatic explanation, and production practice. In the noticing-the-gap activity, the participants compared their own speech act performance and the native speaker models to notice the gap between them. Then the researcher gave them metapragmatic information about the target pragmatic routines, such as the level of politeness and directness. Finally, in the production practice, the participants were given several situations to practice using the target pragmatic routines in pairs. Evaluation was conducted through a computer-animated production task (CAPT). The CAPT is a kind of oral Discourse Completion Tasks (DCTs) which uses animation videos to help the participants understand the situations clearly. The CAPT used for this study was developed by the researcher, and it included 16 scenarios with 20 target pragmatic routines. The participants performed the CAPT online three times: before the instructions (pre-test), immediately after the instructions (post-test), and one month after the instructions (delayed-post-test). The frequencies of the target pragmatic routines produced by the participants were compared among the tests by chi square tests and Fisher’s exact tests. The results showed that 15 out of 20 pragmatic routines significantly increased the frequency at the post-test. Furthermore, at the delayed-post-test, the frequency was maintained in most of the pragmatic routines, with only one exception. These results suggest that explicit pragmatic instruction could have a strong short-term and a medium-term effect on learners’ production of pragmatic routines.

The Ideology of the Jordanian Media Women's Discourse: Lana Mamkgh as an Example

Lecture

Dr. Amani Atieh¹

1. Fahad bin Sultan University

This study aims at examining the patterns of ideology reflected in the written discourse of women writers in the media of Jordan; Lana Mamkgh is taken as an example. This study critically analyzes the discursive, linguistic, and cognitive representations that she employs as an agent in the institutionalized discourse of the media. Grounded in van Dijk's critical discourse analysis approach to Sociocognitive Discourse Studies, the present study builds a multilayer framework that encompasses van Dijk's triangle: discourse, society, and cognition. Specifically, the study attempts to analyze, at both micro and macro levels, the underlying cognitive processes and structures, mainly ideology and discursive strategies, which are functional in the production of women's discourse in terms of meaning, forms, and functions. Cognitive processes that social actors adopt are underlined by experience/context and semantic mental models on the one hand and social cognition on the other. This study is based on qualitative research and adopts purposive sampling, taking as an example a sample of an opinion article written by Lana Mamkgh in the Arabic Jordanian Daily, Al Rai. Taking her role as an agent in the public sphere, she stresses the National and feminist ideologies, demonstrating the use of assertive, evaluative, and expressive linguistic and rhetorical devices that appeal to the logic, ethics, and emotions of the addressee. Highlighting the agency of Jordanian writers in the media, the study sought to achieve the macro goal of dispensing political and social justice to the underprivileged. Further, the study seeks to prove that the voice of Jordanian women, viewed as underrepresented and invisible in the public arena, has come through clearly.

The Indonesians' View on Deadline: How It is Expressed Metaphorically

Lecture

Ms. Dyta Septiyatik¹, Dr. Sailal Arimi¹

1. Universitas Gadjah Mada

Metaphor is inseparable from human language, including from its use in everyday life. Discussing about human life, it is notable to talk about punctuality as it is related to almost every single duty or activity undergone by human. In addition, while an individual is speaking, he or she is likely to use metaphorical expression to deliver what is actually intended which goes beyond the sentence meaning (Black, 1962). By utilizing qualitative descriptive approach, this study aims to discover the meaning behind metaphorical expressions uttered by Indonesians regarding the concept of deadline. The data was collected from the tweets shared by Indonesian Twitter users. Furthermore, in analyzing the gathered data, the relevance theory from Sperber and Wilson was used (Sperber & Wilson, 1986). The result showed at least three ideas: (1) deadline is often used metaphorically by Indonesian Twitter users; (2) majorly deadline is perceived negatively, or if not, it is something that cannot be avoided; and (3) metaphorically, deadline is pictured as alarm clock and shadow. To sum up, deadline can be either something good or something bad, depending on the context. Specifically, the metaphorical expression of deadline is found within workers and students. It is suggested for upcoming researchers to expand the context to more various variables other than working and college life.

The interactional achievement of authenticity in heritage environments

Lecture

Prof. Antje Wilton¹

1. Freie Universität Berlin

This contribution focuses on the role of material, bodily and linguistic resources in the interactional establishment of *authenticity* in so-called *heritage environments*. In the data presented here, interactants engage in and with environments that are characterized by *pastness* as a material quality (Holtorf 2013). In these *perspicuous settings* (Garfinkel 2002), authenticity emerges in and through a shared perceptual and interactionally accomplished experience of the material characteristics and interactional potentials of the heritage environment as a way to connect with its past(ness). The study employs multimodal interaction analysis (Mondada 2013) of video-recorded and transcribed guided and unguided visits (Mondada 2017) to historic sites and archaeological open-air museums to show how embodied actions, visual inspection, sensual explorations such as touching and smelling, and talk are integrated into the ongoing interaction to investigate, establish or reject a claim of authenticity (Boccardi 2019). In order to do so, interactants need to mediate between the primary reality of the present (the *here-and-now* of their visit) and the secondary reality of the (depicted) past (Gibbons 2003, Stukenbrock 2014, Clark 2016). The data show that in these mediations, interactants employ linguistic, embodied and material resources to engage in activities that combine reflexive and immersive elements, and which are integrated into institutionally enforced interactional formats such as demonstrations, hands-on activities and unguided explorations (Kesselheim & Brandenberger 2021). The results of the study are expected to have implications not only for the analysis of situated multimodal interaction in heritage environments as architecturally relevant spaces (Hausendorf & Kesselheim 2016) in which to establish authenticity, but also for professionals in archaeology and the heritage sector aiming to understand how original and recreated heritage environments are interactionally appropriated by visitors with regard to their perceived authenticity.

The Intercultural Interaction and Sociocultural Adaptation Experiences of Asian Students in Estonia

Lecture

Prof. Anastassia Zabrodskaja¹

1. Tallinn University

Asian students come to Tallinn University to study the two-year master's programme "Communication Management". Their reasons for studying in Estonia vary, but the most mentioned is the desire to gain international experience in a European Union country with a good and affordable quality of life. During the first fall semester, each student takes the Basics of Intercultural Communication course, where students are encouraged to observe, monitor, and report on any culturally defined and "different" situation. By the end of the course, students are completing a comprehensive essay in which they must make connections between similar practical experiences and ways of adapting to them.

An interpretive phenomenological study was chosen as the research strategy. It refers to the qualitative method of research; it is best suited to explain the phenomenon of "acculturation". Acculturation has two dimensions: the extent to which one preserves one's heritage culture and adapts to the host society. According to Merriam (2009:13), qualitative research aims to understand "the meaning people have constructed, that is how people make sense of their world and the experiences they have in the world". It also helps us interpret the experiences and feelings one has had from a particular phenomenon. In my study, this contributes to an understanding of the true meaning of "acculturation" and the feelings associated with this phenomenon among Asian students at Tallinn University. In their essays, students generally find that their adjustment is easy in terms of their learning environment, but they note that their adaptation to the local climate, food, language, behaviors, and values is difficult and complicated, resulting in culture and identity shock.

I use an interactive model of foreign-language proficiency, communicative competence, effective intercultural interaction, and sociocultural adaptation (Masgoret and Ward 2006) to highlight the strategies Asian students used to cope with the Estonian social and academic environment. Language and cultural differences proved to be major problems in the acculturation process of Asian students in Estonia. I will show how Asian students overcome obstacles by adapting to various aspects of academic study and integrating into a new sociocultural environment.

The management of (dis)agreement in conversation: Argumentation as a sequential adjustment of epistemic positions

Lecture

Dr. Franco Pauletto¹, Dr. Biagio Ursi²

1. Complutense University of Madrid, 2. Université d'Orléans

Based on the theoretical and methodological framework of conversation analysis (Schegloff, 2007), this qualitative study aims to offer a detailed account of four argumentative sequences from a telephone conversation between acquaintances recorded at the beginning of the COVID-19 pandemic. Argumentation is conceived here as a temporally organized, finely coordinated activity that is carried out along a continuum that goes from agreement to disagreement rather than being characterized as the opposition of two dichotomous positionings (i.e., full agreement versus full disagreement). The conversation is indeed highly topical: two friends discuss, from opposite and sometimes conflicting positions, the usefulness of the lockdown just decreed by the Italian government (March 2020).

The study aims to provide methodological and analytical tools for the analysis of argumentation in talk-in-interaction, which, from our perspective, is an eminently collaborative, locally situated activity that draws on participants' prior knowledge. In the sequences analyzed, the interactants calibrate their contributions turn after turn to exhibit and negotiate their epistemic access to the topic under discussion. Specifically, each turn-at-talk embodies the participant's shifting epistemic positioning on a gradient that goes from [+ knowledgeable] to [- knowledgeable] (Heritage, 2012). From a sequential and temporal viewpoint, the current turn-at-talk redefines the context within which the co-participant will calibrate their contribution in order to produce a coherent responsive action (Heritage, 1984: 242).

Our study is based on an emic perspective – that is, relevant to the participants themselves – rather than on pre-established analytical categories, and aims to highlight the temporal unfolding of the argumentative (and, therefore, epistemic) configurations, as they emerge turn after turn in talk-in-interaction. More particularly, we will focus on the sequential emergence of disagreements and disaffiliative actions produced by participants, through the reference to specific pieces of information and the negotiation of respective epistemic status on the topic at hand, on a turn-by-turn basis. Additionally, we will analyze the mobilization of specific social categories (namely, the elderly as a fragile and exposed group) and the moral implications arising from them in argumentative sequences.

The metapragmatics and materialities of transnationalism: Imagining and enacting care for migrant workers

Lecture

*Dr. Lydia Catedral*¹, *Dr. Farzad Karimzad*²

1. City University of Hong Kong, 2. Salisbury University

If we understand metapragmatics as that which allows social actors to reflect upon indexicals and their contexts of use (Silverstein 1993), then we can understand the metapragmatics of transnationalism as facilitating reflection on the multiplicity of interconnected and shifting contexts (and their associated indexicalities) within and across national borders (Hall 2014; Lo & Park 2017). In this paper, we build on this concept of transnationalism to analyze how migrant-led and migrant-serving organizations based in Hong Kong reflect upon and enact an expansive vision of situated care for migrant workers. More specifically, we propose to think of the metapragmatic reflection of the leaders of these organizations as operating within a fractal system of transnationalism that they navigate in various ways as they zoom in and zoom out to take different chronotopic-scalar positions. We show how, in taking these positions, they are able to presuppose and (re)create the discursively imagined and materially experienced aspects of space-times associated with the diverse situations of migrant workers. In this way, the fractal system we propose can account for both metapragmatic reflection and the perlocutionary effects of such reflection.

Our data come from the first authors' ongoing research into the discourses of and about Filipino migrant domestic workers in Hong Kong, and the resulting ethnographic engagements she has had with grassroots, migrant domestic worker-led organizations, and the select NGO's that support the migrants' direct action and organizing work. In this paper, we focus on discursive moments in which leaders of these organizations reflect on "how contexts work" in relation to the transnational trajectories of and difficulties encountered by migrant workers in and beyond Hong Kong. We also examine how this reflection is linked to the transformation of these organizations' imaginaries, structures and material practices. Specifically, we show how these leaders engage in three semiotic processes within the fractal system of transnationalism: (1) Constructing links between the materialities and imaginaries of the differently scaled space-times in which migrants find themselves; (2) Attributing topical salience to different categories relevant to migrant workers; and (3) Engaging with the fractal details of space-time to understand the specificities of migrants' embodied experiences. All of this, we argue, facilitates a holistic practice of care as it allows these organizations to engage migrants' needs in less predetermined ways. As one example, reflection guided by these semiotic processes led to the expansion of organizational missions to include not only Filipino migrants, but also migrant workers of other nationalities in Hong Kong who share the same visa and employment status.

By highlighting these multi-scalar and complex metapragmatic negotiations, as well as their perlocutionary effects on the material world, this work adds new dimensions to theories of care, transnationalism, and semiotics more broadly. More specifically, we argue that the fractal system of transnationalism provides a framework for thinking about care as interconnected, interpersonal and institutional; transnationalism as inclusive of – but not limited to – connections between home and host countries; and semiotic processes as not only leading to simplification, but also to complexification.

The metapragmatics of swearing: The indexical field of fuck

Lecture

*Dr. Hsi-Yao Su*¹

1. National Taiwan Normal University

This study examines the metapragmatics of swearing and the indexical field of *fuck* in Taiwanese culture. Specifically, it explores public reactions to a swearing incident in a high-profile, live broadcast awards ceremony (the Golden Bell Awards, the Taiwanese equivalent of the Emmy Awards) in October 2022. The recipient of the Best Actress Award, Ying-Hsuan Hsieh, thanked the wrong production team in her acceptance speech and said ‘fuck’ out loud when she realized her mistake. Public reactions were mixed but largely supportive, which is intriguing since swearing in public and by a female are both stereotypically seen as inappropriate in Taiwan—though scholarship addressing swearing as (im)politeness behavior has repeatedly shown the perception of swearing as context-dependent. This study analyzes Hsieh’s apologies, key opinion leaders’ posts, and responses to these posts and related news reports. Informed by Christie’s (2013) discursive pragmatic approach to (im)politeness, this study draws on linguistic anthropological and sociolinguistic concepts of indexicality, enregisterment, and language ideology and explores the following questions:

1. How is Hsieh’s swearing evaluated?
2. What indexical/ideological meanings are associated with Hsieh’s use of *fuck* and swearing in general? What are the more conventionalized meanings and the more emergent, fluid, context-dependent meanings associated with *fuck* and swearing?
3. What contextual assumptions and implications are revealed in these evaluations? What do these tell us about speakers’ beliefs about language (i.e., language ideologies)?

The study attempts to map out an indexical field (Eckert 2008) of *fuck* and swearing and details the process by which critical aspects of contexts affect specific evaluations. Though swearing in such a high-profile context is quite atypical, the data show clear evidence of a metadiscourse that normalizes the use of *fuck*, along the line of (1) authenticity (that Hsieh’s reaction to her mistake is genuine), (2) professionalism (that Hsieh is just like the nominated character she has played), (3) harmless emotion (that Hsieh is directing the frustration toward herself), and (4) entertainment values (that the swearing invokes surprise and laughter). Some commenters, however, still see swearing in a high-profile event as problematic and question whether swearing in English, a foreign and global language, alleviates the perceived level of offense. It is concluded that a discursive approach focusing on indexicality allows us to explore the processes through which various social and indexical meanings are associated with *fuck* and swearing. This atypical incident of swearing reveals much about ideologies of appropriateness, authenticity, emotion, and bilingual language use.

The notion of ‘Freedom’ in Right-Wing Libertarian Populist Discourse

Lecture

*Dr. Marcia Macaulay*¹

1. York University

In the winter of 2022 what was called “The Freedom Convoy” of trucks travelled from many areas of Canada and entered the capital city of Ottawa on 29 January. This ‘convoy’ remained for one month causing enormous disruption in the city. On 14 February 2022 the Federal Government invoked the Emergencies Act to remove the trucks that had taken over the city’s central core. The ‘convoy’ effectively squatted in the city bringing with it its own support systems including gas delivery. Hot tubs and bouncy castles appeared overnight within the area taken over by the truckers. These truckers were protesting a Canada-wide vaccination policy that required all truckers within Canada and those crossing the American border to be vaccinated for Covid 19. Their anger at having to be vaccinated was expressed by a call for ‘freedom.’ Ernesto Laclau would term such usage as an “empty signifier.” This is a referring expression that can trigger multiple meanings. Why was a refusal to be vaccinated expressed in terms of ‘freedom’? What did ‘freedom’ mean in this context of protest? What was particularly marked by these calls for freedom was the presence of Canadian flags embossed with Nazi swastikas as well as the presence of American Confederate flags. For most Canadians this discourse of ‘freedom’ was both confusing and frightening. This paper examines the notion of ‘freedom’ in the discourse of the “Freedom Convoy” using two theories from Pragmatics:

Brown and Levinson’s Face Theory and Positioning Theory. I examined the 622 twitter posts from the principal convoy account: Freedom Convoy 2022. Of these, 278 referenced ‘freedom’ as a lexeme, including synonyms or antonyms. Of these, approximately 45% were “empty signifiers” conveying only positive connotation as in “freedom fighters.”

The remaining 55% concerned ‘freedom’ in two broad conceptual categories: bodily integrity and physical boundaries or borders. All expressed ‘freedom’ in terms of negative face or threats to negative face. Bodily integrity was expressed in terms of bodily autonomy, “my body my choice,” medical autonomy, and further as “medical experimentation,” and even child abuse, “masking children is child abuse.” Freedom of movement was an even more dominant concern. This was expressed in terms of border restrictions to and from Canada, specifically the ArriveCan app requiring 14-day quarantine for unvaccinated truckers entering Canada. Equally this concerned visiting the sick in nursing homes, attending children’s birthday parties, and flying. Such threats to negative face were understood as imposing “apartheid” and ‘feudalism.’ “Democracy” was a concomitant concern. In terms of Positioning Theory, loss or threat to bodily autonomy or freedom of movement was understood as a loss of ‘rights.’ In 2012 at the Positioning Theory Conference (Univ. of Buffalo), Rom Harré noted that in Magna Carta only responsibilities are articulated and not rights. In contrast, the Freedom Convoy 2022 articulates only ‘rights.’ There is no positioning of responsibilities. The Convoy represents a very specific form of right-wing libertarian populism.

The pragmatic duality of humor during oral corrective feedback

Lecture

*Dr. Hilal Ergül*¹

1. University of Northern Iowa

This study focuses on the role of teacher humor during oral corrective feedback (OCF) provided in language classrooms. Meta-analyses have shown humor to yield mixed results in terms of teaching effectiveness (Banas et al., 2011; Martin et al. 2006; McMorris et al., 1997). The discrepancies among these findings may be explained by the instructional humor processing theory (Frymier & Wanzer, 2021; Wanzer, Frymier, & Irwin, 2010), which posits that when the affect during the interaction is positive, the humor is perceived by the students as appropriate, and the processing ability of the student is enhanced; humor can have a positive impact on learning. Combined with the analytical framework for OCF (Lyster & Ranta, 1997), and the General Theory of Verbal Humor (Attardo 2020; Attardo & Raskin, 1991), this study draws on seven EFL teachers' use of humor during OCF in adult intensive English programs at the intermediate proficiency level. Approximately 16 hours of classroom speech data were analyzed using ELAN video transcription and annotation software. Findings indicate that humor may act as a distractor if used during the OCF sequence. As humor engages the teacher and the learners in laughter and play, the focus on the erroneous production may be lost. While the humor clearly contributes to a positive classroom atmosphere in these instances, it seemingly negates the desired accuracy effects of the feedback. The pragmatic implications of these conflicting messages embedded in humor during OCF will be discussed.

The pragmatics of high boundary tones in German

Lecture

***Mr. Timo Buchholz*¹, *Dr. Jet Hoek*², *Prof. Klaus von Heusinger*¹**

1. Universität zu Köln, 2. Radboud University Nijmegen

A high boundary tone at the end of a clause has been analysed as cueing a meaning like “incompleteness”, while a low tone signals “completion” (Westera et al. 2020). In work on relative clauses, this has led to an assumption that at interclausal boundaries, high tones cue stronger integration of the upcoming clause into the preceding syntactic structure than low tones (Sanfelici et al. 2021). To our knowledge, there has been no experimental work on the effect of high tones in coordinated structures.

In an original forced choice experiment, we tested the effect of syntactic cues and boundary tones on clause linkage strength in biclausal structures (syntactically subordinated vs coordinated) in German via a pronoun resolution task. Participants heard stimuli like (1) and (2), with a first sentence consisting of a main clause with one subject referent followed by a causal clause with another subject referent. A second sentence consisted of a nonce verb predicate and an ambiguous pronominal subject. Participants were asked to resolve the ambiguous pronoun. We assume that resolution of the pronoun to the first clause subject indicates stronger linkage than resolution to the subject of the second.

(1) Anna hat den Ball angenommen (H%/L%) weil Gabi nicht mehr drangekommen ist. Sie *zirfte*.

(2) Anna hat den Ball angenommen (H%/L%) denn Gabi ist nicht mehr drangekommen. Sie *zirfte*.

„Anna received the ball, because Gabi didn’t reach it anymore. She *zirfed*.“

We kept the discourse relation (*Explanation*) constant. The first clause was identical in both conditions. The second clause was: (1) syntactically subordinated (*weil* “because” + verb-final word order); (2) syntactically coordinated (*denn* “because” + verb-second). This was crossed with the prosodic manipulation, where the interclausal boundary was produced either low (L%) or high (H%).

Subordination led to more resolutions to the first subject referent than coordination, in line with *weil*-clauses being more integrated than *denn*-clauses (Scheffler 2013). The prosodic manipulation, however, interacted with the type of clause linkage: with subordination, H% increased resolution to the *first* referent compared to L%, but with coordination, H% increased resolution to the *second* referent compared to L%.

We analyse interclausal H% as giving a pragmatic instruction to direct attention to the subsequent clause (specifying “incompleteness”), with different effects on different types of linkage. In subordination, a highlighted subsequent clause will be more integrated than a non-highlighted one, allowing more pronoun resolutions to the first clause. In coordination, the highlighted clause becomes the focus of attention and is therefore more independent of the first clause than a non-highlighted one.

The Pragmatics of Hypocrisy

Lecture

***Prof. Sandrine Sorlin*¹, *Prof. Tuija Virtanen*²**

1. University Paul-Valéry - Montpellier 3, 2. Åbo Akademi University

The myriad expressions in everyday use to refer to hypocrisy testify to the indignation people feel at recognizing it in face-to-face or mediated discourse. Even though hypocrisy is a verbal phenomenon *par excellence*, it has rarely, if ever, received due attention in the study of language. Importantly, it is a relational phenomenon well worth investigating in pragmatic terms. The objective of this talk is three-fold: we will start by showing why the notion of hypocrisy deserves a pragmatic analysis and try to explain why it has received so little attention in pragmatic studies (as well as elsewhere). We will then attempt to delimit the notion in pragmatic terms by resorting to more well-established concepts such as face, (im)politeness (and mixed messages), tact, flattery, deceit/lying, and irony/sarcasm. This will help us disentangle close notions such as ‘polite hypocrisy’ and ‘hypocritical politeness’. Delimiting the pragmatic space of hypocrisy serves our third objective of theorizing the phenomenon. Based on a wide range of English-language data from speech and writing of different kinds, as well as selected examples of both individual and collective or organizational hypocrisy, we will draw a first pragmatic model of the phenomenon. The model comprises five layers: (i) the different types of hypocrites and (ii) the kind of hypocrisy they are practicing, (iii) the language games they favour, (iv) the kind of social action they each engage in, and (v) the degree of exposure of the hypocrisy, by which we mean whether hypocrisy is concealed, metapragmatically revealed, exposed by a third party, or remains tacit between interactants engaged in a game of joint pretence. Devising this general model of hypocrisy, we will exhibit the many different hues it can take and thereby show that hypocrisy needs be considered in a new pragmatic light. In particular, we will defend the point that hypocrisy can have a ‘civilising force’ that has been underestimated. Lastly, we will argue that the study of the phenomenon calls for a renewed philosophy of language that would not take as its premises truth, sincerity, relevance and sufficient information or unambiguous language: these linguistic virtues should be more realistically regarded as the ethical horizon towards which every individual should tend. People conceal, dissimulate and lie, for reasons that are not always amoral but partake of some cooperation that is not first and foremost linguistic but social. Ranging from pro-social to entirely unethical, hypocrisy constitutes a wider socio-pragmatic strategy than might be suspected at first sight. The study of verbal hypocrisy is expected to have an impact on how politeness and related pragmatic theories are conceived and it is likely to throw novel light on the social games carried out in interactions.

The Pragmatics of Tense Shift: Historical Present in Modern Hebrew Personal experience stories

Lecture

*Prof. Zohar Livnat*¹

1. Bar Ilan University

The Historical Present tense (HP) in narratives refers to anecdotal or continuing past events. It typically alternates with the past tense during the story, and is limited to event clauses that belong to the plot outline (Schiffrin, 1981).

The current study is based on a corpus of 65 stories relating a personal experience told by 45 native Hebrew speakers. The stories were found in elicited texts, in which the interviewees were asked to speak freely about any subject they wished. In the resulting discourse, units were identified that may be defined as a “story” according to the framework proposed by Labov (1972), in which speakers describe in the first person an experience they themselves had. The corpus contained 352 verbs in the Historical Present tense. The most frequent verbs in HP are verbs of saying (144 tokens), verbs of motion (54 tokens) and verbs of sensory perception and understanding (45 tokens). The talk will focus on verbs from the latter two groups and will describe their functions in the story.

Previous studies have indicated that the functions performed by HP verbs, which include marking the beginning of a new textual unit, dramatization and vividness, evidentiality, involvement and decreasing the distance between the speakers, differ from one language to another. The research I will present in the talk investigated this question for the first time in modern Hebrew.

The structural function was found to be striking, and a shift from past tense to HP was evident at frame-shift points, in proximity to structural discourse markers that indicate transitions between discourse units, words that mark a change in the course of the plot and time markers that situate the segment that follows in a new time frame.

The “vividness” function was found to be significant as well, however regarding verbs of motion and perception (“I arrive/enter/turn, I see/hear...”), HP verbs seem to vitalize the past events, not necessarily in the sense of bringing them into the “present” of the time of speech, but rather in the sense of creating involvement in the discourse (Chafe, 1994), which is achieved by the speakers giving both their physical and cognitive point of view, in a way that enables the recipient to experience and understand them via the speaker’s sensory experience.

Thus, sensory perception verbs are important because they support the presentation of the speaker’s point of view, but the action indicated in them is not necessarily important. They serve rather as an introduction to surprising information that advances the plot. From the point of view of the addressee experiencing the story, the Historical Present marks a rise of tension at the beginning of the segment that will lead to the peak, and highlights the new element that is about to come. (Thoma, 2011) Thus, it appears to be “dramatic” in the sense that it creates expectations for the appearance of an element having tellable value.

The Relationship Between Mood and Modal Concord in Spanish Directive Complements

Lecture

Dr. Tris Faulkner¹

1. Kalamazoo College

Directive predicates have meanings that are similar to ‘order’, ‘require’, ‘recommend’, and ‘advise’. Being volitional in nature, directives are said to form part of the core group of subjunctive-taking predicates. This means that, like desiderative (e.g., *querer que* ‘to want that’) and purpose clauses (e.g., *para que* ‘so that’), they are expected to, and generally do, take the subjunctive. However, findings from the present investigation suggest that, in spite of this description, there are certain **atypical** contexts in which *indicative* directive complements are strongly preferred; i.e., when there is MODAL CONCORD between the matrix and subordinate predicates.

Geurts and Huitink (2006) define modal concord as the phenomenon in which a sentence with two modal operators, is interpreted as if it contained only a single modal expression (p. 1). They state that there are two constraints that influence the manifestation of a concord construction. The first is that the two modal expressions in question have to be of the same type; for example, both have to be deontic, or teleological, or bouletic, or epistemic, and so on (p. 3). The second is that both have to have “the same, or at least similar, quantificational force” (p. 3); (e.g., weak, weak necessity, strong necessity, etc.) (see: Portner 2018). In the present study, I demonstrate that, in the case of Spanish, similar concord can occur in directive clauses. I show that when a matrix directive embeds another modal predicate (of similar or equivalent strength and modality), the grammatical mood of the subordinate complement becomes the indicative. In the case of subjunctive complements, they are seen to be preferable to indicative, only when there is no concord between the embedded and main directive predicates; which, tends to be in line with **typical** or standard directive constructions. These findings are significant, not only because directives are normatively described as requiring the subjunctive, but also because no previous studies have examined a link between mood and modal concord.

The Relative Effects of Corrective Feedback and Language Proficiency on the Development of L2 Pragmatic Competence: The Case of Request Downgraders

Lecture

*Prof. Yuan-shan Chen*¹, *Dr. Hui-Tzu Hsu*², *Dr. Hsuan-Yu Tai*³

1. Department of Applied English, National Chin-Yi University of Technology, Taichung, Taiwan, 2. Language Center, National Chin-Yi University of Technology, Taichung, Taiwan, 3. Department of English, National Kaohsiung University of Science and Technology, Kaohsiung, Taiwan

Over the past decades, corrective feedback (CF), whether oral or written, has been extensively researched in SLA research (Li and Vuono, 2019). Much empirical evidence supported the relative effects of different CF types (López, Steendam, Speelman & Buyse, 2018; Zhang & Cheng, 2021) and the facilitative effects of CF on writing, speaking and grammar, whereas little attention has been paid to the effect of CF on L2 pragmatics (Kasper & Schmidt, 1996). Despite its pivotal role in SLA research, only a handful of studies to date have addressed the effect of corrective feedback on L2 learners' pragmatic development (Nguyen, Do, Nguyen, & Pham, 2015; Nguyen, Do, Pham & Nguyen, 2018).

To close the research lacuna, the current study aims to (1) investigate the interface between CF and language proficiency on the learners' development of English request downgraders, and (2) to explore how these learners perceived the CF they received. A total of 80 Chinese EFL learners of English were recruited, with 40 third-year English majors as the high-proficiency group and 40 first-year non-English majors as the low-proficiency group. Two CF types (direct vs. metapragmatic) and two proficiency levels (high vs. low) resulted in four quadrants, namely (1) high proficiency + direct feedback (HD), (2) high proficiency + indirect feedback (HI), (3) low proficiency + direct feedback (LD), and (4) low proficiency + indirect feedback (LI). Internal request downgraders (syntactical and lexical/phrasal) were the targets of investigation. The learners were given a dialogue construction task with five high-imposition request situations as the pretest to examine their use of request downgraders. Next, they received explicit instruction, including the consciousness-raising session, the modeling session, and the feedback + revision session. After the instruction, an immediate posttest was administered one week later and a delayed posttest was administered six weeks after the instruction. Finally, an online questionnaire with ten statements on a five-point Likert scale was given to probe these learners' perceptions of CF.

The findings showed that the high-proficiency group performed significantly better than the low-proficiency group across the three tests. Second, metapragmatic feedback was more beneficial than direct feedback for both the high- and low- proficiency learners, probably because the former led to higher level of depth of processing than the latter (Kim and Bowles, 2019). Third, all the learners improved over time on the posttest and the learning effect was retained, as shown in the delayed posttest. Fourth, considering the effect of proficiency and feedback types, the facilitative effect of feedback overrode that of proficiency. Lastly, while all the learners held positive attitude towards the two CF types, they indicated that it was more challenging for them to revise the answers in terms of metapragmatic feedback.

Several pedagogical implications can be derived from the present study. First, the 'explicit instruction + feedback' approach we adopted in this study has been demonstrated to be beneficial to Chinese learners of English to learn request downgraders. Second, the strengths and weaknesses of the two CF types could be used as teachers' considerations in teaching.

The role of group memberships or identities in communicators' production: a relevance-theoretic approach

Lecture

*Ms. Kyu Hyun Park*¹

1. Northumbria University

This paper discusses how ideas of group memberships or identities can affect communicators' linguistic behaviours. It adopts a relevance-theoretic approach (Sperber and Wilson, 1986/1995) to expand the discussion of the principles of relevance theory. The main focus of identities in pragmatics has been on how specific language use can reveal a user's identity in "a particular societal context" (Mey, 2001: 20). According to this approach, the identity of speakers can be identified by the way they construct their utterances. This paper, on the other hand, focuses on what communicators do when they categorise the group memberships or identities of their addressees. This paper also discusses what communicators believe they are doing when they create their utterances.

The empirical work was carried out by observing conversations. Pairs of friends were recruited to participate in this study. Each participant had two interactions: one with their close friend and another with a stranger. The study compared the two interactions. It focused on the communicators' various assumptions depending on the type of audience and how these assumptions affected their production. The participants had an interview following the two interactions to discuss their opinions on their interlocutors and their production.

According to the observation and interview findings, the communicators spontaneously categorised the group memberships or identities of their addressees even though they did not mention the categorisation explicitly. Their presumptions regarding the group memberships or identities of their addressees helped them formulate their utterances, particularly when they lacked information about their addressee (i.e., when they interacted with a stranger).

This paper argues that this result is the communicators' communicative acts that they spontaneously search for their addressees' expectation of relevance and formulate their utterances to meet the expectation of relevance. This shares some ideas of the relevance-guided comprehension heuristic (Wilson and Sperber, 2002). The communicators believed they were generally aware of their addressees' expectation of relevance based on how they categorised the group memberships or identities of their addressees. As a result, the communicators constructed their utterances in order to meet the expectations of their addressees for relevance by drawing conclusions about them.

The role of proficiency level in pragmatic marker recognition and production

Lecture

*Dr. Annarita Magliacane*¹, *Dr. Ariadna Sánchez Hernández*²

1. University of Liverpool, 2. Complutense University of Madrid

Conversational skills are assumed to develop with practice and have not received enough prominence in instructed contexts despite being a pivotal aspect of learners' pragmatic competence (McCarthy & McCarten 2018). Recent research (Jones 2021) posits that teaching conversation strategies can enhance their acquisition and stresses the crucial role that noticing has in the learning process. Noticing, and therefore recognition, are indeed key elements of pragmatic development as they are preliminary steps for the development of any productive ability (Sánchez & Alcón-Soler 2019). However, despite such a pivotal role in pragmatic development, research on pragmatic recognition is rather limited (Barron 2019).

This study fills this research gap by focusing on the recognition of pragmatic markers (PMs) in spontaneous conversation. PMs are linguistic constructions which help the smoothness of interaction (Beeching 2016) by performing a series of functions (i.e., managing the conversation, constructing turns, showing listenership). More specifically, this study presents the design of a research instrument (a test) to assess PM recognition and explores the relationship between PM recognition and production in English as a second language (L2). The test includes different tasks: (i) PM recognition in aural excerpts showcasing different varieties of English; (ii) identification of PM use and functions; (iii) awareness-raising questions about informants' PM use, and (iv) prompted oral production. The test was piloted with 53 learners of English with a pre-intermediate (n = 13), an upper intermediate (n = 19) and an advanced (n = 21) proficiency level.

Firstly, the test internal consistency was analysed, revealing high reliability scores. Moreover, an analysis of frequency and variety of PMs in the fourth task pointed out to the validity of the task for the intended purpose. Altogether, these results showed the potential of this instrument to assess PM recognition and production in English as an L2. Secondly, PM knowledge across proficiency levels was explored, with findings revealing an effect of proficiency on both the ability to recognise and produce PMs. These findings will be discussed in terms of their implications for English language teaching and English language varieties, illustrating the application of this research instrument for future research as well as for the design of teaching material.

The role of prosody for the expression of illocutionary force: a corpus-based study of the pragmatic system of Questions in spoken Italian and French

Lecture

Prof. Emanuela Cresti¹, Prof. Massimo Moneglia¹

1. Università di Firenze

In corpus-based taxonomies of illocutionary acts (Bunt et al. 2017; Weisser 2018; Cresti 2020), questions (*seeking for information acts*) range over types with different semantic and pragmatic features. For instance, *Total questions* are split into *Polar Question* (PQ) and *Request for confirmation* (RC). RC is accomplished when the speaker “presupposes what he is asking”, not a genuine *seeking for information act*, but a *request for consent* (Cresti 2020). However, it is hard to say whether a *Total question* is a PQ or RC since they share syntactic and lexical features. The speaker’s state of mind and presuppositions determine these language activities’ nature.

The paper claims that, both in Italian and French, the prosodic performance allows the selection of the pragmatic value of PQ or RC as a function of their prosodic features within systems strongly constrained by prosody.

The issue is faced through a corpus-based approach. Two highly varied selections of Italian and French interactions (around 4000 utterances each) have been derived from the C-ORAL-ROM corpus (Cresti & Moneglia 2005). A data set of 370 questions in Italian and 335 in French has been settled through a methodology requiring evaluation of the acoustic source by mother-tongue informants.

The weight of questions in speech is evaluated: something less than 10% of utterances are questions. Their typology has been defined considering the correlations among syntactic, pragmatic, and prosodic features. The typology appears largely comparable in the two languages despite their different syntactic and accentual properties (Martin 2009). Beyond *Wh-* and *Total questions*, new types with specific prosodic features were found (*Open Question*). Types that received little attention in previous literature (*Tag questions*, *Double questions*, *Alternative questions*) have been framed within the same Prosodic strategy (*Illocutionary Pattern*), according to Panunzi & Saccone (2018). Illocutionary patterns performing questions record from 10 to 15%.

With regards to *Total questions* (around 40% in both languages), in Italian, the highest frequency f0 contours record a “*slight valley unbound to tonicity*” (Grice et al. 2005; Crocco 2006; Gili-Fivela 2008; Rossano 2010; Savino 2012) and in French (Delais-Roussaire et al. 2015) a “*simply raising contour on the last tonic syllable*”, with variant “*low-rise*” and a “*high-rise*” (Delais-Roussaire 2021; Portes 2020). However, a good lot of *Total questions* (26% in French and 36% in Italian, much more than foreseen before) presents a “*rising-falling mountain contour*” that can be clearly distinguished from the *rising-falling* contour of the assertive illocutionary types (Fonagy 1973; Portes 2017).

Corpus data shows that when a *mountain contour* characterizes *total questions*, the speaker takes an *injunctive stance* (Riegel et al. 1994), and the addressee is required to *validate* a piece of information in the context as a *shared assumption* (PQ). On the contrary, the *valley contour* in Italian and the *final rise* in French occur when the speaker asks for consent to his hypothesis (RC). Experiments devoted to validating this pragmatic distinction are based on substituting the prosodic profile in the same context, confirming the corpus-based finding.

The semantics of the BE+V-ing form with ALWAYS-type adverbials

Lecture

Dr. Mariko Goto¹

1. *Kyushu Institute of Technology*

This study explores why the BE+V-ing construction with *always*-type adverbials such as *always* and *continually* (*always*-progressive for convenience) as in (1) tends to sound more emphatic or emotionally colored than the simple counterpart as in (2), examining Kranich's view of the progressive for reference.

(1) We are always hearing positive feedback.

(2) We always hear positive feedback.

Based on her quantitative data and using *He is always giving people lifts* as an example, Kranich (2010: 217) notes that the *always*-progressive seems to have developed to express, by default, negative speaker attitude in the 20th century. However, while Kranich's (2007: 131) Google search shows that 52% of *always*-progressives are used in a negative sense today, my survey indicates that the percentage of those yielding negative reading is around 57% in 18th-century letters.

Also, Kranich (2007) regards the *always*-progressive as a special kind of progressive that needs to be treated separately from other "normal" progressives. However, the line separating the two is not clear enough. Besides, they clearly share intrinsic features of the BE+V-ing construction. For instance, the construction essentially captures an internal phase of the participialized situation, on which the conceptualizer focusses. This feature alone can be sufficient to render the picture more detailed and vivid than the simple form that describes a wide-angle picture of the whole situation denoted by the verb. *Always*-type adverbials, whether hyperbolic or not, correspond to a situation repetitively holding at any point in time of perception. Therefore, the *always*-progressive can signify the conceptualizer's recurrent perceptions of an actual particular subset of the participialized situation. While examples (1) and (2) are both associated with a habitual practice, the former can depict it as a series of recursive phenomena and the latter a metaphysically continuing phenomenon. This would explain why example (1) can sound more emphatic than example (2) does.

As to why the use of the *always*-progressive is slightly biased toward expressing a negative sense, Kranich (2007: 131) attributes it to a sort of clash between the meanings of the construction and *always*. However, it appears to make more sense if we link the proportion to Kensinger's (2007) psychological research evidencing that negative emotion is remembered more accurately and minutely than positive one. More detailed memories would help us pragmatically better prepare for the future. The BE+V-ing construction that can induce a clearer picture than the simple counterpart would be more likely to be employed for describing more detailed and vivid memory. As the tendency seems to represent an aspect of human nature, the relationship between *the always*-progressive and negative nuance in the 18th century and now would not be so different.

The sequel of an atypical campaign: a psycho-narratological approach to Donald Trump's speeches in his second presidential run

Lecture

*Ms. Belinda Wing-shum Ko*¹

1. City University of Hong Kong

The year of 2016 is an atypical year. Not only is the year a momentous time for modern societies in general, but it is also believed to be a turning point in politics, especially in American politics (Haidt, 2016). On 8 November 2016, Donald Trump was elected to be the 45th President of the United States. A few years after the shocking electoral victory, Trump announced his second presidential run, which I refer to as 'the sequel of the MAGA campaign'. Though unsuccessful, Trump's (a)typical political narrative discourse remains a fascinating area of study.

This presentation adopts a psycho-narratological framework (Ko, 2022) to analyse the speeches delivered by Donald Trump in his 2020 presidential campaign. This integrated analytical framework draws on positioning theory from social psychology (Bamberg, 1997) and theoretical concepts from narratology (Labov & Waletzky, 1967; Bal, 2017); as well as analytical tools commonly used for political discourse analysis (PDA), namely ideological square (van Dijk, 1997), legitimisation strategies (Reyes, 2011) and systemic functional grammar (Halliday & Matthiessen, 2004). Analysis is guided by the following questions:

- How does Trump represent different social/political actors as *typical, recurrent character types* in his 2020 presidential campaign narrative?
- How does Trump, as a *character-bound narrator* in his campaign narrative, construct his presidential identity to the public, who are *character-bound audience*, in an attempt to legitimise himself and his campaign?
- What are the discursive strategies Trump uses in the representation of characters and construction of presidential identity, and how are they linguistically realised?
- How do the constructions of characters and presidential identity reflect Trump's ideology in relation to the wider socio-political context?

The paper contributes particularly to the field of PDA, in which many studies have adopted approaches from critical discourse analysis (CDA) to uncover the relationship of discourse, ideology and power. The psycho-narratological framework enables scholars to deconstruct narrative and its elements exploited by political actors in (re)shaping social/political actors and (re)constructing social/political reality. Through this presentation, it is hoped that the value of taking a psycho-narratological perspective to PDA can be highlighted and that the integrated analytical framework presented can offer contribution to PDA and social and political science.

The significance of “uncreative” semiotic practices in online activism: Domestic workers’ resharing on Facebook

Lecture

Ms. Yuyan Liang¹, Dr. Lydia Catedral¹

1. City University of Hong Kong

Sociolinguistic approaches to semiosis in online spaces can make significant contributions to scholarly discussions of online activism through the tools they offer for exploring the digital dissemination and contestation of socio-political messages (Yang, 2009; Gao, 2002; Kirner-Ludwig, 2020; Silva & Maia, 2022). Such approaches capture how users draw on a wide range of resources – including social media affordances (Zappavigna, 2015; Giaxoglou, 2018; Georgakopoulou, 2015) and multimodality (Law, 2020; Dynel, 2021) – to *recontextualize* (Bauman & Briggs, 1990) semiotic material in novel ways with implications for how socio-political issues are negotiated and understood in the digital space. While this body of work has primarily drawn attention to users’ “creativity” in transforming and repurposing earlier semiotic content (e.g., Vishnyakova et al., 2019; Pennycook, 2007), we argue that we can expand understandings of language and semiosis in online activism by attending to cases where such “creative” semiotics appear to be absent.

Our data come from an ongoing ethnographic study of the social media practices of grassroots organizations in Hong Kong led by migrant domestic workers (MDWs). These organizations advocate for the rights and welfare of MDWs who face various forms of discrimination, social exclusion and exploitation. They engage in direct-action campaigns, information sharing, education, and welfare programs through both offline and online activities. In this study, we focus on the online semiotic practices of members and followers of these organizations by examining how they use social media affordances (e.g., “like”, “comment” and “share”) to interact with the Facebook posts from official organizational pages. This online ethnography is supplemented with offline ethnography and interviews to understand the rationale behind these forms of engagement and how organizational posts are perceived more generally.

Our findings show that resharing organizational posts is one of the primary ways in which members engage online in activism. Organizational posts frequently receive more or equal numbers of “reshares” as compared to “likes” or “comments”. Typically, members reshare posts directly with little or no customization. To explore what shapes these apparently “uncreative” resharing practices, we consider the role of ideology and the material constraints of the offline world. We show how members’ social media ideologies (Gershon, 2010) are shaped by their organizations’ socio-political beliefs, goals and values, and how their work-life reality as MDWs (e.g., spatiotemporal constraints, old technology) restricts their online engagement. We also discuss how these forms of online engagement combine with offline practices to impact these organizations’ ability to maintain members, reach new audiences and disseminate their political messaging. Ultimately, we argue that such “uncreative” practices are significant for activism as they reinforce the communal ideologies of organized members, thereby maintaining the traditional, on-the-ground activism of these organizations. We also contend that including “uncreative” semiotic behaviors in a theory of online practices is crucial for developing a more holistic understanding of how “ordinary citizens” (Land, 2009; Allsop, 2016) use online spaces.

The tension between demoting a minority language and promoting a multilingual policy: The case of Arabic in Israel

Lecture

*Dr. Muzna Awayed-Bishara*¹

1. *Tel Aviv University*

In July 2018, Israel passed a Nation State Law (NSL) that defined Israel as the homeland of the Jewish people alone. The law not only reinforced the second-class status of its Palestinian-Arab citizens, but also transformed the status of Arabic as an official language into a language with a *special* status. Around the same time, Israel's Ministry of Education initiated a project for developing a new multilingual educational policy for its schools. Since its establishment, Israel has administered and maintained two segregated schooling systems: one for the Jewish (Hebrew-speaking) majority and one for the Palestinian (Arabic-speaking) minority. Segregation notwithstanding, the new multilingual policy aims to provide different targets for the teaching of different languages in Israel, with a special emphasis on the need to teach Hebrew and Arabic for fostering intercultural dialogue between Arabs and Jews (Tannenbaum & Shohamy, 2018). Considering the political orientation of language policies which are largely driven by the ideologies, attitudes, and beliefs of various stakeholders (Milani, 2008; Shohamy, 2006), I ask: How do members of the Palestinian-Arab minority perceive the tension between the demotion of Arabic – their mother tongue and the transmitter of their national and cultural identity – and the implementation of a new multilingual educational policy?

To address this question, I draw upon recent theorizations in the field of language policy and applied linguistics that highlight the centrality of studying the communicative practices of minority language speakers as basic building blocks in the production of democratic societies (e.g., Rampton et al., 2018; Stroud, 2018). Previous work has identified the legislation of the NSL that cancelled the official status of Arabic as a spur to constructing a progressive, responsibility-driven sense among Arab educators (Awayed-Bishara, 2020). Therefore, examining whether a top-down multilingual policy serves transformative agendas entails studying the bottom-up practices and perceptions of marginalized groups, who might be disadvantaged by such policies (Stroud, 2001). Recent research recognizes such a focus on practice and treats language educational policy as processual, dynamic, and in motion. This means that policy never just “is,” but rather “does” (McCarty, 2011; Rampton et al., 2018). On that basis, I investigate whether the legislative change of Arabic from an official language to a language with “special status” has changed the way Arabic-speaking teachers/students perceive and respond to a top-down multilingual educational policy. I present data from interviews and ethnographic work that I conducted with 10 teachers (of various subjects) and 10 students from two High schools: one located in a village in Northern Israel, and the other in a town in the triangle area. Data analysis suggests that cancelling the official status of Arabic simultaneously negatively impacts its speakers' sense of belonging, worth, and collectivity but also encourages the emergence of new forms of activism and ingroup solidarity. Data analysis indicates that for a multilingual educational policy in Israel to become part of a transformative project towards social justice and cohesion, there is a need to deconstruct the underlying frameworks that reproduce and perpetuate injustices towards them (e.g., the NSA).

The Use of Address Terms by Saudi Facebook Users in Arabic: A Discursive Approach

Lecture

Dr. Mohammad Mahzari¹

1. Prince Sattam bin Abdulaziz University

This study aimed to identify the address terms used by Saudi Facebook users and understand the address behavior in Facebook. Most of the studies investigated the use of address terms in Arabic in face-to-face communication, but not on Facebook, a dominant platform for everyday online communication and rich with naturalistic data. A total of 1258 Facebook comments were collected from 36 Facebook walls and analyzed based on Friederike Braun's (1988) nouns of address. New types and sub-subtypes were added to Braun's exhaustive list because of the Facebook context. While the Saudi Facebook users employed ten types of address terms, the most common were teknonyms, terms of endearment, proper names, and titles by appointment. Additionally, four types of endearment terms were used, such as fictive terms, affective vocatives, praise attributes, and diminutives. Of those terms, fictive terms and affective vocatives were the most common sub-types of terms of endearment. Moreover, the first name was used mostly with titles, such as *duktu:r* 'doctor/professor,' *muhandis* 'engineer/architecture,' and *?ustadh* 'professor/teacher.' The function of titles was not to have a social distance with the Facebook poster, but to show appreciation or deference for the addressee. Specifically, titles were employed by friends, relatives, and colleagues to support a relationship, not to create social distance or reinforce the degree of formality. Finally, the functions and meanings of Arabic address terms need to be explored in public online platforms, such as Twitter, public Facebook walls, YouTube, etc.

Keywords: address terms, Saudis, Facebook, Arabic, politeness

The ‘persuasive advantage’ of narrative in health communication: Evidence from discussions of vaccination-related indecision on the parenting forum Mumsnet

Lecture

***Prof. Elena Semino*¹, *Dr. Tara Coltman-Patel*¹, *Mr. William Dance*¹, *Prof. Alice Deignan*², *Dr. Zsofia Demjen*³, *Dr. Claire Hardaker*¹**

1. Lancaster University, 2. University of Leeds, 3. University College London

A substantial body of theoretical and experimental work has contrasted narratives and the provision of information as persuasion strategies in communication generally and health communication in particular (Nan et al 2015). Models of narrative processing include three main components that have been claimed to confer a ‘persuasive advantage’ to narratives by decreasing resistance to persuasion: transportation into the story world, identification with characters, and emotional involvement (Bilandzic and Buselle (2012). Experimental research has provided some evidence for this persuasive advantage, albeit depending on a range of factors, such as genre, medium and length (Ratcliff and Sun 2020). Existing evidence, however, has been primarily gathered through lab or field experiments. The present study makes a novel contribution by investigating the use of, and reactions to, narratives vs. information in five threads from the parenting forum Mumsnet Talkwhere contributors respond to a request for advice from a parent who is undecided about consenting to vaccinating their child against the Human papillomavirus (HPV). This approach makes it possible to investigate, in naturally occurring interaction, one particular manifestation of resistance to persuasion, namely, counterarguing. An analysis of the 525 replies in the five threads revealed similar frequencies of narratives and information as a means of providing advice, as well as similar frequencies of direct engagement with narratives and information. However, a difference was found in the *nature* of the engagement, with narratives eliciting a significantly higher proportion of supportive engagement, and information eliciting a significantly higher proportion of challenging engagement. Differences were also identified in the frequency and nature of engagement with different types of narratives, with narratives of illness receiving a higher proportion of (supportive) engagement than narratives about vaccine uptake. While there are contextual reasons for these patterns, the findings provide a new kind of evidence for a potential persuasive advantage of narrative in the context of health-related decision making. The study also highlights the importance of discourse analytic studies of persuasive strategies in health communication ‘in the wild’, alongside experimental research.

To bow or not to bow: The Effectiveness of Explicit Pragmatic Instruction in Japan

Lecture

Prof. B. Bricklin (Brick) Zeff¹

1. Hokkai-Gakuen University

This presentation will address the findings of a study on the effectiveness of explicit pragmatic instruction in helping Japanese students competently make and respond to greetings in American English. One of the first things a student learns in another language is how to perform a basic greeting. (Ebsworth, Bodman, & Carpenter 1996)

Although greetings may seem simple and formulaic in their wording, they are “culturally saturated speech acts that can determine the course of an encounter.” (Dufon 1999) The content and delivery of greeting influence a first impression or the outcome of a lasting impression. Indeed, there are times when understanding the pragmatics surrounding various speech acts can make the difference between merely misunderstanding a word and not recognizing a life-threatening situation. In this study, 120 students were placed in a situation where the greeting speech act should occur, and their participation was recorded in an authentic oral performance. All the students were given a computer-based pre, post, and delayed post-test, including various questions designed to evaluate general greeting practices and the use of various expressions and their appropriateness in different contexts. The students were also asked to demonstrate some awareness of the differences and importance of practicing greetings in questionnaire responses that followed the study. The treatment groups were given structured input-based and awareness-raising tasks. (Ellis 2003) This researcher believes that a communicatively competent person should be able to greet someone in an appropriate manner in the target language. Without this skill, it is challenging to appear competent. This researcher will present findings from the study and discussion that explore this idea of language acquisition and how explicit pragmatic instruction fits into core L2 education goals.

Trademark(tm): a usage-based theory of the trademark sign in the U.S.

Lecture

Dr. LaReina Hingson¹, Ms. Kyra Larsen¹, Mr. David Chandler¹, Mrs. Ellie Dearden¹, Ms. Abby Carr¹,
Ms. Amy Clayton¹

1. Brigham Young University

The trademark sign™ was created for general use by the public as an unregulated legal shorthand for trademark protections. Since its creation it has been used in a variety of discourse contexts. Much of the existing work on trademark centers on the legality of the phrases to which the sign is attached. This study examines the use of the sign itself across written contexts regardless of legal determination of the phrase. Of chief concern was the question: How is the sign used in written communication to systematically convey meaning, and what meaning is conveyed? Secondary was the consideration of how interpretations of parody sometimes resulted from such conveyance.

Using a grounded theory approach (a systematic methodology for developing usage-based theory; Glaser and Strauss, 1967), we collected data using convenience sampling. Grounded theory has been called for by Philips and Egbert (2017) as an informative way to study law language. Grounded theory methodology requires data to be collected until ‘saturation’ had been achieved (Hadley, 2017). In our case, saturation was achieved and data collected to confirm this, resulting in 237 instances across 8 social media platforms. Using trademark law to inform our data coding, we developed a theoretical model of the trademark sign.

Trademark sign theory (simplified):

Word Form + Sign TM (branding, ownership, legitimacy) = Mark

This theory was supported and elaborated by pragmatic theories such as relevance theory (under which information derived from logical deductions and presuppositions are explicature rather than implicature, an orientation we found simplified our analysis of the legal encoding of the sign™; Sperber & Wilson, 1986; Wilson & Sperber, 2012). Under our theory, a set of word forms can be used, and when the trademark sign is added, it always carries a meaning of *legitimacy*, *branding*, and *ownership* which in turn functions to make the propositional content of the phrase generic, thereby creating a mark.

For example, *Jeep Guy*™ includes the identification of word(s) “Jeep Guy”, the addition of the sign “™” to add explicit meaning of legitimacy, branding, and ownership to the user of the mark “Jeep Guy™”. As a mark, the term “Jeep Guy” no longer refers to a specific ‘guy’, ‘jeep’, or referential ‘jeep guy’, but instead systemically refers to a new predicate category “Jeep Guy”.

In discourse, this mark can then be used for a variety of functions, including parody. For example, mismatches in the claim of ownership (i.e. the Self claiming ownership vs. assigning the ownership to another as in *NiceGuy*™), branding (i.e. claiming uniqueness for a non-unique product, such as *egg*™), or legitimacy (e.g. adding or redacting the meaning of the phrase once it’s been made a mark, as in *kenobi’s mullet*™ or *Hermes with shades (tm)*) make the mark one of parody.

The benefit of this approach is it theorizes the use of the sign independent of the effectiveness of a legal claim, leaving the legal judgment up to the law and allowing legal judgment to ‘reflect consumers’ perceptions of language’ (Heymann, 2020).

Translanguaging, “English only” and silence in the university classroom

Lecture

Dr. Toni Dobinson¹, Dr. Qian Gong¹, Dr. Paul Mercieca¹

1. Curtin University

Translanguaging literature has broadly discussed translanguaging as fostering expressive and creative interactions within classroom contexts. Often overlooked, however, are the responses of students who are encouraged to translanguage in spaces they previously deemed to be reserved for the dominant language only. Encouragement of expressive translanguaging assumes there will be successful and meaningful uptake; what may instead occur is student uneasiness with translanguaging due to embedded perceptions of one language being expected in the classroom. To overcome this barrier, plurilingual students may use their full spatial repertoires which go beyond language to peer support (social networks), the use of objects in the material ecology of the space (e.g. laptops, papers and pens) and the use of their bodies. In combination, these assemblages generate meanings according to the situation, the context, and the communicative requirement. Without encouragement for learners to use their full spatial translingual repertoires, prolonged silence may develop. This silence can be used for positive contemplation, and processing of new material important to translanguaging, but, equally it can indicate confusion, insecurities in language competence or subject knowledge, passive disengagement or demotivation, embarrassment or shame in front of peers.

Using Linguistic Ethnography, we investigate the interactions of eight Chinese university students in two classroom settings at an Australian university. We examine how explicit or implicit English only norms at this university, combined with students' beliefs about English use, affect translanguaging practices and how English as an additional language (LX) users incorporate various resources, including spatial repertoires, peer support, and silence, to varying degrees of success within two different EMI classrooms. The pedagogical implications of this examination point towards academics and practitioners needing to embrace and legitimise translanguaging practices, not only at classroom level, but at course, university and policy level.

Trilingual code switching among Yunnanese migrants from Myanmar in Taiwan: A conversation analysis approach

Lecture

*Ms. Haw-Yuann Maa*¹

1. National Taiwan Normal University

Code switching has been studied extensively in recent decades as multilingualism becomes more prominent with the emergence of language contact and interaction. This phenomenon shows speakers' linguistic competence in two or more languages and how they switch from one language to another for various functions during discourse. In Taiwan, there is a group of Yunnanese migrants from Myanmar who are trilingual speakers of Yunnanese, Burmese, and Mandarin Chinese. They are the second-generation migrants from Yunnan, China, who were born and raised in Myanmar and received formal Burmese education before moving to Taiwan as teenagers for further studies or better job opportunities. Although there has been an extensive study by Chang (2014) on the anthropological aspect of Yunnanese migrants from Myanmar, no previous studies have looked into the linguistic features that this group of speakers possess, most notably code switching. They are fluent in all three languages, and when they talk to each other, they are constantly code switching between the three languages. This study hopes to examine the conversation among this group of trilingual speakers and find out the patterns and factors that motivate code switching through conversation analysis despite their similarities in linguistic, social, and cultural backgrounds. Quantitative and qualitative analysis will be conducted on the conversation between three sisters with similar upbringings, focusing on different code switching types, including extra-sentential, inter-sentential, and intra-sentential code switching. Results from recorded trilingual conversation among the sisters indicate that switches between Mandarin-Burmese and Yunnanese-Burmese showed similar patterns, while Yunnanese-Mandarin code switch occurred at a much lower rate. This may be due to the linguistic distance (Wichmann et al. 2010) between the three languages, in which Mandarin and Yunnanese have a much closer distance and may serve similar social or pragmatic function in discourse. Furthermore, the usage of 'we/they code' (Sebba & Wootton 2013) was also present, despite the fact that there were no other participants in the conversation.

Typical/Atypical Inference Levels in Low-Context Culture: A Comparison of Generation Zs and Millennials in the UK Using an Asian TV Drama Clip

Lecture

Prof. Mariko Boku¹

1. Ritsumeikan University

Mutual understanding is crucial for avoiding conflicts and disputes in a multicultural setting, and algorithmic or logical reasoning might be useful for accomplishing this. Some state that logical reasoning does not require knowledge used in the real world. If this is true, then logical reasoning has limitations for resolving misunderstandings in multicultural contexts. The present study aimed to examine whether typical/atypical inference patterns were present in a “low-context culture” as the term was defined by Edward Hall in *Beyond Culture* in 1976, by focusing on a procedural schema, or representation of how people perceive or process information, as opposed to a conceptual schema, or semantic knowledge. This study compared inference levels, or layers or hierarchies of inference, of Generation Zs and Millennials in the United Kingdom. Participants were 33 UK university students (16 Generation Zs and 17 Millennials, or 18 L1-English speakers and 15 non-L1-English speakers). The non-L1-English speakers were from India, Mexico, Hungary, Spain, Russia, Germany, China, Colombia, Malaysia, and Palestine. Participants included 17 males and 16 females, whose average age was 23.1 years. The data were collected by snowball sampling with permission from the ethics committee at a UK university. Materials included an Asian TV drama clip and scales for thinking dispositions. The hypothesis was that there was a difference in inference levels between Generation Zs and Millennials in the UK. The inference levels were coded for statistical analysis. This paper discusses the results as to whether the inference levels of Generation Zs and Millennials in the UK are different, as well as the relationship between inference levels and thinking dispositions. The paper further discusses some limitations and implications of the study.

Typicalising language shift as inevitability: From German to English at an Austrian university

Lecture

*Dr. Marion Nao*¹, *Prof. Kristina Hultgren*¹

1. The Open University

The presentation draws on interview data with 18 participants in different roles within teaching, administration, and governance at university and ministerial level in Austria to examine the accounts they give of the increasing use of English for academic degree programmes unrelated to English, i.e., with no subject-intrinsic reason for the use of the language. Among these, we see a typicalising of English and corresponding atypicalising of German, the official and most widespread societal language. While bilingualism is projected as an outcome of Englishisation, or the increasing use of English, domain-specific monolingualism in the form of instruction paves the way. Such shift, from German to English, is largely presented as inevitable against the wider backdrop of an internationalised academe.

The paper is guided by the research question: How is the shift to English for academic programmes typicalised in participant accounts? In particular, this is explored via framing of formulations that either implicitly or explicitly link English with ongoing and increasing internationalisation, as both a present reality and future inevitability of the modern academe. Such typicalisation or symbolic representation, or indeed mapping of English onto the abstract concept of internationalisation, in itself atypicalises the default alternative, i.e., the German that has previously solely occupied the terrain, in an assumed bilingual relationship. Nevertheless, the atypicalising of German does not remain an unstated alternative; it is indeed exemplified in a participant observation that ‘Germanification is not internationalisation’.

While English has become, or is in the process of becoming, more typical as it increases its presence in the internationalised curriculum, a shift reflected in the accounts of the participants, there are domains within domains or speakers among speakers for which/whom it is formulated as atypical, and the German language as typical. These include stage-based domains of both structure of the degree cycle (bachelor programmes) and human work and life cycle (older academics), as well as relevance of the wider societal domain to disciplinary field. Such embedded reversal of typicality is also examined to better understand the contextual constraints that frame typicality in participant accounts.

Understanding styling practices through the lens of metapragmatics

Lecture

Mr. Florian Grosser¹

1. University of Vienna

Styling practices are a well-established topic in Japanese sociolinguistics. Research has refuted the idea that certain style choices, such as the use of honorifics, directly index the grade of contextual formality in social interactions (e.g. Okamoto 2011). Styling practices have also been investigated with regard to Japanese-as-L2 users' acquisition and situated use of "polite" forms (Cook 2008) and, more recently, a focus on how non-native users perceive and reflect on these styles in classroom settings has emerged (Barke & Shimazu 2022). However, research on metapragmatic perceptions outside the classroom are still lacking.

This research will build up on these works and show how styling practices can be understood through the lens of metapragmatics. It will illustrate how use and shifting of speech style is calibrated in semi-formal interview contexts in which the researcher has to negotiate different degrees of rapport with the interviewees (L1 and L2 users of Japanese), and how the researcher reflects on these interactions in an ethnographic field diary.

The data stem from two sources:

- Audio and video recorded interactions in interviews. The interviews were conducted by the researcher in Japanese in the context of a doctoral research project that investigates ideologies of language (learning) that surface in interactions of L1 and L2 users of Japanese.
- Ethnographic vignettes, i.e. the researcher's self-reflection on his own linguistic practices when looking back at interactions with the research participants. These reflections raise questions about his own metacommunicative competence as a non-native user of Japanese conducting research with different Japanese speakers and how to establish a closer relationship while maintaining the "professional formality" in an interview setting.

I will take a discourse-analytic approach to analyze how metapragmatic acts extend over two communicative events (Wortham & Reyes 2021), i.e., interviews and ethnographic reflections.

The analysis will demonstrate that style choices and perception of choices offer a distinction between levels of metapragmatic awareness.

- How the interviewer and interviewees actually shift between styles in the interview (first level).
- What the interviewees say about their style choices in interactions they had in the past (second-level).
- How the researcher reflects on his own style choices in interactions in his field diary (third-level).

It is shown that metapragmatic awareness of style permeates all levels and that situated shifting of styles indexically presupposes and creates the **context** (the perceived grade of formality of an interview situation) and the **social relation** or rapport between the participants (the calibration of closeness between the researcher and the participants). The L2 users of Japanese tend to orient to normative perceptions of style while also expressing doubt whether they want to do this.

Understanding the Affective Aspects of Chinese Relational Practice from the Perspective of “Heart” and “Face”

Lecture

Dr. Linlin Fan¹, Prof. Yongping Ran²

1. Jinan University, 2. Center for Linguistics & Applied Linguistics, Guangdong University of Foreign Studies

Even following recent strides (e.g. Locher and Langlotz 2008; Chang and Haugh 2011; Langlotz and Locher 2017, 2013; Ran and Zhao 2018; Chang 2018; , to list a few), the pragmatic study of interpersonal emotions (i.e., affective aspects of relational practice) is still in its infancy. The understanding of interpersonal emotions is to some extent reflected in “face”, which is documented as an emotionally invested phenomenon (see, for example, Ho, Fu and Ng 2004; Goffman 1967; Ruhi 2009; Spencer-Oatey 2009, 2007; Culpeper 2011). In Chinese context, there are few attempts to theorize emotions (or *qing* as the indigenous concept in Chinese linguaculture) under the umbrella of “face” (e.g. the theorization of “affection-based face”/“qingmian” in Ran and Zhao 2018; Zhao and Ran 2019; the discussion of emotivity/“qing” and face in Chang 2018). However, there has been debates about whether “face” is the best metaphor to explain the “relational”, how much face actually is relevant in the relational practice and whether face can adequately explain the relational practice in different cultural contexts (O’Driscoll 2011; Intachakra 2012; Arundale 2013; Fukushima 2015). Answering the call of Emancipatory Pragmatics that scholarship should break free its analysis “from the confines of theoretical orthodoxies grounded in dominant thought and practice” (Hanks et al., 2009, p. 2), there are a few tentative attempts in some Asian-based pragmatic investigations to explain relational practice with the “heart” metaphor alongside the orthodox “face” metaphor (e.g., Intachakra 2012; Fukushima 2015).

The current study seeks to contribute to this emancipatory line of theorization by 1) presenting interactional evidence on the relevance of “heart (*qing* as the indigenous concept in Chinese linguaculture)” in Chinese relational practice; 2) exploring the various strategies for doing “heartwork”, and 3) discussing the relationship between the orthodox “face (*lian/mianzi* as the indigenous concept in the Chinese linguaculture)” perspective and the alternative “heart” perspective. To be specific, we examine medical professionals’ management of interpersonal emotions (i.e., the interactional achievement of “heartwork”) when they perform the potentially heart-threatening act (HTA) of “urging payment”. We draw our data from a medical documentary series recorded in the obstetrics department and neonatology department of a Grade-III Class-A hospital (Chinese hospital ranking system) in China. The very act of “urging payment” is not in itself heart-threatening in the institutional context of health care, but it can be rendered “heart-threatening” under certain interactional context. When performing the potentially heart-threatening act (HTA) of urging payment, the medical professionals are found to make extra interactional efforts to render interpersonal emotions “‘appropriate’ to the situation” (Hochschild 1979). It is exactly these extra interactional efforts that we are interested in in this particular research.

This research may contribute to the understanding interpersonal emotions in the underrepresented cultural context of China, and the under-researched medical context of the obstetrics and neonatology.

Key words: interpersonal emotions, medical interaction, heart (*qing*), face (*lian/mianzi*)

Unpacking ‘baby man’ in Chinese social media: A feminist critical discourse analysis

Lecture

Dr. Qian Gong¹, Ms. Yifan Chen¹

1. Curtin University

Unpacking the ‘Baby man’ in the Chinese social media: a feminist critical discourse analysis

Yifan Chen, Qian Gong

Abstract

From April to June 2022, Chinese social media, mainly Weibo, witnessed three high-profile gender-related incidents that drew the attention of the Chinese public. These incidents caused widespread wrath among female groups and sharply accelerated the debate on gender equality on Weibo, the Chinese equivalent of Twitter. In response to the debate, the nomenclature ‘baby man’, in Chinese 男宝, became a popular metaphor of men as self-centred giant babies coddled by an entire patriarchal society, and the ‘baby boy’ discourse was widely spread on Weibo.

By adopting the Feminist Critical Discourse Analysis (FCDA) both as a theoretical foundation and a specific qualitative analysis method, this article seeks to critically examine how gender power and relationships are discursively produced, represented and resisted through the ‘baby man’ discourse on Chinese social media. Specifically, it unpacks how ‘baby man’ is linguistically represented and how different ideologies emerge and are negotiated through the discursive construction of this catchphrase. Through a case study of 43 posts containing ‘baby man’ on Chinese social media, the paper explicates how these posts echo the complex historical and sociocultural backgrounds of the discourse on masculinity gender relations. The finding suggests that the ‘baby man’ has employed discursive strategies, namely: the double irony in ‘baby man’; the blunt resistance against both gender and power relation, which deconstruct the heteropatriarchal gender norm through the mother-son female gaze; and contempt for the nation’s past and current fertility policy. It argues that despite the perennial censorship, these three discursive strategies help reconstruct the extant gender hierarchy backed by conservative Confucianist ethics and challenge the political authoritarianism indoctrinated by the state. The paper concludes that the proliferation of the new term ‘男宝baby man’ has a significant impact on reconstructing established gender relations and resisting China’s authoritarian political power in a highly-censored online environment.

Use of inscribed objects in role-play training sessions at a Japanese insurance company

Lecture

*Ms. Koyuki Mitani*¹

1. *University of Hawaii at Manoa*

Roleplays are widely employed to train novice professionals across various professions. Previous studies on roleplays have illustrated social members' interactional work for dual framing of roleplays—a roleplay frame and a frame that indexes the occasion of the roleplay (e.g., language testing, training for professionals). They have explicated how participants accomplish roleplays by mobilizing their membership knowledge of the social settings directed for the roleplays. At the same time, it has been noted that participants orient to the wider contexts of roleplays in which the current roleplays are occasioned. For example, Linell and Thunqvist (2003) who investigate simulated job interviews observe that participants shift their roles as interviewers and applicants to being unemployed youths and project counselors by conducting advice-giving. This shift is occasioned when instructing the youths becomes relevant in the on-going simulated interviews. As they showed, dual framing of roleplays is a practical task for participants. For roleplays designed as training for professionals, dual framing of roleplays plays a crucial role in instructing novice professionals.

In professions where inscribed objects figure as essential objects (Weilenmann & Lymer, 2014), training novices in the effective use of the inscribed objects is vital. However, to my best knowledge, no study has conducted to examine how the use of inscribed objects are instructed through roleplays. This study aims to fill in the research gap by examining how a trainer at a Japanese insurance company instructs trainees in the use of insurance brochures in roleplays.

The data come from approximately 33 hours of video recordings of the roleplay training sessions. I adopt multi-modal Conversation Analysis (Goodwin, 2000; Mondada, 2018, 2019) to delineate the participants' embodied actions with insurance brochures, which were constitutive of the organization of the instructional roleplays. The analysis reveals that instruction is achieved as the participants maneuver two coexisting interactional frames – a roleplay frame and a training frame - by manually handling insurance brochures in roleplays. Specifically, I identified two actions that trainers' dual framing with brochures accomplishes: assisting and correcting a trainee. For example, while maintaining a roleplay interaction through talk (e.g., question-answer sequence regarding a proposed insurance plan), a trainer simultaneously opens a particular page of an insurance brochure to assist a trainee to formulate the answer to the question, thereby enacting dual framing of the roleplay. The study explicates how the participants coordinate their actions in the concurrent dual frames to achieve the situated instructions that cater for the specific instructional needs emerging from the roleplay interaction at the moment. By illustrating how the two frames are intertwined with each other, I attempt to show that dual framing of roleplays with a brochure is an instructional resource for the trainer to adapt her instruction to the trainees' roleplay performances on site. The findings of the study advance our understanding of the organization of roleplay as training by illuminating the role of inscribed objects in instructing novice insurance agents.

Vaccine indecision on Mumsnet Talk over time: ‘I am still unsure...’

Lecture

*Dr. Zsofia Demjen*¹, *Dr. Tara Coltman-Patel*², *Mr. William Dance*², *Dr. Claire Hardaker*², *Prof. Elena Semino*²

1. University College London, 2. Lancaster University

Vaccinations are among the most effective public health tools at our disposal and have resulted in the eradication of or reduced morbidity and mortality from multiple communicable diseases. Yet, vaccination programmes in 90% of countries in the world have been affected by delayed acceptance or refusal of (some) vaccines despite availability of vaccination services, a phenomenon known as ‘vaccine hesitancy’ (Lancet 2019). Online parenting forums are popular information sources about vaccinations as well as being useful channels for expressing and discussing concerns (Betti et al., 2021; Campbell et al. 2017). Yet relatively little is known about what concerns are raised ‘in the wild’ (as opposed to in surveys) and how.

In this talk we examine text dispersion keywords (Egbert and Biber 2019) in a boutique corpus of 422 Original Posts (ca. 68,000 words) expressing indecision and hesitancy around vaccination on the popular UK-based parenting site, Mumsnet Talk. We describe how we combined automated and manual strategies to identify the 422 relevant posts amongst the 12,380 in a 31-million-word corpus of vaccination discussions on Mumsnet, before comparing these to other discussions about vaccinations on Mumsnet Talk. We outline the key concerns related to indecision (e.g. timing and combination of vaccines, side-effects and adverse reactions in particular personal circumstances, etc.) and how these change over time. We then zoom in on keywords related to the side effects of vaccinations (‘effects’ and ‘reaction’) as a special case study to explore how the imprecise use of such terms, both in our data and more generally in English, might contribute to vaccine indecision.

Verbal humor as a discourse strategy in the environment of adult education: negotiating distance, equality, and othering

Lecture

*Dr. Giorgos Giakoumakis*¹, *Prof. Marianthi Georgalidou*¹

1. *University of the Aegean*

The aim of this presentation is to study adult learners' and educators' discourse strategies and identity construction processes in the context of adult education. More specifically, we investigate humor as a discourse strategy serving the construction of social identities in communities of practice of lifelong learning. We analyze data collected via ethnographic participant observation and the digital recording of spontaneous discourse in the said environment. We apply discourse-analytical approaches to investigate the conversational organization of adult classroom interaction (McHoul, 1978; Mehan, 1985; Seedhouse, 2004; Liebscher & Dailey-O'Cain, 2004; Markee, 2009). We also apply the General Theory of Verbal Humor (Attardo & Raskin, 1991; Attardo, 1994, 2001; Archakis & Tsakona, 2005, 2006) to tackle the sociopragmatic parameters of humorously negotiating identities and power relationships in the environment of adult education.

The systematic analysis of naturally occurring recorded speech in the context of Greek adult classroom humorous interactions shows that interlocutors select targets both outside and inside the educational community. In the first case, humor constitutes a strategy for *othering* exploited by conversationalists to construct shared beliefs and values and strengthen in-group bonding. In the second, it correlates to face management strategies as it attempts to negotiate power relationships within a traditionally organized educational environment in which interaction management is considered the right of the instructors. What is more, data analysis reveals that humorous utterances are selected by educators targeting learners and learners targeting educators alike, to establish increased levels of intimacy contributing to the construction of a less asymmetric relationship between the parties involved. Finally, it is shown that via humor, adult learners negotiate identities of equality transcending age/generation discrepancies in life long educational environments.

War symbols and anti-Asian sentiments in online animal rights advocate discourse

Lecture

*Dr. Arisa Koba*¹, *Mr. Yingqian Zhang*²

1. Nagoya Bunri University, 2. Osaka University

This lecture will demonstrate the results of the discourse analysis of an animal rights group's Facebook page, which has been conducted by authors since 2021. The target of the analysis is the Facebook account of an animal rights advocacy group based in England, its posts, and the comments made on them. We collected our data from the target account's posts and comments made by its followers between March to December 2020, the year which saw a surge of anti-Asian hate speech following the outbreak of novel coronavirus disease. The posts of the account consist of criticism against animal cruelty worldwide, calls for donations, the promotion of their goods, etc. The posts and top 30 (or more) comments were analyzed by the authors using the methodology of critical discourse analysis. Our focus in the lecture will be on comments including war symbols such as "bomb" or "nuke," how they are used, and what discourse is (re)produced by them. Our purpose is to examine the way in which war symbols are used to maintain what van Dijk called "dominance," or the "discursive strategies [of elites] for the maintenance of their inequality" (van Dijk 1993), as well as to unveil the process by which racist discourse is (re)produced in communities which are supposed to be humanitarian, such as animal rights advocacy group.

We found that in our data, almost all the comments including war symbols such as "bomb/nuke them" were elicited from posts criticizing Asian countries. The comment below was aimed at a post on May 6th, which criticized the trafficking of pangolins in China.

No surprise the monsters and to think the British and allies bailed the out the 2nd world war, we should of nuked the bastard's like Japan anoughter murdering killing nation [sic]

This comment clearly shows the writer's position as a "victor country" or the "bomber" and justifies genocide during war-time. The fact that this discursive strategy was employed toward China, the former Axis, indicates that its use is not based on the actual war-time ally/enemy relationship but more likely related to anti-Asian sentiment. Such use of war symbols has been observed with racist connotations. In the "parody" book of O. J. Simpson's trial case, titled "O. J.'s Legal Pad," the drawing of the Judge Lance Ito, the Japanese American judge who was in charge of this case, repeatedly appears with slanted eyes and is depicted as a "kamikaze" warrior. There is even a poem attached to one drawing, saying "HIROSHIMA, NUKE JUDGE ITO, BANZAI, BANZAI, NAGASAKI" (Lee 1995, Kim 1999). Even though symbols such as "nuke" allude to the "victor/defeated countries" or "the Axis/Allies" of World War II, our data show that they are opportunistically used in anti-Asian discourse.

While delineating the role of these symbols in forming the writers' positions and maintaining their dominance, we will also clarify the process of (re)producing racist discourse, even under a supposedly racially neutral agenda such as animal rights advocacy.

What are the emic understandings of attentiveness in Japanese?

Lecture

Dr. Saeko Fukushima¹

1. Tsuru University

This paper attempts to investigate politeness as consideration in Japanese through the lens of attentiveness (*kikubari*, *kizukai*, *kokorokubari*, *kokorozukai* in Japanese). Attentiveness is demonstrated after reading the atmosphere in a situation and inferring the other party's needs. Although the Japanese participants in Fukushima (2020) considered attentiveness as one of the major constituents of politeness, they wrote only one word, 'attentiveness', when they were asked to conceptualise politeness. In this presentation, we probe how Japanese lay people interpret attentiveness more in detail by investigating Twitter data posted by Japanese people.

600 posts were collected, using hashtags. The keywords included *kikubari*, *kizukai*, *kokorokubari*, and *kokorozukai*. The posts were coded based on analysis of the content. The results show that the posts which were categorised in 'People' (who demonstrate attentiveness, including lay people and celebrities) accounts for the biggest proportion (38.44%) in the data. The posters not only made positive evaluation towards them, but they were also helped by the attentiveness demonstrated by lay people. The posts, which describe the celebrities, showcase the posters' admiration towards celebrities who can demonstrate attentiveness and/or posters think that the celebrities succeed, as they can demonstrate attentiveness.

The posts which were categorised in 'Importance of attentiveness' has the second highest frequency (21.17%) in the data. Some posts state the importance of attentiveness in general, and some other posts the importance of attentiveness in business. There were some posts, which were categorised in 'Pointing out the lack of attentiveness'. The posters not only point out the lack of attentiveness of other people, but also the posters themselves. It is shown that posters want to be able to demonstrate attentiveness from the posts categorised in 'Desire of the posters'. Although the number of the posts was not many, there were some posts which define attentiveness, which show that some people pretend to be a nice person, and which praise the posters themselves. The posters in the latter two say that they can demonstrate attentiveness. The posts which express negative interpretation of attentiveness were the fewest (1.14%) in the data.

These results show that Japanese lay people evaluate attentiveness positively in most cases and that they think they should demonstrate attentiveness. These results may be related to ideology in Japanese culture, namely that attentiveness is a virtue. Some posts, however, indicate that there are some people who cannot demonstrate attentiveness these days.

In the presentation, some representative posts in each category are also investigated qualitatively, and politeness in Japanese is discussed in relation to attentiveness.

What disruptive effects in cognitive processing should be taken into account in sign language interpreting? The case of interpreting in a medical context

Lecture

***Mr. Alain Bacci*¹, *Dr. Franck Amadieu*¹, *Dr. Fred Paas*², *Dr. Florence Encreve*³**

1. CLLE, Université de Toulouse, CNRS, Toulouse, France, 2. Erasmus University Rotterdam, 3. Université Paris VIII

Interpreting is a very complex task from a cognitive point of view, as it involves the quasi-simultaneous processing of information in several sensory channels under time pressure. The problem is even more complex when interpreting from a vocal language (VL) to a sign language (SL), as the visual channel is then called upon both to process the language and to process the feedback needed for communication. The fact that these activities can easily overload the cognitive system makes the task of the interpreter, but especially the training for this task, difficult.

Cognitive load theory (CLT) can be particularly useful in providing guidelines for the design of training for the interpreting task. CLT aims to optimise the learning of complex cognitive tasks by transforming contemporary scientific knowledge about how cognitive structures and processes are organised (i.e. the cognitive architecture) into guidelines for instructional design. To achieve this goal, cognitive load researchers attempt to develop pedagogical control of cognitive load by designing methods that substitute productive cognitive load for unproductive cognitive load. The principles used by CLT can be used to design interpreter training.

Our thinking on the design of interpreter training is based on two approaches. The first is based on the use of cognitive load theory, which takes into account the cognitive complexity of the interpreter's task and can provide guidelines for training design. The second approach is to identify the heuristics and strategies that experienced interpreters have developed to reduce cognitive load when interpreting, and to transfer this knowledge to learners through appropriate exercises.

This research, which aims to better understand how interpreting works in order to better teach it, is based on a cross-sectional exploration of several studies:

- 5 filmed observations of French vs. French sign language interpreting carried out under usual working conditions followed by introspective interviews with interpreters to study the actions implemented when they encounter cognitive obstacles (explicitation of heuristics, identification of strategies to solve interpreting problems).
- Verification on a larger corpus of interpreting in order to identify the most frequent treatments. This corpus is currently being built up (massive collection of interpretations made during television news programmes).
- An experimental study aimed at identifying the most effective and transferable cognitive processes: interpretation of a 20-minute conference specifically designed to lead 15 interpreters to implement a maximum number of processing and problem-solving strategies in interpreting.

The pragmatic dimension, i.e. taking into account the speakers and the context, is an important source of cognitive load. It is therefore an integral part of this research. F/LSF interpreting in a medical environment, where the medical gesture, the position of the speakers and the management of gaze are particularly important, will be illustrated during the conference.

What happens to interpersonal pragmatics when everybody swears? Relational and identity functions of swearing in *Only Murders in the Building*

Lecture

*Dr. Karyn Stapleton*¹, *Dr. Kristy Beers Fägersten*²

1. *ulster university*, 2. *Södertorn University Stockholm*

INTRODUCTION: SWEARING & INTERPERSONAL PRAGMATICS

Swearing fulfils interpersonal pragmatic functions, which we have previously investigated (Stapleton, 2010, 2020; Beers Fägersten, 2012, 2017; Beers Fägersten & Stapleton, 2017, 2022; Stapleton et al. 2022). It readily serves negative relational purposes such as aggression, insult, and impoliteness; but equally, it may achieve positive outcomes such as humour, affiliation, facework, and intimacy/trust. In addition, swearing shows intra-individual variation and can serve as a powerful identity resource.

The power of swearing in achieving these effects lies, at core, in its *potential to shock and offend*. In turn, this means that swearing, more than most other linguistic activities, is highly context-dependent for its meaning and consequences. The latter derive largely from the social constraints associated with different categories of speaker and different interpersonal settings.

RESEARCH TOPIC & DATA: WHAT HAPPENS WHEN EVERYBODY SWEARS?

The mystery-dramedy series *Only Murders in the Building* (OMitB, 2021–) takes place in New York City and features a cast of characters reflecting high socio-demographic variation. Airing on the Disney+ streaming service, the series is not subject to FCC regulations regarding the use of obscene language and hence, OmitB includes frequent swearing. All of the otherwise diverse array of characters have in common the recurring use of swear words, such that swearing does not differentiate characters or settings. The interpersonal swearing behaviour exhibited by the cast of characters thus conflicts with research evidence of swearing as occurring mainly among interlocutors who are socio-demographically similar and, in the context of television series, mainly among a subset of characters.

This paper explores the impact of such ubiquity on the interpersonal functions of swearing; and on its reception, both by the characters themselves and potentially by the viewers of the series. A systematic sample of episodes has been transcribed and subjected firstly to a quantitative *content analysis* of frequency, swear word tokens, and character/situational variables: and then to a qualitative *discourse analysis* of interpersonal pragmatic functions. We consider three specific research questions: (1) What relational purposes are achieved by swearing as shown in the series? (2) Do the swearing practices used by the characters index any socio-demographic variables or situational features? (3) What can this analysis tell us about the role of pragmatics in swearing and/or the relationship between scripted versus naturalistic swearing practice?

What is hidden from you: Implicit pragmatic phenomena in Hungarian fake news headlines

Lecture

Dr. Zsuzsanna Németh¹, Dr. Katalin Nagy C.¹, Prof. Enikő Németh T.¹

1. University of Szeged

The study of various types of false information (e.g. lying, disinformation, fake news) has recently become a central topic in pragmatics (e.g. Meibauer 2019). One of the aims of this line of research is to find automatic ways of detecting presumably false information on the basis of linguistic analysis of texts. A special attention is devoted to fake news and their headlines (e.g. Chen et al. 2015). Former research focuses on search for overt linguistic elements, such as pronouns, forward referencing devices, superlatives, definite referring expressions, and intensifiers (Scott 2021).

Transmission of false information frequently uses implicit pragmatic contents that seem to be challenging to identify, because they do not have explicitly available forms. Németh T. et al. (2022) provide some methods to retrieve such implicit phenomena from corpora. Continuing this line of research, the present paper aims to examine three hidden phenomena in fake news headlines: implicit arguments (e.g. implicit subjects and objects), implicit contents in speech acts (incomplete propositional content, implicit illocutionary force), and implicatures (both conventional and conversational). The investigation is based on a corpus consisting of 1000 Hungarian health-related fake news headlines and 1000 non-fake ones.

Relying on manual qualitative and automatic analyses, the main results of the research are the following. While non-fake news headlines are intended to be more informative, fake news headlines often create an information gap (cf. Scott 2021) or suggest implicatures to arouse addressees' curiosity manipulatively. Three manipulative strategies are revealed. (i) In contrast to other types of language use, in the case of fake news, implicit arguments in the headlines are not always resolved in the body of the article, but are used as a manipulative strategy to generate clicks. (ii) Some headlines contain speech acts with incomplete propositional content. Although the explicitly conveyed part of the content is enough to make addressees be able to infer the illocutionary force of the speech act, the information gap triggers a psychological effect on them and makes them click on the headline. (iii) As for implicatures, they are more frequent in fake news headlines than in non-fake ones, presumably because their use allows to avoid responsibility for manipulative information transmission. Finally, it can be concluded that a corpus-based analysis of implicit pragmatic phenomena is possible in fake news headlines and qualitative, manual analysis and a suitable pragmatic annotation may contribute to automated fake news detection.

What role play and elicited conversation can tell about L2 interactional competence?

Lecture

Mr. Jingxuan Wu¹, Prof. Carsten Roever¹

1. University of Melbourne

In L2 interactional competence (IC) studies, role plays and elicited conversations are the most commonly adopted data elicitation methods. However, no studies to date have compared role play and elicited conversation task to investigate what information about L2 IC these two methods can elicit. This study fills this gap. Data were gathered from 54 L2 learners of Mandarin Chinese at four proficiency levels and 12 native speakers of Chinese. Participants were assigned to dyads consisting of similar proficiency level. Each dyad did one elicited conversation task and two role plays.

This study found that elicited conversation tasks were more capable of eliciting topic management, including topic initiation, extension, and shift sequences. Role plays have strengths in eliciting large-scale sequential organization to manage disaffiliative social actions (i.e. preference organization). Specifically, in role plays, interlocutors can deploy pre-expansions, insert-expansions, and post-expansions to organize requests and refusals as dispreferred social actions. Dispreferred actions were observed in both instruments, but the preference organization for disagreements shows clear instrument effects, especially for upper-intermediate level learners. In elicited conversations, these learners organized disagreements as preferred social actions, characterized by immediate response, straightforwardness, and less mitigation. By contrast, upper intermediates' refusals in role plays showed typical features of dispreferred social actions. Their refusals were usually delayed by sequential and linguistic devices, and a higher degree of elaboration, implicitness, and mitigation were observed. The instrument effect was less observable in the advanced level learner' and native speaker corpora. This study has implications for research in L2 interactional competence and for language assessment targeting particular aspects of learners' IC.

Keywords: L2 Interactional Competence, Role plays, Elicited conversation, method, comparison

When it comes to quantifiers, argumentativity is not only about quantity

Lecture

***Mrs. Nicole Katzir*¹, *Prof. Mira Ariel*¹**

¹. Tel Aviv University

The intuition that (1a) is more persuasive than (1b) is presumably accounted for by *several*'s preference for expressing higher quantities than *a few* (see Newstead et al., 1987; van Tiel et al., 2021, inter alia):

1a. The exam was difficult. Several students failed.

1b. The exam was difficult. A few students failed.

However, we argue that quantity alone is not enough to explain this argumentative difference between the two quantifiers. To do so, we present an experimental study and a corpus study. Our findings suggest that (a) *several* indeed contributes to a stronger argument than *a few*, (b) it conveys a larger quantity, and (c) it construes its nominal complement as being composed of individuated entities.

In the experimental study, participants (N=93) read negative product reviews, which included a quantified nominal with one of the quantifiers (e.g., *the remote control had a few/several useless buttons*). They performed two tasks. First, they marked on a scale how satisfied the review writer was with the product. Since all reviews were negative, if *several* is argumentatively stronger than *a few*, items with *several* should receive lower customer satisfaction (CS) scores. In the second task, participants assessed the quantity expressed by the quantified nominal.

Results showed that items with *several* received lower CS scores than items with *a few* ($p < .001$). Additionally, items with *several* were assessed as conveying a higher quantity ($p < .001$). A linear mixed-effects model revealed that higher assessed quantities led to lower CS scores ($p < .01$). However, the quantifier had a significant effect on CS scores, whereby the choice of *several* as a quantifier also leads to lower CS scores ($p < .001$). That is, there are factors beyond quantity that affect CS scores.

An examination of the discourse profiles (Ariel, 2008) of the two quantifiers in COCA (Davies, 2008-) reveals that the distributional patterns associated with each quantifier are indicators of the discourse prominence of the entity denoted by the nominal complement and of argumentative strength (Anscombe & Ducrot, 1983). As predicted, *several* is associated with high prominence, whereas *a few* is associated with low prominence.

Inspired by their diachrony, we argue that argumentativity, quantity, and individuation are motivated differently for each quantifier: for *several*, individuation motivated stronger argumentativity, which in turn motivated association with a larger quantity. For *a few*, its focus on the small size of the quantity motivated weaker argumentativity and, thus, a lower degree of individuation.

When Your Conference Presentation Takes An Atypical Turn: Audience's Question(ing) Design in Question & Answer Sessions

Lecture

Ms. Pınar Topal¹, Dr. Hale Işık-Güler¹

1. Middle East Technical University

“Asking a question is not an innocent thing to do,” as inquiries into what the recipient has said or done may involve potential disaffiliation (Steensig and Drew, 2008, p.7). Conference Question & Answer (Q&A) sessions, in particular, crystallize this interactional phenomenon as a nexus for submitting one’s work to the inspection of academia. In line with this notable point, the present study explores a hitherto neglected field of research within the domains of academic discourse: the language of conferencing. The production of ‘talk for an overhearing audience’ is a prominent characteristic of conference Q&As, as the audience members vigilantly attend to their institutional role-related rights: the entitlement to appraise the focal participants’ turns. The focal participants (i.e., the presenter and the enquirer audience members) may at any time “depart from formal turn-taking” and its typical manifestation as a result of this characteristic (Drew and Heritage, 1992, p.27). Correspondingly, while the typical design of audience interrogatives is ascribed as information-seeking, genuine questions, Q&A sessions also host atypical instances of objections to and questionings of presented works. Such departures from typical information-seeking questions towards questions that convey disagreement make conference Q&As a paramount site of struggle over academic identities, as they open the face of the presenter to threats by the negative evaluations that might come under the disguise of questions. In these sequences, the audience’s attempts at policing and gatekeeping, as well as the presenters’ means of resisting and accepting, are displayed through interactional-pragmatic phenomena. Our analysis offers a discursive account of the video recordings of 25 Turkish Q&A sessions held during a Linguistics conference, in an attempt to explore the appraisal resources (Martin & White, 2005) and the rapport management (Spencer-Oatey, 2002) orientations that the presenters and audience members employ in their atypical turns. Features of the audience’s atypical turn design, such as disaffiliative and evaluative question design, as well as the presenters’ strategies to restore routine conduct during conference Q&A sessions, are micro-analysed. The findings indicate that the members of the audience actively enact their here-and-now position as an information-receiving audience (and the K-epistemic stance that this role assumes) in the formation of genuine, information-seeking questions. Questioning, however, is found to instantiate the audience’s relative epistemic status (e.g., a senior with credentials of a potentially higher role in academia) against the presenting academic (e.g., an early-career researcher) in the larger context of academia through evaluative language. The study offers insights into the institutional ‘fingerprints’ of the professional community of academia, saturated in conference Q&A talk. The findings are conducive to the discursive literature on evaluative language and the institutional impoliteness embedded in the language of conferencing and have potential implications for our understanding of spoken academic discourse.

Who is the city for? Perceptions of ‘urban’ namesigns in semiotic landscapes of gentrification

Lecture

Dr. Gabriella Modan¹

1. *The Ohio State University*

This paper is an examination of interpretations of the word *urban* in namesigns in central-city DC neighborhoods. I conducted semi-structured interviews with African American, White, and Latinx residents and workers in central DC (the main ethnic groups in this part of the city). Participants were first shown closeup images of namesigns with the word *urban*, then images of the facades on which the signs were placed, and asked to discuss what kind of businesses the signs might represent, who the target clientele might be, and if their interpretations changed between the closeup and face images, before going on to a more general discussion of their associations with the word *urban*. Taking an ethnographically informed approach to the study of semiotic landscape (Blommaert 2013), I analyze how, given the interview data, material aspects of the landscape (type-face, color, building materials, store products, etc.) either foster or work against the resignification of *urban* as meaning hip and expensive. Underlying this new meaning are longstanding associations of *urban* in the US context as, alternately, dangerous, decaying, lively, diverse, or Black. When the visual and linguistic semiotics worked together to convey a sleek distinctiveness, *urban* directly indexed general hipness or, for some African American participants, Black hipness, while indirectly indexing qualities associated with the disinvested city (much like Hill’s 2008 finding that Mock Spanish directly indexed a relaxed demeanor while indirectly indexing a racist and demeaning image of Latinxs). When the various semiotic systems sent conflicting signals, participants either attributed older meanings to *urban*, or they had difficulty parsing the semiotics and couldn’t figure out what kind of business the sign might represent. While the newer meaning of *urban* was available to all participants, the older meanings were more available to African American and Latinx participants, and the *Black pride* meaning was only invoked by African American participants. Much like the *new school signs* conveying distinction that Trinch and Snajdr (2020) identified in gentrifying Brooklyn, NY, *urban* signs are part of a globally circulating symbolic economy that prop up and work in concert with 4th wave gentrification processes that rely heavily on “placemaking” (c.f. Gehl 1987) and upscale commerce – processes that benefit developers and capital interests, and often at the expense of the people mostly closely tied to semiotics wielded in the symbolic economy.

Working through idio-pragmatics: An approach in translation to analyzing historical contrastive pragmatics

Lecture

Dr. Damián Robles¹

1. Lamar University

Recently there has been an increase in research in the areas of historical pragmatics and im/politeness (*c.f.*, Kádár and Paternoster 2015; Jucker and Kopaczyk 2017; Kádár and House 2020). Previous studies—from Brown and Levinson, and others—have presented theories and applications relating to the analysis of politeness, and more recently, impoliteness phenomena (*e.g.*, the work of Culpeper, Bousfield, Locher, among others). Interdisciplinary approaches, in translation, dubbing and subbing, in literature and other fields have been the focus of current trends in pragma-linguistics and pragma-philology as well. Yet, studies on historical contrastive pragmatics and impoliteness research are lacking. Specifically, very little work has been done on Spanish historical data or on translations of historical Spanish literary works.

The present study applies the approach of *idio-pragmatics* to analyze historical pragmatics found in impolite discourse. It utilizes translation as a means of socio-historical analysis of 16th and 17th century face-aggravating language. Approximately 50 passages with a high frequency of *vos* were identified using a search function. These were then carefully analyzed to ascertain whether a correlation would be found between *vos* and the use of impoliteness. The passages were taken from the Spanish Brussels 1607/1616 and England 1612/1620 editions of *Don Quixote* in translation, and manually transcribed. The purpose of this investigation was two-fold. On the one hand it presents an approach to analyzing historical pragmatics/impoliteness using translation; and on the other hand, it describes the status and overarching dynamics of vocatives and terms of verbal aggressive nominal address in one of Cervantes' most celebrated literary creations, *Don Quixote*.

Preliminary findings show that impoliteness *formulae* in *Don Quixote*, embodied by the case of *puta* ('whoreson') and its variations, are literary tools to reinforce character development, stance, relational interaction, mood change, and so on. In the case of *puta*, this address term comes in multiple polysemic conventions ranging from an insult to a form of flattery. Impoliteness in *Don Quixote* reflects also prevalent meta-pragmatics concerning Early Modern Spanish period society, tirades against incivility, condemnation of bad religious practice, and attacks on others' physical and intellectual image.

Written responses to complaints – strategies and challenges in EFL interactions

Lecture

Prof. Sara Gesuato¹

1. University of Padua

The fulfilment of interpersonal/transactional goals requires the coordinated *inter*-actional work of participants who take turns engaging and reacting to one another (Geis 2005), gradually co-producing discourse. Nowadays, co-constructed discourse often takes place in the written medium on instant messaging platforms and through texting devices, giving rise to “fingered speech” (McWhorter 2013). Non-native speakers’ responding behaviour in co-constructed spoken interaction is known to be potentially pragmatically deficient (House 1996) due to limited relevant input and instruction in the foreign language (FL) classroom. “Written” dialogic exchanges may pose similar challenges. It is thus worthwhile to explore goal-oriented *reacting* practices in *written* communication produced by *FL* speakers.

This study considers 150 written responses to complaints (about 15,000 words) elicited from EFL university students (mostly Polish, Spanish and Italian speakers) through WDCTs relevant to scenarios adapted from the literature and/or partly reconstructed from the author’s interactional experiences. It examines both the conventions of means (strategies) through which they are realised, identified inductively through repeated readings, and their conventions of forms (wording), explored through a bottom-up approach by identifying recurrent phraseologies (n-grams).

The texts illustrate moves which variously appeal to the addressee’s reason and/or emotions, and are differently distributed across scenarios. The moves overlap with those found in apologies (i.e. Expressing regret; Accounting for the damage caused; Offering to repair, Pleading for understanding; Committing to positive future conduct; cf. Aijmer 1996; Trosborg 1987) and are similarly phrased (e.g. encoding the writers’ negative emotional impact of unintentional damage: *am very sorry for; did not realise that*).

The texts’ illocution is effectively conveyed, despite marginal lexico-grammatical mistakes (e.g. “I’m so sorry for have parked my car in your spot”). Also, openings and closings reveal awareness of the interlocutors’ relative status and role-relationship (e.g. “OMG; Good luck”; vs “Dear Ms X; Kind regards”). However, the interlocutors’ face needs are occasionally threatened through such moves as Shifting the blame and Downplaying the damage (e.g. “I know that you asked me to do it but you have to be responsible for your actions”). Also, in contrast to the communication practices instantiated in a smaller comparable native-speaker corpus (36 texts, about 1,700 words), it appears the complaints infrequently contain a text-final repetition of the illocution, and are focused on the account for the damage caused.

The findings suggest that the role of a complaint recipient and respondent may be arduous for speakers of a FL, because it involves managing contrasting goals (i.e. appeasing the addressee and not losing face) and engaging in responding behaviour on the interlocutor’s terms.

'Atypical' Ethics of Asylum Interpreters: From Invisibility to Advocacy

Lecture

Dr. Fabrizio Gallai¹

1. Università degli studi Internazionali di Roma

Asylum interpreters are required to 'faithfully' interpret what is being said during the interview – a central tenet of their Codes of ethics. However, they have often been found in the relevant literature (e.g., Jacquemet 2011, Pöllabauer 2004, 2015, UNHCR 2010, 122-123) to act as 'principals', i.e., prompting applicants to respond, summarising a testimony, or editing out information. Researchers have partly attributed such omissions, additions, distortions, and other deviations from ethical principles – such as neutrality and impartiality – to a lack of properly trained interpreters and interpreting service users.

This paper aims to respond to this need for qualified interpreters - both within the EU and beyond - by analysing a variety of ethical issues in the context of asylum interpreting. My data consists of real-life asylum interviews involving registered English-Italian interpreters.

In order to investigate the effects of asylum interpreters' ethically 'inappropriate' behaviour, I apply a rigorous and originally structured methodology. Modelling implies two levels of analysis to be foregrounded in the representation of naturally occurring language, extending from the micro-process oriented cognitive sphere to the sociological dimension of the macro-processes of communication. On one hand, the sociological aspects of interpreting as an activity taking place in – and, at the same time, shaping – a particular interaction were analysed through the lens of Goffman's (1981) participation framework. On the other, an interest in the mental processes underlying language use led to the adoption of Sperber and Wilson's (1986/1995) relevance-theoretic framework in order to show how and if interpreters convey implicatures triggered by the original utterance, matching the intention of the source text speaker (Gutt 1999/2000).

The results of this (micro-interactional and macro-ideological) empirical study show the distinctive attitudes and narratives of asylum interpreters, whose behaviour does not follow the main ethical principles for interpreting, which are "codified and reaffirmed collectively by its practitioners" (Pöchhacker 2016, 167). Their role is no longer to be seen as a fixed notion as they adjust their positioning along a spectrum from invisibility to advocacy. They further show that interpreting can empower practitioners and the people they work for, and engage stakeholders (and, ultimately, the State) through an emphasis on *cross-pragmatic competence* (Alves 2007, and Alves and Gonçalves 2003, 2007). In particular, pragmatic alterations in interpreters' renditions can be said to have an impact on modern interviewing techniques, as it has the effect of moving the interpreter into focus, taking power away from the officer (due to the turn-taking system) and destroying the impression of a dyadic exchange.

‘We must guard everything very carefully because we know that there are many people here...’: identity and othering in intercultural workplace conflict resolution meetings

Lecture

*Dr. Ping Du*¹

1. University of Nottingham Ningbo China

This study aims to explore how cultural and professional identities are constructed, negotiated and deployed as resources for cultural othering in intercultural conflictual interactions. The analysis draws on the dataset of an ethnographic case study of intercultural conflict resolution in an organization in China, which comprises 16 audio-recorded meetings (29 hours), eight interviews, observation notes, organizational documents and emails. This organization has seen continuous tension and non-cooperation between the international and Chinese managers, which culminated into a major management crisis when four Chinese managers handed in resignation. The two sides reported in the interviews different views of the causes of the conflict. The Chinese managers attribute the tension mainly to one international manager, Jack, who is seen as ‘biased, uncooperative and irritable’. The international managers consider “indirect communication, hierarchical management and lack of western qualifications” on the Chinese side as major problems. The conflict resolution process lasted for three months. During this period, the Chinese CEO, Wang, conducted a series of group meetings and private meetings, in order to ‘achieve mutual understanding and collaboration’ (Wang in the meetings). The conflict resolution resulted in positive outcomes in general. A new management structure was established, and collaborative relationships were consolidated between most of the international and Chinese managers, while two managers (including Jack and a Chinese manager) were demoted.

This project will focus on Jack’s interactive strategies as a case study, and investigate the processes in which cultural and professional identities are interactionally constructed and negotiated through positioning (Bamberg, 1997) in narratives. This study is also interested in exploring how the cultural other is constructed in the identity construction processes and how these processes manifest ‘larger ideological processes and structures’ (Bucholtz & Hall, 2005, p. 585). Preliminary analysis indicates that the cultural / professional identities are constructed through a range of strategies for positioning in different narratives, for example, ‘the hero narrative’ (van Dijk, 1984), which normally consists of four elements, namely, a us (good people) vs. them (bad people) polarization, an inflexible culture-based morality for demarcation, a imagined battle between us and them, and a territory (the organization) that ‘we’ (the ‘heroes’) are protecting from ‘them’. It is found that while denying being biased, Jack constantly constructs a superior cultural identity that is featured with ‘moral integrity’ and ‘professionalism’. It is argued that instead of the task-oriented goal of problem solving, the processes of constructing superior identities and cultural others serve mainly a relationship-oriented goal, that is, winning the perceived game of power and control. This study will provide a sample at the micro level for our understanding of the larger scale intercultural collaboration at the macro level in the post-pandemic and ‘post-globalized’ world.

“Alone in the nest”: The discourse of war and peace in the online activity of Mansi internet users

Lecture

Dr. Csilla Horvath¹

1. University of Helsinki

The aim of the paper is to describe and to analyse the discourse discussing the events, consequences, attitudes concerning the Russian-Ukrainian War of 2022, created by Mansi users of social media pages, with special attention to the differences in narrative between the Russian- and Mansi-medium discourses. The presentation briefly introduces the situation of Ob-Ugric language use, the history of the Mansi press, the pre-war model of Ob-Ugric peoples' digital discourses and use of internet. The presentation focuses on the Mansi journalists' and public figures' role, and compares their position to the Russian mainstream media as well as to the majority public discourse.

The Mansi language is an endangered Uralic language, spoken in Western-Siberia. Although the prestige of the Mansi language and culture is rising, the number of speakers is critically low. Mansi plays limited role in its Russian-dominated, multi-ethnic and multicultural environment, its use is heavily affected by the loss of the traditional way of life and rapid urbanisation as well. While the Ob-Ugric peoples have been regarded as followers of traditional, nomadic lifestyles, the majority of Mansi live in multi-ethnic urban environment, which, besides intensifying language shift, also creates new tools and domains assisting language maintenance and language revitalization.

The data about Mansi language use were collected during fieldwork in the Khanty-Mansi Autonomous Okrug (eight times between 2006 and 2019) via semi-structured interviews and participant observation carried out at Ob-Ugric institutions and communities in Khanty-Mansiysk. The data on digital linguistic vitality, online language use and discourse about the Russian-Ukrainian War were obtained via online observation at various social media pages.

“Aside from being sexy, what do you do for a living?” A sociopragmatics study of the responses to conversational openers in dating apps

Lecture

*Ms. Clara Cantos Delgado*¹

1. Complutense University of Madrid

In online dating, conversational openers are of key importance (see Dai & Robbins 2021, Kavroulaki 2021) and humour is a resort often used in these initial exchanges. However, this can be a risky strategy. This study analyses the responses from young adults in the UK (18-26) to four formats of intently humorous conversational openers: one-liners, sexually charged remarks, physical compliments and negging. The data sample was controlled regarding English language fluency to minimize cultural shock. Drawing on the literature in the field, it was decided to take into consideration the variables of gender, and sexual orientation since they were perceived to be a potential cause of variation in the responses (see Hoffman et al. 2020). The purpose of this investigation is therefore to answer the following research questions: RQ1. What are Tinder users' opinions and responses to intently humorous conversational openers? and RQ2: What differences can be observed considering the variables of gender and sexual orientation? To comply with the Association of Internet Researchers' ethical guidelines, data was collected via questionnaires and a total of 100 answers from each of the collectives were examined (T=400). The responses were then analysed following an inductive self-made taxonomy, based on their level of cooperativeness, including subcategories which tallied factors such as the usage of humour, or self-descriptions in cooperative ones; or the utilisation of impoliteness strategies (i.e., dismissals, pointed criticisms, and insults) in uncooperative ones. The sample was tagged with the aid of the program for qualitative analysis, Atlas. ti. The LIWC software was then used as triangulation in terms of sentiment analysis. The still preliminary results show that despite the subjectivity of humour use and appreciation, the general tendency was to acknowledge the boldness and effort of making use of this strategy. It proved its efficacy by both maintaining its initial purpose (namely, ice-breaking, expressing sexual interest, complimenting or begging), and providing another frame for interaction (the humorous one), which people used to follow up on the joke, comment upon it, etc., with the ultimate consequence of keeping the communication channel open. In terms of gender and sexual orientation, it was found that in the context of dating apps, women's initiative was highly valued, and their use of humour was positively perceived by both male and female users alike. Contrastingly, the results regarding heterosexual male users were inconsistent in this regard. A complete analysis of the data will enable us to establish statistically significant tendencies and patterns.

“Ecocide is our reality now” – a cross-cultural analysis of the Twitter response to the brown coal mine in Turów

Lecture

***Dr. Martina Berrocal*¹, *Prof. Nadine Thielemann*²**

1. Friedrich Schiller University Jena, 2. WU Wien

This paper analyzes the case of the Turow lignite mine, located in Czech-German-Polish border region, which sparked an international dispute due to its negative environmental impact on the neighbouring settlements. The problem included, among other things, vanishing groundwater, subsidence caused by the operation of the mine etc. . This controversy provoked a direct and immediate response from diverse public(s) on Twitter.

The aim of this paper is to analyse the discourses that emerge on Twitter. We compiled a corpus of tweets tagged by the hashtag #Turow (Zappavigna 2018) which we filtered according to the outreach. For the study, we developed a coding scheme based on conceptual units and main pragmatic functions (inform, appeal, express emotion) (cf. Berrocal & Salamurović, forthcoming) which allowed us to detect and characterize three discourses along the language lines (EN, CZ, PL) (cf. Klemm 2016).

The results show that all three discourse communities are grouped under the same hashtag, however, they differ in the stance adopted towards the mine. While the Polish tweets dominantly inform about the issues and events connected to the mine with an anti-EU touch and in Czech, the tweets express dissatisfaction with how the Czech politicians are approaching the issue, the English tweets point to a transnational environmental discourse. A substantial number of tweets call on EU political actors to intervene and to promote EU's environmental stand, and a similar proportion of tweets air negative attitudes concerning the adverse environmental impact of the mine and its political and environmental implications for the EU energy transition. Our analysis thus gives insights into how differently matters of fossil energy are perceived and negotiated across cultures and at a transnational level.

“I don’t know they’re caught, do I? “: Negotiating Epistemic Access in Dungeons & Dragons

Lecture

*Ms. Samantha Finlay*¹, *Dr. Catrin Rhys*²

1. *Ulster university/Exeter University*, 2. *ulster university*

This paper investigates how participants negotiate epistemic access in games of Dungeons & Dragons (D&D). D&D is a tabletop roleplaying game in which participants jointly create a story through roleplay and dice rolling. One participant takes on the role of Dungeon Master (DM) and creates the world, while the other participants roleplay characters in that world. D&D is played almost entirely through narration, and so the world, actions, events, and characters are constructed almost entirely through talk-in-interaction. This creates a highly distinctive setting in which a speaker’s epistemic access is regularly overtly negotiated.

A further notable feature of epistemics in the D&D setting is that during roleplay, participants observably orient to two distinct epistemic domains – one that represents the player’s knowledge, and one that represents the character’s (Finlay & Rhys 2019). While these domains mostly overlap, they diverge when the player knows information the character does not and vice versa. Furthermore, if, during roleplay, a player claims access to knowledge that is outside the character’s domain, this can result in a breach. As such, it is important for the participants to establish what their characters know in order to avoid causing breaches by displaying information their character would not know.

This paper builds on this research by analysing how participants negotiate epistemic access in this context. Because the DM constructs the world through narration, information about the world is only accessible to the players through his talk. Players negotiate access to this knowledge through information requests that in other contexts might seem semantically anomalous, eg. “Did I see the child go down?” or “i don’t know they’re caught, do i?”. The DM will provide either a fitted answer with the requested knowledge, or a non-answer with an account for not answering – typically that the character does not know this information. This shows that players are only granted access to information if their characters have access to it; otherwise, the players do not have the epistemic right to access this knowledge and the DM does not grant them access. The paper thus investigates the distinctive form and interactional environment of information requests through which participants negotiate epistemic access and orient to character and player epistemic domains in this context. The analysis provides insights not only into the complexity of epistemic access in roleplay environments but also into the role of epistemic access in other interactional projects such as decision making.

“I will kill you in the appropriate time, place and manner should the occasion arise” - The role of explicitness in the use of threatening language

Lecture

*Dr. Marianna Varga*¹

1. Hungarian Research Centre for Linguistics

Background There has been numerous substantial linguistic and legal research to define what constitutes a threat, but there is still scant knowledge of threatening language due to the paucity of empirical studies (Muschalik 2016, Christensen 2019). However, Muschalik (2018) draws attention to an interesting correlation between the forms and functions of threats by analyzing an American English corpus of judicial opinions containing legally relevant threat utterances. In this work it has been claimed threats either explicitly denote the ‘who-does-what-to-whom’ scenario with futurate expressions, violent verbs, reference to the patient and agent, a plain focus on the speaker and taboo words, or they do not refer to any future events or harmful acts and the participants in these acts at all. Semi-explicit or semi-vague threats are much less frequent in this corpus. The degree of explicitness –as the author argues– depends on the function of the threat: due to plausible deniability, a *manipulative threat* is less explicit than the *retaliative threat*.

Aims What constitutes a threat in the legal sense depends on how the law defines it, so it is worthwhile to extend the research cited above with data from other nations. For this reason, in this research I seek to answer the following questions by analyzing quantitatively and qualitatively a Hungarian legal corpus: Is there a correlation between the degree of explicitness and the function of threats based on these data, and are written threats less explicit due to a greater chance of being sanctioned? Given that many times the same person in the same case threatens differently, it is useful to compare written and verbal threats (e.g. in a special case a man texted: “My darling, as I look at you, I immediately remember why the smile of the man lying under the tram is not sincere”, but during a phone call he said: “I’m gonna stomp your guts out”, “I’ll kill your mother” [Translated from Hungarian.]). The presentation will also discuss some relevant aspects of the comparison between the American and Hungarian threats.

Data The corpus involves 265 judicial opinions from criminal cases tried in Hungary between 2013-2022. The sample was selected based on a keyword search of the electronic database <https://eakta.birosag.hu/anonimizalt-hatarozatok>. The main criteria for the selection were that the cases should include a criminally relevant threat and a text or voice material suitable for linguistic analysis.

Results The results are considered useful complements to existing research on threatening and explicitness in conflictive language use.

“It is our duty to secure our own customs” – Attitudes about migrants, language learning and dialect use in the rural North of Europe

Lecture

***Prof. Lena Ekberg*¹, *Dr. Ellen Bijvoet*², *Prof. Jan-Ola Östman*³**

1. Lund University, 2. Uppsala University, 3. University of Helsinki

Much research on migration, language contact and linguistic variation in the last decades has focused on the challenges that migrants encounter in big cities. In contradistinction to this, our previous work has concentrated on the social and linguistic encounters that migrants meet with when they arrive in sparsely populated dialect areas in the North of Europe: one in Finland (Swedish-language Ostrobothnia) and one in Sweden (Värmland, bordering on Norway). These regions are well known for their dialects that markedly differ from the spoken Swedish standard – something that may cause problems for people outside the region in general, and for non-native speakers in particular.

In our previous studies, we have focused on the concept of integration from the point of view of the migrants, and on how their construction of a new identity is reflected in the dialect features they adopt, or resist adopting (cf. Ekberg & Östman 2020, Bijvoet & Östman forthc.).

In the present study we focus on “the locals”, i.e. members of the traditional local rural population. Data were collected through focus-group discussions on site, and by researchers using the local dialects.

For members of the local population, speaking the local dialect is the preferred choice of language. Speaking standard Swedish is seldom an option for them; they consider this way of speaking to be “pretentious language”. At the same time, there is an explicitly mentioned understanding that the dialect is hard for migrants. Members of the local population, too, see this as an aggravating circumstance for language learning, as well as for migrants’ possibilities to interact with them. The migrants learn Swedish at school, but they will not hear standard Swedish in their everyday life. Still, the locals choose to keep to their dialect. As one of them explains: “It is our duty to secure our own customs”.

In the present study, we use narrative analysis (e.g. De Fina 2013) to investigate the opinions and attitudes among members of the local population toward incoming migrants and settlers in general, and their expectations regarding the linguistic integration of migrants in particular. We specifically ask whether the traditional local residents feel that it would be desirable for the migrants to learn the local dialect? Our results show that to some locals, it is appreciated if migrants learn the local dialect, to others this is felt to be too much of an invasion on the local customs of the community.

“The youths are wiser now”: a progressive discourse analysis of resistance in Nigeria’s electoral rhetoric

Lecture

*Mrs. Chioma Ikechukwu-Ibe*¹, *Mr. Sopuruchi Christian Aboh*²

1. Department of Humanities (DipSUM), University of Salerno, Italy, 2. Department of English and Communication, The Hong Kong Polytechnic University, Hong Kong SAR

Abstract

The past fifteen years have demonstrated Nigeria’s electoral system to have taken a particular dimension, featuring two major political parties in Nigeria - the Peoples Democratic Party (PDP) and the All Progressive Congress (APC), and yielding almost predictable political results. However, in the recent time, specifically in 2022, building up to the 2023 Nigeria general elections, an atypical tectonic turn has been observed in the Nigerian political system. In what is present, a third political party- Labour Party (LP), formed in 2002, which has not produced any Nigerian president since its inception, joined the 2023 presidential race alongside PDP and APC. This groundbreaking atypicality has transported Nigeria’s electoral movement from its status quo to a momentous epoch while attracting the media’s attention. In this paper, we rely on the methodological procedures and tenets of progressive discourse analysis (PDA) in examining Nigerians’ resistance against the two major political parties- PDP and APC and their presidential candidates. In addition, we critically discuss the support of Nigerians for the presidential candidate of LP during the buildup to the 2023 Nigeria general elections. Data for the study consist of 1000 tweets on ‘Peter Obi’ and the ‘#Obidient Movement’ in September 2022. The analysis reveals that tweets from Nigerian youths on Peter Obi and the ‘#Obidient Movement’ construct resistance via three distinct discursive strategies: identification of PDP and APC as Nigeria’s lifetime anti-progressives, construction of Peter Obi of LP as the anticipated political saviour, and identification of Nigerians as being politically wiser. The study’s contribution to scholarship is established in the novel approach adopted in discussing Nigeria’s electoral rhetoric and identifying social media as sites for atypical resistance, stance-taking, social change, and revolution.

Keywords: #Obidient Movement, resistance, general elections, Twitter.

“We refugee women are capable of sharing our stories and leading campaigns for a fairer world”: migrant identity and affective positionings in UK charity refugee narratives

Lecture

Dr. Sofia Lampropoulou¹, Dr. Korina Giaxoglou², Ms. Paige Johnson¹

1. University of Liverpool, 2. The Open University

This study examines practices of migrant positioning in overtly anti-racist, pro-humanitarian refugee narratives featured in campaigns of UK migrant charity organisations. We focus on a small corpus of 37 written narratives posted on the blogs of nine charity organisations and NGOs during the period of January 2017 to August 2021 following changes to the UK immigration and asylum-seeking policy after Brexit. Unlike existing studies that focus on explicit discriminative representations of refugees, asylum seekers, immigrants and migrants (RASIM) in the UK media (Gabrielatos&Baker, 2008), we focus on migrant positionings in declared pro-migrant narratives. We investigate linguistic traces of prevalent discourses that, despite the seemingly antiracist nature of the texts, contribute to sustaining a hegemonic racist ideology. To this end, we focus on traces of *liquid racism*, an elusive and ambiguous form of racism that reproduces embodied and culturally racist sign systems (Weaver, 2010).

Our approach combines methods and heuristics from narrative analysis (De Fina&Georgakopoulou, 2019) and critical discourse analysis (Fairclough, 1995). Our dataset primarily consists of refugee success stories, which in this case involve narratives of personal experience of emotional turmoil attributed to the long process of asylum seeking where the focus is on how refugee managed to rebuild their lives. These success stories address a wide audience, ranging from other refugees to potential donors who might be moved by such stories. Given the important role of affect in these stories, our analysis pays attention to tellers' acts of *affective positioning*, that is the ways in which tellers position themselves and others affectively within the taleworld, the storyrealm, and broader master-discourses to construct their identities (Giaxoglou, 2021).

We argue that migrant positionings are used to emblemize RASIM personal experience which are, in turn, utilized to authenticate acts of appeal for support made by the charity organisation. We show how these stories covertly reproduce racist hierarchies by mobilising the RASIM personal experience for their wider express goals. This, in turns, challenges the humanitarian ethos upon which anti-racism is predicated (van Dijk, 2021). We conclude by calling for greater self-reflexivity on behalf of charity organizations and migrants alike, with self-critique of the outlets and the forms that encourage the reproduction of racist sign systems. Our study contributes to research concentrating on tracing racism in anti-racist texts and to critical narrative analysis to the study of migrant narratives.

“You may feel a few butterflies in your stomach the first time walking out on a frozen lake”: Balancing between positive and negative risk in adventure tourism discourse from “arctic Lapland”

Lecture

*Prof. Annelie Ädel*¹, *Prof. Jan-Ola Östman*²

1. Högskolan Dalarna, 2. University of Helsinki

In alignment with the theme of the conference, this study deals with atypical risks and risk-taking. Risk involves two core elements: *adversity* (referring to something unwanted) and *potentiality* (referring to things that may, but need not, happen). ‘Risk’ is typically thought of as something negative, and as something that should be avoided at all costs. Risk-taking characteristically has to do with the probability of an unwanted event occurring (e.g. Hansson, 2018). This type of negative perspective clearly predominates in discourse studies related to risk (e.g. Crichton et al., 2016; Ädel et al. 2022), not to mention in public perceptions of risk.

However, risk may also, albeit atypically, be seen as something positive and energizing, as in the context of financial markets (cf. e.g. Giddens, 1999) or in gambling. These types of voluntary risk taking have been approached through concepts such as ‘action’ (Goffman, 1967) and ‘edgework’ (e.g. Lyng, 2014).

In this study, we explore both negative and positive aspects of risk in the context of adventure/extreme tourism. Our focus is specifically on how risk is discursively constructed on adventure tourism websites for Sápmi (referred to as “[arctic] Lapland”), centring on destinations in Sweden (Kiruna), Finland (Rovaniemi) and Norway (Tromsø). Our primary material from the booking platform Adrenaline Hunter amounts to 12,000 words. In the material, it is precisely the balance between negative and positive aspects of risk that is foregrounded (cf. e.g. Imboden, 2012), but in a scalar sense, ranging from ‘soft’ to ‘hard’ types, with a negotiable awareness of how relative what counts as ‘extreme’ may be. We find that “extreme tourism” is a highly relative concept, for example marketing an everyday activity (like walking on ice) as an “extreme” experience for an audience not too familiar with snow and ice.

When looking at risk in a tourism context, the issue of sustainability inevitably arises. In tourism discourse, sustainability may be framed through negative risk but also through positive risk from the point of view of the tourist (foregrounding benefits of enjoyment and “butterflies”). We investigate the balance between something that needs to be managed but simultaneously helps construct (a feeling of) “adventure” in relation to different kinds of responsibility – individual-moral, formal-juridical, and culture-collective.

“I did not realize that emoji are annoying (ㄟㄟㄟ)”：Constructing and challenging norms in the metapragmatic discourse about emoji

Poster

*Dr. Wan-Hsin Ann Lee*¹

1. National Taiwan Normal University

The study investigates how the use of emoji is talked about in the Taiwanese context and discusses how politeness shapes the evaluations of such practice to be either typical or atypical in online discourse. The study is inspired by an online discussion concerning a failed online conversation between a customer and a shop owner. The customer messaged the shop owner to inquire about the details of a product. The question featured a transliterated Japanese discourse marker, a greetings sticker and the emoji “tears of joy”. The conversation ended abruptly with the shop owner’s verbal attack on both the question and the way the consumer initiated this interaction. This confused customer reposted the conversation on an e-shopping forum asking why the communication failed. Among over 1200 lines of replies from online viewers, the appropriateness of using “tears of joy” and emoji in general is extensively evaluated. Some viewers argue that using graphicons to show friendliness is typical and polite whereas some contest that feigning friendliness is impolite and insincere, interestingly for both identical and distinct reasons. This incident, an online conversation between a customer and a shop owner, is treated by some as a business transaction, plainly formal and emoji-prohibited. Significantly, it is also reckoned by others to be an instance of non-public online interaction, expectedly informal and emoji-tolerant. These divergent stances foreground how semiotic knowledge about emoji is far from shared but, remarkably, misrecognized by many as normalized. The study draws from this interesting discussion to address three questions regarding the metapragmatics of emoji.

1. What are viewers’ respective reasons to describe the use of emoji as typical and atypical?
2. How do speakers’ sociopragmatic concerns lead to contrasting evaluations between typical and atypical practice?
3. How does the metapragmatic discourse about emoji manifest semiotic ideologies concerning politeness in digital communication?

The study finds that the contrasting pair of typical and atypical use of emoji is non-fixed, inextricably interwoven with politeness, and yet reported by many as commonsensical. The rationalization about how to use emoji appropriately as a piece of mutual knowledge is so established that breaching these supposedly unquestionable norms usually lead to misunderstandings and severe criticisms. In this case, online discourse remains a site to attend to how established linguistic norms in offline interaction meet newly emerged phenomena and are challenged. How politeness is re-defined with the use of emoji and what politeness concerns are prioritized are worth the attention to allow us a better understanding of digital discourse practice.

A Contrastive Study of Chinese “-ma (嘛)” and Japanese “-jan (じゃん)” : Focusing on the One-N(P) Sentences and Colloquial Quotative Forms

Poster

*Ms. Qiong Wang*¹

1. The University of Tokyo

This study tries to characterize the roughly corresponding Japanese and Chinese sentence-final particle constructions “-jan (じゃん)” and “-ma (嘛)” by comparing their pragmatic meanings in the one-N(P) sentences and colloquial quotative forms. Data is collected from some corpora, including CSJ corpus and CEJC corpus in Japanese, CCL corpus and MLC corpus in Chinese.

For the one-N(P) sentences, the observation focuses on the meaning of the N(P) and the connection with the context. It is shown that (1) both “-jan (じゃん)” and “-ma (嘛)” have a strong tendency to occur after kind-denoting nouns with no modifiers and (2) “-jan (じゃん)” is most likely to be used at the end of the turn, whereas “-ma (嘛)” is often to be followed with the sentences explaining the N(P) or following the same topic. It is seen that thematization usage can be found in Chinese “-ma (嘛)”, but not yet in Japanese “-jan (じゃん)”. Thus, both examples are found natural to use “孩子嘛 (child-*ma*)” in response to the question “Are you tired of her doing so?” to show tolerance and understanding, and to be followed with a comment on children in general as “孩子嘛, 花花, 希望 (child-*ma*, the flowers of our motherland, the hope of the nation)”. Similar examples can be only found to comment on the hearer’s childish behavior using “*Akachan-jan* (baby-*jan*)”, but it sounds odd to add more evaluative comments afterward in the same situation as Chinese.

For the colloquial quotative forms, colloquial quotative form “-tte (*iu*) (っていう)” cooccur with “-jan(じゃん)” in Japanese and verb “*shuo* (说)” cooccur with “-ma (嘛)” in Chinese have been compared. (1) Both the two work for confirming the information with the hearer, and they describe the reported speech information. However, it is shown that (2) “-jan(じゃん)” is seldom used with the past tense of the colloquial quotative form “-tte (*itta*) (っていった)”, and can be hardly used to mark the information collected from the context, but “-ma (嘛)” is used to mark both “what-is-said” and “what-is-implicit”, which also include the information recovered from the context. The original speaker of the quoted sentence can be either the hearer, the speaker or a third person in Chinese, and tends to be expressed in the sentence. But Japanese colloquial quotative form is most likely to occur with information considered as common knowledge by the speaker without mentioning of the original speaker. For example, “*Shizuoka attakai-tteyu-jan* (It is said that Shizuoka’s warm-*jan*)” is a quoted sentence to remind the hearer of the weather of Shizuoka, while the original speaker is not mentioned in the context.

Some other characteristics of these constructions (e.g. cooccurrence with the first person and the second person) may also be accounted for in terms of the contrastive analysis presented in this study.

A Contrastive Study of Requests, Apologies, Refusals, and Expressions of Gratitude in Portuguese and Spanish

Poster

*Ms. Beatriz Oliveira*¹

1. Universidade de Aveiro

Despite being geographically close, Portugal and Spain considerably differ in their sociocultural norms, which consequently exert an extraordinary influence on verbal behaviour. Hence, believing in the words of Chomsky (2006) that language is a product of culture, we are carrying out a study that falls within the fields of intercultural pragmatics and interlanguage pragmatics focused on the production of speech acts.

Speech acts refer to actions carried out mainly by means of language. Even though they are being performed on a daily basis by speakers of Portuguese and Spanish, their usage has rarely been covered, especially in Portuguese, both as a native and a foreign language. This research investigates the similarities and differences in expressing the speech acts of requests, apologies, refusals and expressions of gratitude by native speakers of European Portuguese, native speakers of Spanish, and non-native speakers of Portuguese whose native language is Spanish. The choice of these particular speech acts is due to the fact that they can be categorised as *face-threatening acts*, according to Brown and Levinson's (1978, 1987) terminology, and therefore suitable for studying verbal politeness.

Our main goals consist in examining and comparing the similarities and differences in the production of speech acts and expression of verbal politeness by the native speakers, observing the linguistic and pragmatic strategies transferred from the native language (Spanish) to the target language (Portuguese). Lastly, analysing whether the proficiency level of grammatical competence affects the pragmatic competence in what refers to the realisation of these four speech acts.

In order to achieve our goals, we have been collecting data through two versions of a Discourse Completion Test (DCT) (Blum-Kulka, House & Kasper, 1989) - one in Portuguese and the other in Spanish, which consists of twenty different situations that require the production of the targeted speech acts. Each situation is influenced by socio-pragmatic factors of social power and social distance between the interlocutors, as well as the ranking of the imposition of the action or seriousness of the offence.

A Feeling, a Desire or Something Else? A Case-Study of Idioms with *Voglia* and How Learners of Italian as FL and SL Acquire Them

Poster

Dr. Andrea Civile¹, Dr. Andrea Fiorista¹, Dr. Alice Migliorelli¹, Dr. Mauro Le Donne¹

1. University for Foreigners of Perugia

In foreign and second language teaching, helping learners to become socio-pragmatically competent means supporting them in developing awareness of sociocultural variables (Brown & Levinson, 1987) and knowledge about taboos, mutual rights, obligations, and conventional courses of action that apply in the community of the target language (Roever, 2006). Idioms, from this perspective, are useful communication tools that reflect the interaction of language systems with the emotion system, which deals with the assignment of values and opinions to specific entities, events, or situations (Foolen, 1997). However, coping with formulaic constructions, which interpretations are unpredictable from individual lexical meanings under the effects of regular compositional rules, is not always an easy task, especially when it comes to consistently distant cultural and linguistic references (Kecskés, 2014).

In this presentation, Italian formulaic constructions with *voglia* will be analyzed in terms of cultural significance to facilitate learners in developing socio-pragmatic awareness. As a matter of fact, this noun can be considered conceptually transparent, if the meaning “desiring something or someone” is maintained in the in-context; on the other hand, as grammaticalization stages of the expression *hai voglia di* might lead to morphosemantic opaqueness, learners could find it harder to decode (Brinton & Traugott, 2005). For this reason, in order to facilitate FL/SL Italian learners in developing such socio-pragmatic awareness, the study aims to design an effective and ad-hoc teaching intervention.

Before implementing the pedagogical treatment, a data-driven investigation will be conducted with both native and non-native speakers: the purpose is to observe their degree of awareness in encoding expressions derived from the target construction *avere voglia di*, such as *avoglia* and *hai voglia*. From this perspective, data analysis will provide evidence in terms of natives’ perceptions and most common contexts of usage, as well as learners’ difficulties in understanding/producing the formulaic expression. These will form the basis of the final teaching intervention structure.

A Pragmatic Approach of Types and Functions of Allusion and Its Mechanism in Chinese Diplomatic Discourse

Poster

Prof. Mian Huang¹

1. Chongqing Normal University

Although the notion of allusion occurs frequently in the criticism of many works and many writers, little effort has been made to discuss the various possibilities for different types of allusion and their manifestations in Chinese diplomatic discourse. This research is an investigation of the different types and functions of allusion in the statements made by the Chinese Ministry of Foreign Affairs spokesmen on the official website of Chinese Ministry of Foreign Affairs. The notion of allusion is usually synonymous with an indirect or passing reference to some event, person, place or artistic work. So, the present paper sets itself to deal with this notion from a pragmatic point of view. More specifically, the study attempts to answer the following question: What are the pragmatic functions of the types of allusion used in Chinese diplomatic discourse? Hence, the main aim of the paper is to answer the question raised previously, and according to this aim it is hypothesized that evaluation, persuasiveness and politeness constitute the pragmatic functions used in Chinese diplomatic discourse and idioms, proverbs and literary quotes are the most evident types of allusion in China's diplomatic discourse. For achieving the aim of the study and verifying or rejecting its hypothesis, a theoretical survey of the notion of allusion and its types and pragmatic function is carried out to depend on in the analysis of the data in the self-constructed corpus under study. With the combination of discourse analysis with conversational analysis, it is shown that highly understood in metaphorical senses, allusion draws on metaphor as an underlying mechanism. This paper argues that it is the resemblant and imaginative properties of metaphor that opens up possibility for Chinese Foreign Ministry spokesmen to employ allusion to implicitly indicate their intersubjective stance for interactive purposes on diplomatic occasions.

A Relevance Theoretic Approach to Vlogging in India

Poster

Dr. Urjani Chakravarty¹, Dr. Gulab Chand²

1. Indian Institute of Management Bodh Gaya, 2. Manipal University Jaipur

In the current times, India is at par with the world in social media usage. If the numbers are to be believed on average Indians are accessing social media for at least 2.25 hours per day. Users of social media have risen to a whopping 518 million till the year 2020, which is around 43 per cent of the total population of the country. Research states the trend will be on the rise till 2040. Though Facebook is supposed to be the favorite amongst the digital platforms, YouTube is coming a close second in the matter of usage. The users are provided with a voice and a choice to air it whenever they find it necessary. Other than the possibility of freedom of speech through comments etc., YouTube is also being seen as an employment provider. India as a developing economy welcomes the possibility of employment opportunities thus provided. The current paper will deliberate the use of YouTube as a communication medium providing proof of its relevance in the lives of middle class women. Methodologically speaking, the paper will have a Relevance Theoretic approach (Sperber and Wilson 2002), which explicates creation of the video contents and their reception through viewers' comments. The line of argument will establish that middle class women vloggers come under categories of, 1. Regular vloggers 2. Celebrity vloggers 3. Business House vloggers utilize YouTube as a means of socio-cultural conversation and connection.

A Study on the Variety of Intensifiers Taught in English Language Textbooks in Japan

Poster

*Mr. Timothy Wilson*¹

1. Hiroshima Shudo University

Words can mean many different things depending on the sentence that they appear in, and this can be a problem for Japanese learners of English who often have trouble telling the different meanings apart, especially when the words are synonyms or from a specific group of words like intensifiers. We use intensifiers when we want to increase the power (intensify) of other words, and they have been the focus of different studies over the past years because of their capacity to influence and enhance communication. Moreover, the differences in the use of intensifiers between American and British English native speakers have been extensively studied (Biber et al., 1999; Romero, 2012; Tagliamonte & Roberts, 2005), and it has been found that although there is no significant difference between the number of intensifiers used there were significant differences in the particular type used.

This study, therefore, examines the use and variety of intensifiers that are introduced and taught in communication-focused textbooks in Japan. Four of the most commonly used CEFR A2/B1 level textbooks were selected (2 American and 2 British) and intensifiers were extracted and analysed, using MAXQDA, according to their function and use. The results determine which types of intensifiers are most commonly used and whether there is a difference in the type and quantity of intensifiers taught depending on whether the textbook is written in American English or British English. Specifically, it tries to investigate how using intensifiers ensures the desirable level of appropriateness for teaching these in the Japanese classroom. In the results, it was found that for the intensifiers *so*, *pretty*, *really*, and *too*, the differences were marginal and not significant, but the intensifiers *very* and *such* were used considerably more in the British textbooks and the difference was significant. As a result of this, it can be clear that teaching various and appropriate intensifiers to learners helps them to be better able to choose the right words and reply properly and appropriately when faced with a particular communicative situation.

An investigation of disagreement between *kohai* and *senpai* by Japanese youth living in the United States

Poster

*Dr. Yan Wang*¹, *Ms. Mira Parker*¹

1. Carthage College

Increased intercultural contact has drawn linguists' attention to investigating how culture-specific practices are sustained and/or changed by a different culture. The *senpai-kohai* (senior-junior) hierarchical relation is regarded as a significant cultural concept in Japanese society. Consequently, a disagreement, which is a "dis-preferred speech act" (Pomerantz 1984), or Face-threatening Act (Brown and Levinson 1987), when conducted by a *kohai* toward a *senpai*, is generally regarded as an act challenging social expectations in Japan.

Taking approaches of discourse analysis, this study examines how Japanese young people who have been exposed to western culture utilize various strategies to conduct disagreements while maintaining the hierarchical order and interactional harmony between *kohai* and *senpai*. Two 30-minute semi-authentic conversational data were collected, each of which has a male *kohai* and a female *senpai* who are Japanese college students studying abroad in the United States. By closely analyzing sequences where a divergence emerges between the *kohai* and *senpai*, this study shows that disagreement patterns are not merely determined by power relation; rather, other social and interactional factors such as gender, conversation topics, individual personalities, and intimacy between the speakers all come into play.

In particular, both *kohai* and *senpai* tend to use negative politeness strategies such as delays, pauses, and hedge expressions like *tabun* "probably" and *chotto* "a little bit" to decrease the intensity of their disagreements. Yet, compared to the *senpai*, the *kohai* asks more clarification or confirmation questions, which, on one hand, signal their doubts and point out the problems in the *senpai*'s prior utterances; and on the other hand, show their respectful attitude toward the *senpai*, given that asking questions is a form of acknowledging a lack of knowledge. Further, the *kohai* often "dilutes" or "disguises" their disagreements with partial agreements or by adding limitations/qualifications to the *senpai*'s statement. For instance, instead of giving a clear disagreement to oppose the *senpai*'s prior complaint about the difficulty of the English language, the *kohai* slightly shifts the focus by emphasizing that written English is hard for everyone. In addition, the force of disagreement varies depending on the topic on which the misalignment occurs; for example, when talking about personal preferences about food, the *kohai* is more likely to produce straightforward and strong statements against the *senpai* in comparison with topics involving academic ability. Occasionally, the male *kohai* can even use positive politeness strategies to tease the female *senpai*. The data further suggest that the *kohai* tends to follow the *senpai*'s lead; namely, when the *senpai* presents their different opinions in a forceful tone, the *kohai* appears to be more assertive in engaging in the disagreement; while when the *senpai* uses negative politeness strategies, the *kohai* also presents disagreement with more mitigators and more likely makes a compromise to achieve agreement or interactional harmony with the *senpai* eventually.

This study suggests that disagreement provides a window to show how communication is influenced by power relationships in the globalized world.

An Irish-Algerian cross-cultural pragmatic investigation into the realization of invitations.

Poster

Mr. Islam Ben Adel¹

1. *University of Limerick*

It is now a well-established fact that intra-lingual pragmatic variation has been found to exist as a result of the systematic impact of the macro-social factors, such as region, gender, age, social class, and ethnicity on the conventions of language use (Barron and Schneider 2009; Barron 2017; Schneider 2021). As such, the macro-social factors of power and social distance have a significant role in influencing interlocutors' preferences in generating and construing speech acts in the dynamic process of interaction (Liu *et al.* 2021; Félix-Brasdefer 2007). Although extensive research has been carried out on speech acts in Irish English and Algerian Arabic (cf. Barron 2017; Sekkal 2018), no study to date has examined the effects of power and social distance on the realization of invitations in Algerian Arabic and Irish English (cf. Félix-Brasdefer 2003; Garcia 2008). Upholding the principles of variational pragmatics, the present investigation will contribute to understanding the rituals of conversational exchanges involved in negotiating invitations in the Algerian and Irish societies at both the intralingual and interlingual levels. Methodologically, the population for this study comprises eighty university students: 40 Algerian Arabic native speakers and 40 Irish English native speakers. The data for the study has been collected via open role-plays and retrospective verbal reports (Félix-Brasdefer 2018). The study results will identify pragma-linguistic variation among female speakers in the Irish and Algerian social groups with reference to contextual factors, such as distance-closeness, social status, politeness, and (in)directness. The results will also highlight the underpinning socio-pragmatic processes involved in invitation exchanges in both groups.

Another Glance at English Directives: How Different Directive Constructions Prefer to Cooccur in Discourse

Poster

Dr. Hidemitsu Takahashi¹

1. Hokkaido University

Research on directives has been largely concerned with the choice between competing alternative expressions. This paper focuses on the ways in which two or more directive sentences occur in discourse, as in: “**Do me a favor**, will you, Karen? Just between us, Harry Bowman has asked me to go out with him and I have a feeling he’s married. **Would you let me have a peek at his personnel file?**” (Sidney Sheldon, *Nothing Lasts Forever*). Here, the imperative *do me a favor* occurs with a request sentence with *would you* in a single stretch of directive discourse.

There is a wealth of literature on directive speech acts. Included are a set of felicity conditions for making proper inferences, politeness theory (Brown and Levinson 1987, Leech 2014) and the sequential management of requests and their responses (Clark and Schunk 1980) and the operation of cognitive-pragmatic mechanisms (Pérez-Hernández and Ruiz de Mendoza 2002) as well as work on grammar and social action involving directive expressions (Couper-Kuhlen 2014). However, the ways in which directive constructions cooccur in discourse have escaped serious attention, although analyses from this perspective are expected to help clarify the essential nature of directive discourse as well as the semantic/pragmatic features of individual directive constructions. Based on an investigation of a total of 945 tokens of 15 indirect directive constructions collected from 28 American fictional stories, this paper looks at their cooccurrence patterns in discourse and discusses their motivations. The main findings include: (i) indirect directive constructions in declarative form (e.g. *I want you to*) occur with other directive constructions more frequently than those in interrogative form (e.g. *Can you*); (ii) the majority of indirect directives prefer to occur with the imperative; (iii) the imperative occurs more frequently with suggestion constructions than with request; and (iv) several recurrent combinatory patterns can be discerned – notably, “preface plus specific content of request”, “specific suggestion followed by its enumerations”, “repetition of one and the same propositional content of request or plea,” among others.

It is argued that contrary to common belief, the imperative in English is not necessarily a “less polite” directive form, which should be replaced by a more “refined” alternative. Rather, many indirect directive constructions heavily rely on the imperative, which can be said to be a construction capable of dealing with a wide range of illocutionary acts due to its schematicity and versatility in meaning.

Nowadays, social media platform has become a living document, in which people share events, thoughts, achievement, protests and various emotions in the real time context. The openness in social media has enabled its users to have a particular, consistent form and unique pattern of interaction (Golbeck et al., 2011; Herrera-Viedma et al., 2015). An example would be the existence of a dialogue between many users in a big scale, in which they interact anonymously to discuss the same topic. This normally occurs whenever there is an event which stimulates negative feelings. With such a commonly shared interest, these users build some sort of communal solidarity, like in the so-called ‘fandoms’. In addition, there is a parasocial relationship phenomenon between fans in the fandoms with their idols, which eventually strengthen the emotions and intensify a different form of solidarity (Eren, 2021). Therefore, this preliminary study aims at analysing extensively the form and pattern of interaction between members of an immensely popular KPop Idol Fandom as well as seeing how the solidarity is built and shifted from its typical literal meaning. This study would also like to investigate how hyperreality and parasocial relationships are manifested in a linguistic context. The data for the case study are obtained from a two-hour online live conversation between this fandom’s members on twitter space. The data are transcribed and then analysed qualitatively by using a critical discourse analysis approach to see how hyperreality and parasocial relationships are manifested through language and the interaction pattern. The tentative findings reveal that the fandom members have emotional closeness with their fellow fangirls, in which they build such a shared hatred and hence create a ‘punishment’ directed towards a particular target whom they consider as a hater of their idol and summon this target in order to ask for verbal clarifications. The ‘summon’ includes a ‘judgement’ process which is manifested linguistically through words and expressions of swearing, verbally uttered prejudice, topics of conversation being led towards judging the target, interruptions and minimum speaking opportunities for the target. From the conversation, it is shown that the fans seem to have built an “alternate universe” outside of their reality namely their fandom, in which they form an atypical solidarity due to the commonly shared idol, context and purpose. This solidarity can be considered as atypical because it has shifted from the positive meaning into a common interest to hate and judge those considered as the haters of their idol.

Keywords: atypical solidarity, hyperreality, parasocial relationship

Autism: deficit or difference? A reconsideration of the way we assess theory of mind

Poster

Ms. Rachel Cullen¹

1. PhD student

This work investigates the hypothesis autistic people have a different but effective way of communicating. Challenging the widely accepted view of autistic people as having social communicational deficits (Tager-Flusberg, 2007) which were linked to theory of mind deficits (Baron-Cohen, 2000).

In the last decade there has been a shift towards conceptualising autistic people as neurodivergent based on natural diversity in human cognition (Kapp, et al, 2013; Pellicano & den Houting, 2022). Milton (2012) reframed the communication breakdown between autistic and non-autistic people as a ‘double problem’ with responsibility on both sides for its amelioration. Challenging the perception autistic people have social communication deficits and reframes it as a joint communication problem.

Building on previous work exploring autistic and non-autistic communication linked to theory of mind ability, this study revisited the Wellman and Estes (1986) ‘spoon test’. A test used to assess knowledge of the distinction between mental states and tangible objects and as such was seen as a valid way to evaluate theory of mind development.

100 autistic and 74 non-autistic responses to 6 subtle linguistic changes were analysed: the indefinite article was changed to the definite in three places and the tense was changed from past to present in three places. It was theorised these subtle changes would not affect the ability to distinguish between tangible and imaginary objects if it was a valid measure of theory of mind. It was found these 6 changes significantly affected both groups differently and the original ‘spoon test’ lacks validity and replication as a theory of mind measure.

In light of these results, I suggest autistic people may process linguistic phenomena differently compared to non-autistic people. Additionally, it is imperative to investigate if similar theory of mind tests can be rendered invalid with subtle linguistic changes. If so, this would question the validity of claims surrounding autistic theory of mind deficits and more widely the way theory of mind is currently measured.

As an autistic person, I am particularly interested in the concept of there being more than one theory of mind. My work will unpack this proposition and illustrate what it means and how it can be empirically tested.

Autistic and non-autistic adult women's written narratives of emotional autobiographical memories

Poster

*Ms. Florence Merken*¹, *Ms. Philippine Geelhand*¹

1. *Université Libre de Bruxelles*

Narrative research has been identified as a great tool in linguistic studies, as it ecologically reveals qualitative and quantitative differences in individuals experiencing communicative difficulties - but who still show good structural language skills (Geelhand et al., 2020; Manolitsi & Botting, 2011). Narrative research within the autistic population has until now included predominantly male samples, but it is now argued that the communicative profile of autistic women might differ from men's (Sturrock et al., 2020). However, the nature of these differences is still poorly understood. Moreover, most narrative studies rely on oral tasks; given that autistic adults tend to prefer written or computer-mediated communication (Gillespie-Lynch et al., 2020), it seems increasingly important to investigate whether the atypical traits in the communication of autistic adults identified in oral tasks would be replicated in a written one.

With this study, we aimed at offering a better perspective on the specific linguistic challenges that autistic women face compared to non-autistic women, through a semi-structured task that resembles every-day narrative situations (i.e., memories storytelling). Participants were 15 autistic and 15 non-autistic (NA) cisgender women, pairwise matched on age ($M(\text{age})= 34.73$). As the study took place during the lockdown, recruitment and testing were done online and in writing. Participants were asked to write 4 autobiographical memories, based on 4 emotion cue words. No time limit was given, but a minimum and maximum number of characters were allowed for each narrative (1000-1800).

Group differences were found in all aspects of the analysis, the first being the microstructure: autistic women wrote longer narratives, used more unique and infrequent words and showed greater productivity than NA women. On the macrostructure level, autistic women showed reduced use of explicit causal connectives. As for the internal state language, autistic women used less cognitive state terms but slightly more perceptual terms. Microstructure results seem in line with those observed in written studies that previously included mostly men (Brown et al., 2014; Price et al., 2020), which could indicate a specific microstructural profile of autistic adults in writing. Autistic women however wrote longer narratives and used more perceptual terms than NA women, which shows unique traits that were not identified in predominantly men samples (Finnegan & Accardo, 2018). Macrostructure and internal state language measures seem to corroborate results observed in oral studies (Geelhand et al., 2020), indicating common challenges of narrative expression for autistic adults, in both writing and speaking. This indicates that although the atypical features of autistic women's communication may be more discrete than those of autistic men (Sturrock et al., 2020), they are still not comparable to NA women, suggesting that autistic women still experience challenges that may be harder to perceive. This exploratory study led to the preparation of a bigger research project investigating both the influence of gender (in a non-binary approach) and medium of communication (oral or written), which methodology we hope to discuss during the poster session, in relation with the results presented here.

Autistic children's novel metaphor comprehension under reduced uncertainty

Poster

**Prof. Agustín Vicente¹, Dr. Elena Castroviejo², Dr. Ingrid Lossius Falkum³, Dr. Kristen Schroeder³,
Dr. Camilo Ronderos³, Ms. Isabel Martín-González²**

1. Ikerbasque Foundation for Science/University of the Basque Country, 2. University of the Basque Country, 3. University of Oslo

Introduction

Usually, studies about the autistic population's abilities to understand purely novel metaphors do not provide any specification as to what properties are relevant to understand them (Kasirer & Mashal, 2016). Yet, one of the difficulties of dealing with innovative figures of language may be uncertainty about what is meant (Pouscoulous, 2014), and how to access the relevant piece of encyclopedic knowledge (Melogno & Pinto, 2022). It is also common that the actual novelty of the metaphors used when testing metaphor comprehension in autistic individuals is not fully controlled for through norming studies with typical population (i.e. Norbury, 2005). When some context is provided and novelty is controlled for, both ASC children and adults with high functioning language perform close to Typically Developing (TD) peers (Vulchanova et al., 2019). Still, some atypicalities in processing measures are found.

Objectives

Our main goal is to study average-IQ autistic children's comprehension of novel metaphors controlled through a norming study with supporting context vis à vis TD children's comprehension.

A secondary goal is to examine correlations with other measures, and their power as predictors of metaphorical capacity in ASC. More specifically, the sense convention task (Iversen, Ronderos & Falkum, in prep.), and autism severity.

Methods

We combine a picture selection task with gaze movements recordings. Our design manipulates two conditions: literal and metaphorical. The metaphorical condition includes a context sentence and a metaphor, e.g. "Grasshoppers jump a lot [context sentence] That child is a grasshopper [metaphor]. Which one is it?". The literal condition is exactly the same but "child" is substituted by "animal". All metaphors in our study have been tested for novelty in a previous norming study (N=21).

Analysis plan

We will conduct two types of analyses. The first one will be a group comparison with TD peers on each group's relative accuracy. One group will be matched by verbal mental age (PPTV-III) and the other one by chronological age.

The second type of analysis will be only within the ASC sample. We will look for main effects of any of the measures cited in the previous section.

Between Collective and Individual: A Contrastive Study of the Expression “Common Sense” in Japanese, English, and Dutch

Poster

Dr. Ruth Vanbaelen¹

1. University of Tsukuba

This work in progress examines the way the concept of “common sense” is used across three languages, i.e., Japanese, English, and Dutch. The goal is to investigate if the expression is used to indicate a shared understanding, a personal interpretation, or a continuum between the two extremes of the collective and the individual. This will help language learners as well as translators to render their thoughts/texts more accurately.

This is a three-step research. Firstly, dictionary entries and definitions for each language are reviewed to comprehend the level of individuality that is assigned to the concepts. High-frequency keywords are used as indicators. Next, survey data of 173 participants is analyzed. Respectively 60, 42, and 70 native speakers of Japanese, English and Dutch provided definitions and examples of the expression “common sense” in their first language through an anonymous online platform. Finally, attention goes to how expressions are translated between the languages to increase the understanding regarding differences and similarities.

Survey results indicated that keywords used in dictionaries reappear most frequently in definitions of Japanese participants, but to a lower degree in English and even less in Dutch. Also, in 34% of the answers of Dutch speakers and to a lesser extent in English (9.5%), “logic” and related words were used, whereas none of the Japanese speakers chose these as keywords. In addition, when concentrating on keywords as “group” and “individual” as well as words related in meaning (e.g., most people/society and own/self), Dutch speakers focused more on the “individual” than English or Japanese speakers with the latter group leaning the most towards the “collective”. Detailed analysis of this tendency is under way and in-depth results will be provided on the poster. The preliminary results indicate that, although “common sense” seems to be commonly understood in different languages, in this three-language study, the focal point moves along the axis of the collective-individual continuum depending on the language. Finally, translations proved to be complex. Stand-alone expressions (e.g., in dictionaries) often have one straightforward translation, but translations in context (e.g., in novels) tend to shy away from “common sense”-related expressions. Examples of the language pair Japanese-English, which according to the above analysis is closer on the collective-individual continuum than Japanese-Dutch, and their analysis will be presented.

As this is a work in progress, on the technical side, further research will firstly compare the positive/negative format of the expressions with the actual meaning that is expressed. In addition, supplementary data will be collected for 1) languages, such as German and Swedish, that use expressions similar to Dutch and 2) languages, such as French, Spanish and Portuguese, in which, even though marginally, two expressions remain, one leaning towards the Dutch tendency of individualism and one with a more group-oriented meaning. On the meta-linguistic side, a closer look at the separate cultures/societies will provide valuable insights on the concept of collective-individual.

Dealing with atypicality in oral and written discourse concerning refugees who have experienced torture

Poster

Dr. Iphigenia Moulinou¹

1. University of Athens, Greece

The poster I submit presents part of my post-doctoral research on the social representation and identity of refugees who have experienced torture (henceforth RsT). It is concerned with the challenges psychologists and solicitors have to face when presenting in writing or in oral form the story of RsT before the asylum jury. My approach is ethnographic and concentrates on the diverse linguistic practices of the different actors involved during the initial stages of assistance, later on through the stages of the asylum application process to the initial post-migration period. The research is conducted with participant observation in socio-institutional settings in Greece where professionals work with RsT. The preliminary results of my study are compared with the findings of researchers in other European host countries.

Two kinds of data will be analyzed: a meeting between NGO solicitors dealing with RsT and professionals of *Babel Day Centre*, the oldest and most well-known center which provides mental health service to RsT particularly, and interviews with these professionals. My presentation will be structured around two particular instances regarding atypicality issues in interaction. The first focuses on how experts deal with RsT who claim asylum because in their country they were persecuted for witchcraft, tortured and threatened. The data analyzed consist in interviews with psychologists and solicitors of RsT. Through discourse analysis, and mainly through the analysis of metapragmatic comments, reported speech and epistemic stance, concerning their interaction with the asylum seekers and the asylum jury, I examine to what extent western discourse and culture can meet and deal with discourse on witchcraft, in the asylum context. The second instance focuses on the discourse of psychologists and solicitors who write the reports to be submitted to the asylum jury. I describe how the discourse of the RsT is re-modelled in the written language of the solicitors, passing from an atypical to conventional forms. The ethical issues emerging in this transformative process will also be discussed and a comparison with the findings of researchers in other European countries will be made.

Development and Evaluation of Learning Materials on Vocabulary with Cross-linguistic Similarity -Compared with Showing Dictionary Definitions

Poster

*Ms. Yewen Wang*¹

1. Graduate School of Human-Environment Studies, Kyushu University

This paper develops learning materials for Japanese vocabulary which has cross-linguistic similarity to Chinese, and analyzes the effectiveness of learning materials via the experimental method. In this experiment, Chinese JSL learners were randomly assigned to a control group and an experimental group, respectively. In both groups, the learners learned 6 Japanese words with cross-linguistic similarity to Chinese. Both groups were given the same target words, examples, pictures and exercises in the learning materials. The difference was that the control group was given the dictionary definitions of Chinese and Japanese words, while the experimental group was given learning materials with some instructed strategies. Before and after the learning process, the learners took a pre-test and a post-test. All the tests were the same: there were 40 Japanese sentences in the test; 30 sentences contained the target words in the learning materials; 8 sentences contained Japanese words with cross-linguistic similarity which did not appear in the learning materials; and 2 dummy questions were set to test whether the learners answered carefully. 35 participants were involved in the analysis, with 17 in the control group and 18 in the experimental group. The learners were requested to judge if the meanings of underlined words were appropriate for the sentences by using a five-point scale (1 indicates inappropriate and 5 indicates appropriate). The underlined words were selected from previous research, a Chinese-Japanese homonyms dictionary for Japanese-Language Proficiency Test (JLPT) Level N1 and N2. Meanwhile, the participants were unable to correctly judge the meanings of those words in the preliminary test. The scores were calculated according to the answers on the five-level scale. In the pre-test, the average scores of the control and the experimental groups were 122.47 and 116.22. Statistically, there was no significant difference between the levels of the participants' performance in the two groups in the pre-test ($t=1.883$, n.s.). In the post-test, the average scores of the control group and the experimental group were 162.18 and 165.67. Compared with the pre-test, the scores of the two groups were significantly improved (control group: $t=15.80$, $p<0.01$; experimental group: $t=15.36$, $p<0.01$). Comparing the degree of improvement of the two groups, the experimental group was better than the control group at the $p=0.05$ significance level ($t=2.366$, $d=0.800$). Thus, both learning materials were found to be effective in learning words with cross-linguistic similarity. Dictionaries are considered useful for learning vocabulary, but some studies pointed out that the explanations in dictionaries were not sufficient. Simply listing and comparing the meanings of L1 and L2 words did not lead to better learning results. By contrast, the learning materials of the experimental group analyzed the features of word-formation, provided collocations used in the context of daily life, explained meanings concretely and summarized usage patterns. The results showed that this could help learners elaborately process meanings and establish new form-meaning connections that were different from L1. This study suggests that when teaching words with linguistic similarities, combination of approaches can be used to help learners understand better, rather than comparing meanings only.

Development of Narratives of Second Language Learners of English

Poster

*Dr. Anna H.-J. Do*¹

1. New York City College of Technology, City University of New York

Abstract

There is a considerable body of evidence exploring the development of first-language narratives (e.g., Bamberg, 1997; McCabe & Peterson, 1991a; Verhoeven & Stromqvist, 2001). However, there is a dearth of adequate research investigating narratives of ELLs (cf. Bardovi-Harlig, 1995, 2000).

The study is to assess the narrative skills of second language learners at three distinct stages of their development – beginner, intermediate, and advanced. ELL narrative skills include the lexicon, syntax, and pragmatics areas of speaking expression.

The data used in this study are drawn from narrative stories created by forty 11th and 12th grade ELLs when compared to eight 11th and 12 grade English-speaking students from the same high school. The subjects were given only pictures with the entire narrative deleted. Subjects were then asked to provide their own oral narrative version of the story which was tape-recorded and transcribed for analysis.

The study documented serious gaps between the three groups with respect to their use of lexicon, syntax, and pragmatics. While advanced students, as expected, tended to perform better than beginner and intermediate students, their use of verb tense, pronouns, and prepositions was not significantly better than the other two groups.

Due to the lack of research with ELLs, this study would be critical in shedding additional light on these stages of learning. This study would not only allow ELL teachers to understand more clearly critical gaps in narrative skills but also provide them with certain tools to modify their instruction and better serve the needs of ELLs.

Disappointed and Distant: The Emotional Facial Expressions of Ironic Speakers

Poster

*Dr. Marc Aguert*¹

1. Normandie Univ, UNICAEN, LPCN

As verbal irony was described as a rhetorical device intended to express negativity (Colston, 2015; Roberts & Kreuz, 1994), we explored the emotions that subtend its use. A set of 104 silent videos was retrieved from Aguert (2022). In these videos, all the speakers were saying the same utterance (“Honestly, it was really great”), in the context of a role-play, but with different contexts which led half of them to be sincere and the other half to be ironic. We submitted these videos to 293 judges, undergraduate students, and asked them to describe the speakers’ mental state in a single word, allowing us to build a corpus of 13 780 words which characterized sincere and ironic speakers. Analysis of the corpus mainly consisted in calculating a specificity score for each word (a measure of the frequency of a word in certain parts of the corpus, Lebart et al., 2019) and determining the valence of these words. Results showed that the judges first described the speakers with emotional labels, mainly negative for ironic speakers (“disappointed” and “sad”) and mainly positive for the sincere speakers (“happy”, “joyful”). The fact that the most frequent qualifier for ironic speakers was “disappointed” confirms that irony is a device that appears in contexts where speakers’ expectations have been thwarted (Attardo, 2000; Colston, 2000; Utsumi, 2000). After emotional labels, the words produced by the judges described the speakers’ enunciative attitude (i.e., their attitude toward their own words). In particular, sincere speakers were qualified as quite confident (“sure”, “persuasive”, “involved”, etc.), while ironic speakers were qualified as not very confident (“not sure”, “wary”, “embarrassed”, “skeptical”, etc.). The actual word “ironic” rarely appeared which suggests that facial expression alone is not enough to conclude that a person is ironic. However, participants at least perceived that ironic speakers were not sincere, and that they distanced themselves from their words, which confirms that pragmatic insincerity is an important ingredient of irony (Kumon-Nakamura et al., 1995). Finally, our results support a conception of facial expressions as a socio-communicative device, fulfilling pragmatic functions, rather than as the facial display of our felt emotions (Scarantino, 2017).

Exemplification, Topic Management, and Unexpectedness: The Case of the Japanese X Toka

Poster

*Ms. Motomi Kajitani*¹

1. *The University of New Mexico*

The Japanese exemplification marker *X toka* has functions that are not often discussed, including (i) managing topics (Nakamata 2008) and (ii) highlighting *X* and expressing the speaker's stance on it, including negative attitude and unexpectedness (Suzuki 1998; Taylor 2010; Taki 2020; Barotto 2021). Using conversational data from YouTube videos, this study qualitatively examines these functions from a cognitive-pragmatic perspective. The results reveal that the construction functions to mark a new topic in topic narrowing (the topic is narrowed from T1 to T2), shifting (the topic is shifted from T1 to T2), or recapturing (part of T1 is recaptured as T2) as well as to introduce a topic to an addressee out of the blue. They also show that some topic management function subtypes involve speaker-, speaker- and addressee-, or addressee-unexpectedness. Overall, the study suggests that *toka* functions to put *X* at the forefront of the addressee's attention (Talmy 2010) so as to talk about it further. It also reveals an intricate network of the discourse-pragmatic functions of the *X toka*, that embraces multiple layers of (inter)subjectification (Traugott 2003).

Explicature and the narrowing or broadening of target texts by sign language interpreters

Poster

Dr. Campbell McDermid¹, Anita Harding¹

1. Gallaudet University

Translators and interpreters work between languages and cultures in an attempt to represent the “sense” of a source text to a target language audience. However, little has been done specifically concerning how sign language interpreters represent the meaning of Deaf signers, specifically when the interpreters are constructing target texts in spoken English. To address this gap, a qualitative study was done with 22 sign language interpreters to compare their target texts in spoken English to four source texts in American Sign Language (ASL), for a total of 44 samples. Using Carston’s (1996) earlier discussion of explicatures, Klaudy’s (1998) taxonomy of potential changes in translated texts, and work in the field of translation on explicitation, compression and expansions (Kamenická 2007; Klaudy & Károly, 2005), various strategies were noted in the 44 target texts. Some strategies may have strengthened the meaning of the ASL utterances for an English audience, for example by substituting a pronoun (he/she/they) for the role of the individual (the secretary, the engineer), leading to a narrowing of meaning (Carson, 1996), also referred to as specification (Gumul, 2006; Kamenicka, 2007; Klaudy & Karol 2005) or particularization (Molina & Albir, 2002). Some additions such as the use of conjunctions to compound nouns or the inclusion of the article “the” were seen as obligatory and strengthened the target text meaning. The inclusion of prepositional or phrasal verbs in spoken English to replace a single verb in ASL was seen as optional and strengthening, as they resulted in more native-like sounding texts. One optional compression strategy, the use of agentless passive voice in English when the subject was specified in ASL, resulted in a broader meaning leaving the audience to work out who was performing the action and thus weakening the “sense” of the target text. Another optional strategy, the use of indefinite pronouns such as “someone” when the agent was specified in ASL also potentially weakened the target text. By recognizing the strategies used and examining their potential impact on an audience’s ability to comprehend a target text, it is believed interpreters can then make more informed choices about how they work from ASL into spoken English.

Facework of Intimacy and Distancing in Teacher-Student Interviews

Poster

Dr. Makoto Imura¹, Dr. Seiko Otsuka¹

1. Osaka Institute of Technology

This study examines role performance and relationship building in teacher-student interactions from the perspective of facework (Goffman, 1967) through discourse analysis. Particular attention will be paid to the teacher-student interactional facework related to the use of honorifics and the teacher's self-presentation (Goffman, 1981).

Our conversation data consists of 10 pairs of one-on-one teacher-student interviews conducted as part of a long-term extracurricular project on English extensive reading. The project recruited volunteer students and aimed to keep them motivated to engage in extensive reading through cooperative learning among students. In the first year of the project, teachers are expected to play a role of building rapport with students and encouraging them to read more English books. Interviews were conducted to help the teachers build a good rapport with the students and at the same time, to understand their situation so that they can motivate them properly.

Japanese has its own honorific system, and the use of honorifics should be considered when analyzing conversations, especially when there is a hierarchical relationship between conversation participants. Japanese honorifics have the function of adjusting and indicating distance from others (hierarchical relationship and degree of intimacy), and they also have the function of presenting "demeanor" (Goffman, 1981) of the user due to the ideology of cultural orthodoxy. However, its use or non-use is bound by social norms. While its use from students to teachers is socially mandated, teachers can choose if they use it to students or not. The use of honorifics by teachers toward students indicates that there is an authoritative distance between them, but also that they are sophisticated teachers who show some respect to students and treat them as equals. At the same time, however, it also keeps students at a distance and prevents creating of rapport.

In their interviews, teachers have two conflicting objectives as described above - the need to establish a close relationship with students so that they feel comfortable discussing their concerns and, conversely, the need to play the role of a mentor who encourages learning. In this study, we will analyze in particular how and in what situations teachers try to achieve these two purposes from the perspective of facework, using teachers' use of honorific expressions as a clue.

In the analysis, for example, in many situations in which the interactive roles of interviewer and interviewee are fixed, such as when asking about student's motivation for participating in the project, honorifics are used at the end of sentences. On the other hand, non-use of honorifics is observed in situations where the conversation developed in a reciprocal role manner, such as when discussing students' personal lives. This may indicate that facework of authority and that of intimacy are used differently, depending not only on the topic but also on the participation framework in the interaction.

Factors Influencing Request Emails by Japanese Learners of English in Academic Settings

Poster

Dr. Riko Umeki¹

1. *Fukuyama Heisei University*

This present study aims to better understand factors influencing request emails by Japanese learners of English (JLE) in academic settings. Recently, researchers have shown an increased interest in computer-mediated communication including email. In the field of second language pragmatics, previous studies on academic request emails have revealed important findings related mainly to five aspects: proficiency level of L2, social distance, social power, familiarity with emails, and the order of discourse moves in emails (e.g., Biesenbach-Lucas, 2007; Bjørge, 2007; Bou-Franch, 2011; Chen, 2015; Economidou-Kogetsidis, 2011; Economidou-Kogetsidis, 2016; Savić, 2018). These findings suggest that these five aspects are decisive factors for L2 learners to successfully realize requests in academic emails. However, very few studies have investigated how they actually influence request emails by L2 learners. Thus, the main purpose of this study is to examine how factors affect requests realized by JLE in academic emails. The study collected email data ($N=300$) from 75 JLE with intermediate proficiency level, asking them to complete an online written discourse completion test with four different academic settings. The data was first categorized from four aspects: frame move, strategy, internal modifiers, and external modifiers. The categorized data was then analyzed using decision tree analysis to predict factors that influenced an outcome (e.g., category use). The results show that in terms of strategy, “social power” had the most influence on strategy use. Especially, with social power, “English proficiency level” is most likely to affect strategy use. In line with Economidou-Kogetsidis (2011), JLE with lower proficiency level tend to use direct strategies such as *Imperatives* and *Want/Need statements*. Despite the significant influence of “English proficiency level” on strategy use, interestingly, this factor had either no effect or the least effect on category use in frame move, internal modifiers, and external modifiers. The findings suggest that regardless of English proficiency level, there are pragmatic features almost inaccessible for L2 learners to acquire on their own without specific opportunities to learn them. Further research is required in order to establish efficient pragmatic instruction considering the findings from the present study.

Gender and Professional Identity: Variation in Discourse Particles among Taiwanese Educational YouTubers

Poster

*Ms. NienEn Liu*¹

1. University of Edinburgh

A popular genre among Taiwanese YouTubers is educational videos. To stand out in the competitive industry, educational YouTubers are expected to be both entertaining and professional. In this paper, I explore the relationship between gender and professional identity evidenced by variations in their use of Discourse Particles (DPs). DPs (e.g. *ne*, *ou*, *a*) in Mandarin are discourse items indicating the speakers' affective attitude and emotion colouring (Han, 2019; Simpson, 2014; Tseng, 2006). DPs are shown to index certain gendered or professional identities. For instance, Chuang (2005) shows that Taiwanese women use certain DPs to infantilise themselves to represent their cuteness. Starr (2011) also suggested that the use of DPs indicates casualness while their absence index the professional and distant characteristics. The use of DPs, as a feature of vernacular speech, may thus index 'casualness' and so increase intimacy with the audience and function as a strategy which YouTubers use to build a following on the platform.

The data is divided into four groups: female science-teaching, male science-teaching, female English-teaching, and male English-teaching. The two most popular Taiwanese YouTubers within each group are selected. Four hours of video clips in total (i.e. 30 minutes for each speaker) where they demonstrate the relevant knowledge backgrounds to the audience form the corpus. After collecting all the DPs from the corpus, I examined the types of DPs by analysing their positions in utterances, prosodic features, contexts, and minimal pairs.

The results show that English-teaching YouTubers have greater variation in their DP use, featuring more types, including utterance-medial interjections (e.g. *ne*, *a*) and utterance-initial and -final modal particles (e.g. *en*, *wa*, *ma*, *ba*) and tokens of DPs to create a casual teaching style whereas science-teaching YouTubers apply fewer types (mostly utterance-final modal particles, such as *ou* and *la*) and tokens of DPs. This finding suggests the fundamental difference of teaching styles between English and science education, with YouTubers emphasizing aspects of closeness and distance respectively via their variation in DP use.

While gender was not a major variable across fields, female and male speakers used different strategies to express their professional identities when they teach different subjects. Female English-teaching YouTubers use more types, including various interjections and modal particles and tokens of DPs than male ones, while female science-teaching YouTubers use fewer types and tokens of DPs, particularly the interjections (e.g. *ne*), than their male counterparts.

The results suggest that DPs are stylistic variables used by Taiwanese educational YouTubers to manage the tension between entertainer and professional personas. As science education is still a male-dominant field in Taiwan, female YouTubers in this genre are inclined to index a more professional speech style than male ones. In contrast, while the English-teaching genre shows a relatively casual style of teaching compared to the science-teaching field, female speakers in this genre tend to create intimacy between themselves and the audience with various types of DPs whereas men have individual strategies to negotiate their relationship with the audience.

Gender differences in pragmatic abilities of autistic children and adolescents (Work in Progress)

Poster

*Ms. Marie Belenger*¹, *Prof. Mikhail Kissine*²

1. Université Libre, 2. Université Libre de Bruxelles

Autism Spectrum Disorder (ASD) is a neurodevelopmental disorder characterized by lifelong socio-communicative impairments as well as restricted interests and repetitive behaviors (Psychiatric Association, 2014). One of the most robust specificities of ASD is that autistic individuals have difficulties with pragmatic abilities (Paul, 2007). ASD is more frequently diagnosed in males than females with a 3:1 ratio (Loomes et al., 2017). There is growing evidence that diagnosis tools are less likely to identify autistic females. Until very recently, researchers did not focus on the interaction effect of gender & autism diagnosis on pragmatic abilities, even though previous studies on the subject reported a gender effect within the autistic population. Autistic females seem to encounter fewer difficulties than autistic males, but they are still not comparable to non-autistic females (Sturrock et al., 2021). Furthermore, autistic females seem to be more likely than autistic males to camouflage their autistic behaviors — including pragmatic functioning (Parish-Morris et al., 2017). Therefore, this project aims at further delineating the pragmatic profile of autistic females, trying to determine whether they present a unique pragmatic profile – different from their autistic male peers as well as from their non-autistic female peers.

Participants are autistic & non-autistic adolescents (9-16 years old). The existence of a possible diagnosis bias against females also warrants the inclusions of adolescents presenting a high likelihood of autism (i.e., an autistic sibling in their family).

Pragmatic abilities are evaluated through a narrative task as narratives offer a more ecological way to investigate pragmatics than standardized tests. After a small “get-to-know” talk with the experimenter, participants are asked to tell a story based on a wordless picture book. Narratives are verbatim transcribed and detailed discourse analysis of the transcript are performed. Discourse analysis includes: the story grammar – that is the general coherence of the story – as well as the linguistic tools used to make meaningful connections between phrases – that is the story cohesion (i.e., choice of referential expression, use of adequate connectives and discourse markers, disfluencies. It also includes the use of Internal State Language (ISL). In addition, parents are asked to complete questionnaires assessing pragmatic abilities of their children.

Data collection is now in progress and should be over by June 2023. For discourse analysis, outcome variables will be counts therefore linear regression will be used for analysis. Camouflage (measured by the disfluencies ratio) will be analyzed by means of cumulative link regression models.

Our hypothesis is that narratives of autistic females will differ from those of both autistic males and non-autistic females. We expect autistic females to include more salient elements, causal explanation and ISL than autistic males. The increased use of those elements will make the narratives of autistic females more coherent than those of autistic males but still less coherent than those of non-autistic participants. As there are very few previous studies on this matter and because they included small sample sizes and/or lacked power, we expect other differences to emerge beyond our specific hypotheses.

Gendered perspectives on mansplaining

Poster

Ms. Kerrigan Beagley¹, Dr. Lisa Johnson¹

1. Brigham Young University

This study considers the popular term “mansplaining,” gendered speech acts, and general miscommunications. Although the term is common in public discourse, no universally accepted definition of mansplaining exists; different writers identify different linguistic and interactional features with the term, and there is evidence that men’s and women’s perceptions of the concept may differ (Bridges, 2017). Johnson (2020) defines one kind of mansplaining within the framework of speech acts and illocutionary force (Austin, 1975), arguing that mansplainers incorrectly interpret knowledgeable women’s assertions as questions or requests for information. The mansplainers’ responses represent more than a benign misunderstanding, since “pernicious social structures” encourage harmful presuppositions about women’s knowledge and expertise (17). While Johnson provides a reasonable account of “speech act-confusion mansplaining,” she admits that only empirical research can test the inferences made about mansplainers’ attitudes. The purpose of this study is to obtain empirical data on mansplaining as it is perceived by both men and women. Primary research questions are (1) What linguistic features characterize mansplaining? (2) Do most women/men view mansplaining in the same way? (3) How might a female definition of mansplaining differ from a male one? (4) How do instances of mansplaining differ from other instances of speech act confusion?

Data collection is divided into two phases. An online survey targets a broad sample of women to test basic definitions and accepted characteristics of mansplaining. The information from the survey informs the next phase, a series of semi-structured interviews with white, college-aged men at a religious university. In addition to questions about demographics and upbringing, the interviews include discussions of such topics as social interactions, (mis)communication, and the interviewee’s understanding of mansplaining. Finally, male participants are asked to perform mansplaining while describing a stereotypically male-oriented task (like changing a tire). Analysis compares the use of mansplaining features in the performance to the baseline discourse in the rest of the interview.

This in-depth investigation into male attitudes and assumptions sets the present study apart from most previous work that focuses only on the female perspective. Yet such information is vital to understanding the mansplaining phenomenon and to potentially mitigating communication problems and dismantling culturally rooted presuppositions about gendered speech acts. It also differs from Bridges (2017) in using interviews to follow up on men’s expressed opinions.

We expect to find that women’s ideas about and experiences with mansplaining will be similar to each other. We expect men to view mansplaining differently from women and to unknowingly employ linguistic features associated with the practice.

Gesture in learners signed-to-spoken language interpreting

Poster

Mrs. Elisabeth Hansen¹

1. University College Copenhagen

The aim of this study is to uncover which co-speech gestures students make use of on their 5th semester in the Danish Bachelor's programme of Sign Language and Speech-to-text Interpreting when interpreting from Danish Sign Language to spoken Danish and identify any patterns in the appearance of these gestures. I hope to shed some light on the subject to incorporate this new knowledge in our training program.

My research questions are:

Which types of gestures do the students use?

Are there any patterns in the use of gesture? If so, which patterns can I identify?

The study is a qualitative preliminary research project applying video analysis to recordings of semi authentic dialogue interpreting in the classroom.

The empirical data consists of 5 video recordings (total length approx. 70 minutes) of semi authentic dialogue interpreting by 5th semester students.

The primary participants in the dialogue were all dependent on the interpreting as the hearing participant does not know any sign language and the two deaf participants have no hearing. The topics for the dialogues were selected by the students and were all semi authentic but performed in the classroom setting. The room was set up with tables, chairs and cameras and the students were asked not to make special adjustments in their positioning for the sake of the cameras.

All the participants - both the students acting as interpreters and the primary participants - signed a written consent-form beforehand as they were informed how the recordings would be treated and with which purpose. They were not initially informed of the studies exact focus as I did not want the students' performance to be affected by that awareness. After the class was over, I did however inform all the involved parties of the aim of the study.

The recordings will be transcribed using a detailed software program and analyzed using the method of multi-modal video analysis and the theoretical framework of conversation analysis.

At the conference I wish to share my project idea, the design, and some preliminary results in a poster presentation. I hope to engage in useful discussions and fruitful feedback from peers.

Hidden inequalities in the L2 classroom: The case of pragmatic markers in Spanish translation

Poster

*Dr. Luzia Dominguez*¹

1. Cardiff University

In my poster I will present a quantitative analysis of errors in the translation of pragmatic markers from English into Spanish in a cohort of second year undergraduate students of Spanish in Cardiff University. The primary objective of this analysis is to determine the correlation that exists, if any, between errors in the translation of pragmatic markers and certain social categories that are interpreted as measures of disadvantage.

In particular, I will examine the correlation of these errors with ethnic identity and race. Also, I will look at their correlation with variables that could be defined as a measure of socioeconomic class: household income and parents' level of education, amongst others. Other variables could be useful to measure disadvantage, so this would be an interesting discussion to have with other researchers. Furthermore, the presence of a second or third language in the household, and if this is Spanish, will be considered, as these variables may have an impact in student's pragmatic proficiency in Spanish. Other variables regarding use and competence in different languages may be relevant.

Ultimately, I wish to learn about the (co)relation between social inequality and the development of pragmatic skills in the context of academic learning of a second or further language. The enquiry will set some foundations to further examine the link between academic success in a second or further language and measures of social disadvantage. Though a qualitative analysis may be limited and other approaches may be necessary to fully understand any causal links between disadvantage and pragmatic performance, with this research I would like to initiate a conversation on the issue.

This work is framed within a more ambitious project. The broader project aims to examine second (or further) language acquisition in an academic context and encourage young pupils from disadvantaged backgrounds in deprived areas of Cardiff (in Wales, United Kingdom) to take on the study of a second or further language and, through the means of modern language education, wider access to Higher Education for these pupils. Even if access to Higher Education is not achieved, current research shows that there are other benefits of bilingualism and multilingualism, from cognitive improvement to job opportunities, between others. This, in a context where, due to Brexit and a current recession, access to modern languages education is being cut in comprehensive schools and risks to become accessible only to the most privileged in society.

How doctors and patients negotiate different interpretations of empathy through the interaction of simulated medical consultation in English as a lingua franca

Poster

*Ms. Yukako Nozawa*¹

1. Toyo University

This poster presents the initial stages of a qualitative case study, which is an on-going analysis on how doctors and patients co-construct empathic communication in simulated medical consultations in English as a lingua franca (henceforth ELF) by negotiating different perspectives and interpretations on the concept of empathy. Empathy has been widely recognised as a core element of patient-centred communication; however, Hojat (2002, 2007) points out that the number of research on behavioural aspect of empathy is still limited. Specifically, Marsden (2014) argues the lack of participant's perspective in defining the concept of empathy. This study, therefore, adopts the two phases of inductive approach, that is, grounded theory approach (e.g., Glazer and Strauss, 1967) and conversation analysis (e.g., Sacks et al., 1974). At the first phase, the researcher conducts interviews on the participants: 1) two simulated patients from overseas and 2) seven student doctors from Japan, in order to investigate how they interpret the concept of empathy. At the next phase, audio-recorded and transcribed data of six sessions of simulated doctor-patient communication is analysed by using conversation analysis in order to examine how they practice their understanding of empathy in medical interviews in ELF. The current stage of analysis has revealed two findings; firstly, the student doctors tend to understand empathy as a cognitive domain, while simulated patients tend to interpret as an emotional attribute. Secondly, conversation analysis has revealed that the expression of empathy becomes more explicit as the medical interview proceeds, which is similar to the study by Morse et al. (2008) stating that the expressions of empathy only appear in the later stages of medical interviews. In the following process of grounded theory approach, the interview data is to be analysed in a more detailed manner in order to investigate how the concept of empathy is informed by the participants' perspective. Likewise, the more detailed conversation analysis reveals how the expression of empathy becomes more explicit through the medical consultation, that is, how the participants negotiate the different understanding of the concept of empathy and co-construct more empathic communication through interaction in ELF.

Identifying the effect of variability on word learning in ASD

Poster

Ms. Solene Jaspard¹, Prof. Gaetane Deliens¹

1. Université Libre de Bruxelles

When developing language, children are exposed to a speech input which is, in several respects, highly variable. The acoustic signal associated with the production of one word, for instance, differs every time this word is produced by a new speaker. Additionally, a child is also likely to encounter one particular word in a variety of semantic contexts. Studies focusing on typically-developing (TD) children have shown that speaker and contextual variability can be beneficial for word learning, because variability increases the salience of the invariant (and hence relevant) properties of a word-object. Whether this is also true for children on the autism spectrum remains so far uncharted. We will also investigate whether a supportive effect of variability on lexical learning might correlate with the linguistic development trajectory of autistic children.

We propose to address these objectives by presenting 9-to-11-year-old children with two implicit word learning tests. In the first one, we will study the effect of speaker variability on autistic and non-autistic children. They will be presented with 8 new label-object associations over the course of 2 successive days. Half of the to-be-learned labels will be repeated multiple times by the same speaker (Same Speaker Condition), the other half will be repeated each time by a different speaker (Variable Speaker Condition). Our second test will examine the effect of contextual variability. To this end, autistic and non-autistic children will be presented with a series of pseudowords embedded in a story. Half of those pseudowords will be presented in the same story repeated twice by the same speaker (Repeated Context Condition), and the other half will be presented in two different stories told by the same speaker (Variable Context Condition). Each child will take part in both conditions, spaced apart by at least one week. Learning performances will be assessed immediately after reading time, and again after a night of sleep at home.

Our principal hypothesis is that a deficit in invariance detection – a learning process whereby people manage to extract, over multiple exposures, relatively invariant elements of the word-object exemplars – is likely to significantly contribute to language impairments in autism. If this is true, we should observe poorer learning performances in the variability conditions (vs. no variability conditions) for autistic children who have been delayed in their acquisition of language. In contrast, we expect TD children and autistic children with no history of language delay to reach better performances in the variability conditions.

Ultimately, the proposed project has the potential to provide valuable insights into the learning conditions that are best suited to the needs of autistic children who present language delays, or at risk of presenting some. Through this project, we also hope to make meaningful contributions to the debates about language predictors in autism.

Impoliteness in Adversarial Contexts

Poster

Mr. Rodrigo Agustin Lana¹

1. University of Heidelberg

The present study aims to contribute to the body of research in cross-cultural pragmatics by comparing the production of impoliteness in speakers of British English and Peninsular Spanish. Most research conducted in the impoliteness field has so far been observational in nature and focused on contexts where there are clear power imbalances between the interlocutors, including military trainings (Bousfield 2008) and interactions between unskilled workers and exploitative employers (Márquez Reiter and Kádár 2022). The present study, in contrast, adopts a more carefully controlled design to investigate the use of impoliteness in adversarial contexts through the proxy of card game interactions. This design will allow me to answer the following research questions: a) Is impoliteness sanctioned or neutralized by speakers in the context of card game interactions? b) Are the type, directionality and frequency of impoliteness strategies used by my speakers affected by external factors, including culture, gender and age?

The object of analysis will consist of a parallel corpus of card game interactions among speakers of British English and Peninsular Spanish. This corpus will include 50-minute recordings of participants playing shedding-type card game Uno. Each group will involve 4 participants, with 6 interactions for each of the languages under study being recorded. The corpus will also be stratified by gender and age. Instances of impoliteness will then be identified according to the following criteria: a) speakers fail to mitigate the face-threatening potential of an FTA when mitigation is needed, or b) speakers intentionally maximize the face-threatening potential of an FTA. The next step will be to develop a coding scheme to categorise the instances of impoliteness found in the corpus. In order to do this, I intend to refine existing taxonomies of impoliteness (Culpeper 1996, Bousfield 2008) to create my own classification of impoliteness strategies. Then, I will make use of statistical tools to establish whether there are any significant differences between different social groups (old vs. young speakers, men vs. women). Combined with qualitative analysis of individual instances of impoliteness, these tools will allow me to describe how impoliteness is constructed beyond the single-utterance level. The present study also has the potential to expand the body of knowledge regarding cross-cultural variation in the use of impoliteness. Although research has found the types of impoliteness strategies in Spanish and English to be similar (Kaul de Marlangeon and Alba-Juez 2012), it remains to be ascertained whether the frequency and directionality of said strategies are equally comparable.

Inclusive language ideologies in a highly exclusive educational environment: Teachers' valorization of multilingual repertoires at an international school in Flanders

Poster

*Ms. Anne-Sophie Bafort*¹

1. University of Antwerp

It has become a hallmark of educational excellence and employability to be able to speak several world languages. This has led elite educational institutions, especially international schools, to use their teaching of such multilingual repertoires as a sign of exclusive distinctiveness, linguistic capital and language-based social superiority. At the same time, however, they promote inclusive language ideologies and inclusive forms of multilingual teaching. As such, international schools have become sites of ideological tensions, in which social actors simultaneously express and embody ideologies of inclusivity and exclusivity. Little is known, however, about how international schools reconcile these tensions, since the bulk of scholarly attention has been devoted to non-elite schools. This poster discusses how middle/high school teachers reconcile such diverging ideologies of language at an elite international school in Flanders. Fieldwork was conducted in one international school with English as its official language but teaching a wide variety of multilingual students. Analysis of observational data and semi-structured interviews suggests a complicated, constantly ongoing ideological balancing act among teachers. Through the use of yearly celebratory 'mother tongue days' and everyday translanguaging pedagogies, teachers of all subjects aim to 'holistically' develop students' multilingual repertoires. Yet, such efforts are constrained by the use of English as the official language and by competing views that portray English monolingualism as inclusive. Moreover, not all students' linguistic repertoires are always valued equally: languages such as German, French and Chinese receive more pedagogical attention than Czech, Hindi or Gujarati. By mapping the complex manner in which international school teachers aim to reconcile language-based exclusivity with inclusive ideologies, this poster sets out to add to the growing body of research on the valorization of forms of multilingualism in elite educational institutions.

Interactions of secondary-school students during collaborative writing and their potential for writing development

Poster

Ms. Julia Schrittenlacher¹

1. University Duisburg-Essen

Collaborative writing **enables students to jointly create texts and engage in metalinguistic discussion on writing** (Myhill et al. 2016). Usually, it involves **considerable interaction** between two or more authors in a face-to-face interaction (Swain & Lapkin 2001). In contrast to “peer planning or peer response activities, where the interaction occurs only in the pre- or post-writing stages respectively” (Storch 2016, 387), the entire text production process is carried out responsibly by (at least) two writers. Writing education assumes that the mutual exchange and the **need to verbalize thoughts creates a wide range of learning opportunities** (Storch 2016). However, there are currently only a few studies on the actual procedural and interactive accomplishment of collaborative writing situations (but see Herder et al. 2020). Particularly, the question of how collaborative writing is realized in inclusive secondary school classrooms and how heterogeneously composed pairs work together is a desideratum.

Thus, the PhD project to be presented in a poster aims to explore student interactions during collaborative writing in order to identify potential benefits and hurdles of working in heterogeneously composed tandems. For this purpose, the data collection in the project starts with a preliminary assessment of students’ writing competence and writing styles. On this basis, heterogenous ‘writing tandems’ are specifically put together. For the collaborative writing task, argumentative tasks are chosen as they involve a certain level of complexity and thus may well stimulate conversational exchanges on how to produce the text. Following this, a qualitative-reconstructive analysis of the thematic structures and interactive practices of the students’ writing interactions presents the first step of analysis. In a second step, these provide information about the learning potential of collaborative writing and on their conditions for success. In this way, the project attempts to provide applicable knowledge on collaborative interaction in inclusive German classrooms.

The poster presents the research design of the PhD project. In addition to the empirical procedure and theoretical framework, the poster presents first insights into the data collected in eighth grade German secondary classrooms (videographed writing interactions, text products, screen capture recordings).

Investigating the strategies used by Italian and British English native speakers in making requests.

Poster

*Ms. Beatrice Massa*¹

1. *Phrasee*

Requests are one of the most ubiquitous speech acts in everyday talk and, due to their face-threatening nature, are characterised by the use of numerous strategies dependent on sociolinguistic variables like power relations and social distance (Stavans & Webman Shafran, 2018). Requests have been intensely investigated in English and other languages, yet very few studies have examined them in Italian (Napoli, 2021; Pozzuoli, 2015). This research aims to address this gap by comparing requests in British English and Italian. Specifically, the study looked at the distribution of direct and indirect strategies, the relationship between these strategies and power, and how these are affected by power relationships and social distance.

Data was collected via a web-based DCT, including nine situations adapted from the DCTs in Blum-Kulka and Olshtain (1984) and Marti (2006), at two points in time (2019 and 2022). The study comprised 40 university-aged (19-26) native British English (BrESs) and Italian speakers (ItSs). Responses were coded following Blum-Kulka and Olshtain's (1984) request strategy framework, comprising three main strategies (i.e., Direct, Conventionally Indirect, and Non-Conventionally Indirect) divided into 9 sub-strategies. The Italian data was also searched for the pronoun *mi* 'to/for me'. Instances were then manually sorted to eliminate cases where *mi* did not belong to the construction *Mi X?*.

Findings reveal that, overall, both BrESs and ItSs favour Conventionally Indirect strategies. This is consistent with previous studies on English (e.g., Fukushima, 2000) and Italian (Pozzuoli, 2015). ItSs, however, used Direct strategies more than twice as often as BrESs, especially in situations presenting both power differences and social distance. *Mi X?* was observed only in situations with no power or social distance differences (Rossi, 2012), but a variation of this construction, *Mi + potere X?* (where *potere* means 'can/could') occurred in all types of social power and distance situations. This study supports previous research on English requests and provides important insights on the use and performance of requests in Italian.

Invitations in Japanese: An analysis of their turn formats and sequential organisations

Poster

Dr. Chisa Matsukawa¹

1. *University of Central Lancashire*

In recent years, there has been a growing interest in the associations between linguistic form of various actions (e.g. requests) in turn design (Drew, 2012) and the specific interactional and sequential environments in which different forms are used (Drew and Couper-Kuhlen, 2014). In line with this, the cluster of studies explored the activity of invitations in authentic telephone calls in seven different languages (e.g. English (Drew, 2018) and French (Traverso et al., 2018)) from the Conversation Analysis (CA) perspective. The studies demonstrated the relationship between a certain grammatical format of invitation and the interactional and sequential environment in which it is made. With respect to Japanese invitations, Szatrowski (1993, 2004) explored the organisations of the invitation sequences by using authentic telephone data from 談話分析 *danwa bunseki* (Japanese Discourse Analysis). However, the analytical focus was not their turn design formats and the interactional contexts in which particular formats of invitations commonly occur.

Therefore, the present study aims to explore Japanese invitations in authentic telephone calls by using the CA methodology. The analytical focus is placed on their turn design formats and the interactional contexts in which particular formats of invitations commonly occur. The data will be gathered by several exchange university students from Japan. The participants will be asked to record their telephone conversation for ‘a study on decision making’. The potential telephone conversation would be an informal conversation among their friends. Possible results would back up one of the findings of Matsukawa (2017) that explored invitation sequences in Japanese by using open role plays. The analysis of the data revealed the relationship between a certain grammatical format of invitation and the interactional and sequential environment in which it is made – for example, the use of imperative in the invitation proper reflected the indication of certainty displayed by the invitee in the pre-expansion (Schegloff, 2007). In the presentation, the preliminary findings of the present study will be presented.

L1 pragmatic transfer in Japanese L2 students' written peer feedback

Poster

Dr. Sugene Kim¹

1. Nagoya University of Commerce & Business

Peer review is an important component of collaborative learning in which students provide feedback on each other's written work. Empirical studies have shown that peer review in second language (L2) writing classrooms not only helps to improve students' writing skills but also activates (meta)cognitive processes conducive to self-regulation by engaging students in critical thinking and reflection. Despite these pedagogical benefits and prevalent use, some studies (e.g., Carson & Nelson, 1996; Hyland, 2000; Mangelsdorf, 1992; Nelson & Carson, 1998) observe that students from group-oriented Asian cultures are predisposed not to reap these benefits because of their reluctance to criticize others' work. These students' abstention from making negative comments has been explained in terms of their culture, in which verbal negotiations or expressions of one's inner thoughts are less valued than preserving group cohesion.

To verify and extend the claim of the previous research, this study explored whether anonymity helps ameliorate their alleged reluctance to give negative feedback. Nineteen Japanese L2 students reviewed essays in the face-to-face and anonymous modes, and their feedback commentaries were comparatively analyzed according to their types (i.e., praise, suggestion, criticism), levels of negativity (i.e., bluntly negative vs. mitigated), and mitigation strategies implemented.

Results showed that Japanese L2 students adopt an extremely polite interpersonal rhetorical stance regardless of the peer review mode. Of the negative feedback commentaries, bluntly negative comments accounted for a scant 5% in both modes. Criticism almost always assumed a mitigated form, and it was not uncommon to employ multiple mitigation strategies or lexical hedges in a single commentary. The provision of critical comments in the form of a suggestion was by far the most common, followed by making requests for clarification, providing explanations, and making positive remarks. As consistently reported in previous studies, lexical hedges used to express uncertainty, possibility, and imprecision—e.g., the introductory verb “to think,” downtoners (e.g., “a little bit,” “somewhat”), adverbs of frequency (e.g., “sometimes”) and politeness markers (e.g., “please”)—were employed in the majority of the feedback comments regardless of the peer review mode. The pragmatic competence with respect to hedging disagreement or requests did not correlate with the language used (i.e., L1 vs. L2) or reviewer's L2 proficiency. These observations suggest that the use of mitigating devices is transferred from learners' L1 repertoire, indicating that cultural attributes might not be a major factor influencing Asian students' reluctance to provide negative feedback in peer interactions.

L2 Sensitivity to Scalar Boundaries in Implicature Processing

Poster

***Dr. Glenn Starr*¹, *Dr. Emilie Destruel*²**

1. University of Wisconsin - Milwaukee, 2. University of Iowa

Recent scalar implicature research reveals that participants are more likely to derive implicatures in scenarios involving bounded versus unbounded scales (Van Tiel et al. 2016; Ronai & Xiang 2021). To illustrate, when a participant hears the statement “This math problem is difficult” and is asked, “Would you conclude that the problem is difficult but *not impossible*?” that participant will likely respond “yes”. However, with the statement “This student is intelligent”, a hearer is much less likely like to conclude that the speaker intended to mean “the student is intelligent but *not brilliant*”. Researchers argue that scales like < *difficult, impossible* > contain endpoints that are built-in to the lexico-semantics of the stronger term, thus making the stronger scale-mate more distinguishable from its weaker counterpart. In this way, endpoints economize the facilitation of implicatures and lessen dependence on context. Unbounded scales, however, contain relative adjectives that better describe ranges rather than endpoints. As such, reference to the contextual domain is necessary before a delineation between scalemates can be made in relation to the object being described. Thus, more effort is required to determine whether implicature calculation is necessary because hearers have difficulty (1) identifying a borderline and (2) establishing clear standards which might warrant the derivation (Frazier et al. 2008).

Some research suggests L2 learners do not process input as efficiently as native speakers, particularly when the properties place a high demand on cognitive resources. However, L2 learners often demonstrate increased sensitivity to surface-level lexico-semantic, pragmatic, and contextual cues during sentence processing (Clahsen & Felser 2018). Since bounded or partially bounded scales are argued to include clearer delineations between scalar items, this study investigates L2 sensitivity to scalar boundaries and examines whether learners will derive implicatures at the same (or higher) rate as native speakers. Native speakers and L2 participants will complete an inference task and decide whether or not the speaker meant to negate a stronger scalemate. Target bounded/unbounded scales consist exclusively of pairs of gradable adjectives, an understudied part of speech in the L2 scalar implicature literature. We also consider cross-linguistic phenomena as a factor in our analysis. Results from this research will provide insight into the processing of different types of adjectival scales by L2 learners and further our understanding of scalar diversity. The experiments are now underway, and we are eager to present our results in July.

Language teacher identity in a non-native context: A case study of teachers of English language in Ghana

Poster

*Dr. Joyce Anku*¹

1. University of Ghana

This study seeks to understand how English language teachers in Ghana construct their professional identities as teachers of English as a Second Language. This study will employ semi-structured interviews to gather data on the professional identities of the study participants. Participants for the study will be drawn from selected Basic schools in the Adenta Municipality. The data will be analysed qualitatively by coding, identifying, categorising and interpreting the emerging themes. The study expects to unravel how teachers of English as a Second Language in Ghana negotiate their professional identities in a non-native context such as Ghana. The study also expects to understand the beliefs teachers of English language in Ghana hold about how they are perceived as teachers of English as a second language, by their students and other colleagues. Finally, the study is expected to reveal the pedagogical practices teachers of English as a Second Language in Ghana engage in, which contribute to their identity.

Language, gender and gendered discourses in the Community of Practice of Professional Chefs

Poster

Ms. Natalia Lara¹

1. University of Westminster

The poster is based on my PhD research titled 'Language, gender and gendered discourses in the Community of Practice of Professional Chefs.' The research is inspired by a paradox: for centuries women are taught and expected to be the best cooks they can be to undertake the domestic labour involved with cooking; however, woman professional chefs are in the minority. The office of national statistics published a dataset from 2018 on occupation, and this included the statistics for chefs. It found that only 17% of chefs are women (Clegg,2018). Therefore there is a significant gender segregation in this particular workplace, which remains largely under-researched. The research is divided into two main strands, one is to identify how language is used in a professional kitchen and the extent to which it may be gendered; and the other is to identify the gendered discourses circulating in and about the profession. This will be executed through a linguistic ethnographic methodology in a fully functioning professional kitchen, including interviews with the participants (chefs), and different discourse analytic approaches. The main theoretical framework consists of the combined work of Sunderland (2004) on Gendered Discourses alongside Butler (1990) performative notion of gender and Crenshaw (1989) intersectionality theory. Conducting this research is important to gain an understanding of why this particular profession is so heavily sex segregated. However, sex cannot be considered as the sole factor for this phenomenon. Especially, when considering how diverse and multilingual the world we live in today is. The factors affecting this are likely to be complex but will involve race, age, ethnic background, language and gender identity will contribute to enforcing the developed gender discourses and ideologies. Not only may this research contribute academic insights but also lead to a greater understanding of the existing gender divide in the hospitality industry. This research therefore has the potential to be utilised by this industry to give a greater understanding for their sex segregation in the workplace and mitigate exhausting staff shortages caused by the recent pandemic and Brexit.

Listenership always matters: Listener responses in L2 paired speaking assessment

Poster

*Ms. Rena Gao*¹

1. *The University of Melbourne*

As one of the essential abilities enabling social interaction, **active listening** has a crucial component in social action engagement. The deployment of different tokens of **listener responses (LR)** reflects the cooperation among interlocutors and displays understanding of others in conversation. Lack of expectable LRs may lead to barriers to mutual understanding and construction of talk in social interaction (Sacks et al., 1974). Thus, the competence of employing LRs in conversation is considered as one facet of **interactional competence (IC)** (Ross, 2018; Lam, 2022).

However, previous studies in the assessment of IC have mostly focused on interactional abilities from the perspective of speakers, such as in receipt design (Roever & Ikeda, 2021), topic management (Galaczi & Taylor, 2018), or performing social roles (Roever & Dai, 2021). Less research has investigated the production of listener responses between interlocutors under second language paired oral assessments scenarios. For paired interactive speaking assessments, such as the Business English Certificate (BEC) preliminary assessment, which targets lower-proficiency examinees' performance of cooperating in conversations in business contexts, studying how examinees perform active listening is also essential.

This study aims to investigate second language users' active listening ability in a paired speaking assessment through both quantitative and qualitative analyses of the production of listener responses. Thus, we developed a paired interactive assessment format for the business context, and included 60 participants with matched language proficiency who were randomly divided into 30 dyads. Results show that (1) L2 speakers with higher L2 proficiency tend to use more active listener responses, especially with topic transitions, (2) raters value the production of listener responses in collaborative tasks, such as in mini presentation tasks, (3) types of listener responses are more varied in highly interactionally competent speakers. This study investigates active listening as a target in paired speaking assessments and justifies the inclusion of this ability as part of the assessment of overall interactional performance. It contributes to our understanding of the role of active listening in L2 IC and pragmatics studies.

Looking at Taarof from the inside and the outside. First findings from an online study

Poster

***Ms. Niloufar Saber Gigasari**¹*

1. Guest Researcher

Are specific types of cultural behavior unique to a particular setting? Do people apply these types of behavior to new contexts while interacting? And how do these behaviors differ in the new context compared to the country of origin? Focusing on Taarof as an expected cultural behavior in Iran, this contribution addresses these questions through an empirical study. Taarof interactions have rules such as insistence on an offer or expressing one's refusal of an offer indirectly. For this study, Taarof has been investigated among Iranians in two different locations, Iran, and the Netherlands. An online open-ended questionnaire, which includes reflection on video fragments, personal experience, and questions regarding aspects of the background of the participants was used in data gathering. The analysis of the data received from the participants in the two aforementioned countries reveals some aspects of differences in the use of Taarof. For instance, the effects on Taarof of the new cultural context, the Netherlands. In addition, while Iranians in both countries still recognize and practice Taarof, Dutch Iranians appear to have more flexibility in expressing their offers and demands directly. Moreover, the data concerning Taarof interactions collected among Iranians living in Iran reveal several dimensions of geographical variation.

Metaphor understanding in school-aged children: from good-enough to very good understanding ?

Poster

***Ms. Sarah Ferrara*¹, *Dr. Marc Aguert*², *Dr. Christelle Declercq*¹**

1. Université de Reims Champagne-Ardenne France Laboratoire C2S (Cognition, Santé, Société), EA6291, 2. Normandie Univ, UNICAEN, LPCN

Metaphors have always been a privileged object of study for pragmatics. However, how and when they are understood by children remains a matter of debate. While certain authors have shown that children understand metaphor as soon as 3 or 4 years (Pouscoulous & Tomasello, 2020), others have shown a later understanding, around 8 years of age (Deckert et al., 2019). We propose to explain this divergence by distinguishing several levels of metaphors understanding. This proposal is in line with the fact that adults often process language with simple heuristics which allowed them to build “good enough” representations of meaning (Ferreira & Patson, 2007). Understanding would not be either correct or incorrect: some representations incomplete and imprecise are correct “enough” to ensure the conversational flow. In the current study, the development of nominal metaphor comprehension during the school years was studied within this theoretical framework. We hypothesized that a “good enough” comprehension-where, without being precise and accurate, the retrieved meaning is compatible with the whole situation-would be observable earlier in development than a “very good” comprehension-where the retrieved meaning accurately reflects the common ground between the target and the source of the metaphor.

Data collection is in progress. We are aiming for 350 participants from 5- to 11-year-old. The children listened to short stories ending with a metaphor (e.g., “A butterfly is a rainbow”). They then listened to a reformulation proposal. They were instructed to judge the degree of similarity between the reformulation and the metaphor on a 5-point scale. For each metaphorical utterance, there were two acceptable reformulations: (i) the “metaphorical” reformulation (e.g., “butterflies are full of colors”) conveys a meaning which, if judged very similar to that of the metaphor, reflects a “very good” understanding; (ii) the “situational” reformulation (e.g., “butterflies are very beautiful insects”) conveys a meaning, which, if judged very similar to that of the metaphor, reflects a “good enough” understanding. Preliminary results showed an interaction between the age and the type of reformulation. As children got older, they found metaphorical reformulations more similar to the metaphors than situational reformulations. Our data suggest that young children were already able of “good enough” understanding, with little change with development. On the contrary, “very good” comprehension improved significantly with age. Since 11-year-olds did not reject the situational reformulation as a bad one, this suggests that children understanding of metaphor might remain “good enough” when they are older. This could be the case in daily communication when the stakes of understanding the metaphor are low. More research is needed to explore which determinants enable children to progress to “very good” comprehension.

Multimodal Analysis of Elderly People's Understanding of Instructions

Poster

Dr. Mariko Karatsu¹

1. University of Arizona

This study investigates how understanding is embodied and achieved in a setting of instruction where elderly residents (users) in their eighties and nineties individually listen to instructions from staff (an instructor) on how to use a safety alarm device at an assisted living facility in Japan. Drawing on multimodal conversation analytic research (e.g., Mondada, 2019; Streeck, Goodwin, and BeBaron, 2011) on the organization of instruction and understanding, the paper examines how and when the users achieve and show their understanding of the instructor's directions (i.e., what they should do here and now) and their understanding of what actions they should take in the future (i.e., how to operate the device). It focuses on positions of their understanding as displayed in sequences and how their understanding is embodied with linguistic and non-linguistic resources. Data for this study consist of seven recorded meetings in Japanese at an assisted living facility for the elderly. Three of them were video recorded, and the length varied between approximately twenty minutes to one hour. A micro multimodal analysis is particularly applied to the three video recorded instructions.

Conversation Analytic studies have shown how understanding is sequentially embodied, monitored, and achieved in various institutional instructional settings (e.g., Goodwin, 1996; Koschmann et al., 2011; Mondada, 2011; Mori & Yamagimati, 2015; Nishizaka, 2011; Okada, 2018). It is publicly demonstrated by multimodal semi-otic resources (i.e., linguistic resources and non-linguistic resources such as body movement and the materials involved) in a temporally unfolding activity of instruction. For example, researchers have demonstrated how when visible materials are central to the activity, joint attention among participants (Goodwin, M. & Goodwin, C., 2012) is established for successful understanding of the instruction (Mondada, 2011; Mori & Yamagimati, 2015) and how a core sequence is expanded when understanding problems occur (Nishizaka, 2011). However, not much CA research is done on the organization of instructions for elderly people and their understanding of the instructions on how-to-use-it.

This study shows how the instructor's framing activities (Goffman, 1974), coordination of his verbal and non-verbal behavior, and the users' physical accessibility to the device are essential components for their understanding of the instructions. It demonstrates how the instructor's directions are projected by his metalanguages and gestures and how his action projection helps the users' understanding of his directions, e.g., early preparation for the action. It also shows how the instructor uses different scaffolding strategies, monitoring the user's different understanding of his directions. Finally, it discusses how particularities of the setting may affect the participants' practices and interactional contingencies of instruction and understanding. It will contribute to the research on instruction and intersubjective understanding by providing empirical evidence and accounts for the situated interaction at the facility for elderly people.

Multimodal interaction analysis of non-lexical vocalisations in low-verbal autistic children

Poster

Dr. Fernanda Cruz¹

1. *University Federal of São Paulo*

This work analyses non-lexical vocalisations produced by low-verbal autistic children. Seven dyads of naturalistic interactions between non-autistic adults and low-verbal autistic children over five years old were analysed from a multimodal conversation analysis perspective. Data were extracted from an audio-visual corpus of interactions in institutional (school) and non-institutional settings (home). The data are in Brazilian Portuguese. The videos are visualised using the ELAN tool and transcribed. The analyses showed that in some cases participants did not reach a mutual understanding of the semantic meaning of non-lexical vocalisations, while in other cases, the meanings of vocalisations emerged between the participants in the multimodal process of sense-making in their embodied context. A microanalysis of where these vocalisations occurred and their multimodal aspects (linguistics, bodily, material, and spatial) suggests that: a) such occurrences are both *initiated* by the autistic child and *responsive* to the non-autistic interlocutor's turn; b) some vocalisations play an important role in the sequential organisation of the interaction, promoting the maintenance of intersubjectivity of low verbal children; and c) non-autistic adult interlocutors perform a varied set of actions, recycling, incorporating, retaking, assigning meaning, and repairing the non-lexical vocalisations produced by autistic children. The indexical analysis shows how communicative ecologies create meaning. This study thus contributes to our understanding of the interactional behaviour of these children and their interlocutors.

Naming Domestic Animals: Cattle Names in an Iraqw Speech Community

Poster

Dr. Chrispina Alphonse¹

1. Lecturer, The University of Dodoma

This study investigates the naming and names of cattle in the Iraqw agropastoral speech community of Tanzania. This aspect of language use is fascinating given the central role of cattle in Iraqw culture, as well as the antiquity of cattle rearing among Iraqw people. The analysis focuses on the meanings of names, their functions, as well as factors that determine the choice of names. This qualitative study was conducted in Mbulu, specifically in Gunyoda village, where like other nearby villages the majority of people keep livestock. The data were collected by interviewing cattle owners who were selected through purposive sampling.

The study reveals that this community bestow names not only to cattle but also to dogs, oxen and donkeys. Traditionally, cows and dogs are frequently named domestic animals, whereas bulls and donkeys receive names only when engaged in farming. This is to say the introduction of ox-ploughing triggered the naming of bulls and donkeys. Bulls' and donkeys' names are not in most cases indigenous; instead, foreign names are preferred. This confirms that naming processes for animals are not random. Individual animal names are not mere labels: they serve a specific function to the name giver, other family members and even the society in general. The naming of animals is shaped by motivations related to human-animal relations and identity. Human-animal relations are at play when an animal is addressed by using its specific name in order to perform a required action. Identity becomes relevant when an animal is called/instructed by using its specific name within a group of animals.

With respect to the meanings of cows' names, sometimes these are derived from a colour of a cow, their place of birth, the structure of their horns, and/or the manner of acquisition. However, in some cases, the meaning of the name does not correspond to the source of such a name. This is so because, traditionally, a female calf is named after its mother, without considering colour and other factors. All female calves born by the same cow inherit the name of their mother. Regarding the event of naming, cows receive a name after they have given birth to their first calf. This is the time when owners need a name for interacting with a cow when milking, etc. As the paper elaborates, names for cows serve functions like identifying individuals, addressing or calling, and furthering other goals of human-animal interaction. Through its focus on cattle naming, this paper makes a contribution to a posthumanist linguistics, where multi-species interaction is understood to have its role to play in explaining the nature of language.

Parental Scaffolding During Book Reading in Japanese Households

Poster

Mrs. Moeko Ozaki¹

1. Keio University

Based on extensive research spanning linguistics, psychology, sociology, and anthropology, the Japanese are said to value interpersonal relationships (Crane & Fernald, 2016; Hess et al., 1980; Markus & Kitayama, 1991). For instance, *omoiyari* (empathy) and *amae* (reliance on others) are seen as typical communication features in the Japanese language (Doi, 1973; Lebra, 1976). The majority of these research, however, are based on a small number of samples (Fernald & Morikawa, 1993), and it has not yet been satisfactorily proven in a context-controlled setting how Japanese toddlers learn to display these social tendencies (Frosch et al., 2001)

In light of these constraints, this research discusses how Japanese parents use book reading to scaffold the development of empathy and social routines. An ample amount of Japanese parent-child dyads were recorded while they engaged in shared book reading. From the perspectives of conversation analysis and language socialization, the videos were meticulously transcribed and analyzed. The study's findings show that Japanese parents frequently enact the characters and take advantage of the occasion to interact with their children in routines that foster empathy. This voice change (or non-change) may have an impact on when and how children develop social skills and empathy.

Perceptions of bullshit in political discourse re-framed for entertainment purposes

Poster

Dr. Mariya Chankova¹

1. South-West University N. Rilski, Blagoevgrad

The digital environment is praised for offering ample opportunity for communication and information exchange, especially for its affordances in amplifying the voices of ordinary citizens. The changes in the way (political) news are disseminated have had an impact over consumption: discourse on digital platforms tends to be fragmented and the sheer volume of content produced daily can negatively impact political news consumption. Researchers noted a decrease in the general demand for political news, along a notable decrease in the quality of political news (van Aelst et al. 2017). Political satire – satiric or ironic scrutiny of the political arena in order to expose its absurdity or hypocrisy – has long had its niche.

This study takes a look into re-framing political discourse for entertainment purposes. Examining the kind of political discourse (utterances, declarations, speeches and the like) which qualifies to be re-framed for entertainment purposes, thus becoming the object of satire or derision, can provide insight into the question how people gauge political discourse. The hypothesis tested in this study is that one reason for re-framing a piece of discourse is the perception of bullshit (or ascription of bullshit) on the part of content-creators. The category of bullshit is described by Frankfurt (2005) as being pervasive in our culture, with political discourse being particularly prone to it. Bullshit consists in creating an artifice, the aim of which is to misrepresent what is being done (Frankfurt 2005: 54). This study is therefore focused on teasing out the characteristics of bullshit ascriptions on the part of the hearers. The analysis involves sifting out re-framing strategies in the user-generated content and identifying the discursive (or performance) elements which have given rise to ascriptions of bullshit. A study of the re-framing strategies themselves will allow for a closer understanding of the intentions of the content-creators.

The data were collected from the content-sharing platform YouTube and feature French language channels specialized in political commentary and satire. The relevant excerpts were transcribed, and a pragmatic approach was used in the analysis, mainly illocutionary act analysis and discourse analysis.

Preliminary results (the work is still in progress) suggest that the category of bullshit is strongly associated with manipulation, dishonesty and incompetence, undesirable qualities of political discourse for the content-creators. The latter also note the lack of genuine plurality of voices, both in the political scene and on traditional media. They seem to position themselves as alternative voices in the digital sphere, contributing to bridging the (perceived) rift in the communication between political actors and citizens.

Phonetic Alignment in Semi Naturalistic Conversations

Poster

Ms. Charlotte Dumont¹, Ms. Marie Belenger¹, Prof. Mikhail Kissine¹

1. Université Libre de Bruxelles

Phonetic convergence is a natural phenomenon whereby interlocutors unconsciously alter their verbal and non-verbal behaviors to align with those of their conversation partner (Pardo, 2006). Convergence comes along with associated benefits such as conversational fluidity, better cooperation and greater empathy, rapport, and closeness. Accordingly, it also has an impact on the first impression individuals make on others, and influences the quality of the subsequent interactions and the relationships (Soliz & Giles, 2014). Pitch, measured as voice signal fundamental frequency (F0), is the prosodic index that has been the most extensively studied in the context of phonetic convergence. A few previous studies suggested that autistic individuals tend to converge less than non-autistic individuals (e.g. Lehnert-LeHouillier et al., 2020). However, these studies involved controlled experimental paradigms, in which participants are asked to read the same list of words before and after a cooperative task. In such context, it appears easier to converge than in a naturalistic conversation.

Studying phonetic convergence in more naturalistic contexts seems crucial to understand the impact it can have on everyday interactions of autistic individuals. This study aims to study phonetic convergence in semi naturalistic conversations by investigation variation in F0.

In this study, 30 participants (15 autistic and 15 non-autistic) from 9 to 16 years old ($M(\text{age}) = 11,2$) engaged in a three minutes get-to-know talk with the investigator. They were then asked to tell a story based on a wordless picture book. The experimenter always began the task by describing the first page of the book. We analyzed the mean F0 per sentence, and speech rate from the first segment by the experimenter, as well as at three time points from the child's speech: when the child starts the story telling, in the middle of it and at the end. We expected greater phonetic convergence (less mean absolute difference) at time point 1 and a progressive shift (greater mean absolute difference) from time 2. We expected non autistic participants to have a greater difference in mean absolute F0 between time point 1 and time point 3, indicating greater phonetic convergence.

Contrary to our expectation, linear regressions did not show difference in F0 mean absolute and speech rate difference across time. These results seem to indicate that participants, regardless of the group diagnosis, did not converge in a narrative task.

This yields interesting questions concerning the methodological choices, as phonetic convergence has found to be weaker in challenging task (Abel, 2015). Narrative tasks could be too difficult for participants to engage in convergence. Furthermore, as raised by Hogstrom et al. (In Press), the age difference between experimenter and children could be an explanation to our results, as anatomic development has an obvious impact on F0 and may limit the degree of convergence. Finally, a strong limitation to this study is the small sample size; our method should be replicated with a larger sample size.

Pragmatic and discursive development in children with Developmental Language Disorder: do prosody and gestures pave the way?

Structural language competence has been shown to modulate the development of both pragmatic and discursive abilities (Katsos et al., 2011; Berman, 2007; Pronina, 2022). Previous research suggests that multimodal (prosodic and gestural) cues might support pragmatic and discursive comprehension when structural components of language are impaired, as in the case of children with Developmental Language Disorder (DLD) (Kirk et al., 2011). Here we aim to investigate the children's ability to infer pragmatic meanings when these are presented with accompanying gestures and/or prosody, comparing Typically Developing (TD) children to children with DLD.

Forty-eight children with DLD (and 48 age-matched TD children) aged 5 to 10 were evaluated for their linguistic (CELF-5) and cognitive (K-BIT) abilities according to two inclusion criteria: low structural language scores (< 1 SD) for the DLD group and nonverbal IQ scores within normality for all participants. Then, they participated in a visual-world eye-tracking experiment that assessed whether and when they process prosody and gestures to infer target pragmatic meanings. After hearing and watching a video displayed at the centre of the screen, they were asked to point at the image representing the meaning of the utterance they heard. We manipulated content (within-subjects: literal speech acts; nonliteral meanings; discourse structure - from less complex to more complex) and the multimodal cues present in the video (within-subjects: prosodically-enhanced, multimodally-enhanced, and no-enhanced). Each content type was evaluated through 12 experimental trials, preceded by three familiarization trials. Two main dependent variables will be analysed across experimental conditions and groups: the offline selection of the target image and the proportion and timing of fixations to the target picture. We now finished pilot studies with a preliminary sample, and expect to gather data for final results during november-february 2022/23.

We expect children with TD to show a larger accuracy and proportion of fixations, as well as faster fixations to the target image in the multimodally-enhanced condition, compared to their DLD peers, followed by the prosodically-enhanced condition and the no-enhanced condition. We predict this pattern to hold especially for complex pragmatic meanings (nonliteral meanings over discourse structure and literal speech acts). Our results will inform the extent to which multimodal communication may help children to process linguistic information when structural language is compromised.

Pragmatic Aspects of Multilingual and Multi-modal codeswitching between Vernacular Arabic, French, and English: A Study of Algerian English as a Foreign Language Learners' Facebook Practices.

Poster

Ms. Asma Rahmouni¹

1. Limerick University

This research investigates the pragmatic functions of vernacular Arabic, French, and English codeswitching among Algerian EFL learners who are considered multilingual speakers of three languages (Arabic, French, and English) with different competency levels on a Facebook group. Codeswitching is defined as the alternation of the linguistic varieties within the same conversation (Myers-Scotton 1993). Facebook users tend to code-switch for a variety of reasons that could be in response to a particular topic, to strengthen group identity, to enhance the connection to the readers, or to involve them by using expressions and words in another language (Halim and Maros 2014). Facebook has been chosen for this study because it is prevalent among the population under investigation. Facebook users have created new forms of language interaction, such as shortening the form of words, using emoticons, or pictures to describe their feelings, or by alternating between different languages and varieties (Khadim 2014). The study will scrutinize users' multilingual and multi-modal adjustment of speech styles while interacting, with particular emphasis on politeness and accommodation to other users. The study adopts a virtual ethnographic approach (Hine 2000, 2008, Kelly-Holmes 2015, Androutsopoulos 2008). The data are collected through a screenshot tool, and a qualitative content analysis of status updates and observation of the Facebook group's interaction is used as a tool to categorize data into general themes for the purposes of linguistic analysis. A corpus of linguistic data from the posts and comments of the Facebook group is being compiled and analyzed to investigate code-switching and possible motivations and pragmatic drivers for the alternation.

Pragmatic Functions and Perceptions of Chinese Rhetorical Questions in Mundane Conversations – Is it Impolite?

Poster

*Ms. Jun Wang*¹

1. *University of Wisconsin-Madison*

This study focuses on two research gaps. First, I argue against the previous literature which associates rhetorical questions with impoliteness. My 26-hour mundane dialogue data shows the pragmatic functions of Chinese rhetorical questions are not offensive. In the literature, rhetorical questions (RQs) are associated with impoliteness, such as challenging the interlocutor in English and Gonja (the native language of Ghana) (Goody, 1978; Illie, 1994, 1999, 2004), indirect face-threatening acts (FTA) for excuses and criticisms in English and Tzeltal (a Mayan language) (Brown and Levinson, 1978), showing speakers' unpleasant or unsatisfactory mood (Shao, 1996; Zhao, 2000), or using in disputes, complaint or blaming (e.g. Lan, 2002; Yu, 2004, 2007, 2018; Zhu, 2004; Liu, 2014). However, my data (1000-minute TV drama and 26-hour mundane dialogues) shows that 1) in Chinese the most frequent RQ form is “不是***bú shì***...吗***ma***”; 2) the main function of “不是***bú shì***...吗***ma***” is to bring up old information or to remind the hearer facts the speaker thinks they both know. It is a pre-phrase and served as reason/background information for later explanations. I argue against the previous literature and I argue this type of RQs does not cause FTA, nor shows speakers' unpleasant mood or being used in disputes or complaints. To my best knowledge, no studies about Chinese rhetorical questions take both emic and etic approaches. Only researchers' judgments of functions based on the excerpts and no input from the interactants were shown. This ongoing study conducts semi-structured interviews with thirty Chinese native speakers to investigate their perceptions of the usage of Chinese rhetorical questions. The interviewer first asks interviewees opinion on rhetorical questions and whether they feel it's offensive if someone said it to them; and then the interviewer plays the audio clips of the conversation and then ask the interviewees whether they feel offended or not if they were the interactant. The initial results (data collected so far) show that there is a gap between people's general perceptions and context-based usages. Although participants think it's better to avoid using rhetorical questions, they confirmed the usage of RQ in audio clips is not offensive.

My study reconfirms the importance of contexts in interactions– although RQs in the forms (questioning) can be challenging or criticizing the interlocutors which cause FTA, the pragmatic use of RQs in the dynamic interactions can be varied according to the specific contexts (e.g. intonation, speaker's intention, etc.).

Pragmatic Self-Concepts of School-Aged Children

Poster

***Mrs. Maria Busch*¹, *Prof. Stephan Sallat*¹**

1. Martin Luther University of Halle-Wittenberg

Background

The development of pragmatic competence during the phase of childhood and adolescence is closely associated with bio-psycho-social development, social participation and peer relations (Blaskova & Gibson, 2021; Bryant, 2015). The assessment of pragmatic competence is primarily done via observations and interviews of caregivers and educators (Adams, 2002). However, the subjective perspectives of the involved children themselves have hardly been included in applied and clinical linguistics, despite the fact that the UN Convention on the Rights of the Child calls for children's perspectives to be taken into account in all matters affecting them (Roulstone & McLeod, 2011).

Subjective beliefs that people hold about their own qualities and competence are defined as self-concept. A positive self-concept is related to motivation and learning processes among others. Within the self-concept, a distinction is made between subareas, such as the verbal and social self-concept (Trautwein & Möller, 2016). However, it is unclear how children's self-concepts can be described in terms of pragmatic competence, which include linguistic-pragmatic and social-pragmatic aspects (Andrés-Roqueta & Katsos, 2017).

Research Question

The present PhD project (work-in-progress) explores the research question of which self-concepts school-aged children express considering pragmatics.

Methodology

In order to answer the research question, in a first step, a scoping review is done to analyse the extent to which pragmatic competence has been considered in international self-concept research. In a second step, qualitative data collection and analysis is done using method triangulation to explore the pragmatic competence of school-aged children via the Clinical Evaluation of Language Fundamentals – Fifth Edition (Wiig et al., 2020) and to analyse the children's self-concepts regarding pragmatics through semi-structured interviews.

Results

At the IPC18, the results of the scoping review will be presented on the poster, as well as the methodology of the empirical part of the study.

Predicting Suicidality: The Role of Information Structure

Poster

***Mr. Eyal Liron Dolev*¹, *Prof. Guido Seiler*¹**

1. University of Zurich (Zurich Center for Linguistics)

In recent years there has been a growing interest in language as a source of predictors for mental health status, and more specifically for suicidal thoughts and behaviors (STBs). Existing studies investigating different linguistic features as predictors of STBs almost exclusively focused on lexicon and prosody, cf. the literature review by Homan et al. (2022) surveying 75 studies. Of these, only four (5%) discussed morpho-syntactic features, and none of them actually considered syntax as a feature. Further, 53% of the studies (excluding those studying prosody) used LIWC for analysis, a proprietary software for computerized text analysis based on word counts (Tausczik & Pennebaker, 2010). The studies were almost exclusively done from a psychometric and not from a linguistic point of view; they offer very limited linguistic insight. There is therefore a large gap in our linguistic knowledge and understanding of language use by individuals with STBs and patients diagnosed with depression.

We will present a new interdisciplinary project on the topic, involving the Zurich Center for Linguistics and the Department of Psychology of the University of Zurich, as well as the Data Science Institute of the Columbia University and psychiatric hospitals at several other sites. The project aims to arrive at better predictions regarding STBs based on different behavioral and experimental data.

As part of this study, 100 psychiatric patients speaking a variety of German will be recruited. Two assessments will be conducted, during the inpatient stay and four weeks post-discharge. The assessments include recordings of conversations with the participants, psychiatric and psychological evaluations. Primary outcome will be STBs (assessed with the Beck Suicidal Ideation Scale; Kliem et al., 2017), and secondary outcome suicide attempts and hospital readmissions. The recorded conversations will be transcribed and annotated (part-of-speech tags and dependency parsing; automatically or manually, according to language variety), and then syntactically analyzed using NLP tools and corpus searches.

Specifically, we will investigate to what degree subjects exploit information-structural means. In order to do so, speakers must accommodate their speech production according to the presumed Common Ground at the time of the utterance, i.e., they need to take account of the states of mind of the addressee (Chafe, 1976) and thus construct a Theory of Mind (ToM) (Berecz et al., 2016). The ability of depressed subjects to construct a ToM has been subject to debate. However, most studies reviewed by Berecz et al. (2016) demonstrated an altered ToM in individuals with depressive disorders as compared to healthy individuals. We hypothesize that the altered ToM has an influence on depressive/suicidal individuals' ability to appropriately manage information packaging using syntactic informational structural means. We will investigate the distribution of several syntactically variable features.

Preliminary results from our pilot study suggest that there is a hierarchy of syntactic features distinguishing healthy individuals from individuals with STBs.

Preferences and Understanding of Pragmatic Jokes in Japanese Learners of English

Poster

Dr. Goran Vaage¹

1. Kobe College

Very little research within pragmatics exists on how humor affects language learning and how learners experience humor in a foreign language. The purpose of this paper is to investigate how well Japanese learners of English understand jokes on various linguistic levels, and to which degree the understanding of these joke types can be taught in the classroom. 49 Japanese undergraduate students of English took part in this study by participating in two anonymous surveys containing various questions around a randomized set of English jokes divided into pragmatic jokes, word and sound jokes, semantic jokes, and jokes with no relationship to language play. The first survey was conducted before undergoing a curriculum on the pragmatic structure of English jokes of two 90-minute classes, and the second survey directly afterwards. The participants were asked to score on a four point scale how well they understood the various jokes, and how funny they found them. A typical pragmatic joke would be of the following type: "Is the doctor at home?" the patient asked in his bronchial whisper. "No" the doctor's young and pretty wife whispered in reply. "Come right in." The pre-curriculum survey showed little difference in understanding between the various joke types. After going through the curriculum, there was less improvement in the understanding of pragmatic jokes compared to word and sound jokes, and semantic jokes based on syntactic ambiguity. The reason for this result is likely that pragmatic jokes vary greatly in content and in the degree of reference to the outside world (i.e., culture), whereas puns found in word and sound jokes, and the syntactic ambiguities of semantic jokes share common features which can be discovered by learners with the proper training. On the other hand, there are limitations on how fast learners can acquire cultural knowledge needed to boost the understanding of pragmatic jokes. Overall, the results showed that a curriculum focusing on jokes in a foreign language is useful because it improves learners' ability in producing language play, which is an overlooked but important component of advanced language proficiency, but that the span in complexity of pragmatic jokes creates challenges to the creation of such a curriculum.

Production of referential expressions in typical and autistic children: a linguistic pragmatic study

Poster

Dr. Melania Masià¹, Ms. Zuriñe Abalos², Dr. Elena Castroviejo²

1. Universitat de les Illes Balears, 2. University of the Basque Country

Referring expressions are necessary for discourse cohesion. The choice between a full DP, an overt pronoun or a null pronoun depends on the articulation of the new and old information in a sentence. In a Romance null-subject language like Spanish, there is a division of labor between null pronouns, which prefer antecedents in prominent (subject) positions, and overt pronouns, which do not have a clear preference for an antecedent in any specific position (Alonso-Ovalle et al., 2002; for Catalan, Mayol & Clark, 2010; for Italian, Carminati, 2002). Regarding discourse structure, null pronouns in subject position tend to express topic continuity, while overt pronouns in the same position tend to mark a topic shift (Givón, 1983; Rigau, 1989).

Aim: In this study, we investigate the developmental patterns in the distribution of the different referential expressions in Spanish in subject position by typically-developing children and autistic children (ages 6-12). Most of the studies on the selection of referring expressions have been based on questionnaires and self-paced reading tasks. In this study we take a more naturalistic approach and analyze semi-spontaneous discourse (see Bel et al., 2010; Bel & Albert, 2016). In particular, we look at four constraints that may affect the choice of the anaphoric expression: (i) the salience (syntactic position and discourse function) of their antecedent, (ii) the accessibility and distance of their antecedent, (iii) their discourse function and (iv) the rhetorical relation between the clauses.

Hypotheses: Constructing discourse connectivity involves coordinating several sources of information, such as morphosyntax, pragmatic information and the representation of the listener's mental state. It thus takes a long time for children to reach adult-like performance in the use of referring expressions (Hickmann, 2004; a.o.). Around age 8, typically-developing children show more perspective taking in complex linguistic tasks (Shin & Cairns, 2012). Therefore, in topic shift contexts, older typically-developing children would produce more overt pronouns and full DPs, reducing ambiguity on anaphora resolution. In topic maintenance contexts, no age group difference is expected but the production of overt pronouns and full DPs would be higher than in adults. Language acquisition in autism shows significant delays (Tager-Flusberg et al., 2005). Regarding the autistic group performance, we expect to find a delay in the control of referring expressions, compared to typically-developing children. In addition, pragmatic difficulties have been observed across autistic population. Each of the factors that influence the choice of anaphoric elements may then weight differently in autistic children.

Design: The study consists of semi-spontaneous oral productions of narrative texts produced by typically-developing children and autistic children in two age groups (6-8 and 9-12 years old). The data is obtained by means of children telling the story in the picture book *Frog, Where Are You?* by Mercer Mayer and will be annotated using the CLAN software (MacWhinney, 2000) and the CHILDES project tools and analyzed.

Prosody and gesture as markers of focus in 3- to 6-year-olds' interactive speech

Poster

*Ms. Sara Coego*¹, *Dr. Núria Esteve-Gibert*², *Prof. Pilar Prieto*³

1. *Universitat Pompeu Fabra*, 2. *Universitat Oberta de Catalunya*, 3. *ICREA-Universitat Pompeu Fabra*

Focus marking is an important part of pragmatics which governs crosslinguistically the co-occurrence of prominent prosodic patterns and co-speech gestures in discourse. Adult speakers have been shown to combine prosodic prominence with non-referential gestures (i.e., gestures not depicting the semantic content of speech) in focalization, especially for contrastive focus (e.g., Ambrazaitis & House, 2017). From a developmental perspective, previous studies have mainly investigated children's use of prosody to indicate focus independently from their use of co-speech gestures (see Chen, 2018 for a review). To our knowledge, only one study (Esteve-Gibert et al., 2021) has systematically investigated children's joint use of both cues to mark focus. The authors found that French-speaking 5-year-olds use non-referential head gestures to signal focused constituents, especially in corrective and contrastive contexts, but not the prosodic cues reported for adults. Even though this finding points towards a precursor role of co-speech gestures for focus marking in development, further research is needed to determine if it can be replicated in earlier stages of acquisition and in other languages, and to fully understand how prosody and gestural cues come to interact in children's marking of focus.

The present cross-sectional study analyzes the developmental trajectory of 90 3- to 6-year-old Catalan-speaking children with three main goals: 1) to determine if children use prosodic prominence and co-speech gestures in distinguishing between broad, (narrow) contrastive, and (narrow) corrective focus in interaction; 2) to study how both cues interact in this context; and 3) to see whether the use of both types of cues varies in development. To elicit data we used an interactive game (adapted from Esteve-Gibert et al., 2021) in which children were encouraged to help a puppet select an object (target object) and place it inside a toy train by providing an instruction such as the following: *agafa la flor blava*, "take the blue flower". The number and color of the objects displayed before the child changed in each experimental condition: broad focus (only the target object displayed); contrastive focus (target object, which contrasts in color or form with an object previously mentioned, shown alongside a different object); corrective (target object, which contrasts in color or form with an object the puppet mistakenly collects, shown alongside a different object). Participants were video recorded. Auditory data was coded following *Cat_ToBI* (Prieto et al., 2015). Some acoustic parameters (duration, maximum pitch, and pitch range of accented syllables) were automatically extracted in Praat (Boersma & Weenink, 2019). Video data was annotated in ELAN for gesture type and speech alignment.

Preliminary results with 7 participants showed that, first, children used more prosodic and gestural cues (e.g., head, hand, and body forward movements) in the corrective focus condition, followed by the contrastive focus and the broad focus conditions. Second, children significantly combined prosodic with gestural cues for corrective focus, while both cues were not always coupled in the marking of broad and contrastive focus. Finally, an increase in the joint use of prosodic prominence and gestures through the developmental period studied was observed.

Quantitative and qualitative analysis of the Italian epistemic marker “mi sa” [to me it knows] compared to “so” [I know], “non so” [I don’t know], “non so se” [I don’t know whether], “credo” [I believe], “penso” [I think]

In this research 2 closely intertwined Studies – the first of which serves as a pilot for the second one – on the Italian epistemic marker *mi sa* [lit. to me it knows] are presented. This marker, which seems to have no equivalent in other European languages, has received little attention in the literature. Specifically, no investigations have been conducted:

- on the occurrences of *mi sa* in contemporary spoken corpora;
- on the epistemic relationship between *mi sa* and other modal expressions that use the verb *sapere* [to know] in the first person singular of the simple present (*so* [I know], *non so* [I do not know], *non so se* [I do not know whether]);
- on the supposed epistemic synonymy of *mi sa* with *credo* [I believe] and *penso* [I think].

Study 1 filled the first gap by analyzing the occurrences of *mi sa* detected in the Italian spoken corpus KIParla (a contemporary and upgradable corpus collecting more than 100 hours of conversations, freely accessible at <https://kiparla.it>). Their analysis led to the identification of six types of structures, which can be reduced to two main ones, differing in meaning and morphology:

- ***mi sa che* + proposition**, e.g., *mi sa che mi si è fermato l'orologio* [I think that my watch stopped] (97.9%, including the plain form *mi sa che* + proposition 60.6%, *mi sa* parenthetical 26.6%, *mi sa* + elliptical proposition 5.3%, *mi sa che* [pending] 4.3% and *mi sa di no* 1.1%) and
- ***mi sa di*** [metaphorical], e.g., *mi sa tanto di collegio* [to me it looks a lot like a boarding school] (2.1%).

Starting from the results of Study 1, Study 2 was developed to fill the second and third gap through the qualitative and quantitative analysis of a questionnaire specifically designed and administered online. It was completed by 201 participants, almost all were native Italian speakers (92.04%; 4.48% were bilingual; only 3.48% were not Italian mother-tongue). As for the epistemic relationships between the six epistemic markers and the supposed epistemic synonymy, the statistical analysis revealed that for the majority of the participants:

- in the epistemic continuum that goes from unknowledge to uncertainty and then to knowledge, *non so* [I do not know] refers to unknowledge; *non so se* [I do not know whether], *mi sa* [to me it knows], *credo* [I believe] and *penso* [I think] to uncertainty; *so* [I know] to knowledge;
- *mi sa* [to me it knows], *credo* [I believe] and *penso* [I think] are synonyms from an epistemic perspective;
- *non so se* [I do not know whether] is much more uncertain than *mi sa* [to me it knows], *credo* [I believe] and *penso* [I think]. These four epistemic markers seem to occupy a different position along the uncertainty continuum ranging between two poles: doubt (high uncertainty - *non so se p* [I do not know whether p]) and belief (low uncertainty - *mi sa* [to me it knows], *credo* [I believe] and *penso* [I think] that p).

Gestures are an integral part of human communication, as much as speech. The two modalities are linked temporally, semantically and pragmatically, which indicates that they form an integrated system (Kendon, 2004; McNeill, 1992). Gestures are mainly used with speech (Graziano & Gullberg, 2018), however, pantomimes (i.e., gestures produced in absence of speech) can also be produced and can shed light on cognitive processes and pragmatic functions underlying language processing (e.g., Gershkoff-Stowe & Goldin-Meadow, 1998; Goldin-Meadow et al. 2008). For example, pantomime can provide important insights into the linguistic domain of compound processing.

Theoretical and experimental work suggests that Italian compounds are processed differently according to the head-directionality parameter: that is, left-headed compounds allow for a syntactic reading, while right-headed ones allow for a morphological reading (e.g., Di Sciullo & Williams 1987; Lami & van de Weijer 2022; Marelli et al. 2009).

However, some compounds, i.e. mirror compounds, can allow for both positions of the head (e.g. *auto*_{MODIFIER}*noleggio*_{HEAD} vs. *noleggio*_{HEAD} *auto*_{MODIFIER} “car rental”): these pairs of compounds are composed of the same constituents (head and modifier) with equal syntactic relations and semantic features (Radimský 2007; 2013) but can be both left- and right-headed. This characteristic raises some questions: 1) what are the factors that determine such a position? 2) how do speakers process these types of compounds?

This pilot study aims at tackling these questions by looking at how people represent these compounds in gestures without speaking, in other words, how they mime them.

We selected 36 Italian mirror compounds and distributed them into two lists containing either the left- or the right-headed compound. Each compound of the list was then read to an Italian native speaker who was asked to gesture/mime it without speaking (a new compound was presented after the pantomime was completed). Four people participated in the study and produced 199 gestures. For each compound we analysed: a) whether it was represented as a whole or whether its constituents were pantomimed separately; b) whether the order of the gestures reflected the order of the constituents.

Preliminary results show that: a) right-headed compounds tended to be represented as a whole, while for left-headed compounds each constituent was represented separately; b) modifiers were pantomimed before heads irrespectively of their order in the target compounds. Moreover, we also observed that modifiers tended to be represented as entities while heads as actions.

These findings corroborate a morphological reading for right-headed compounds. More interestingly, they also indicate that the modifier might be perceived as the most salient constituent of the compound and is mostly represented as an entity. This suggests that cognitive-pragmatic principles might guide compound processing, and this is clearer when syntactic constraints, inherent in speech, are absent. This also provides additional evidence that gestures can reveal underlying cognitive and pragmatic processes that would not be visible if only speech would be considered (McNeill, 1992).

Representations of the current Ukrainian military conflict in the local linguistic landscape

Poster

Prof. Milan Ferencik¹, Mr. Jonathan Eddy¹

1. University of Prešov

The outbreak of the military conflict in Ukraine has led to the emergence of a new layer multimodal signage in public spaces as a channel of the crisis communication in the neighbouring states. Slovakia, and especially the east of Slovakia, has found itself at the frontline of the humanitarian response as either a transit or destination country. Using photographic data collected by the authors in the Eastern Slovak towns of Prešov and Košice, and Blommaert's (2013) ethnographic research on linguistic landscape as a methodological framework, the poster documents, analyses, and discusses these new additions to the local linguistic landscapes. Our corpus of signs indexing consists of billboards, informational signs, notices, stickers, flags, fliers and graffiti and documents both 'top down' (official, semi-official, regulated, emplaced in authorised locations and professionally produced) and 'bottom up' (unofficial, ad hoc, temporary, unregulated) flows of signage. The two groups of signs differ in their placement, materiality, functions and the ways they use semiotic resources. While the official signs placed on the municipal offices use more professional design and are more carefully structured, unofficial signs are largely situated in areas with high volumes of footfall, i.e. on the Main Street as well as side streets off the Main Street and close to busy intersections and pedestrian crossings, and are mostly placed on municipal infrastructural property, such as lampposts, fuse-boxes, traffic lights and crossings. As to linguistic resources, official signs were largely Slovak-Ukrainian bilingual, whereas the more ad hoc, unofficial signs widely utilized English as a single unifying lingua franca due to its more immediate and universal comprehensibility when compared to Slovak and Ukrainian. Overall, the often transient, non-permanent, and fluid nature of the signs mirrors the ever-changing situation in Ukraine. The findings suggest that, in terms of reflections of the situation in Ukraine, the signs have four primary functions: solidarity, 'on the ground' support, advice and protest, and back up Shohamy's and Gorter's (2009:4) claim that linguistic landscape "contextualizes the public space within issues of [...] political and social conflict[s]". What is more, the use of signs involves users' categorizations which "fuel thy dynamics of power in public space and [they] are core ingredients of social and political conflicts" (Blommaert, 2013:48). As to their historicity, the official signs are observed to be gradually disappearing from the local linguistic landscapes as a reflection of changing attitudes to the conflict and the changing political situation, the unofficial signs are still visible with new examples appearing in response to events in Ukraine, all of which supports Nekvapil's (2022:127) claim that the "stability of [...] signs corresponds to a certain degree with their different functions."

Securitizing Speech Acts: Characteristic Approaches for Communicating Existential Threats and Their Successfulness

Poster

*Ms. Regina Holze*¹

1. *University of Passau*

Securitization Theory is a well-researched political phenomenon based on Buzan, Wæver and de Wilde's framework from 1998. It describes the process of ascribing urgency and importance to one political issue that is framed as a potential existential threat to a nation or group, and convincing others of this interpretation of the situation. If successful, it leads to the demand that urgent, far-reaching emergency measures must be taken immediately to solve the problem. Language is the central element in these deliberations as it is the instrument deciding about the success of a securitization attempt. However, no characteristic speech acts (cf. Austin 1962) nor those necessary for successful securitization have been described on an empirical basis.

Therefore, this research project aims at closing the described gap with three in-depth case studies focusing on successful securitization attempts during the COVID-19 pandemic in culturally diverse English-speaking countries. The selected countries are New Zealand, Great Britain and the United States, because of their different political and cultural approaches to the pandemic. As a methodology, corpus-assisted discourse analysis has been chosen (cf. Partington et al. 2013; Baker 2020) with the research questions asking about characteristic and successful speech acts within the securitising act. The research design features two corpora, one with statements by Prime Ministers/Presidents, which is used to explore the characteristics of securitizing speech acts across the three speakers, and one control-corpus with newspaper articles from the three countries in order to trace the success of the securitizing move with the audience. This research is currently in process, first findings seem to indicate that similar speech acts might lead to success of the securitizing move even if speakers' cultural backgrounds as well as their characteristic speech acts differ.

Seditious Sheep: Weaponizing metaphors in Hong Kong Children's Books

Poster

*Dr. Jennifer Eagleton*¹

1. Hong Kong based independent scholar

Five members of the speech therapists' union in Hong Kong were recently given jail terms over three children's books depicting so-called "seditious" sheep that the authorities said showed support for the 2019 protest movement and "incited hatred" towards the city's government. The books featured cartoons of sheep that were trying to repel wolves from their village. The judge hearing the case said that children reading the books "would be told they are the sheep and the wolves that are trying to harm them are Chinese authorities" (Walker, 2022). This poster will analyze these books in accordance with critical discourse analysis principles (Fairclough 2005; Wodak & Ludwig 1999) and contextualize them in the light of concurrent events (the introduction of the National Security Law and the 2019 protest movement); how the authorities and others discussed the story as an analogy of recent events will also be discussed, as well as the representation of certain figures in the stories through both Chinese and English language resources. Children's literature - including comic books as "vehicles for political socialization" (Patterson 2019) will also be discussed in this poster.

Semi-spontaneous speech: comparing autistic and typically developing children

Poster

*Ms. Zuriñe Abalos*¹, *Dr. Elena Castroviejo*¹, *Dr. Begoña Vicente*¹

1. University of the Basque Country

The present study compares the semi-spontaneous speech of 30 Spanish-speaking autistic children aged 6;0-11;11 years with that of 30 typically developing (TD) children matched in verbal mental age. Previous works examining production in autism have reported difficulties in producing and comprehending questions (Vila 2021), organizing a coherent narrative (Diehl et al. 2006) or being relevant in conversation (Ying Sng et al. 2018). Yet, the underlying causes of these difficulties are under debate. In this research, we use the analytical tools from the *Question Under Discussion* methodology to obtain more fine-grained data about the pragmatic abilities of autistic children for monologic and dialogic discourse. In particular, we examine the comprehension and production of questions (explicit, implicit, potential), the production of explicit/implicit (non-) associated topic shifts (TS), and the management of explicit/implicit rhetorical relations (RRs).

We hypothesize that the autistic group will find more challenging to:

(i) Identify the shared common Big Question (i.e. the interlocutor's intentions) unless explicitly stated, leading to more irrelevant responses to explicit questions, oriented, for instance, towards the child's personal interests:

(1) A: Do you like Bilbao?

B: In Bilbao there's a huge tower.

(ii) Identify potential questions, leading to less relevant subquestions and/or more TS:

(2) A: This cow is thirsty. (Potential question: *How can we help this cow?*)

B: Cows sleep 14 hours on average. (Associated implicit TS)

iii) Understand that before the asserted proposition enters the Common Ground, this must be grounded and accepted by the hearer, leading to fewer subordinating RRs (e.g. Elaboration), and/or more implicit TS and RRs, i.e. realized in the absence of discourse markers, for example:

(3) The child fell. The deer threw him. (Implicit cause-effect RR)

Production data will be collected from the book *Frog, where are you?* (Mayer 1969) and the ELSA protocol (Barokova et al. 2020), and analyzed using the CLAN software (MacWhinney 2000). The novel coding system that we will use will allow us to code aspects of discourse structure production, with the ultimate aim of contributing to better characterizing the pragmatic difficulties that are thought to be pervasive across the spectrum.

Social media as a platform of cultural representations: Looking at Japanese work culture through YouTube content

Poster

***Dr. Hsin-Hua Chiang*¹, *Dr. Saki Ohira*², *Prof. Etsuko Yoshida*³, *Dr. Kazuyo Murata*⁴**

1. The University of Tokyo, 2. Ritsumeikan Asia Pacific University, 3. The University of Shiga Prefecture, 4. Ryukoku University

As a global social media for sharing video content, YouTube has become a popular platform that enables transcultural communications. The research aims to portray the dynamics of constructing and reconstructing cultural representations on social media by choosing Japanese work culture as the major theme. With the growth of international workers resettling in Japan, increasing discussions about the work environments, particularly in the office setting, can be observed on YouTube. Compared to the governmental materials that provide relevant knowledge to overseas audiences, most of the content on YouTube is provided by Japanese or international employees working in the country, thus facilitating a bottom-up approach to cultural representation. The videos cover a wide range of types such as self-expression, interview, vlog, documentary, etc., sharing diverse experiences and opinions about the business culture. The video data was retrieved from YouTube in October 2022 by a mixed set of keywords related to “Japan”, “business”, “working”, and “culture”. The research has browsed related videos uploaded between 2009 and 2021, then selected 262 videos with more than 500 views. To better focus on the contexts of Japanese office culture, the contents relevant to internship, job hunting, part-time jobs, working visas, and recruitment are omitted. In addition, self-employed jobs (e.g., YouTubers, freelancers, etc.) and non-office settings (e.g., restaurants, factories, farmlands, etc.) are excluded from the analysis. The data is then investigated by both quantitative and qualitative methods. The first part of the research presents a quantitative overview of the metadata (uploading date, length, view, language, backgrounds of the uploaders, etc.). Out of the selected 262 videos, 151 (49%) are English-speaking or embedded English subtitles, and 176 (67%) are uploaded by individual users. The research then characterizes the keywords of each video to highlight the main dimensions of Japanese work culture portrayed in the contents. The five topics with the highest total views are commuting, drinking parties, meetings, hierarchy, and morning assemblies. The second part of the research applies interactional sociolinguistic and social constructionist approaches (Holmes 2008, Murata 2015) to discover how these five topics are presented in the content. The discourse analysis indicates salient patterns of cultural representation. On the one hand, explicit strategies are utilized by the senders’ specific word choices, comparisons, or helpful hints, while implicit strategies can be observed in the usage of captions, highlights, and sound or visual effects. On the other hand, the cultural representations are deliberated through the comments and replies under the video. Throughout the interactions between the sender and the audience, video content on social media provides a collaborative and dynamic platform for presenting and representing Japanese work culture.

Sociopragmatic Analyses of the Sequential Organisation of L2 Requests

Poster

Dr. Aika Miura¹

1. Rikkyo University

The aim of the current preliminary study is to present a framework for analyses of the sequential organisation of requests made by Japanese learners of English to provide pedagogical implications for effectively teaching pragmatics to L2 learners. This study investigates shopping role plays conversed between interlocutors (i.e. trained interviewers) and learners (i.e. test-takers) extracted from the National Institute of Information Communications Technology (NICT) Japanese Learner English (JLE) Corpus, which is composed of written transcripts of oral proficiency interviews. In the shopping role plays, learners were asked to negotiate a refund or an exchange of the purchased item. The learners' proficiencies are grouped into the CEFR B1, B2 and C1 levels.

The initial stage of analysing sequential organisation of L2 requests starts with dividing a request sequence into different parts: 'pre-expansion', 'requestive head act' and 'post-expansion', drawing on Al-Gahtani and Roever (2012). Thus, the co-construction of the interactions is also examined by investigating 'insert expansions' (i.e. interlocutor insertions between the request and its acceptance) to see how much the interlocutor contributes to completing a given role-play task. The analyses are guided by the following questions:

1. Is there a preferred order of sequence adopted by Japanese learners of English? Is the order deductive (i.e. a requestive head act followed by its post-expansion) or inductive (i.e. a requestive head act preceded by its pre-expansion)?
2. What kinds of pre-expansion and post-expansion are examined? Are these reasons, background information, complaints, concessions, ironies or something else? Do Japanese learners tend to make emotional appeals or provide objective facts?
3. What kinds of co-constructions of the interactions are examined? How much repair is made by learners and interlocutors (cf. Ikeda, 2021)?

In addition to the micro-analyses mentioned above, the following macro-analytic questions are addressed:

1. Are there any different tendencies in sequential organisation across different proficiency levels of learners (e.g. the CEFR B1, B2 and C2 levels)?
2. Are there any different tendencies in sequential organisation across different contextual settings (e.g. purchased items, services and shops)?
3. How successful are the learners' negotiations at the end of the interaction? Are the learners' requests fully, partially, scarcely or never accepted?
4. How do EFL teachers evaluate learners' sequential organisation of requests? How much are they socio-pragmatically appropriate and why? Are there any correlations between the degree of appropriateness and proficiency level?

Through the analyses of the sequential organisation of L2 requests, pedagogical implications for teaching pragmatics to Japanese learners of English are expected to be provided. Teaching not only the choice of pragmalinguistic features (e.g. the use of desire verb *want* or *would like*) in the requestive head acts, but also constructing a request sequence in a sociopragmatically appropriate manner should be a prerequisite for improving learners' interactional competence.

Ikeda, N. (2021). Assessing L2 learners' pragmatic ability in problem-solving situations at English-medium university. *Applied Pragmatics*, 3(1), 51–83.

Subjectivisation and Depersonalisation as overt and covert techniques of authorial stance taking in linguistic research papers written in English, Serbian and German

Poster

Ms. Milica Rodić¹

1. Heidelberg University

Across cultures, authors use a variety of linguistic strategies to implement their own voice into their academic texts either overtly or covertly. Based on a corpus of 34 linguistic research articles written in three languages – English, Serbian and German, the aim of this study is to investigate how authors use authorial stance markers (i.e. author's "voice" in the text) across these three academic communities.

The analysis focuses on two distinctive strategies of overt and covert stance taking, according to Martín-Martín (2008): *subjectivisation*, as the overt expression through self-mentioning, and *depersonalisation*, through which stance is covertly expressed by diminishing the presence of the author. This data-based but category-inspired analysis was conducted through MAXQDA – a software tool for qualitative and quantitative text analysis.

Preliminary results revealed notable quantitative differences in the use of these markers, as the strategy of subjectivisation is used most frequently in English and least frequently in German, whereas the strategy of depersonalisation is used most frequently in German and least frequently in Serbian. These differences are further elaborated by a qualitative analysis of potential contextual factors which may impact the use of these strategies beyond cultural differences to reveal significant cross-cultural implications and enhance mutual understanding in future academic discourse.

Taking Experiential Learning to Task: The TBELT Model

Poster

***Dr. Catherine Box*¹, *Dr. Domenica DelPrete*²**

1. University of Pennsylvania, 2. Columbia University

Educators across disciplines have drawn on the principles of experiential learning (EL) (Kolb, 1984, 2015) to design engaging lessons that provide real-world reflective learning experiences in a variety of intra- and inter-cultural contexts. Drawing on theories from human development and learning (i.e., Dewey, 1910, 1997; Lewin, 1997; Piaget, 1969, 2000), Kolb's EL cycle conceives learning as an emergent process, during which learners pass through four stages (concrete experience, reflective observation, abstract conceptualization, and active experimentation) sequentially. It has served as a foundation for inclusive, democratic learning across diverse educational contexts.

The cycle design *per se* necessitates a concrete learning experience and a reflective observation (Kolb, 1984), which, through actively engaging participants, maximizes comprehensibility and promotes retention of abstract concepts. In addition, the *Learning Style Inventory* (Kolb & Kolb, 2011) leads to an individualized learner profile intended to address diverse learning styles. Despite its many affordances for classroom implementation, how classroom teachers can effectively transition between activities within a cycle, scaffold tasks within the cycle, and/or provide opportunities for post-task debriefing remains understudied. To fill this implementation gap, this poster will present a model of learning that merges Kolb's 4-phase cycle with Task-Based Learning (TBL) (Ellis, Skehan, Li, Shintani, & Lambert, 2020), which we have termed *Task-based Experiential Learning and Teaching (TBELT)*. For each stage of Kolb's cycle, we design a pre-, during-, and post-stage activity, which lends cohesion to the experiential process by providing (1) explicit introductions to each stage, (2) transitions between stages, and (3) ample opportunities for debriefing throughout the cycle. This creates opportunities for participants to increase their own awareness of experiential learning, and for facilitators to assess participants' mastery of learning objectives. As such, engaging in the cycle creates a more robust, scaffolded experience.

Longitudinal data draw from several sections of a graduate-level course in Experiential Learning Design, given in Spring 2021, and again Spring 2022. In this course, the facilitators of this workshop piloted TBELT through creating a project that required students to utilize a template merging Kolb's cycle and TBL. This integration led to student presentations that provided opportunities for robust discussions on topics such as interpreting contextualization cues in intercultural business meetings, recognizing and responding to microaggressions in everyday interactions, and fostering productive interfaith dialogues on college campuses. This poster will present vignettes from our data. In addition, it will provide an example activity design, which will allow educators to see how they can apply the TBELT model to a pedagogical experience related to topic in their field.

The Arabic Tayyib: Current developments and new trends

Poster

Mrs. Amereh Almossa¹

1. *University of York; Princess Nourah Bint Abdulrahman University*

The Arabic discourse-pragmatic feature TAYYIB occurs frequently in natural interactional settings. Several studies have reported that TAYYIB (lit. 'good/well') has developed several discourse-pragmatic functions in many Arabic varieties, e.g. Egyptian (Ismail, 2015), Jordanian (Al-Harashsheh & Kanakri, 2013) and Lebanese (Ayash, 2016). Although the formal and functional variability of TAYYIB has been documented, the variation and change of TAYYIB have not been studied. This paper examines TAYYIB in Najdi Arabic (NA) in light of grammaticalization, with an attempt to explore discourse-pragmatic functions and how the variation is constrained by linguistic and social factors.

A total of 491 TAYYIB tokens were extracted from a corpus of 18 hours of audio-recorded dyadic conversations with 60 native speakers of NA. Two different phonetic realisations were identified: (i) full *Tayyib* [tʰajjib], (ii) and reduced *Tab* [tʰab], whereby *Tab* underwent phonetic reduction by the deletion of [jji]. *Tayyib* is the most frequent variant, accounting for approximately 75% of the total. A reversed pattern is found in Jordanian and Egyptian Arabic, where *Tab* represents 70% in both varieties. This difference between NA and other Arabic varieties reflects the conservative nature of NA in maintaining many features of Standard Arabic (Holes, 2006; Holes, 2015). Drawing on the conversation analytic approach within a variationist framework, multiple discourse-pragmatic functions of TAYYIB are attested. *Tayyib* is used for the interpersonal functions to perform agreement, acceptance and acknowledgement. For textual uses, *Tayyib* and *Tab* are employed as a turn-taking and topic-closure device, to mark transitions in the discourse, and as mitigators while marking topic shifts.

The statistical analysis reveals a significant association between the variants of TAYYIB and their function, and speakers' age and gender. Regarding the function, while *Tayyib* is significantly more frequent with the interpersonal function, the reduced form is only used for textual and interpersonal-textual functions with no significant association observed with either. As for social factors, *Tab* is significantly more likely to be used by the young (16-20 years-old) than by adults (aged 30-40), and by females than males. This can be interpreted as an indication of ongoing change driven by young, primarily females, towards greater use of the innovative form. Given the evidence of linguistic change in *Tayyib*, including pragmatic strengthening, and decategorialisation, while *Tab* exhibits semantic bleaching, pragmatic strengthening, and phonetic erosion, the study suggests that TAYYIB is undergoing grammaticalization, with the *Tab* variant being the most advanced form along the grammaticalisation cline (Hopper & Traugott, 2003). However, the fact that *Tab* has a higher frequency and interpersonal usage in Jordanian and Egyptian Arabic suggests that the grammaticalization in NA is likely to still be underway in NA but in a much slower and more modest manner.

The evidence of the MultiModal Narrative (MMN) intervention on preschool children's narrative and pragmatic abilities

Poster

*Ms. Julia Florit-Pons*¹, *Dr. Alfonso Igualada*², *Prof. Pilar Prieto*³

1. *Universitat Pompeu Fabra*, 2. *Universitat Oberta de Catalunya*, 3. *ICREA-Universitat Pompeu Fabra*

Existing intervention programs have been designed for improving narrative skills (e.g., Spencer et al., 2015) or pragmatic skills (e.g., Kasari et al., 2010) in both typical and atypical populations, but very few train both skills in the same program. Besides, to our knowledge, multimodality (e.g., embodied speech involving hand and bodily gestures, and facial expressions) has not been fully integrated into these interventions, despite some evidence of its beneficial role in development (e.g., Hostetter, 2011; Vilà-Giménez & Prieto, 2021). On these lines, we have designed an intervention program, the MultiModal Narrative (MMN) intervention, which trains narrative macrostructure (i.e., structural elements of the narrative) as well as pragmatic and perspective-taking abilities (i.e., understanding characters' perspectives and emotions) with the aid of multimodal strategies (i.e., embodying the different actions and emotions of the stories). The aim of this study is to determine the effectiveness of the MMN intervention taking an inclusive perspective, i.e., applying it with two different supports in two contexts: with universal support in preschool classrooms and with intensive support in speech-language therapy sessions with children with Autism Spectrum Disorder (ASD) and Developmental Language Disorder (DLD).

The participants of the application in the universal support will be around 120 5-year-old typically developing (TD) children, while the participants of the intensive support will be 75 4- to 6-year-old children: 25 ASD, 25 DLD, and 25 TD.

Specifically, we have used a between-subjects pre- and post-intervention design. The MMN intervention consists of 9 30-minute sessions where the interventionist (teacher or therapist) trains narrative macrostructure and perspective-taking through different strategies (i.e., video cartoons, a storyteller, icons, question-and-answer sequences, multimodality). The intervention with universal support has been applied with 3 groups (control group, and 2 experimental groups: multimodal and non-multimodal). In comparison, the intervention with intensive support has been applied with 3 groups (experimental group and 2 control: TD and ASD/DLD treatment as usual). Participants were administered different tasks both at pre- and post-test: 2 narrative retelling tasks, and 2 tests for expressive and receptive pragmatic skills.

Preliminary results of the application of MMN with universal support with 47 TD children in 3 preschool classrooms have shown that participants in the experimental groups significantly improved from pre-test to post-test in terms of receptive pragmatic skills, and did not improve in terms of narrative and expressive pragmatic skills, and that the children in the multimodal group outperformed those in the control group. Also, for the application of the intervention with intensive support, preliminary results with 6 ASD children and 4 DLD children have suggested that both groups significantly improved their receptive and expressive pragmatic skills from pre-test to post-test.

Although these findings are still preliminary and will be complemented with data from more than 150 participants (full results will be presented during the conference), results seem to indicate that the MMN intervention is beneficial in boosting preschoolers' pragmatic skills. All in all, initial evidence suggests that multimodality should be systematically introduced in clinical and educational interventions.

The expression of substitution in Italian in monologic and dialogic contexts: a corpus-based analysis

Poster

Ms. Antonia Russo¹

1. University of Bergamo

In my contribution, I aim to outline a typology of the strategies used to express substitutive contrast and to observe and explain the variation in the use of these strategies on the basis of greater/minor dialogicity/monologicity.

The literature has been mainly dedicated to the analysis of the strategies that are most commonly associated with the substitutive contrast relation, i.e. those characterized by precise syntactic configurations and by the presence of dedicated lexical elements. Such a relation can be encoded through subordinative ([*sub. conj.* p], [q]/[q], [*sub. conj.* p]) (Manzotti 2002), coordinative/juxtapositive ([p], [(*subst. conn.*) q]) and paratactic correlatives configurations ([*neg.* p] (and) [(*subst. conn.*) q]) (Tekavčić 1971, Anscombe/Ducrot 1977, Rudolph 1996, Mauri 2008), for each of which Italian has a set of dedicated markers: *invece (di/che)* (instead (of/that)), *piuttosto (che)* (rather (than)), *anzi/anziché* (rather (than)), *ma e bensì* (but).

I will show that the strategies mentioned above constitute only a part of the repertoire available to the speaker to express substitution and that the choice of one or the other strategy seems to vary considerably in monologic and dialogic contexts. An initial pilot investigation showed that in monologic contexts there is a greater use of the strategies that are normally associated with substitutive contrast, whereas in dialogue, less specific strategies are often used (profrastic *no*, adverbs *in realtà/in verità* (in fact/in truth) or no explicit strategy at all).

For this purpose, I will use the KIParla corpus (Mauri *et al.* 2019) and in particular the KIP module. This module in fact contains free conversations, lectures, examinations, student receiving and semi-structured interviews, thus enabling the analysis of diaphasic variation phenomena.

The greater presence of explicit and complex strategies within the monologues seems to be linked to different causes. One of these may be the greater ability to control the speech in monologue, the professor plans the speech and repeats it. In dialogue, on the other hand, the speech is unplanned and is characterised by the use of more general terms. Furthermore, since the substitutive relation is intrinsically dialogic, in monologues seems to be necessary for the speaker to include the interlocutor's viewpoint to be substituted. This fact leads the speaker to develop more complex and explicit strategies that highlight the different viewpoints at play and the reciprocal positions with respect to them.

The Imposition of Gender Images in Japanese Society: The Use of 'Kawaii' in Young Female Magazines

Poster

*Ms. Yuka Nishiyama*¹, *Prof. Ayako Namba*¹

1. Kwansei Gakuin University

The relationship between Japanese fashion magazines and readers can be described as 'hierarchical interdependence' (Hayashi, 1977) as the texts of those magazine articles convey implicit female gender stereotypes. Drawing on specific linguistic strategies to construct their dominance (Hayashi, 1995; 1997; Takagi, 2012), the magazine articles induce readers to unconsciously accept the former as benevolent advisors (Maynard, 1997; Nakamura, 2007). 'Kawaii', one of the major compliments in Japanese, simultaneously compels women to protect their femininity, fragility, and delicacy (McVeigh, 1996; Asano-Cavanagh, 2014) while also upholding long-standing gender stereotypes. Existing linguistic research on 'kawaii' deals with the unique value of the term in Japanese society. However, there remains much scope to explore the distinctive features and roles of the linguistic devices surrounding 'kawaii' and to identify how these relations intertwine with gender ideology in society.

This paper aims to reveal how Japanese female fashion magazines reinforce a covert suppression based on distinctive uses of the complimentary adjective 'kawaii'. To achieve this goal, this study examines how specific linguistic strategies present in the magazine articles tactically guide young females to reproduce gendered stereotypes. Drawing on the notion of politeness (Ide, 1986) the present paper argues that 'kawaii' shapes gender ideology through three grammatical features: ellipsis, honorifics, and final particles.

Data collection lasted for one year, covering the period of April 2021 to March 2022 (in total 12 volumes), with texts drawn from two popular Japanese fashion magazines, *Can Cam* and *Non-no*, each of which target women in their early-20s. Extracting samples of all phrases containing 'kawaii' published during the period, 698 sample phrases were obtained. Specifically, this study analyzed the use of 'kawaii' with specific reference to the ellipsis, honorifics, and final particles accompanying sample phrases to elucidate the dominant structures communicated by the writers (magazine editors) to the readers (female consumers).

Ultimately, three key findings emerged from this analysis. First, ellipses attached to 'kawaii' phrases demonstrated the following characteristics: omission of the subject and the predicate by ending with case particles (e.g., '-wo', '-ni'). By consciously deleting the subject, the writers of the magazine articles include their readers in the texts, imprinting onto them claims disguised as the readers' 'thoughts'. Additionally, the formation of ungrammatical phrases (e.g., the omission of verbs, incomplete endings using the nouns) inscribes the writer suggestions onto the female readers without drawing upon strongly-worded expressions or imperative constructions (e.g., 'should do', 'must do', or 'have to do'). Secondly, honorifics were used when models under contract gave personal comments. In this instance, the writers likely used expressive respect to communicate an 'elegant' or 'deferential' impression to the readers. Thus, by using the honorifics, the writers position featured models as assumed role models, as heroines acting as idealized templates for the young readers to duplicate. Third and finally, the writers attached concluding particles to the adjective 'kawaii' to express an empathetic atmosphere when offering suggestions.

The linguistic manifestation of politeness in digital communication (e-mails): in relation to university professors and native/non-native students

Poster

Dr. Andrea Pap¹, Dr. Judit Bándli¹

1. Eötvös Loránd University

Polite linguistic behavior serves the establishment and maintenance of interpersonal relationships, conformed to communicational and sociocultural expectations (Watts 2003). The demand for politeness can be observed in written communication as well. The changing social context, online education, has altered the communication channel between students and teachers, with digital communication gaining more ground (Merrison – Wilson – Davies – Haugh 2012).

This form of written communication affects students' linguistic behavior as well as the choice of linguistic expressions. The characteristics of written language activity may be observed not only in the communication of Hungarian native speaker students, but also that of non-native speakers of Hungarian. The language user's pragmatic competence and communicative linguistic ability determine digital communication as well (Bachman 1990). For non-native speakers of Hungarian, due to the deficiencies in the appropriate pragmatic competence, selecting the adequate linguistic form expected in each situation poses an even greater difficulty, particularly in formal, asymmetrical interpersonal situations, such as the teacher-student relationship (Economidou-Kogetsidis 2016, Pap 2022). The standard method of interaction between university students and teachers is electronic messages, which is a form of written communication comprising unique and conventional linguistic elements. Informal and formal forms of address are the characteristic linguistic expressions of sociocultural relations, indicating the nature of the social relationship being formed in the discourse, as well as the social relationship between the interaction partners.

The aim of the research is to investigate the linguistic tools implicating politeness in the written Hungarian language communication of non-native speaker students and native speaker Hungarian students in e-mails written to university professors, as well as to provide a comparative analysis of the two groups regarding their linguistic behavior. The study focuses on digital communication in the relation of teacher-student interaction, underlining the manifestation mode of polite linguistic characteristics and communication patterns. The theoretical and methodological framework of the study is based on previous L1 and L2 research of Hungarian and other languages (Economidou-Kogetsidis 2021; Chen 2001; Domonkosi-Ludányi 2018, Pagliara 2018).

The investigation examines the conventional formal parts of the e-mails, such as address forms and closings, along with politeness formulae. Furthermore, it elaborates on the means of marking the addressee in the e-mails (e.g. nominal, pronoun forms, other grammatical devices) and the perspectives manifested in requests. The examined corpus is our own collection, comprising the Hungarian messages of students, native and non-native speakers of Hungarian, attending tertiary education in Hungary (Eötvös Loránd University, KKM). The present study encompasses the analysis of 250 e-mails in total, the collection of which was carried out between 2019 and 2022. The comparative analysis of the linguistic behavior of the two researched groups (native and non-native speakers of Hungarian) highlights the discrepancies that may aid the observance of difficulties experienced by students of Hungarian as a foreign language in their written communication in Hungarian. The present research pioneers in comparing the characteristics of L1 and L2 electronic communication regarding to Hungarian. The results including methodological issues may bear valuable educational implications for teaching Hungarian as a foreign language.

The noblesse oblige: On the manifestation of politeness in EFL doctoral defense session interactions

Poster

*Dr. Nadia Mayahi*¹

1. Department of English Language and Literature, Shahid Chamran University of Ahvaz, Ahvaz, Iran

The dissertation defense session is a compulsory oral examination in the higher education system of many countries. This criticism-generating setting calls for a distinct type of discourse characterized by polite linguistic behavior. Drawing on a symbolic interactionist perspective, this study aimed to identify how the Iranian EFL participants of doctoral defense sessions adopt politeness strategies in this evaluative conflict-prone context. This study is based on the discourse analysis of the transcripts of the recordings of the disputation segment of six doctoral defense sessions (about 7 hours) chosen randomly from a corpus of 56 Iranian EFL defense session recorded in 14 universities. The findings suggest that the degree and form of using politeness strategies in the Iranian EFL defense sessions, to a great extent, depend on the role of the defense participants. Interestingly, the most powerful individuals in terms of social and academic status (i.e., internal and external examiners) tended to adopt a wider range of politeness strategies highlighting their academic identity and modesty. The candidates, on the other hand, were more concerned with defending their own stance by focusing on the ideational aspect of the interaction. *This study highlights the importance of observing politeness in the evaluative discourse of the defense session* and has pedagogical implications for EFL oral academic literacy practices. Politeness as the prominent feature of the committee members' talk-in-interaction, manifested through showing modesty and considerateness and out of a sense of noblesse oblige, indicates the developmental status of defense sessions. Performing their academic persona and educational role, the committee members who belong to the same in-group network seem to look at the defense session as the doctoral candidates' last site for learning in which they learn how to accept disagreements and criticisms with grace and appreciation. As an elegant strategy in managing conflict, politeness in academic interactions deserves more attention, particularly in EFL contexts.

The Use of Aggressive Language in Twitter: a Contrastive Study Between Peninsular Spanish and British English

Poster

Mrs. Almudena Diaz¹

1. Complutense University of Madrid

The main aim of this poster is to present part of the ongoing research for my doctoral dissertation which aims to establish whether there are differences in the amount of aggressive language used on Twitter in Peninsular Spanish and British English. Aggressive language on Twitter is a subject that arouses a great interest among scholars from many different academic backgrounds (linguistics, psychology, sociology, or computer science among others). Albeit there are many terms used to describe aggressive language (e.g., hate speech, toxicity, flaming, incivility, abusive language, verbal aggression), several researchers (Sue et al., 2007; Waseem et al., 2017 among others) have already classified these terms regarding the implicit or explicitness of the language used. In fact, I propose a classification based on the previous works in automatic aggression detection by Kumar et al (2018a, 2018b, 2020) in which language can be Overtly Aggressive (OAG), Covertly Aggressive (CAG), and Non-Aggressive (NAG).

Still at an early stage, my research attempts to quantify the amount of OAG, CAG, and NAG language found in random tweets collected from several Trending Topics. After the first step, which analyses various tweets in Peninsular Spanish (n° of tweets = 1261) and British English (n° tweets = 1097) with Natural Language Processing (NLP) tools, I can present the first results on the amount of OAG automatically detected. Thus, these preliminary results indicate that the automatically OAG expressions in Peninsular Spanish (143 tweets) double those in the British English dataset (only 68). Not only do these two datasets differ in quantity but also in quality, with the Spanish dataset scoring higher values. Additionally, a sentiment analysis has been carried out on the two datasets, obtaining that 43% of the British A-OAG expressions correspond to negative sentiment, while the Spanish equivalent reaches 80%.

The social implications of these findings are yet to be seen. However, the first step on the way to reducing aggressiveness in online communication, on social networks, and, particularly, on Twitter is to be aware of its presence not only in the form of isolated tweets from celebrities but filtered in the daily communication of any person.

Threats and Warnings in Dominican Spanish and American English: A Cross-Cultural Pragmatics Study

Poster

*Ms. Vicky Hansly*¹, *Dr. Federica Barbieri*¹

1. Swansea University

Research in sociolinguistics suggests that Dominican Spanish speakers are subjected to negative perceptions and attitudes by other Latino groups (Terrell, 1982, Garcia et al., 1988), as well as to the misunderstanding of their linguistic and cultural identity by American speakers of English (Bailey, 2000). Dominican Spanish speakers have also been shown to have negative self-perceptions of their own dialect (Zentella, 2007).

Cross-cultural pragmatics research shows that Spanish speakers employ higher levels of directness than English speakers when producing a face-threatening speech act (Blum-Kulka & House (1989), Marquez-Reiter (2000), Pinto & Raschio (2007)). Given this background, the present study examines threats and warnings in speech among Dominican speakers of Spanish and American speakers of English. Specifically, the study investigated the strategies most commonly used by Dominican Spanish and American English speakers, the differences in the rates of use of indirectness strategies among American English speakers and Dominican Spanish speakers, and the relationship between politeness parameters in a given situation and the level of indirectness in threats among both participant groups. The study employed a spoken discourse completion task (DCT), following the approach used by Nelson et al. (2002). The study included 32 participants: 16 native English-speaking Americans, and 16 native Dominican and Dominican-American Spanish speakers, all living on the East Coast of the United States. Participants ranged in age from 18 to 56 and included 23 females, 8 males, and one non-binary. Once transcribed, the data was classified using a taxonomy of threatening and warning strategies adapted from the taxonomies of Nelson et al. (2002), Bataineh & Aljamal (2014), and Al-Omari (2007).

The key finding from the study was that Dominican Spanish speakers produce threats and warnings with a higher level of directness than American speakers. Findings suggest that Dominican Spanish speakers and American English speakers employ mostly similar strategies when producing a threat or warning, with both groups most commonly employing the strategy of offering reason. However, the Dominican Spanish group displayed overall higher levels of directness than the American English participants. Overall, this study supports previous research showing that Spanish speakers employ a higher level of directness in interaction than English speakers. (Blum-Kulka & House, (1989); Marquez-Reiter (2000), Pinto & Raschio (2007).

Understanding the Influence of Remote Communication on Social Interaction: Comparison Between Video Conference and Virtual Reality

Poster

Ms. Émilie Lamarre¹, Prof. Douglas Shiller¹, Prof. Stefano Rezzonico¹

1. Université de Montréal

Background. Dyadic conversations are organized in a turn-taking system in which one person speaks at a time and changes of speaker occur quickly with minimal gaps and overlaps (Sacks et al., 1974). Social interactions also involve *backchannels*: small verbal and non-verbal behaviors of the listener that support the speaker (Eiswirth, 2020). Backchannels must be taken into consideration since they can occur overlapping with on-going speech without being disruptive (Yngve, 1970) or during silences, preserving communication between interlocutors (Kogure, 2007). Gaps, overlaps and backchannels are influenced by the context of the interaction. Results from Boland et al. (2022) show that remote conversations by video conference have longer gaps between turns than local face-to-face conversations. Seuren et al. (2021) mention that when overlaps occur during a video conference, their resolution may be delayed due to latency (delay caused by the transmission of signals). While we know that communication by video conference interferes with the smooth exchange of turns in conversations, our knowledge concerning communication in *virtual reality* (VR) remains poor. The use of VR for research, therapy, and personal purposes has been rapidly gaining in popularity because of continued improvements in immersion and realism (Pan and Hamilton, 2018; Peeters, 2019). Therefore, the present study aims to describe and compare the coordination between interlocutors in two contexts of remote communication: video conference and VR.

Procedures. This study examines dyadic conversations between pairs of French Canadian speakers (18 to 30 years old, typical development). Participants of a dyad need to have known each other for at least three years. In both contexts, participants are placed in separate rooms, using only computers to communicate with each other. In the video conference context, participants sit in front of their computer and are connected through *Zoom*. They can only see the video of their interlocutor – from shoulders and above – in full screen. In the VR context, participants stand in a playing area and use *Oculus Rift-S* headsets and controllers to communicate via the program *VRchat*. The immersive experience allows participants to interact with each other through a chosen avatar that can recreate head movement (e.g., nodding, shaking), some hand gestures (e.g., pointing) and body movement (e.g., walking closer or further). In each context, participants are asked to have a five-minute unscripted conversation on a general topic such as “What would be your ideal travel destination?”

Analysis. Interactions will be transcribed and coded following the principles of content analysis. First, markers of coordination (gaps, overlaps and backchannels) will be analyzed in each context with regard to type, frequency, and length. Then, results from the video conference will be compared to those from VR to highlight the differences and similarities between these remote communication contexts.

Conclusion. This study will improve our knowledge of how the use of virtual reality as a means of communication influences the organization of communication between two people. This work represents a first step toward the use of this promising new technology to help people living with communication impairment improve their interactional competence.

Use of Interactional Metadiscourse in Research Articles Written in English by Native English and Japanese Writers

Poster

*Dr. Kayo Fujimura-Wilson*¹

1. Yamaguchi University

In English writing, metadiscourse markers are used to state information clearly while considering the interaction between writers and readers. Metadiscourse markers comprise interactive markers, which help to guide the reader through the text, and interactional markers, which involve the reader in the text (Hyland, 2005, p. 49). Interactive markers include transitions, frame markers, endophoric markers, evidentials, and code losses, and interactional markers include hedges, boosters, attitude markers, self-mentions, and engagement markers. Metadiscourse markers have been widely examined in English texts written by native and non-native English writers. Although some studies have analysed essays written by Japanese learners of English in EFL classrooms, few have examined professional academic research articles by Japanese researchers in academic writing; therefore, this study analysed interactional metadiscourse markers to illustrate the way in which they are used by native English and Japanese writers in academic research articles. Writers used these markers to emphasize or soften their claims, and to show their stance and identity in order to negotiate their claims with readers. For example, boosters, such as *show* and *definitely*, were used to close down the possibility of diverse ideas stating views with a confident voice while talking to and involving readers (Hyland, 2005). While self-mentions, such as the use of *I* and *we* and writers' own citations, were used to show their identity and set out their research process and findings like telling a story, hedges were used to soften writers' claims in discussion and results sections. This study analysed 20 research articles of soft science disciplines written by native English and Japanese writers. In general, soft science disciplines include linguistics, education, and business studies.

The results showed that although Japanese researchers had advanced English writing skills, they still tended to use these interactional markers less frequently than native English writers. Boosters which indicate certainty and full commitment to an assertion, and engagement markers (e.g., *consider*, *you can see that*) which are used to explicitly build a relationship with readers (Hyland, 2005, p. 49) were particularly less frequently used by Japanese writers. In addition, hedges were used more often by native English writers than Japanese writers.

Furthermore, although native English writers in soft science disciplines tactically used these markers for negotiating their arguments with readers, their Japanese counterparts might not have fully mastered the use of these markers in terms of rhetorical use even though they are at an advanced level of English proficiency. It is not easy for non-native English writers to understand the rhetorical meanings of terms in English. Considering the differences between native English and Japanese writers regarding the use of interactional markers, this study finally discusses what Japanese writers could do to acquire the use of interactional markers to help build a relationship with readers and suggests pedagogical implications for non-native English writers.

Vagueness as a manipulative device: a perceptual study of ‘mentre’ in Italian political tweets

Poster

*Ms. Serena Coschignano*¹, *Mr. Antonio Bianco*¹

1. University of Pavia

Implicit linguistic means are vital for processing economy: information is processed with less effort when presupposed or implied (1). However, speakers can also convey information implicitly as a strategy to persuade addressees of doubtful contents, which would be more easily recognized and rejected if asserted (2). Specifically, the content of implicatures and vague linguistic expressions is reconstructed by addressees themselves, making it less likely that they will reject such information (3). Political discourse tends to present ideologically charged contents implicitly: e.g., the vagueness of the Italian connective *mentre* ‘while’ – vague because it can convey in certain contexts both temporal and adversative meaning – is used in political tweets to tendentiously suggest a contrastive relation between distinct events involving Italians and migrants (4), as (a) shows:

a. While (*‘mentre’*) [we (=Italians) were confined indoors]_p, [the government continued to transport #migrants]_q. (Daniela Santanchè, 16-4-20)

Here, Santanchè presents p and q as synchronous events, but the adversative nuance of *mentre* leads the addressee to inferentially derive they are also incompatible (5), therefore constructing an ideological opposition between Italians (ingroup) and migrants (outgroup).

Following recent perception studies (6,7), we will run an experiment to investigate the manipulative effect of *mentre* in the discursive creation of Italians vs. migrants dualism. Respondents will be shown real tweets in context, previously annotated for manipulative vs. neutral uses of *mentre*: stimuli will be selected from a corpus of 910 political tweets on migrations published between January-May 2020. The experiment will consist of an online questionnaire, in which participants (volunteers) will see both manipulative/vague and neutral uses of *mentre*. After each stimulus, participants will be asked whether the tweet’s author is presenting the events as related and incompatible; if so, whether they think incompatibility is factual or manipulative and whether the tweets are discriminatory (on a likert scale). To prevent unintentional bias and overthinking, participants will only be provided with an approximate description of the project and given limited time to answer (8).

Variety preferential pragmatic features in multilinguals in Belgium.

Poster

Prof. Katja Lochtman¹

1. Vrije Universiteit Brussel

Most research on German as a pluricentric language to date has focused on differences between the standard varieties in Germany, Austria or Switzerland. Moreover, the focus in these studies is mainly on linguistic-structural features, with pragmatic differences (if any) only briefly touched upon. In Belgium, German is a minority language within a region, where French is the dominant language, resulting in both individual and societal language contact. At the individual level, many German-speakers in Belgium come from or live in German-French bilingual families. In this sense, language contact in interpersonal communication concerns both intracultural as well as intercultural communication.

Focusing on speech act analysis (requests for repair), the present study used a written production questionnaire or Discourse Completion Task (DCT) with 178 informants (N = 178). By looking at the distribution and frequency of several pragmatic strategies across varieties of the same language (German speakers in Belgium, N = 75 and German speakers in Germany, N = 31) on the one hand and different languages (German L1, N = 106, and French L1, N = 73) on the other, the present paper discusses the variety preferential pragmatic features used by bilingual (German and French, N = 49) as opposed to monolingual (German or French) speakers (Lochtman 2022).

Keywords: variational pragmatics, contrastive pragmatics, German as a pluricentric language, multilingualism

“God, how attractive I am”: A CMC-based study of Persian self-praise

Poster

*Dr. Maryam Farnia*¹, *Ms. Narges Mazaheri*¹

1. Payame Noor University

This study investigated self-praise strategies by Persian social network users on Instagram. To this end, Instagram captions were randomly selected from April 2021 to April 2022 by means of Instagram search functions, and from public personal profiles which promoted their posts by one of the hashtags related to self-praising in Persian language. Overall, more than 250 captions were collected, and after polishing and eliminating posts with irrelevant contents to their hashtags, 200 Persian captions with the size of 6711 words were examined in the final analyses. The data were analyzed based on Ren and Gudo's (2020) model of self-praise. The findings showed that the frequency of explicit self-praise was higher than implicit self-praise strategies. Moreover, Persian speaking users showed more tendency to employ modified explicit self-praise over explicit self-praise without modification.

“Insanity Literature” on Chinese Social Network Sites: Metaphorical Talk and Complaint Speech Act

“Insanity Literature” on Chinese Social Network Sites: Metaphorical Talk and Complaint Speech Act

“Insanity Literature” is a new form of language popular on Chinese social network sites serving to vent emotions through words. It imitates the utterance of insane people who lose control and occasionally present paraphasia in conversations due to mental disorders. This language form has the following features that exclude it from literal truthfulness: a) they are neither the true description of the real world nor of the speaker’s thoughts; b) there is often redundant and repeated information; c) there are limited coherence and logic between sentences, some of which even digress. The three features are demonstrated through plentiful rhetorical devices, which define Insanity Literature as metaphorical talk. As this language use applies to various situations in online conversations, to investigate its pragmatic functions and communicative intentions, the present paper randomly collected 200 posts of “Insanity Literature” on the Chinese social network Weibo and conducted a quantitative and qualitative analysis in terms of its metaphorical use and speech acts. Based on the Grounded Theory developed by Corbin and Strauss in 2008, the researcher coded and categorized both rhetorical devices and pragmatic strategies employed in the posts. The categorization was thoroughly discussed.

The findings show that there are seven rhetorical devices in total, which are usually adopted in combination (64.5%). 35% of the posts employed a single device and only 4% had no devices. Among them, hyperbole, hyperbolic simile and hyperbolic metaphor are the leading rhetorical devices employed to produce the “insane” effect (74%, 21%, and 18.5% respectively). It is also observed that Insanity Literature is most frequently used to perform the complaining speech act at a proportion of 65%. Further examination reveals seven pragmatic strategies primarily adopted in expressing complaints, involving accusation, interrogation, emotion, self-denigration, narration, threat and solution, which may severely threaten the hearer’s face. Hyperbole, however, largely reduces this risk by explicating the falsity of utterances and thus implicating a lower severity. What’s more, self-denigration is proven to be a powerful strategy for expressing dissatisfaction with mitigation. The study also elucidates via relevance theory the understanding process of communication in the form of Insanity Literature, which acts as evidence for the universality of the relevance-theoretical framework.

“Is it just sea?” Multifaceted Functions of the Interrogative Form in Corrective Feedback in Finnish Sign Language Interpreter Training

Poster

*Mrs. Maija Tjukanov*¹

1. University of Helsinki

Interrogative form (in content questions a question word, in polar questions the suffix *-kO* in Finnish) is a common resource in institutional advising situations, for example, in helplines, medical contexts and counseling. This paper investigates the functions that interrogative formatted utterances have in feedback given by the peer students of sign language interpreting and the teacher for a student who has just done an interpreting exercise. All students are hearing L2 learners of Finnish Sign Language (FinSL), and the teacher is a hearing sign language user as well.

The data for the paper are 15 hours of naturally occurring, videotaped dyadic and multiparty feedback discussions in sign language interpreter training in two universities of applied sciences in Finland. Each interpreting exercise in the training is followed by feedback discussion. In the sessions, the dominant language is spoken language. The methodologies used are multimodal conversation analysis and interactional linguistics.

Prior research on advising in spoken language interactions has shown that one central aspect of the use of interrogatives is to prevent rejection and resistance of the advice. However, very little is known about how interrogatives are used for giving advice in situations where sign language interpreting is practiced. The study shows that advising the use of sign language has similarities with instructing embodied skills, for example, in dancing and playing an instrument.

I will examine the following issues: 1) How are interrogatives used in corrective feedback on sign language interpreting? 2) What kind of understanding of epistemic and deontic rights of participants do the interrogatives display? 3) What kind of role do the signs have in relation to simultaneous verbal feedback?

The preliminary findings indicate that while interrogatives are used for requesting for information by the student commentators, the student commentators also simultaneously propose a correction by signing the word that is the target in the interrogative question (Student: *'is it just sea'* [signs simultaneously SEA]). Teachers, on the other hand, regularly use an interrogative as a pedagogical question, displaying that they know the answer. In general, the design and use of interrogatives in feedback by the peers and the teachers is different, associated with differences in the epistemic and deontic position of the peers and the teachers.

“Just Like Real Chicken”: Discourse Analysis of News Around Novel Foods in Singapore’s Media

Poster

*Dr. Keri Matwick*¹, *Dr. Kelsi Matwick*²

1. Nanyang Technological University, 2. University of Florida

This poster aims to identify the discursive strategies of the media in their re-constructions of novel foods, including plant-based meats and alternative, cell-based, and cultivated meats. Building on critical media discourse analysis, we apply the analytical framework of discursive news values analysis (Bednarek and Caple, 2017) to investigate how novel meats are made newsworthy through language (specifically in the headlines and body text). We analyze the coverage of the world’s first cultured meat available for commercial sale in Singapore in *The Straits Times*. The study identifies news values and themes in the flagship newspaper’s most-read online articles on lab-grown meat (2019-2022). It finds that the coverage relies on news values of Proximity, Positivity, Impact, Eliteness, and Superlativeness, constructing a sociocultural understanding of new foods as positive, innovative, and profitable, and significantly for Singapore, Tasty. We argue that these media stories may increase understanding of new foods and make them more relatable through positive gastronomic descriptions and metaphors.

Specific Aims: This *Novel Foods* project aims to:

- Identify how language is used in the construction of meaning of novel foods in Singapore’s (social) media and government discourse;
- Relate media and social media texts to broader sociocultural and sociopolitical contexts of Singapore;
- Examine the role of novel food innovation in relation to Singapore’s national priorities;
- Generate insights into the future of novel foods and their cultural impact in Singapore.

Significance: This project addresses three problems of academic significance:

- What is the cultural impact of novel foods?
- Why and how are novel foods considered the future of food?
- What can media discourse tell us about the underlying concerns in the development and eventual integration of novel foods into Singapore society?

Sample data and analysis:

<https://www.straitstimes.com/singapore/environment/cell-cultured-chicken-meat-gets-hawker-treatment-at-curry-rice-stall>

”In a world’s first, a hawker in Singapore recently offered a cell-cultured chicken meal at an affordable price of \$4.

And diners said the meat tasted “just like real chicken”. Cultured meat is made from growing animal cells in a bioreactor - similar to the vats used in brewing beer - instead of slaughtering actual animals.

The slices of lab-grown chicken were served alongside a hearty portion of white rice drenched in curry, together with eggplant and cai xin, a Chinese flowering cabbage, and a bottle of iced lemon tea at Loo’s Hainanese Curry Rice in Tiong Bahru.”

Proximity: novel food constructed as culturally, gastronomically, and geographically near

“The benefits of the vaccine outweigh the risks... they say”. An empirical study on Facebook comments on news conveying uncertainty and conflicting opinions about the possible adverse effects of the AstraZeneca vaccine

Poster

***Prof. Ilaria Riccioni*¹, *Prof. Alessia Bertolazzi*¹, *Prof. Ramona Bongelli*¹**

1. University of Macerata

This study – which is a work in progress – aims to analyse reactions to two posts published on the public Facebook page of the Italian newspaper *Il Corriere della Sera* about the possible adverse effects of the AstraZeneca vaccine. The first post, published on 16 March 2021, contains a link to an article reporting the declaration of Emer Cooke, director of the EMA (European Medicines Agency), following the precautionary suspension of the administration of the vaccine in some European countries (Spain, France, Germany, Italy, Portugal and Slovenia), after reports of confirmed cases of thromboembolism. The post includes the following short text: “The European Agency: ‘Final decision on Thursday, to date the benefits of the vaccine outweigh the risks’”. The second post published only two days after the first one, on 18 March 2021, provides an account of the EMA press conference held on the same day, where the AstraZeneca vaccine was declared “safe and effective”. In this case, only part of the article published by the newspaper is quoted in the text of the post: the post contains excerpts of the declarations and the link to the article (which can, however, be read in full only by subscribers).

In order to understand the positioning of Facebook users who responded to the two posts (and to the articles they refer to), two corpora have been collected: the first dataset contains 190 comments; the second one 340. Both sets of comments were extracted the day after the publication of the two original posts. The study uses a mixed method approach, combining automatic and manual analyses, quantitative (sentiment analysis, word list, word concordance) and qualitative (pragmalinguistic analysis) methodologies, and focusing on aspects such as positive/negative assessments and agreement/disagreement strategies. Furthermore, special attention is paid to the users’ epistemic positioning, with an emphasis on the communication of uncertainty and the ways in which it is conveyed in the comments.
